INDEX

NAME INDEX

ABOLINS, Prof. Leo : Alkaline Phosphatase in various Cell Types of the Anterior Pituitary of the Guinea Pig, 556
Academy, 1948 : The Royal (Dr. A. Tindell Hopwood), 876
Acheson, G. G., and West, Dr. T. F. : Reaction of β-Naphthol with l-α- and l-β-Phellandrene, 976
Ackers, C. P. : Practical British Forestry, second edition, *review* by Prof. E. P. Stebbing, 295
Acta Crystallographica, No. 1, 1005
Adam, Prof. N. K. : Interaction of Water and Porous Materials, 629
Adams, Agatha Boyd (edited by Knight, Prof. Edgar W., and) : University of North Carolina Graduate School Research and Publications, *review*, 705
Addison, Prof. Herbert : Hydraulic Measurements, second edition, *review* by B. C., 79
Addison, Lord : Honorary degree of doctor of laws of the University of Sheffield conferred on, 555
Adolph, E. F., and associates : Physiology of Man in the Desert, *review* by Dr. B. McArdle, 744
Adrian, Prof. E. D. : The Physical Background of Perception, *review* by Dr. O. A. Trowell, 498
Aeronautical Society, Royal :
  Gold Medal awarded to Sir Bennett Melvill Jones, 593
  Silver Medal awarded to I. I. Sikorsky, 593
  Bronze Medal awarded to Miss F. B. Bradfield, 593
  Simms Gold Medal awarded to Sir William T. Griffith, 593
  George Taylor (of Australia) Gold Medal awarded to Dr. J. W. Drinkwater and W. G. Glendinning, 593
  Edward Busk Memorial Prize awarded to Air Marshal the Hon. Sir Ralph Cochrane, 593
  R.38 Memorial Prize awarded to W. M. Widgery, 593
  Branch Prize awarded to A. N. Clifton and J. A. Kirk, 593
  Election of officers for 1948–49, 843
Aeronautical Society, Royal, and others : Symposium on Internal Stresses in Metals and Alloys, 70
African Council, Central : Appointment of Dr. J. E. Keyston as research secretary, 230
African (East) Industrial Research Board : Report for 1946, 122
African (South) Council for Scientific and Industrial Research : Second Annual Report, 903
African (South) Institute for Medical Research : Annual Report for 1946, 162
African (South) Museums Association : Annual General Meeting (J. R. Harding), 984
African (West) Cacao Research Institute (O. J. Voelcker), 117
Agharkar, Prof. S. P. : Scientific Research in India, 513
Agnew, L. R. C. : Weight of the Rat Thymus, 205
Agricultural, Animal Health and Forestry Research, Committee for Colonial: Second Annual Report, 143
Agricultural Parasitology, Institute of : Place taken by a new Nematology Department of the Rothamsted Experimental Station, 1006
Agricultural Research Council : Awards of Postgraduate Scholarships, 16
Agricultural and Horticultural Research Station, Long Ashton : Annual Report for 1946, 862
Agriculture for Scotland, Department of (Ministry of Agriculture and Fisheries and the) : Postgraduate Scholarships in Husbandry, Agricultural Economics, Statistics and Agricultural and Dairy Engineering, 637
Agriculture and Fisheries, Ministry of : Bulletin 22, Practical Soil Sterilization, 196
  Bulletin 65, Crop Production in Frames and Cloches, 196
  Bulletin 138, Irrigation, 196
  Agricultural and Veterinary Scholarships, 430
Agriculture and Fisheries, Ministry of, and the Department of Agriculture for Scotland : Postgraduate Scholarships in Husbandry, Agricultural Economics, Statistics and Agricultural and Dairy Engineering, 637
Ahmad, Dr. Nazir : Scientific Research in India, 513
Ainsworth, Dr. G. C. : Mycological Education, 507
Aircraft Establishment, Royal : New Chemical and Physical Laboratory at the, 212
Air Force, Royal : Opening of a new School of Education, 469
Aitkenhead, P. : Awarded an Agricultural Research Council Postgraduate Scholarship, 16
Aiyangar, Rao Bahadur K. V. Rangaswami : Elected a Fellow of the Royal Asiatic Society of Bengal, 553
Akers, Sir William : Tribute to Sir Robert Robinson at the special meeting of the Industrial Research Committee of the Federation of British Industries at the Royal Institution, 509
Al-Hussaini, A. H. : Alkaline Phosphatase in Fish Gut, 274
Albareda-Herrera, Prof. J. M. : Appointed a member of the Pontifical Academy of Science, 922
Albert, Dr. Adrien, and Goldacre, Reginald : Mode of Action of Acridine Antibacterials, 95
Albert, Dr. Adrien, and Marshall, P. B. : Absence of Correlation between Respiratory Inhibition of Plasmodia by Acridines and Antimalarial Action, 1008
Alberts, Hugo W. : Forage Resources of Latin America, 657
Alexander, Dr. F. E. S. : Observations of Unorthodox Radar Vision in the Vicinity of New Zealand and Norfolk Island, 146
Alexander, Prof. N. S. : *Obituary* of Prof. M. C. Potter, 673
Alexander, R., and others : Isolation in Chick Embryos of a Filtrable Agent possibly related etiologically to Lumpy Skin Disease of Cattle, 526
Allen, Dr. Clifford : An Analysis of Volitional Life (C. Lambek), translated from the Danish by Agnete Kortsen, *review*, 789
  Our Inner Conflicts (Dr. Karen Horney), *review*, 830
Allen, Prof. J. : Scale Models in Hydraulic Engineering, *review* by Prof. J. Th. Thijsse, 219
Allen, Dr. L. A. : Biological Aspects of Water Pollution, 875
Allen, Philip : Awarded a Commonwealth Fund Fellowship, 1006
Allen, R., and others : Comparison of Cross-Sections for the Capture of 220 and 900 keV. Neutrons, 727
Allibone, Dr. T. E. : Elected a Fellow of the Royal Society, 466
  Electromics, *review*, 702
  Development of the Spark Discharge, 970
Allied Circle, Amsterdam, and the British Society for International Understanding : Study Conference on the Overseas Territories of Western Europe, 843
Alliot, H. (Noriot, Ch., et) : La lutte contre les termites, *review* by A. D. I., 544
Allsopp, Dr. A. : Chromatographical Study of Meristematic Plant Tissues, 833
Allsopp, C. B., and Catcheside, Dr. D. G. : Chemical Breakage of Chromosomes, 1011
Almada, José de, and others : Colonial Administration by European Powers, 372
Alston, A. H. G. : Information on the Berlin Herbarium, 272
Alty, Prof. Thomas : Appointed deputy principal of the University of Glasgow, 16
Aluminium Development Association : Research Scholarship, 882
Ambache, Dr. N. : Peripheral Action of Botulinum Toxin, 482
American Association for the Advancement of Science : George Westinghouse Science Writing Awards for 1947 presented to George A. Keaney and Steven M. Spencer, 125
  Centenary Meeting, 717
American Chemical Society (Chicago Section) : Willard Gibbs Medal for 1948 awarded to Prof. Carl F. Cori, 388
American Institute of Biological Sciences : Establishment of an, 512
American Public Health Association : Lasker Group Award for 1947 presented to the British Ministries of Food and Health, 16
American Society of Mechanical Engineers, and others : Conference on Mechanical Wear, 758
American Telephone and Telegraph Co. : Frank B. Jewett Fellowship awards for 1948–49, 429
Amoroso, Prof. E. C., and others : Ovarian Activity in the Pregnant Mare, 355
Amos, Dr. A. J. (Kent-Jones, Dr. D. W., and) : Modern Cereal Chemistry, fourth edition, *review* by A. L. Bacharach, 293
Anantaraman, M. : Oribatid Mites and their Economic Importance, 409
Anderson, G. W. : Appointed agricultural officer, Zanzibar, 966
Anderson, Sir John, and others : Atomic Challenge, a Symposium, *review*, 995
Anderson, Dr. J. G. C. : Awarded a Wollaston Fund of the Geological Society, 122
Andrade, Prof. E. N. da C. : *Addendum* to *obituary* of Prof. P. Lenard, 48
  Max Planck, 284
  The Atom and its Energy, *review* by Prof. P. B. Moon, 582
  Max Planck Memorial Ceremony at Göttingen, 751
Andrew, E. R. : Awarded a Commonwealth Fund Fellowship, 1006
Andrew, G., and others : Reversion, a New Procedure in Absorptiometry, 805
Andrewartha, Dr. H. G., and Birch, L. C. : Measurement of 'Environmental Resistance' in the Australian Plague Grasshopper, 447
Andrewes, Dr. C. H. : The Common Cold, 328
Andrews, F. W. : Degree of D.Sc. of the University of London conferred on, 51
Angyal, Dr. S. J., and Rassack, R. C. : The Sommelet Reaction, 723
Animal Health Trust : Fison Lectures (Prof. L. Seekles), 637, 1005
  Award of a research grant to J. Steele, 924
Anscombe, Dr. F. J., and Singh, Dr. B. N. : Limitation of Bacteria by Micro-Predators in Soil, 140
Anthony, Lieut.-Colonel H. D. : A Descendant of Benjamin Franklin, *review*, 909
Anthropological Institute, Royal : Huxley Memorial Lecture for 1947 (Dr. W. L. H. Duckworth), 628
Appleton, Sir Edward : Science and the Progress of Industry, 368
  Special meeting of the Industrial Research Committee of the Federation of British Industries at the Royal Institution in honour of, 508
  The Scientist in Industry, 508, 537
  Scientific Radio, 794
  Appointed a member of the Pontifical Academy of Science, 922
Appleton, Sir Edward, and others : Anomalous Effect in Ionospheric Absorption, 967
Applied Biologists, Association of : Symposium on Biological Aspects of Water Pollution, 874
Applied Mathematics, Communications on (New Journal issued by the Institute for Mathematics and Mechanics of New York University), 636
Arber, Dr. Agnes : Awarded the Gold Medal for 1948 by the Linnean Society of London, 272, 882
Archæological Survey of the Union of South Africa ; Report for 1946–47, 881

NAME INDEX

Archæology in Ankara, British Institute of : Inauguration of the, 270
Aristotelian Society: Supplementary Vol. 21, Explanation in History and Philosophy, *review* by F. I. G. Rawlins, 665
Arley, Dr. Niels : Blackett's Hypothesis of the Magnetic Field of Rotating Bodies, 598
Armattoe, Dr. R. E. G. : Given a Viking Fund award to undertake a field trip to West Africa, 125
Armellini, Prof. G. : I fondamenti scientifici della astronomia, *review* by H. S. J., 419
Armitage, Dr. F. D. : Mycological Education, 507
Army Council : Appointment of Prof. F. J. M. Stratton as deputy scientific adviser, 388
Armytage, W. H. G. : Lyon Playfair and Technical Education in Britain, 752
Arnold, Prof. Chester A. : An Introduction to Palæobotany, *review* by Prof. John Walton, 623
Arnon, Dr. D. I. : Trace Elements in Plant Physiology, 364, 365
Arrol, Dr. W. J. : Determination of Radioactive and Stable Tracer Isotopes, 694
Arrol, Dr. W. J., and Glascock, Raymond : Microsynthesis of C^{14}-Labelled Ethyl Iodide, 932
Ash, G. M. : The Study of Critical British Groups, 735
Asiatic Society of Bengal, Royal : Medal Awards, 553
    Election of members of Council for 1948, 553
    Election of Fellows, 553
ASLIB : Study Group on Special Librarianship, 430
    Meeting to discuss the formation of a proposed Institute of Recorded Sound, 493
ASLIB (Northern Branch) : Conference, 430
Astbury, N. F. : Structure and Properties of Metals, 264
Astbury, Prof. W. T. : The Structure of Biological Tissues as revealed by X-Ray Diffraction Analysis and Electron Microscopy, 514
Astbury, Prof. W. T., and others : Ultracentrifugation and Electron Microscope Studies of Tissues of Inbred Strains of Mice, 759
Astronomical Society, Royal : Geophysical Discussion on the Main Geomagnetic Field, 462
    Publication of papers for the Geophysical Supplement of the *Monthly Notices*, 924
Astrup, Dr. Tage, and Permin, Per M. : Fibrinokinase and Fibrinolytic Enzymes. 689
Aten, jun., A. H. W. : Reported Radioactivity of Osmium, 1019
Athenæum, The : Elections upon Rule II, 125
Atkin, J. B. : Incidents and Reflections, 866
Atkins, K. R. : Transfer Rates in Liquid Helium Films, 925
Atomic Energy Commission : To provide funds for Fellowships, 593
Atomic Scientists' Association (London Branch) : Lectures on Atomic Energy, 164
Audus, Dr. L. J. : Appointed to the Hildred Carlile chair of botany at Bedford College, London, 347, 427 ; work of, 427
Auerbach, Dr. Charlotte : Awarded the Keith Prize for 1945–47 of the Royal Society of Edinburgh, 716
Auger, Prof. Emile : Appointed head of the Natural Sciences Section of U.N.E.S.C.O., 304
Aughtie, —. : Calculating Machines, 713
Austin, Prof. G. Wesley : Cementiferous Paints and their Uses, 569
Australasian Antarctic Expedition, 1911–14 : Scientific Reports, Series B, Vol. 7, Meteorology (Dr. Edward Kidson), 709
Australia, Commonwealth of : Twentieth Annual Report of the Council for Scientific and Industrial Research, 999
Australia (Commonwealth of), National Geographic Society and the Smithsonian Institution : Scientific Expedition to Arnhem Land, 195
Australia and New Zealand Association for the Advancement of Science : Report of the Twenty-fifth Meeting, 881
Australian Scientific Research Liaison Office : Appointment of J. E. Cummins as chief scientific liaison officer in London, 1007
Austrian Chemists, Association of (Steirmark Branch) : To arrange an International Conference on Powder Metallurgy, 307
Avimo, Ltd. : Simultaneous Recording of Related Oscillograph Traces, 89
Awolowo, Obafemi : Path to Nigerian Freedom, 332
Ayliffe, R. S. : Appointed assistant conservator of forests, Trinidad, 51
d'Azyr, Félix Vicq (1748–94), 634

BABCOCK, Ernest Brown : The Genus Crepis, *review* by Prof. I. Manton, 455
Bacharach, A. L. : Controlling the Staff of Life, *review*, 293
    Appointed a member of the Chemical Research Board, 924
Bache (Alexander Dallas), Scientist and Educator, 1806–1867 (Merle M. Odgers), *review* by Lieut.-Colonel H. D. Anthony, 909
Bacon, Dr. J. S. D. : Appointed lecturer in biochemistry in the University of Sheffield, 307
Badcock, W. J. : Appointed chief soil conservation officer, Nyasaland, 966
Baddiley, Dr. J. : Awarded the Meldola Medal for 1947 of the Society of Maccabæans, 715 ; work of, 715
Baddiley, Dr. J., and others : Synthesis of Adenosine Triphosphate, 761
Baden-Powell, D. F. W. : Long-Distance Correlation of Boulder Clays, 287
Badger, Dr. G. M., and Reed, Dr. R. I. : Relative Reactivity of Aromatic Double Bonds, 238
Bailey, Dr. A. S., and Robinson, Sir Robert : Relation of Vomicine to Strychnine and Brucine, 433
Bailey, Sir Edward : Awarded the Wollaston Medal of the Geological Society, 122
    Geology of the Salt Range of the Punjab, 265
    Obituary of Dr. A. L. Du Toit, 426
Bailey, Dr. G. H., and Bausor, H. W. : Chemistry for Matriculation, fourth edition, *review* by Dr. S. H. Harper, 992
Bailey, Dr. L. H. : Ninetieth Birthday of, 964 ; work of, 965
Bailey, Prof. V. A. : Spontaneous Waves in Discharge Tubes and in the Solar Atmosphere, 599
Baker, H. Albert, and others (edited by) : Annual Review of Microbiology, *review* by Sir Paul Fildes, 995
Baker, Dr. H. G. : Relationships in the Plumbaginaceæ, 400
    Significance of Pollen Dimorphism in Late-Glacial *Armeria*, 770
    Bottom Deposits of Lake Windermere in relation to the Quaternary History of the British Isles, 987
Baker, Dr. John R. : The Status of the Protozoa, 548, 587
Baker, Dr. John R. (Thomson, Sir George, and) : Proposed Central Publication of Scientific Papers, 771
Baker, Dr. John W. : Olefine Reactions Catalysed by Lewis Acids, 171
    Appointed to the readership in the mechanism of organic reactions in the University of Leeds, 471
Bald, J. G., and others : Plant Virus Diseases, 945
Balfour of Inchrye, Lord : Importation of Books into Britain, 304
Bálint, Dr. Peter, and Kabdebó, Dr. Helene : Premortal Increase in the Output of Sodium and Chlorine in Fasting Rats, 57
Ball, Eric G. : What is a Dialysate? 404
Ball, S., and others : Chemistry of Visual Processes, 424
Ballard, B. G. : Appointed director of the Radio and Electrical Engineering Division of the National Research Council of Canada, 513
Baly, Prof. E. C. C. : *Death* of, 48 ; *obituary* by Prof. R. A. Morton, 120
Bamber, T. F. : Appointed assistant lecturer in the Department of Mining in the University of Sheffield, 16
Bannon, J., and Curnow, C. E. : Structure of Calcium Fluoride Films Evaporated on Polished Glass Surfaces, 136
Barakat, Mohamed Zaki (Schönberg, Prof. Alexander, and) : Stereochemistry of Trimeric Thioaldehydes, 722
Baral, S. S., and others : Abnormalities in the *F*-Region of the Ionosphere at Calcutta, 24
Barber, D. R. : Chronometric Observations of the Song of *Fringilla coelebs* Linn., 277
Barber, Mary : Appointed to the University of London readership in bacteriology at St. Thomas's Hospital Medical School, 637
Barber, N., and Longuet-Higgins, M. S. : Water Movements and Earth Currents—Electrical and Magnetic Effects, 192
Barber, N. F. : Bridge Networks discriminating between Positive and Negative Sequences in Polyphase Supply, 685
Barclay, Dr. Alfred E., and others : Studies of the Renal Circulation, *review*, 663
Barcroft, Sir Joseph : Biography of, 164
Bardsley, W. (Tolansky, Prof. S., and) : Application of Multiple-Beam Interferometry to the Study of Oscillating Quartz Crystals, 925
Barer, Dr. Robert (Jones, W. M., and) : Electron Microscopy of the Sarcolemma, 1012
Barker, F. C. : Scattering of 100-MeV. Neutrons by Protons, 726
Barker, K., and others : New Formulation of D.D.T. with Selective Properties, 484
Barker, S. A., and others : Enzymic Conversion of Amylose into Amylopectin, 127
Barlow, Dr. R. B., and Ing, Dr. H. R. : Curare-like Action of Polymethylene *bis*-Quaternary Ammonium Salts, 718
Barnes, Dr. B. : *Obituary* of Prof. P. A. C. Dangeard, 878
Barnes, Prof. R. H. : Physiology and Biochemistry of Fats and Lipoids, 534, 535
Barnóthy, Prof. J. : Mesons of Different Masses, 681
Barrell, H. : Promoted to the grade of Senior Principal Scientific Officer, 195
Bartlett, John W., and others : The Artificial Insemination of Farm Animals, edited by Enos J. Perry, *review* by Dr. Arthur Walton, 831
Bartlett, Prof. M. S. : Smoothing Periodograms from Time-Series with Continuous Spectra, 686
Barton, Dr. D. H. R. : Awarded the Harrison Memorial Prize for 1947, 270
Barua, Dr. B. M. : Awarded the Dr. Bimala Churn Law Gold Medal of the Royal Asiatic Society of Bengal, 553
    Elected a Fellow of the Royal Asiatic Society of Bengal, 553
Bate-Smith, E. C. : Paper Chromatography of Anthocyanins and related Substances in Petal Extracts, 835
Bateman, N. : Awarded an Agricultural Research Council Postgraduate Scholarship, 16
Bates, Prof. L. F. : Elementary Theory of Electricity and Magnetism, *review*, 829
    Modern Magnetism, second edition, *review* by E. C. S., 871
    Introduction to Modern Physics (F. K. Richtmyer and E. H. Kennard), fourth edition, *review*, 912
Bates, Dr. W. J., and Occhialini, Dr. G. P. S.: Applications of the Reflecting Microscope to the Nuclear Plates Technique, 473
Baud, Dr. C. A. : A Cytochemical Study of the Perinuclear Lipidic Layer in the Liver Cell, 559
Bauer, Dr. D. J. : Association of Xanthine Oxidase with Virus Multiplication, 852
Bausor, H. W. (Bailey, Dr. G. H., and) : Chemistry for Matriculation, fourth edition, *review* by Dr. S. H. Harper, 992
Bavink, Prof. B. : *Obituary*, 122
Bawden, Dr. F. C. : Physiology of Resistance to Disease in Plants, 422
    Report on the Department of Plant Pathology, Rothamsted Experimental Station, for the Years 1939–45, 676
Bawden, Dr. F. C., and Kassanis, B. : Plant Virus Diseases, 945
Bawden, Dr. F. C., and Roberts, F. M. : Plant Virus Diseases, 945
Bawn, Dr. C. E. H. : Appointed to the Grant-Brunner chair of physical and inorganic chemistry at the University of Liverpool, 715 ; work of, 715
Baxter, E. G., and Gold, Dr. V. : A Simple Moving-Boundary Apparatus, 403
Bay, Z., and Papp, G. : Coincidence Device of 10^{-8}—10^{-9} Sec. Resolving Power, 59
Bayliff, R. W., and others : Meteor Whistles, 478
B.C.U.R.A. Quarterly Gazette, No. 1, 841
Beacham, T. E. : Awarded a moiety of the Clayton Prize for 1947 of the Institution of Mechanical Engineers, 470
Beadnell, C. M. : Nature's Own Zoo, *review* by Seton Gordon, 744
Beals, Ralph L. : Cherán, a Sierra Tarascan Village, 697
Bean, H. S. (Berry, Prof. H., and) : Bactericidal Activity of Phenols in Aqueous Solutions of Soap, 396
Beard, Dr. J. S. : The Natural Vegetation of Trinidad, 31
Beatty, Dr. R. T. : Radio Data Charts, revised by J. McG. Sowerby, fourth edition, *review* by B. G. P., 871
Beaufort, Dr. Lieven Ferdinand de : Awarded the Joy Gobind Law Memorial Medal of the Royal Asiatic Society of Bengal, 553
Beaumont, A. : Potato Blight and the Weather in Britain, 429
Beaven, Dr. E. S. : Barley ; Fifty Years Observation and Experiment, *review* by Sir John Russell, 828
Becker, Prof. Ludwig : *Obituary* by Prof. W. M. Smart, 161

NAME INDEX

Becquerel, Prof. Jean : Discovery of Radioactivity, 609
Bedford, Dr. T. : Human Factors in Industry, 791
Bedford College, London : Appointment of Dr. L. J. Audus to the Hildred Carlile chair of botany, 347, 427
  Appointment of Gordon Manley to the University of London chair of geography, 430, 511
  Title of professor of social studies in the University of London conferred on Mrs. Barbara Wootton, 924
Beeby, Dr. Clarence E. : Appointed assistant director-general of U.N.E.S.C.O., 304
Beer, Prof. G. R. de : Re-elected president of the Ray Society, 555
  Elected president of the Linnean Society for 1948–49, 882
  Orientation of Birds on Migratory and Homing Flights, 996
Beer, Dr. R. J. S., and others : The Melanin Problem—a Synthesis of 5 : 6-Dihydroxyindole, 525
Beesley, A. E., and Foster, Dr. G. E. : Effect of Colchicine Treatment on the Alkaloidal Content of *Datura metel*, 561
Beevers, Dr. C. A. : Demonstration of the Heart Beat, 65, 321
Begg, Dr. Michael, and Robertson, Dr. Forbes W. : Nutritional Requirements of *Drosophila melanogaster*, 769
Beharrell, Sir George : Presented by the Netherlands Ambassador with the Insignia of Commander in the Order of Orange-Nassau (Civilian Division), 307
Behnke, Jane (Thimann, Kenneth V., and) : The Use of Auxins in the Rooting of Woody Cuttings, *review* by Prof. M. Thomas, 993
Beilby Memorial Fund : Awards for 1947 to Dr. G. V. Raynor and Dr. G. R. Rigby, 231
Bell, Dr. A. E. : Theory of Skating, 391
Bell, Dr. G. D. H. : Appointed director of the Plant Breeding Institute, Cambridge, 714 ; work of, 714
Bell, R. P. : *Obituary* of Prof. J. N. Brønsted, 269
Bellamy, Dr. L. J., and Watt, C. H. : Factors Involved in the Deactivation of Penicillin Solutions by Rubber Tubing, 940
Bendz, W. I., with the assistance of Scarlott, C. A. : Electronics for Industry, *review* by Prof. J. Hollingworth, 582
Bené, Frank : The Food of Humming-Birds, 881
Benedict, Ruth : The Chrysanthemum and the Sword, *review* by Peter Lawrence, 77
Benham, W. E. : Electronic Waves and Thibaud's 'Particles', 93
Bennet-Clark, Prof. T. A. : Interaction of Water and Porous Materials, 630
Bennett, Dr. G. M. : Stereochemistry of Trimeric Thioaldehydes, 723
Bennett, Dr. Wendell C. : The Ethnogeographic Board, 304
Benson, Robert B. : *Obituary* of Prof. Theodore D. A. Cockerell, 229
Bentley, H. R., and others : Action of Nitrogen Trichloride on Proteins—Production of Toxic Derivative, 126
Bentor, V., and others : Active Penetration of Fat into Adipose Tissue, 482
Bergel, Franz : Degree of D.Sc. of the University of London conferred on, 637
Bergmann, Dr. E. : A Synthesis of Fluoranthene Derivatives, 889
Bergström, Prof. Sune, and Holman, Ralph T. : Total Conjugation of Linoleic Acid in Oxidation with Lipoxidase, 55
Berlin Herbarium : Information on the (A. H. G. Alston), 272
Berliner, Victor, and others : The Artificial Insemination of Farm Animals, edited by Enos J. Perry, *review* by Dr. Arthur Walton, 831
Bernal, Prof. J. D. : Science in Social Affairs, 68
  Proposed Central Publication of Scientific Papers, 799
  World Co-operation in Science, 840
Bernhard, Prof. K. : Physiology and Biochemistry of Fats and Lipoids, 534, 535
Bernische Naturforschende Gesellschaft : Commemorative Meeting to mark the Jubilee of the Discovery of the Electron, 16
Berridge, Dr. Emily : *Obituary* by Dr. E. M. Blackwell, 87
Berriman, R. W. : Electron Tracks in Photographic Emulsions, 432
Berry, Prof. H., and Bean, H. S. : Bactericidal Activity of Phenols in Aqueous Solutions of Soap, 396
Bessis, Dr. Marcel C. : Awarded a grant from the Lady Tata Memorial Fund, 966
Best, A. C. : A Standard Radio Atmosphere for Microwave Propagation, 146
Besterman, Theodore (edited by) : British Sources of Reference and Information, *review* by R. Brightman, 789
Bethe, Prof. Hans Albrecht : Awarded the Henry Draper Medal for 1947 of the U.S. National Academy of Sciences, 861
Beynon, Dr. W. J. G. : Scientific Radio, 794
Beynon, Dr. W. J. G., and others : Anomalous Effect of Ionospheric Absorption, 967
Bezer, Henry James, and Schnurmann, Dr. Robert : Rate of Wear in the Region of the Validity of Amontons' Law, 728
Bhabha, Dr. H. J., and Daniel, R. R. : Meson Scattering with Nuclear Excitation, 883
Bhagavantam, Prof. S., and Rao, B. Ramachandra : Diffraction of Light by Very High Frequency Ultrasonic Waves, 927
Bhagavantam, Prof. S., and Rao, D. A. A. S. Narayana : Dielectric Constant of Diamond, 729
Bhandarkar, Prof. D. R. : Elected a honorary Fellow of the Royal Asiatic Society of Bengal, 553
Bhatnagar, Dr. S. S., and others : A New Sulpha Compound ('6257') and its Use in Human Cholera Infection, 395
Bibliography of Natural History, Society for the : Election of Officers, 1006
Bichel, Dr. Jörgen : Effect of *p*-Aminobenzoic Acid on the Leucocyte Count in Leukæmia, 353
  Awarded a grant from the Lady Tata Memorial Fund, 966
Bickley, Prof. W. G. : 'Semaphore' Numerals, 807
  A Technique for Mechanical Vibration Problems, *review*, 954
Biguenet, Charles : Les cathodes chaudes, *review* by D. A. Wright, 500
Bilham, E. G. : "Here is the Weather Forecast", *review* by M. K. Miles, 540
Binks, W. : Promoted to the grade of Senior Principal Scientific Officer, 195
Biochemical Society : Symposium on Biochemical Reactions of Chemical Warfare Agents, 225
Biological Sciences, International Union of : Symposium on Trace Elements in Plant Physiology, 364
Biometric Society : Formation of a British Region, 271
Birch, L. C. (Andrewartha, Dr. H. G., and) : Measurement of 'Environmental Resistance' in the Australian Plague Grasshopper, 447
Birkbeck College, London : Appointment of Prof. A. C. Offord to the University of London chair of mathematics, 637, 757
  Retirement of Prof. P. Dienes from the University of London chair of mathematics, 756
Birks, John B. : Appointed a lecturer in natural philosophy in the University of Glasgow, 16
Bishop, D. J. : Operational Research in the Research Associations, 585
Bishop, G. R., and others : Comparison of Cross-sections for the Capture of 220 and 900 keV. Neutrons, 727
Bishop, P. O. (Harris, Dr. E. J., and) : Low-Frequency Noise from Thermionic Valves working Under Amplifying Conditions, 971
Bishopp, D. W. : The Main Geomagnetic Field, 464
Bittner, John J., and others : Nutrition in relation to Cancer, 106
Black, Dr. E. B. : Nitrogenous Constituents of the Potato, 211
Black, Dr. W. A. P. : Seasonal Variation in Chemical Constitution of some Common British Laminariales, 174
Blackburn, Dr. Julian : National Intelligence, *review*, 37
  The Framework of Human Behaviour, *review*, 502
  Local Government Reform, 825
Blackburn, Dr. K. B. : Chromosomes and Classification in the Genus *Rosa*, 734
Blackett, Prof. P. M. S. : The Main Geomagnetic Field, 464
Blackett, Prof. P. M. S., and others : Atomic Challenge, a Symposium, *review*, 995
Blackith, R. E. : Primary and Secondary Responses in Biological Assay, 20
Blacklock, Prof. J. W. S. : Appointed to the University of London chair of pathology at St. Bartholomew's Hospital Medical College, 924
Blackwell, Dr. D. E., and others : Lead Telluride Cells for Infra-Red Spectroscopy, 281
Blackwell, Dr. E. M. : *Obituary* of Dr. Emily Berridge, 87
Blair, Dr. G. W. Scott : The Flow of Glaciers, 821
Blanshard, Paul : Democracy and Empire in the Caribbean, 948
Bleaney, Dr. B. : Radio Physics, 795
Bleaney, Dr. B., and Loubser, J. H. N. : Collision Broadening of the Ammonia Inversion Spectrum at High Pressures, 522
Blewett, M., and Coles, M. (Fraenkel, Dr. G., with the assistance of) : B_T, a New Vitamin of the B-Group and its relation to the Folic Acid Group, and other Anti-Anæmia Factors, 981
Bliss, Henry Evelyn : A Bibliographic Classification, Vol. 2, Classes H—K, the Human Sciences, *review* by R. B., 705
Bloomfield, Dr. G. F. : Cross-Linking in Polymeric Systems, 298
Blundell's School : Second Number (1937) of the *Magazine* of the School Science Society, 271
Boas, Dr. W. (Honeycombe, R. W. K., and) : The Disordering of β-Brass by Cold Work, 612
Bobtelsky, Dr. M. (Jordan, J., and) : *p*H of Trisodium Citrate Solutions stored under Customary Laboratory Conditions, 240
Bøggild, Dr. J. K. : Cloud Chamber Investigation of Straggling of Short-Range Particles produced by Slow Neutron Reactions, 810
Boivin, André : Elected a *correspondant* for the Section of Rural Economy of the Paris Academy of Sciences, 272
Bolton, Dr. Charles : *Obituary* by Prof. H. P. Himsworth, 86
Bolton, J. G., and Stanley, G. J. : Variable Source of Radio Frequency Radiation in the Constellation of Cygnus, 312
Bond, C. R. : The Assaying of Penicillin, 286
Booker, Dr. H. G. : Scientific Radio, 794
Boon, Dr. W. R. : The Assaying of Penicillin, 286
Boot, Shoe and Allied Trades Research Association, British : First Annual Report, 880
Booth, Andrew D. : A New Fourier Refinement Technique, 765
Booth, F. : Theory of Electrokinetic Effects, 83
Booth, J. D. : Calculating Machines, 713
Booth, Dr. R. G., and others : Action of Nitrogen Trichloride on Proteins—Production of Toxic Derivative, 126
Boothby, O. L., and Bozorth, R. M. : 'Supermalloy', a New Magnetic Alloy, 554
Boothroyd, A. R., and others: An Electrolytic Tank for Exploring Potential Field Distributions, 845
Bor, Dr. N. L. : Appointed assistant director of the Royal Botanic Gardens, Kew, 840 ; work of, 840
Borger, R. (Cowling, Prof. T. G., and) : Electrical Conductivity of the Ionospheric *D*-Layer, 515
Born, Prof. Max, and Cheng, Kai Chia : Theory of Superconductivity, 968, 1017
Born, Dr. Wolfgang : Embryology of Monsters, 88
Boschma, Prof. H. : *Elminius modestus* in the Netherlands, 403
Bose, Prof. S. R. : Awarded the Paul Johannes Bruhl Memorial Medal of the Royal Asiatic Society of Bengal, 553
Bosley, W., and others : X-Radiation from a 20-MeV. Betatron, 1022
Bosworth, Dr. R. C. L. : Thermal Mutual Inductance, 166
Botanic Garden, Calcutta (Royal) : Early History of the (Dr. D. Chatterjee), 362
Botanic Gardens, Kew (Royal) : Collection of Bog-mosses (*Sphagnum*) presented by W. R. Sherrin, 716
  Retirement of Dr. John Hutchinson, 799
  Appointment of Dr. N. L. Bor as assistant director, 840
Botanical Society of the British Isles : Conference on the Study of Critical British Groups, 514, 733
Bourne, Dr. E. J., and others : Enzymic Conversion of Amylose into Amylopectin, 127
  Starches of the Wrinkled and the Smooth Pea, 206
  Photochemical Degradation of Starch, 762
Bourne, Dr. Geoffrey H. : Alkaline Phosphatase in Taste Buds and Nasal Mucosa, 445
Bourne, L. E. A. : The Electronic Organ, 196
Boursnell, Dr. J. C. : Reaction of Mustard Gas with Proteins, 225
Bouwers, A. : Achievements in Optics, *review* by S. Weintroub, 704
Bowden, Dr. F. P. : Elected a Fellow of the Royal Society, 466
Bowden, Dr. F. P., and Gurton, O. A. : Birth and Growth of the Explosion in Solids initiated by Impact, 348
Bower, Prof. F. O. : Botany of the Living Plant, fourth edition, *review* by Prof. F. T. Brooks, 153
  Death of, 592 ; *obituaries* by Prof. J. Walton, Sir Edward Salisbury, and L. J. F. Brimble, 753

NAME INDEX

Boyd, R. L. F. : Reproduction of Photographically Recorded Oscillograph Signals, 227
Boyland, Dr. E. : Nutrition and Cancer, 106
  Biochemical Reactions of Chemical Warfare Agents, 225
  Nitrogen Mustards, 226
  Appointed to the University of London chair of biochemistry at the Royal Cancer Hospital (Free), 347
  Induction of Tumours by Chemical Compounds, *review*, 621
Bozorth, R. M. (Boothby, O. L., and) : 'Supermalloy', a New Magnetic Alloy, 554
Brabazon of Tara, Lord : Elected president of the Royal Institution, 347, 717
Bracewell, R. N. : Scientific Radio, 794
Bradfield, Miss F. M. : Awarded the Bronze Medal of the Royal Aeronautical Society, 593
Bradfield, J. R. G. : Awarded a Commonwealth Fund Fellowship, 1006
Bradford Technical College : Appointment of Dr. E. W. Fell as senior assistant in metallurgy, 272
Bradley, Dr. A. J. : Structure and Physical Properties of Metals, 263
Bradley, H. : Operational Research in the Research Associations, 585
Bradley, Dr. W. : Appointed professor of colour chemistry and dyeing in the University of Leeds, 16
Bradwell, D. : Appointed analyst, Medical Department, Cyprus, 637
Bragg, Sir Lawrence : Internal Stresses in Metals and Alloys, 70
  Organisation and Work of the Cavendish Laboratory, 627
Bragg, S. L. : Awarded a Commonwealth Fund Fellowship, 1006
Brahmachari, H. D. (Nath, Prof. M. C., and) : Relation of Intermediary Metabolites to the Lowering of the Potency of Pancreatic Insulin in the Animal System, 18
Brambell, Prof. F. W. Rogers : The Field Study and Conservation of the British Fauna, 408
Brandt, C. W., and Ross, D. J. : Podocarpic Acid as a Source of an Œstrogenic Hormone, 892
Braude, Dr. Ernest A., and Stern, E. S. : Solvation of Hydrogen Ion in Oxygen-containing Solvents, 169
Braude, Dr. R. : Stimulation of Growth in Pigs by Iodinated Casein and Stilbœstrol, 856
Brech, E. F. L. : Research on Management, *review*, 869
Brehm, Dr. Warren J. : Awarded a Frank B. Jewett Fellowship for 1948–49 by the American Telephone and Telegraph Co., 429
Bremner, J. W. (Poole, Dr. J. H. J., and) : Investigation of the Radioactivity of Rocks by the Photographic Method, 884
Breuil, Abbé Henri : Awarded the Prestwich Medal of the Geological Society, 122
Brewer, Griffith : *Death* of, 387 ; *obituary* by M. J. B. Davy, 510
Brewin, E. G., and others : Pressor Effect of Renin on Pulmonary Artery Pressure, 893
Brian, M. V., and Brian, A. D. : Regulation of Oviposition in Social Hymenoptera, 854
Brier, G. W. : Northern Hemisphere Surface Pressure and Climatic Fluctuations and Vegetation Growth in Northern Finland, 730
Brightman, R. : X-Ray the City ! (Dr. Ernest Fooks), *review*, 297
  Men of Science in Industry and Society, *review*, 374
  Industrial Research, 1947 (edited by Dr. Percy Dunsheath), *review*, 705
  Science Advances (J. B. S. Haldane), *review*, 747
  British Sources of Reference and Information (edited by Theodore Besterman), *review*, 789
Brimble, L. J. F. : *Obituary* of Prof. F. O. Bower, 754
Brindley, Dr. G. W., and Méring, J. : Theory of the Structure of Clay Minerals—Banded X-Ray Reflexions from Clay Minerals, 774
Brink, N. G., and others : Anti-Pernicious Anæmia Factor, 676
Bristowe, Dr. W. S. : A Book of Spiders, *review* by T. H. S., 706
British Architects, Royal Institute of (Acoustics Group of the Physical Society and the) : International Symposium on Noise, 197
British Association for the Advancement of Science : Installation of Sir Henry Tizard as president, 88
  Officers for 1948, 88
  Programme of the Brighton Meeting, 675
British Association for the Advancement of Science (Division for Social and International Relations of Science) : Conference on Human Factors in Industry, 514, 791
British Association of Chemists : Education in Chemistry, the Teaching of Chemistry in Schools and the Training of Chemists and Chemical Technicians for Industry, 31
British Association for Commercial and Industrial Education : The Short Road to Industrial Co-operation, 571
British Boot, Shoe and Allied Trades Research Association : First Annual Report, 880
British Bryological Society : Annual General Meeting, 802
British Coal Utilization Research Association : Publication of a *Quarterly Gazette*, 841
British Commonwealth of Nations : Opening of Scientific Liaison Offices, 923
British Council : Conference Grants to foreign men of science, 164
  Scholarships for 1948–49 at Foreign Universities, 347
  Appointment of E. Bolton King as director of the Science Department, 674
  Annual Report for the Year ended March 1947, 944
British Drug Houses, Ltd. : Appointment of Dr. V. Petrow as chief research chemist, 555
British Electrical and Allied Industries Research Association : Establishment of a new Section on Power Generation, 162
  Twenty-seventh Annual Report, 492
British Empire Cancer Campaign (Genetical Society of Great Britain and the) : Symposium on the Genetics of Cancer, 843
British Glaciological Society, and others : Discussion on the Flow of Glaciers, 819
British Hat and Allied Feltmakers' Research Association : Grant of £1,000 for research in the Textile Industries Department of the University of Leeds, 1006
British Hydromechanics Research Association : Formation of the, 230
British Industries, Federation of : Special meeting of the Industrial Research Committee at the Royal Institution in honour of Sir Robert Robinson and Sir Edward Appleton, 508
British Industries, Federation of (Industrial Research Committee) and the Industrial Association of Wales and Monmouthshire : Joint regional conference on Industry and Research in Wales, 233
British Institute of Archæology in Ankara : Inauguration of the, 270
British Institute of Management : Presidential Address (Sir Charles Renold), 675
British Institute of Radiology: Silvanus Thompson Memorial Lecture (Prof. W. T. Astbury), 514
British Iron and Steel Research Association : To erect accommodation in Sheffield, 307
  Retirement of R. H. Myers as head of the Steelmaking Division, 595
  Appointment of Dr. A. H. Leckie as head of the Steelmaking Division, 595
British Journal of Surgery : War Surgery Supplement No. 1, Wounds of the Head, 635
British Medical Association : First Annual Scientific meeting since the War, 842
British Museum (Natural History) : Appointment of David Dilwyn John and Dr. Francis Charles Fraser as deputy keepers in the Department of Zoology, 270
  Exhibits illustrating the Succession of Life through Geological Time, 429
  Reopening of the Coral Gallery, 758
  Exhibition of Viruses and Virus Diseases, 966
British Mycological Society : Discussion on Mycological Education, 507
British National Committee for Crystallography, 390
British National Committee for Scientific Radio (Radio Section of the Institution of Electrical Engineers and the) : Convention on Scientific Radio, 233
British Oxygen Co., Ltd. : Offer to the British Welding Research Association to provide a prize fund, 17
British Rheologists' Club : Papers on War-time Rheological Investigations for the British Armed Services, 252
British Rheologists' Club, and others : Conference on Rheological Properties of Textile Materials, 307, 737
  Discussion on the Flow of Glaciers, 819
British Rubber Development Board : Publication of No. 1 of *Rubber Developments*, 89
British Science Writers, Association of : Open to accept Associate Members, 272
  Forum Discussion on Science and the Press, 882
British Social Hygiene Council : Ethics and Science Conference on Society and the Individual, 197
  Summer School on the Schools and the Land, 470
  Summer School on the International and Cultural Relations of Social Biology, 842
  Ethics and Science Conference on Where does Freedom End, 843
British Social Hygiene Council and the Town and Country Planning Association : Conference on the Family, 125
British Society for the History of Science, and others : Discussion on the Place of the History of Science in Education, 347, 572
British Society for International Understanding (Allied Circle, Amsterdam, and the) : Study Conference on the Overseas Territories of Western Europe, 843
British Society for Research on Ageing : Conference, 966
British Tar Confederation : Formation of a Coal Tar Research Association, 757
British Trust for Ornithology: Fourteenth Annual Report, 841
British Welding Research Association : Offer from British Oxygen Co., Ltd., to provide a prize fund, 17
  Appointment of Dr. H. G. Taylor as director, 49
British Zoologists, Association of : Discussion on the Field Study and Conservation of the British Fauna, 408
Brittan, N. H. : The Study of Critical British Groups, 735
Britton, Clare : Sociology of Mental Disease, 408
Broadley, Sir Herbert : Appointed deputy director-general of the United Nations Food and Agriculture Organisation, 637
Broch, Dr. Hjalmar : Stylasteridæ (Hydrocorals) of the John Murray Expedition to the Indian Ocean, 822
Broda, E. : Isotope Exchange and Molecular Structure, 901
Brodetsky, Prof. S. : To retire from the professorship of applied mathematics and headship of the Department of Mathematics in the University of Leeds, 307, 467 ; work of, 467
Brogan, Prof. D. W. : Science and Politics, 6
  Approaches to Sociology, *review*, 950
Bromberg, Y. M., and others : Variations in Spermatogenesis in Oligospermic Men, 176
Bronk, Prof. D. W. : Elected a foreign member of the Royal Society, 921 ; work of, 921
Bronowski, Dr. J., and others : Atomic Challenge, a Symposium, *review*, 995
Brönsted, Prof. J. N. : *Death* of, 15 ; *obituary* by R. P. Bell, 269
Brookbank, W. G. : Appointed agricultural officer, Tanganyika, 51
Brooks, A. C. : Appointed chief chemist, Federation of Malaya, 966
Brooks, Prof. F. T. : The Living Plant, *review*, 153
  Physiology of Resistance to Disease in Plants, 422
Brooks, Prof. S. C. : *Death* of, 674
Broom, Dr. Robert : Awarded the Neill Prize for 1945–47 of the Royal Society of Edinburgh, 716
Broom, Dr. Robert, and Robinson, J. T. : Size of the Brain in the Ape-Man, *Plesianthropus*, 438
Brotherton Collection Committee : Eleventh and Twelfth Reports of the, 882
Brouha, Lucien, and others : What People Are, a Study of Normal Young Men, *review*, 502
Brouwer, Prof. L. E. J. : Elected a foreign member of the Royal Society, 921 ; work of, 921
Brown, Dr. Archibald : Awarded a Commonwealth Fund Fellowship, 1006
Brown, F., and others : Separation and Identification of Methylated Sugars on the Paper Chromatogram, 720
Brown, F. G. W. : Elements of Mechanism (Peter Schwamb, Allyne L. Merrill and Walter H. James), sixth edition revised by Prof. Venton Levy Doughtie, *review*, 79
  Calculus based on the Fundamental Concept of Number, *review*, 261

Brown, Dr. G. L., and Dias, M. Vianna : Sensitivity of a South American Frog to Curare, 234
Brown, P. E., and Lynn-Allen, E. : Breeding of Avocets in Britain, 271
Brown, Walter : Appointed a lecturer in mathematics in the University of Glasgow, 16
Brown, Prof. W. : Physiology of Resistance to Disease in Plants, 422
Brownlee, K. A. : Industrial Experimentation, third edition, *review* by M. R. Sampford, 747
Bruce, Dr. Chas. E. R. : Transition from Glow to Arc Discharge, 521
Bruce, Maurice : Chronicle and Commentary, *review*, 151
  Empires in Transition, *review*, 908
Bruckner, Prof. V., and Kovács, Dr. J. : Addition of Maleic Anhydride to Anethole, 651
Bruckshaw, Dr. J. G. : The Main Geomagnetic Field, 463
Bryological Society, British : Annual General Meeting, 802
Bryson, Dr. Lyman : Science and Freedom, 577
Buchanan, A. S., and Heymann, Dr. E. : Electrokinetic Potential and Surface Structure of Barium Sulphate, 649, 691
Buddenbrock, Prof. W. von : Request for reprints of papers, 514
Budó, Prof. A. : Dielectric Relaxation of Molecules containing Rotating Polar Groups, 133
Bull, G. A. : Meteorological Factors in Radio-Wave Propagation, 146
Bullard, Dr. E. C.: The Main Geomagnetic Field, 462
Bullen, Prof. K. E. : The Bikini Bomb and the Seismology of the Pacific Region, 62
Bunker, H. J. : Hygiene of Beer Production and Consumption, 1025
Bunn, C. W. : Crystal Structure of Polyvinyl Alcohol, 929
Bunton, Dr. C. A. : Awarded a Commonwealth Fund Fellowship, 1006
Bunton, Dr. C. A., and others : Formation of Hydroxy Peroxides, 172
Burch, Dr. C. R. : The Reflecting Microscope, 732
Burgess, R. E. (Thomas, Dr. H. A.) : Survey of Existing Information and Data on Radio Noise over the Frequency Range 1–30 Mc./s., 107
Burkitt, Miles : Archæology at Oxford, *review*, 459
Burland, Miriam S., and others : Combined Radar, Photographic and Visual Observations of the Perseid Meteor Shower of 1947, 278
Burn, Prof. J. H., and Dutta, N. K. : Acetylcholine and Body Temperature, 18
Burström, Prof. H. : Trace Elements in Plant Physiology, 364
Burt, Sir Cyril, and others : The Trend of National Intelligence, *review* by Dr. Julian Blackburn, 37
Burton, Prof. H., and Duffield, J. A. : The Melanin Problem—a Synthesis of 5 : 6-Dihydroxy-indole and its Derivatives, 725
Burton, K. : Higher Fatty Acid Dehydrogenase of Mammalian Liver, 606
Burtt, A. W. : Appointed chief chemist, Singapore, 966
Bushnell, Dr. G. H. S. : North American Archæology, *review*, 501
  The Navaho (Clyde Kluckhohn and Dorothea Leighton), *review*, 545
  Latin American Cultures, 697
Buston, Dr. H. W. : Title of reader in biochemistry in the University of London conferred on, 924
Busvine, Dr. J. R. : Recent Mosquito Eradication Campaigns, 189
Butcher, Devereux : Exploring our National Parks and Monuments, *review* by Frances Pitt, 376
Butcher, Dr. R. W. : Some Problems of Water Buttercups, 735
Butler, Dr. C. G. : Honey Farming (R. O. B. Manley), *review*, 544
Butler, F. H. C. : The Field Study and Conservation of the British Fauna, 409
Butler, Sir Harold : Peace or Power, 414
Butler, J. R. : Awarded an Agricultural Research Council Postgraduate Scholarship, 16
Butler, O. I. : Appointed senior lecturer in charge of the Department of Electrical Engineering in the University of Sheffield, 471
Butler, R. W. : Appointed veterinary officer, Tanganyika, 637
Buxton, Prof. Patrick A. : The Louse, second edition, *review* by Dr. A. D. Imms, 418
  Tsetse Flies and the Development of Africa, 802
Byrd, Admiral Richard : Awarded the Vega Medal of the Geographic Society of Sweden, 430

CACAO Research Institute : The West African (O. J. Voelcker), 117
Cahn, R. W., and others : Mechanical Behaviour of Crystal Boundaries in Metals, 682
Cahn, Prof. T. : Physiology and Biochemistry of Fats and Lipoids, 534
Cain, A. J., and Cushing, D. H. : Second Occurrence and Persistence of the Amphipod *Orchestia bottæ* M. Edwards in Britain, 483
Calcutt, G., and Newhouse, J. P. : Inhibition of the Photodynamic Action of 3 : 4 Benzpyrene, 53
Calcutta Statistical Association : Publication of a *Bulletin*, 124
Calhoun, Hermione Grant (Dougherty, Dr. Ellsworth C., and) : Possible Significance of Free-living Nematodes in Genetic Research, 29
Callan, H. G. : Ribose Nucleic Acid in the *Drosophila* Egg, 440
Calvinist Lawyers, Society of, and the Christian Society of Scientists and Physicians in the Netherlands : Discussion on Atomic Energy, 123
Cameron, Prof. A. T. : Recent Advances in Endocrinology, sixth edition, *review*, 376
Cameron, J. F. : Honorary degree of the University of Cambridge conferred on, 965
Campbell, D. D. : Appointed agricultural officer, Uganda, 471
Campbell, Leon, and Jacchia, Luigi : The Story of Variable Stars, *review* by H. S. J., 460
Campbell, Dr. Neil, and Khanna, Nandoomal : Reduction of 1 : 4-Diketones, 54
Canada, National Research Council of : Thirteenth Annual Report, 491
  Formation of a Radio and Electrical Engineering Division under B. G. Ballard, 513
  Establishment of a Committee on Corrosion Research, 553
  Post-doctorate Fellowships in Pure Chemistry, 555
  Publications of the, second edition, 595
Cancer Campaign, British Empire (Genetical Society of Great Britain and the) : Symposium on the Genetics of Cancer, 843
Cancer Hospital, Royal : Appointment of Dr. Eric Boyland to the University of London chair of biochemistry, 347
Cannon, Prof. H. Graham : The Field Study and Conservation of the British Fauna, 408
Caplan, Dr. Anthony : 'Consolidated Gold' Fields of South Africa, Ltd. Gold Medal awarded jointly to J. K. Lindsay and, 924
Capper, Pass and Son, Ltd. : Awards to the Institution of Mining and Metallurgy and the Institute of Metals for papers on metallurgy, 347
Caribbean Commission : First Annual Report, 555
Carmichael, H. : Promoted to the grade of Senior Principal Scientific Officer, 195
Carnegie United Kingdom Trust : Thirty-third Annual Report, 232
Carpenter, N., and others : Atomic Oxygen and Dissociation in Flame Gases, 726
Carr-Saunders, Sir Alexander, and others : The Trend of National Intelligence, *review* by Dr. Julian Blackburn, 37
Carson, A. S., and others : Bond-Strength of C—Cd in Cadmium Methyl and of C—I in Methyl Iodide, 725
Carstairs, Dr. G. M. : Awarded a Commonwealth Fund Fellowship; 1006
Carter, Dr. Kenneth : Made a director of Laboratories Glaxo (Argentina) S.A., 717
Carter, Dr. S. R. : 'Plasthetics', *review*, 581
Cass (Sir John) Technical Institute, London : Course for Teachers of Chemistry, 595
Cassels, J. M. (Latham, R., and) : Scattering of Neutrons by Lead, 282
Cassidy, F. A. : Appointed senior inspector of mines, Nigeria, 51
Casteret, Norbert : My Caves, translated by R. L. G. Irving, *review*, 830
Castle, W. B., and others : Nomenclature of the anti-*Rh* Typing Sera, 492
Catcheside, Dr. D. G. (Allsopp, C. B., and) : Chemical Breakage of Chromosomes, 1011
Cattley, J. G. : Sex Reversal in Copepods, 937
Caullery, Prof. Maurice : Elected a foreign member of the Royal Society, 921 ; work of, 921
Cave-Browne-Cave, Wing-Comdr. T. R. : The Draining of Binley Lake and its Ecological Consequences, 420
Cavendish Laboratory : Organisation and Work of the (Sir Lawrence Bragg), 627
  Summer School in Metal Physics, 637
  Summer School in Electron Microscopy, 758
Cawley, Dr. C. M. : Promoted to the grade of Senior Principal Scientific Officer, 195
Cazal, Dr. Pierre : Awarded a grant from the Lady Tata Memorial Fund, 966
Central African Council : Appointment of Dr. J. E. Keyston as research secretary, 230
Central Electricity Board : Twentieth Annual Report, 822
Ceylon, National Museums of : Administration Report for 1946, 346
Chadwick, Sir James : Pre-elected Master of Gonville and Caius College, Cambridge, 882. 964 ; work of, 964
Chak, I. M., and Giri, Dr. K. V. : Regeneration of Prothrombin Activity by Carbon Dioxide, 354
Challenger Society : Grants in aid of research in Marine Biology or Oceanography, 595
  Grant from the Development Fund to assist in paying expenses of oceanographers attending joint meetings, 843
Challinor, Dr. S. W., and others : Effect of Ion-Exchange Treatment on the Stability of Apple Juice, 1023
Chalmers, Dr. B., and others : Mechanical Behaviour of Crystal Boundaries in Metals, 682
Chalvet, O., and others : Isotope Exchange and Molecular Structure, 901
Chamberlin, Prof. R. T. : *Death* of, 387
Champernowne, D. G. : Appointed professor of statistics in the University of Oxford, 966
Champion, Prof. H. G. : Preservation of the *Kauri* in New Zealand, 72
  The Future of the New Forest, 547

Clay, Harold : Industrial Co-operation, 571
Clayson, D. H. F., and Chater, C. W. : Cleaning and Sterilization of Plant and Utensils in the Food Industry, 1025
Cleaver, R. E. L. : Awarded a Commonwealth Fund Fellowship, 1006
Clément, Dr. G. : Physiology and Biochemistry of Fats and Lipoids, 534
Clements, Prof. Guy Roger, and Wilson, Prof. Levi Thomas : Manual of Mathematics and Mechanics, second edition, *review*, 789
Clemmesen, Dr. Johannes : Awarded a grant from the Lady Tata Memorial Fund, 966
Cleveland Museum of Natural History : The Museum in Education, 677
Clifton, A. N. : Awarded a Branch Prize of the Royal Aeronautical Society, 593
Clifton, Charles E., and others (edited by) : Annual Review of Microbiology, *review* by Sir Paul Fildes, 995
Clinch, Dr. Phyllis E. M., and others : Transmission of a Disease Resembling Virus Yellows through the 'Seed' of Sugar Beet, 28
Cloos, Prof. H. : Ground Blocks of the Continents and Ocean Bottoms, 71
Clothworkers, Worshipful Company of : Further grant of £10,000 to the Textile Industries Department of the University of Leeds, 1006
Coal Board (National) : Scientific Aspects of the Work of the (John Crossland), 546
Coal Tar Research Association : Formation of the, 757
  Election of Dr. E. V. Evans as president, 757
  Election of Dr. D. McNeil as director of research, 757
Coal Utilization Research Association, British : Publication of a *Quarterly Gazette*, 841
Coates, Prof. J. E. : Retirement from the chair of chemistry at University College, Swansea, 1004 ; work of, 1004
Coats, Ltd., J. and P. : Research Fellowships in chemistry or physics at the University of Glasgow and the Royal Technical College, Glasgow, 164
Cochran, Dr. W. : The Fourier Method of Crystal Structure Analysis, 765
Cochrane, Air Marshal the Hon. Sir Ralph : Awarded the Edward Busk Memorial Prize of the Royal Aeronautical Society, 593
Cockcroft, Sir John : Data for Nuclear Physics, *review*, 418
  Awarded the James Alfred Ewing Medal for 1947 of the Institution of Civil Engineers, 592 ; work of, 592
Cockcroft, Sir John, and others : Atomic Challenge, a Symposium, *review*, 995
Cockerell, Prof. T. D. A. : *Death* of, 194 ; *obituary* by Robert B. Benson, 829
Codrington, K. de B. : Appointed to the University of London chair of Indian archæology at the Institute of Archæology and at the School of Oriental and African Studies, 430
Cohen, Abraham : Time Study and Common Sense, *review* by J. Leigh, 910
Cohen, Dr. John : Science in Social Affairs, 68
Cohen, Morris R. : A Preface to Logic, *review* by Prof. A. D. Ritchie, 623
Cohen, S. G. : Interaction of Fast Neutrons with Indium, 475
Coker, R. E. : This Great and Wide Sea, *review*, 38
Cole, David F. : Osmotic Work performed by the Renal Tubules, 640
Cole, Prof. F. J. : Early English Naturalists, *review*, 373
Cole, G. D. H. : The Intelligent Man's Guide to the Post-War World, *review* by Maurice Bruce, 151
  Local and Regional Government, 825
Colebrook, F. M. : Scientific Radio, 793
Coles, M. (Fraenkel, Dr. G., with the assistance of Blewett, M., and) : B_T, a New Vitamin of the B-Group and its relation to the Folic Acid Group, and other Anti-Anæmia Factors, 981
Collier, Donald, and others : Indians before Columbus, *review* by Dr. G. H. S. Bushnell, 501
Collier, Dr. H. O. J., and others : Pharmacological Activities in different Rodent Species of *d*-Tubocurarine Chloride and the Dimethyl Ether of *d*-Tubocurarine Iodide, 817
Collinge, Dr. W. E. : Presentation of his collection of terrestrial Isopoda to the Yorkshire Museum, 51
Collins, F. D., and others : Chemistry of Visual Processes, 424
Colonial Agricultural, Animal Health and Forestry Research, Committee for : Second Annual Report, 143
Colonial Medical Research Committee : Second Annual Report, 143
Colonial Microbiological Research Institute, Trinidad : Opening of the, 675
Colonial Office : The Colonial Empire (1939–1947), 332
Colonial Office Advisory Committee on Education in the Colonies : Report on Education for Citizenship in Africa, 948
Colonial Primary Products Committee : Interim Report, 779
Colonial Products Research Council : Fourth Annual Report, 142
Colonial Research Committee : Fourth Annual Report, 141
Colonial Service : Appointments and Promotions, 51, 471, 637, 802, 966
Colonial Social Science Research Council : Third Annual Report, 142
Colston Research Society : Symposium on Cosmic Rays, 125
Colvin, Brenda : Land and Landscape, *review* by Prof. L. Dudley Stamp, 868
Colvin, Brenda, and Tyrwhitt, Jaqueline : Trees for Town and Country, *review* by Sir Edward Salisbury, 497
Comline, R. S., and Whatley, F. R. : Inactivation of Flavine Adenine Dinucleotide by Tissue Extracts, 350
Commerce, International Chamber of : Brochure No. 123, Economic Conditions of Germany To-day and its International Repercussions, 659
Commerce, Ministry of (Northern Ireland) : Formation of a Council of Scientific Research and Development, 162
Commonwealth of Australia : Twentieth Annual Report of the Council for Scientific and Industrial Research, 999
Commonwealth of Australia, National Geographic Society and the Smithsonian Institution : Scientific Expedition to Arnhem Land, 195
Commonwealth of Nations, British : Opening of Scientific Liaison Offices, 923
Commonwealth Economic Committee : Industrial Fibres, 961
Commonwealth Fund : Awards of Fellowships, 1006
Communications on Applied Mathematics (New Journal issued by the Institute for Mathematics and Mechanics of New York University), 636
Compton, Dr. Karl T. : Awarded the Public Welfare Medal for 1947 of the U.S. National Academy of Sciences, 50 ; work of, 50
Conant, Dr. J. B. : On Understanding Science, 865
Consiglio Nazionale delle Ricerche, Pavia : Congress on Genetics at the Centro di Genetica, 966
Constant, H. : Elected a Fellow of the Royal Society, 466
Conway, Prof. Edward J. : Microdiffusion Analysis and Volumetric Error, revised edition, *review*, 583
Conway, Dr. H. D. : Aircraft Strength of Materials, *review*, 503
Cook, Dr. : Mycological Education, 508
Cook, Dr. A. H. : Title of University of London reader in organic chemistry conferred on, 637
Cook, Prof. J. W. : Documentation of Organic Chemistry, *review*, 415
  Colchicine, its Chemical and Biological Properties, 554
  A Text-Book of Practical Organic Chemistry (Dr. Arthur I. Vogel), *review*, 995
Cook, Prof. J. W., and Schoental, Dr. R. : Oxidation of Anthracene by Osmium Tetroxide, 237
Cook, Richard K. : Equations of Piezo-electricity, 524
Cook, Dr. W. R. Ivimey (McLean, Dr. R. C., and) : Practical Field Ecology, 158
Cooper, A. R. : Load Dispatching and the British Grid System, 822
Cooper, C., and others : Final Values of Elements of the Geomagnetic Field at 5-Degree Intervals of Latitude and Longitude, Epoch 1945, 161
  The Earth's Main Magnetic Field and its Secular Change, 1905–1945, 161
Cooper, J. P. : Resistance to 'Inanition' in Grass Seedlings, 894
Cooper, Dr. L. H. N. : A Submerged Ancient Cliff near Plymouth, 280
Cooper, Dr. L. H. N., and Steven, G. A. : An Experiment in Marine Fish Cultivation, 631
Cooper, Dr. R., and Prowse, Dr. W. A. : Radio Physics, 795
Cooper, Dr. R. (Prowse, Dr. W. A., and) : Gas Discharges at Centimetre Wave-lengths, 310
Cope, Dr. C. L. : Human Factors in Industry, 791
Cope, Dr. F. W. : Awarded a Murchison Fund of the Geological Society, 122
Copeland, Dr. D. H., and others : Nutrition in relation to Cancer, 106
Copeland, Melvin T., and Towl, Asst. Prof. Andrew R. : The Board of Directors and Business Management, *review* by E. F. L. Brech, 869
Copsey, E. H., and others : Empirical Data on Hilbert's Inequality, 361
Corbet, Dr. A. S. : *Death* of, 799 ; *obituary* by N. D. Riley, 1003
Cori, Prof. Carl F. : Awarded the Willard Gibbs Medal for 1948 by the Chicago Section of the American Chemical Society, 388
Cornish, Dr. Vaughan : *Death* of, 714 ; *obituary*, 839
Coryell, Prof. C. D. : Isotope Exchange and Molecular Structure, 901
Cosmic Ray Laboratory : New Italian (Opened by the Italian Centre for Research in Nuclear Studies), 254
Cosslett, Dr. V. E. : The Electron Microscope, *review* by G. D. P., 955
Cosslett, Dr. V. E., and Markham, Dr. Roy : Structure of Turnip Yellow Mosaic Virus Crystals in the Electron Microscope, 250
Cossor, Ltd., A. C. : Simultaneous Recording of Related Oscillograph Traces, 89

Cotereau, H., and others : Influence of Vitamin P (Vitamin C_2) upon the Amount of Ascorbic Acid in the Organs of the Guinea Pig, 557
Cott, Dr. Hugh B. : Edibility of the Eggs of Birds, 8
Cottin, M., and Varjadebian, B. : Isotope Exchange and Molecular Structure, 901
Coulson, Prof. C. A. : Free Valence in Organic Reactions, 901
Courrier, Robert : Appointed 'secretaire perpétuel' for the physical sciences of the Paris Academy of Sciences, 966
Courtauld, S. : *Death* of, 15
Courtauld's Scientific and Educational Trust Fund : Formation of the, 593
Cowan, H. J. : Appointed lecturer in civil engineering in the University of Sheffield, 471
Cowley, J. M., and Walkley, Allan : Reaction between Manganous Ion and Manganese Dioxide, 173
Cowling, Prof. T. G. : Appointed professor of applied mathematics in the University of Leeds, 307, 468 ; work of, 468
  The Main Geomagnetic Field, 464
  Cosmic Rays, *review*, 785
Cowling, Prof. T. G., and Borger, R. : Electrical Conductivity of the Ionospheric *D*-Layer, 515
Cox, Prof. A. H. : Awarded the Lyell Medal of the Geological Society, 122
Cox, D. R. : Fibre Movement in the Drafting Process, 737
Cox, Dr. H. Roxbee : Elected president of the Royal Aeronautical Society for 1948–49, 853
  Appointed chief scientist at the Ministry of Fuel and Power, 1007
Cox, S. M. : Annealing of Glass, 401, 813
Craggs, Dr. J. D., and others : X-Radiation from a 20-MeV. Betatron, 1022
Craig, D. P., and Maccoll, Allan : The Non-Benzenoid Aromatic Hydrocarbon Pentalene, 481
Craigie, Dr. James : Awarded the Medal of Freedom by the Government of the United States, 215
Crammer, Dr. J. L. : Paper Chromatography of Flavine Nucleotides, 349
Crammer, R. W. : Written Expression in Science, 533
Crawford, B. H. : Degree of D.Sc. of the University of London conferred on, 924
Cripps, Sir Stafford : Elected a Fellow of the Royal Society under Statute 12, 843
  Honorary degree of the University of Cambridge conferred on, 965
Crismon, Jefferson M., and others (edited by) : Annual Review of Physiology, Vol. 9, *review* by Dr. O. A. Trowell, 542
Crisp, —. : Interaction of Water and Porous Materials, 630
Crisp, D. J., and Chipperfield, P. N. J. : Occurrence of *Elminius modestus* (Darwin) in British Waters, 64
Crook, E. M., and Sheffield, F. M. L. : Plant Virus Diseases, 945
Crossland, John : Scientific Aspects of the Work of the National Coal Board, 546
Crow, Sir Alwyn : The Rocket as a Weapon of War in the British Forces, 329
Crowdy, S. H. : Treatment of Apple Canker Lesions with Plant-growth Substances, 320
Crowther, Prof. J. A. : Atomic Energy, *review*, 4
  A Short History of Science, *review*, 260
  Discovery of Radioactivity, 609
Crowther, J. G., and Whiddington, R. : Science at War, *review* by S. Weintroub, 907
Cruz-Coke, Prof. Edouardo : At the opening of the Fourth South American Chemical Congress, 655
  Appointed a member of the Pontifical Academy of Science, 922
Crystallography : British National Committee for, 390
Crystallography, International Union of : First General Assembly and International Congress, 124, 390, 801
  Appointment of a Provisional Executive Committee of the American Section, 801
Csáky, Tihamér Z. (Virtanen, Prof. Artturi I., and) : Formation of Oxime-Nitrogen in *Torula*-Yeast Fed with Potassium Nitrate, 814
Cuffe, Robert C. : Lightning Arrester Discharge Currents, 885
Cullen, Dr. William : Honorary membership of the Institution of Mining and Metallurgy conferred on, 923
Cullinane, Dr. N. M., and Chard, S. J. : Mechanism of Substitution in the Naphthalene Nucleus, 690
Cullis, Prof. W. C. : Elementary Physiology, *review*, 828
Cullwick, Prof. E. G. : An Anomaly in Electromagnetic Theory, 969
Cumming, M. C. (Munro, Dr. H. N., and) : Nitrogen Metabolism after Fracture, 560
Cummins, J. E. : Appointed chief scientific liaison officer for Australia in London, 1007
Cunningham, Admiral Sir John : Elected an honorary member of the Institution of Electrical Engineers, 122
Cunningham, Admiral of the Fleet Lord : Honorary degree of doctor of laws of the University of Sheffield conferred on, 555
Curnow, C. E. (Bannon, J., and) : Structure of Calcium Fluoride Films Evaporated on Polished Glass Surfaces, 136
Cushing, D. H. (Cain, A. J., and) : Second Occurrence and Persistence of the Amphipod *Orchestia bottæ* M. Edwards in Britain, 483
Cwilong, Dr. B. : Sublimation in the Atmosphere over the Oceans, 62
Cymerman, Dr. J. : Appointed lecturer in organic chemistry in the University of Sydney, 471

DAIN, J., and others : 30-MeV. Electron Synchrotron, 504
Dale, Sir Henry : Awarded the Medal of Freedom with Silver Palm by the Government of the United States, 215
Dale, Sir Henry, and others : Atomic Challenge, a Symposium, *review*, 995
Dalfsen, J. W. van, and others : Complexity of Fresh *Hevea* Latex, 177
Dallemagne, Prof. M. J. : The Theory of Primary Calcification in Bone, 115
Dallemagne, Prof. M. J. (Govaerts, Dr. J., and) : Influence of Folliculin on Bone Metabolism, Studied by means of Radiophosphorus, ${}^{32}_{15}P$, 977
Dalziel, Dr. J. M. : *Obituary* by Dr. F. R. Irvine, 920
Dam, Prof. Henrik : Dicumarol Poisoning and Vitamin K Deficiency in relation to Quick's Concept of the Composition of Prothrombin, 1010
Dance, H. R. and I. W. : An Introduction to Filmstrips, *review* by Lieut.-Colonel Eric Lowe, 830
Dangeard, Prof. P. A. C. : *Death* of, 48 ; *obituary* by Dr. B. Barnes, 878
Daniel, Peter M., and others : Studies of the Renal Circulation, *review*, 663
Daniel, R. R. (Bhabha, Dr. H. J., and) : Meson Scattering with Nuclear Excitation, 883
Danish Institution of Civil Engineers : Opening of new headquarters, 124
Darby, J. F., and Swan, J. B. : Scattering of D—D Neutrons by Deuterium, 22
Darke, S. J. (Jacoby, Dr. F., and) : Animal Tissue Culture with a Synthetic Medium, 768
Darling, Dr. F. Fraser : Natural History in the Highlands and Islands, *review* by Prof. A. D. Peacock, 457
Darlington, Dr. C. D. : Awarded the Trail Award and Medal for 1947 of the Linnean Society of London, 51, 882
Darwin, Sir Charles : Use of Equivalent Metric Values in Scientific Papers, 144
  Awarded the Medal of Freedom with Bronze Palm by the Government of the United States, 215
Daudel, R. and Mme., and others : Isotope Exchange and Molecular Structure, 901
David, Prof. W. T. : *Death* of, 839
David, Prof. W. T., and others : Atomic Oxygen and Dissociation in Flame Gases, 726
David, Prof. W. T. (Leah, Dr. A. S., and) : A Bunsen Flame as a Column of Luminous Gas, 524
Davidson, Sir John : Elected president of the Institution of Civil Engineers for 1948–49, 924
Davies, J. G. (Ellyett, C. D., and) : Velocity of Meteors Measured by Diffraction of Radio Waves from Trails during Formation, 596
Davies, J. H. : Appointed an assistant lecturer in economics in the University of Sheffield, 1007
Davies, O. L., and others : A Method for Estimating Percentage Germination of Fungal Spores, 642
Davies, R. E. : Appointed honorary lecturer in biochemistry in the University of Sheffield, 307
Davies, R. G. (Eaton, Dr. J. K., and) : Toxicity of Azo-Compounds and other Substances to the Fruit Tree Red Spider Mite, 644
Davies, R. H. : A Simple Moving-Boundary Apparatus, 1021
Davis, Dr. J. G. : Cleaning and Sterilizing of Dairy and Ice Cream Plant, 1025
Davis, Watson : Proposed Central Publication of Scientific Papers, 896
Davy, M. J. B. : *Obituary* of Orville Wright, 269
  Obituary of Griffith Brewer, 510
  Obituary of G. L. Overton, 921
Dawes, Dr. Ben : The Trematoda of British Fishes, *review* by Dr. G. Lapage, 222
  A Rare Cœlom-Dwelling Trematode, 642
Dawson, Dr. I. M., and McFarlane, Dr. A. S. : Structure of an Animal Virus, 464
Dawson, R. M. C. (Richter, Dr. D., and) : Brain Lactate in Emotion, 205
Dawson, W. J. : Awarded the Bessemer Gold Medal for 1948 of the Iron and Steel Institute, 512
De Castro, Prof. A. : Appointed a member of the Pontifical Academy of Science, 922
Dean, R. F. A., and Holman, W. I. M. : Nicotinic Acid in Human Blood Cells at Birth, 439
Debenham, Prof. Frank : Awarded the Victoria Medal for 1948 of the Royal Geographical Society, 553
Debray, M., and others : Abnormalities in the *F*-Region of the Ionosphere at Calcutta, 24
Dee, Prof. P. I. : Nuclear Physics in Photographs, *review*, 333
Demers, P., and others : Comparison of Cross-sections for the Capture of 220 and 900 keV. Neutrons, 727
Deming, Prof. Horace G. : Fundamental Chemistry, second edition, *review* by Dr. S. H. Harper, 992
Dempsey, Dr. T. G., and others : *p*-Aminosalicylic Acid in the Treatment of Tuberculosis, 435
Den Hartog, Prof. J. P. : Mechanical Vibrations, third edition, *review* by A. L. P., 503
Dennis, R. W. G. : Distribution Patterns in European Basidiomycetes with reference to some British Species, 1015
Desch, Dr. C. H. : Elected a Fellow of the Institute of Metals, 16
  The Flow of Glaciers, 820
Design for Freedom Committee : Design for Recovery, 660
Deslandres, Dr. H. A. : *Death* of, 194 ; *obituary* of, 303
Desnuelles, Prof. P. : Physiology and Biochemistry of Fats and Lipoids, 534
Deuel, Dr. H., and others: Reaction of Boric Acid with Polysaccharides, 96
Development Fund : Grant to the Challenger Society to assist in paying expenses of oceanographers attending joint meetings, 843
Dewberry, Elliot B. : Food Poisoning, second edition, *review*, 540
Dewsnap, N. (Wood, Dr. W. A., and) : Internal Stresses in Metals, 682
Dias, M. Vianna (Brown, Dr. G. L. and) : Sensitivity of a South American Frog to Curare, 234
Dienes, Prof. P. : Retirement from the chair of mathematics at Birkbeck College, 756 ; work of, 756
Dienes, Dr. Z. P. : Appointed to a lectureship in mathematics at University College, Leicester, 514
Dieterlen, Mme. G. : Les Ames des Dogons, *review* by G. I. Jones, 622
Dijkstra, Dr. L. J., and Snoek, Dr. J. L. : Effect of Lattice Distortions on the Mean Rate of Propagation of Large Barkhausen Discontinuities, 886
Dilke, M. H., and others : Catalytic Poisons and Magnetic Susceptibility, 804
Dingemanse, Dr. Elizabeth, and others : Isolation of a New Androstenol-3(α)-on-17 from the Urine of a Patient with Adrenal Cancer, 848
Dingle, Prof. Herbert : Lorentz-like Transformations, 209
Distèche, A. : Use of Solubility Curves at Varying *p*H and Constant Ionic Strength for the Precipitation and Crystallization of Proteins, 130
Divekar, P. V., and others : A New Sulpha Compound ('6257') and its Use in Human Cholera Infection, 395
Diver, Capt. C. : The Field Study and Conservation of the British Fauna, 409
Dixon, Dr. M. : Reactions of Lachrymators with Enzymes and Proteins, 226
  Biochemical Reactions of Chemical Warfare Agents, 225
Dmochowski, Dr. L., and others : Ultracentrifugation and Electron Microscope Studies of Tissues of Inbred Strains of Mice, 759
Dobb, Maurice : Soviet Economic Development since 1917, *review* by Maurice Bruce, 908

Dodd, Norris E. : Appointed director-general of the United Nations Food and Agriculture Organisation, 637
Dodds, Prof. E. C. : *Obituary* of Prof. James McIntosh, 713
Dodgson, K. S., and Williams, Dr. R. Tecwyn : Isolation of Stilbœstrol Monoglucuronide from Human Urine, 604
Doisy, Prof. Edward A. : Appointed a member of the Pontifical Academy of Science, 922
Dollar, Dr. A. T. J. : Recording Crevices in Plane Surfaces by Pigment-fillings held in Cellulose Acetate Moulds, 358
Dollfus, Dr. Robert Ph. : Parasites (animaux et vegétaux) des helminthes, *review* by Dr. G. Lapage, 662
Don, P., and others : Isolation in Chick Embryos of a Filtrable Agent possibly related etiologically to Lumpy Skin Disease of Cattle, 526
Donald, C. M. : Pastures and Pasture Research, second edition, *review* by Dr. John Grainger, 747
Doodson, Dr. A. T. : Rivers—a National Heritage, *review*, 911
Dorey, Dr. S. F. : Elected a Fellow of the Royal Society, 466
Dormer, Dr. K. J., and Street, Dr. H. E. : Secondary Thickening in Excised Tomato Roots, 483
Dostrovsky, Dr. I., and others : Fractional Distillation and its Application in the Concentration of the Heavy Isotopes of Oxygen and Hydrogen, 858
Doudoroff, Dr. Michael, and others : Arsenolysis and Phosphorolysis of the Amylose and Amylopectin Fractions of Starch, 96
Dougherty, Dr. Ellsworth C., and Calhoun, Hermione Grant : Possible Significance of Free-Living Nematodes in Genetic Research, 29
Douglas, Hon. Lewis W. : Honorary degree of doctor of laws of the University of Sheffield conferred on, 555
Dowson, Dr. W. J. (Volcani, Z., and) : A Plant Disease caused by a Spore-forming Bacterium under Natural Conditions, 980
Drennan, D. H. : Appointed agricultural officer, Tanganyika, 51
Drever, Prof. James : The Psychology of Industry, second edition, *review* by T. H. Hawkins, 955
Drew, Dr. Kathleen M. : Genetics and Algal Life-Histories, 223
Drewe, E. C., and Maurice, D. : Solar Noise, 167
Drinkwater, Dr. J. W., and Glendinning, W. G. : Awarded the George Taylor (of Australia) Gold Medal of the Royal Aeronautical Society, 593
Druce, Dr. Gerald : University of Prague Sexcentenary Celebrations, 670
Drucker, Dr. Philip : Some Implications of the Ceramic Complex of La Venta, 594
Drummond, Sir Jack : Awarded the Medal of Freedom with Silver Palm by the Government of the United States, 215
  Presented by the Netherlands Ambassador with the Insignia of Commander in the Order of Orange-Nassau (Civilian Division), 307
Drury, Dr. A. N. : Sir Charles Sherrington and Diphtheria Antitoxin, 266
Dryden, J. S., and Meakins, R. J. : Treatment of Glass and Steatite Ceramic with Quaternary Ammonium Compounds for the Improvement of Electrical Insulation Resistance, 23
Du Toit, Dr. A. L. : *Death* of, 387 ; *obituary* by Sir Edward Bailey, 426
Dubouloz, Prof. P. : Physiology and Biochemistry of Fats and Lipoids, 535
Duckworth, R. B., and others : A Method for Estimating Percentage Germination of Fungal Spores, 642
Duckworth, Dr. W. L. H. : Some Complexities of Human Structure, 628
Duffield, J. A. (Burton, Prof. H., and) : The Melanin Problem—a Synthesis of 5 : 6-Dihydroxy-ondole and its Derivatives, 725
Dufraisse, Charles : Elected a member of the Paris Academy of Sciences in the Section of Chemistry, 514
Dufrenoy, Dr. Jean, and Pratt, Prof. Robertson : Evidence for an Electrostatic Field on Penicillin Assay Plates, 849
Duncan, Prof. W. J. : Potential Theory of Aerofoils, *review*, 703
  Mechanical Admittances and their Applications to Oscillation Problems, *review* by Prof. W. G. Bickley, 954
Dundee Royal Infirmary : The Early Days of (Dr. Henry J. C. Gibson), 555
Dunham, Dr. K. C. : Mineral Resources of the United States, *review*, 991
Dunlop, Dr. George : Food Production from Hill Grazing Land, 585
Dunn, Dr. J. A. : Scientific Research in India, 513
Dunsheath, Dr. Percy (edited by) : Industrial Research, 1947, *review* by R. Brightman, 705
Dunsmuir, Dr. R., and others : Pinhole Radiography of Magnetrons, 244
Duperier, Dr. A. : Height of Meson Formation, 645
Dustin, Jun., Dr. P. (Parmentier, R., and) : Early Effects of Hydroquinone on Mitosis, 527
Dutta, N. K. (Burn, Prof. J. H., and) : Acetylcholine and Body Temperature, 18
Duveen, Denis I. : Humour and Humanism in Chemistry, *review*, 869
Dyer, Dr. Bernard : *Death* of, 270 ; *obituary* by G. Taylor, 386
Dyers and Colourists, Society of : Appointment of Dr. Cyril J. W. Hooper as editor and general secretary, 347
Dyers and Colourists, Society of (and others) : Conference on the Rheological Properties of Textile Materials, 307, 737

EALES, Dr. N. B. : Recent Research in Marine Biology, 737
East African Industrial Research Board : Report for 1946, 122
Eastman Kodak Research Laboratories : Retirement of Dr. S. E. Sheppard, 270
Eaton, Dr. J. K., and Davies, R. G. : Toxicity of Azo-Compounds and other Substances to the Fruit Tree Red Spider Mite, 644
Ebaugh, Cameron D. : Education in Guatemala, 945
Eckersley, T. L. : Triple Splitting of Ionospheric Rays, 597
Eddy, Prof. Samuel, and others : Guide to the Study of the Anatomy of the Shark, *Necturus*, and the Cat, second edition, *review* by Dr. P. D. F. Murray, 955
Ede, Chuter : University Representation in the House of Commons, 468
Eden, Anthony : Honorary degree of doctor of laws of the University of Sheffield conferred on, 555
Edgerley, L. F. : Appointed assistant conservator of forests, Mauritius, 471
Edisbury, Dr. J. R., and others : Units and Useful Range in Photo-electric Colorimetry, 247
Edlund, Torbjörn : Absorption of Protein and Bacteria from Normal and Infected Joints, 102
Edney, Dr. E. B. : Biology in Colonial Universities, 506
Education in Industry and Commerce, National Advisory Council for : Appointment of Sir Ronald Weeks as chairman, 801
  Elections to the Standing Committee, 923
Educational Film Groups, National Federation of : First Annual Conference, 965
Educational Foundation for Visual Aids : Appointment of John A. Harrison as director, 802
Edwards, —. : Sociology of Mental Disease, 407
Edwards, Dr. G. : History of Anæsthesia, *review*, 458
Edwards, Joseph, and others : The Artificial Insemination of Farm Animals, edited by Enos J. Perry, *review* by Dr. Arthur Walton, 831
Edwards, J. P. : Appointed deputy director of forestry, Malaya, 471
Edwards and Co., Ltd., W. : High-Vacuum Equipment, 676
Egedal, J. : Daily Variation of the Horizontal Magnetic Force at the Magnetic Equator, 443
Egerton, Sir Alfred : Awarded the Medal of Freedom with Silver Palm by the Government of the United States, 215
  Insulating Materials and Methods for Use at Low Temperatures, 323
  Degree of D.Sc. of the University of London conferred on, 347
  To accept the chairmanship of the Scientific Advisory Council of the Ministry of Fuel and Power, 1007
Ekbote, R. B., and Sahasrabuddhe, K. R. : Shrivelled Wheat Grain from Rust-Affected Crop as Seed, 442
Eldridge, Prof. John A. : College Physics, third edition, *review* by S. Weintroub, 954
Electrical Engineers, Institution of : Coopers Hill War Memorial Prize and Medal for 1946 awarded to E. C. Cherry, 90
  Page Prizes for 1947 awarded to D. T. Hollingsworth and M. K. Taylor, 90
  Election of Sir Thomas Purves and Admiral Sir John Cunningham as honorary members, 122
  Faraday Medal awarded to Prof. M. L. E. Oliphant, 122
Electrical Engineers, Institution of (Radio Section), and the British National Committee for Scientific Radio : Convention on Scientific Radio, 233, 793
Electrical Engineers, Institution of (Research Committee of the) : British Research in the Radio Field, 943
Electrical and Allied Industries Research Association, British : Establishment of a new Section on Power Generation, 162
  Twenty-seventh Annual Report, 492
Electricity Board, Central : Twentieth Annual Report, 822
Electronics, Institution of : Third Annual Exhibition by the North-West Section, 924
Eley, Dr. D. D., and others : Catalytic Poisons and Magnetic Susceptibility, 804
Elliott, A., and MacNeice, G. G. : Transmission of the Atmosphere in the 1-5 Micron Region, 516
Elliott, W. H. : Adenosinetriphosphate in Glutamine Synthesis, 128
Elliott, W. H., and Gale, Dr. E. F. : Glutamine-synthesizing System of *Staphylococcus aureus*, its Inhibition by Crystal Violet and Methionine-sulphoxide, 129
Ellis, Dr. Oliver C. de C. : Extinction of Petrol Fires by Methyl Iodide, 402
Ellison, Dr. M. A. : Solar and Terrestrial Relationships, *review*, 951
Ellyett, C. D., and Davies, J. G. : Velocity of Meteors Measured by Diffraction of Radio Waves from Trails during Formation, 596
Elmore, D. T. : Separation of Pyrimidine Nucleosides by Synthetic Resin Ion-Exchangers, 931
Elsden, Dr. S. R. : Appointed senior lecturer in microbiology in the University of Sheffield, 16
Elsevier's Encyclopædia of Organic Chemistry (edited by E. Josephy and F. Radt), Series 3, Carboisocyclic Condensed Compounds, Vol. 13, Tricyclic Compounds, *review* by Prof. J. W. Cook, 415
Elton, G. A. H. : Theory of the Streaming Potential, 847
Emeléus, Prof. H. J. : Appointed a member of the Chemical Research Board, 924
Emery, Dr. J. L. : Appointed honorary lecturer in pathology in the University of Sheffield, 16
Ende, Prof. M. van den, and others : Isolation in Chick Embryos of a Filtrable Agent possibly related etiologically to Lumpy Skin Disease of Cattle, 526
Engel, Dr. A. von (Stott, F. D., and) : Optical Transmission of a Colloidal Solution in a Magnetic Field, 728
Engel, Dr. R. W., and others : Nutrition in relation to Cancer, 106
Engineers, Society of : Simms Gold Medal awarded to J. G. Milton, 346
  Bessemer Premium awarded to C. D. Mitchell, 346
  Nursey Premium awarded to R. Cecil Smart, 346
  Bernays Premium awarded to Bernard Payne, 346
  Election of E. E. Turner as president, 346
Engle, Earl T. (edited by) : The Problem of Fertility (Proceedings of the Conference on Fertility held under the auspices of the National Committee on Maternal Health), *review*, 113
Engström, Dr. A., and Jakus, M. A. : Intracellular Determination of Protein by X-Ray Microspectrography, 168
Ennion, Dr. E. A. : The Field Study and Conservation of the British Fauna, 409
Enoksson, Bertil : Influence of Solvent Movement on Sedimentation, 934
Enquiry, No. 1, 757
Enskog, Prof. David : *Obituary* by Prof. S. Chapman, 193
Erdös, Thomas (Snellman, Olle, and) : Effect of Calcium Ions on the Charge of Myosin, 526
Erdtman, Prof. Holger, and Gripenberg, Dr. Jarl : Antibiotic Substances from the Heart Wood of *Thuja plicata* Don., 719
Eriksson, H. A. S. : Energy of the Ground-State of Helium-like Atoms, 393
Erkama, Dr. J. : Trace Elements in Plant Physiology, 364
Essen, Dr. L. : Scientific Radio, 793
Estevez, J. M. J. : Contact Laminated Plastics, *review*, 788
European Periodicals Publicity and Advertising Co., Ltd. : First Post-war Exhibition of German Books, Periodicals and Newspapers, 595
Evans, C. C., and Sugden, Prof. S. : Exchange Reactions and Electrolytic Dissociation, 901
Evans, E. A. : Elected president of the Institute of Petroleum for 1948–49, 758
Evans, E. Price (Tansley, A. G., and) : Plant Ecology and the School, 158
Evans, Dr. E. V.: Elected president of the Coal Tar Research Association, 757
  The Gas Industry in Britain, 832

- Evans, Dr. U. R. : Written Expression in Science, 533
- Eve, Prof. A. S. : *Death* of, 510 ; *obituary* by Sir George Thomson, 838
- Everett, A. J., and others : Formation of Hydroxy Peroxides, 172
- Everett, Dr. D. H. : Appointed to the chair of chemistry at University College, Dundee, 715 ; work of, 715
- *Evolution*, an International Journal of Organic Evolution, No. 1, 162
- Ewens, Dr. R. V. G. : Constitution of certain Binuclear Metallic Carbonyls and Nitrosyls, 530
- Exhibition of 1851, Commissioners of the : Awards of Senior Scholarships, 966
- *Experimental Psychology, Quarterly Journal of* : To be published by the Experimental Psychology Group, 272
- Experimental Psychology Group : To publish a new journal, the *Quarterly Journal of Experimental Psychology*, 272
- l'Exploration de la Mer, Conseil Permanent International pour : Discussion on Climatic and Ecological Ghanges in Northern Waters, 428
- Exton, Jr., William : Audiovisual Aids to Instruction, *review* by Lieut.-Colonel Eric Lowe, 745

- FAGELSTON, I. : Promoted to the grade of Senior Principal Scientific Officer, 195
- Fairley, Dr. N. Hamilton : Medical Diseases in Hot Climates, *review*, 499
- Fallot, Prof. Paul : Elected a member of the Section of Mineralogy of the Paris Academy of Sciences, 802
- Falls, Capt. Cyril, and others : Atomic Challenge, a Symposium, *review*, 995
- Falmouth, Viscount : Elected chairman of the Imperial College of Science and Technology, 17
- Family Planning Association of Great Britain : International Congress on Population and World Resources in relation to the Family, 882
- Fankuchen, Dr. I., and others : Structure of Cyclo-octatetraene, 165
- Fanning, Leonard M. : American Oil Operations Abroad, *review* by H. B. Milner, 186
- Faraday, Dr. Joseph Escott (compiled by) : Faraday's Encyclopedia of Hydrocarbon Compounds, Vol. 4, C_8, *review*, 583
- Faraday Society : General Discussion on the Interaction of Water and Porous Materials, 307, 629
- Faraday Society, and others : Symposium on Internal Stresses in Metals and Alloys, 70
- Faragó, P. S. : Electron Multiplier Tube of Large Effective Cathode Surface Area, 60
- Farmer, E. H. : Elected a Fellow of the Royal Society, 466
- Farnworth, A. J., and Speakman, Prof. J. B. : Action of Sulphuryl Chloride on Wool, 850
  - Chemical Mechanism of Permanent Set, 890
- Fast, J. F. (Snoek, Dr. J. L., and) : Metastable States of Nickel Characterized by a High Initial Permeability, 887
- Feather, Prof. N. : A Revised Sargent Diagram, 431
- Federation of British Industries : Special meeting of the Industrial Research Committee at the Royal Institution in honour of Sir Robert Robinson and Sir Edward Appleton, 508
- Federation of British Industries (Industrial Research Committee) and the Industrial Association of Wales and Monmouthshire : Joint regional conference on Industry and Research in Wales, 233
- Feibleman, James : The Revival of Realism, Critical Studies in Contemporary Philosophy, *review* by Prof. A. D. Ritchie, 623
- Feigl, Prof. Fr. : Inner-Complex Salts of Trivalent Thallium, 436
- Feindel, W. H., and others : Intravenous Methylene Blue, a New Method for Studying the Nervous System, 318
- Fell, Dr. E. W. : Appointed senior assistant in metallurgy at the Bradford Technical College, 272
- Fell, Dr. Honor B. : Awarded the Trail Award and Medal for 1942 of the Linnean Society of London, 51, 882
- Ferguson, W. S. : A Possible Relation between the Action of Clover Juice on Isolated Muscle and 'Bloat' in Cattle, 816
- Fernandes, F., and others : A New Sulpha Compound ('6257') and its Use in Human Cholera Infection, 395
- Feversham, Earl of : Sociology of Mental Disease, 408
- Fiennes, R. N. T.-W.- : Control of Cattle Trypanosomiasis, 602
- Fildes, Sir Paul : Honorary degree of the University of Cambridge conferred on, 965
  - Annual Review of Microbiology (edited by Charles E. Clifton, Sidney Raffel and H. Albert Baker), Vol. 1, *review*, 995
- Finalayson, W. : Appointed assistant conservator of forests, Tanganyika, 966
- Finch, Prof. G. I. : Elected president of the Physical Society for 1948–49, 758
  - Radio Physics, 795
- Findlay, Dr. J. D., and Yang, S. H. : Capillary Distribution in Cow Skin, 1012
- Finney, D. J. : Probit Analysis, *review* by Prof. J. H. Gaddum, 417
- Finnish Institute for the Exploration of the Sea : Appointment of Dr. Risto Jurva as director, 347
- Fischer, Dr. Albert : Amino-Acid Metabolism of Tissue Cells *in vitro*, 1008
- Fisher, James : Bird Recognition, I, Sea-Birds and Waders, *review* by Frances Pitt, 831
  - Orientation of Birds on Migratory and Homing Flights, 998
- Fisher, Prof. R. A. : Mathematical Theory of Tetraploidy, 758
- Fisher, R. B., and others : Quantitative Paper Chromatography, 764
- Fisher, W. A. P. : Photo-Elasticity in Mechanical Engineering, 329
  - A Large Field Compensator of the Berek Type, 848
- Fisheries School at Cronulla, New South Wales (G. A. Steven), 986
- Fishwick, V. C. : Dairy Farming, *review* by S. B., 544
- Fitter, R. S. R. : The Field Study and Conservation of the British Fauna, 409
- Fleming, Sir Alexander : Elected a member of the Athenæum under Rule II, 125
  - The Assaying of Penicillin, 287
  - Awarded the Medal for Merit by the Government of the United States, 800
  - Awarded the Grand Cross of Alfonso X, and an honorary degree of the University of Madrid conferred on, 966
- Fleming, Sir Arthur : The War Effort of a Great Engineering Organisation *review*, 113
- Fletcher, J. R. : Appointed inspector of mines, Malaya, 802
- Fleure, Prof. H. J. : Some Aspects of British Civilization, *review* by D. B. Harden, 746
- Fleure, J. L. : Appointed survey probationer, Malaya, 637
- Fleury, Prof. P. : Physiology and Biochemistry of Fats and Lipoids, 535
- Flint, Prof. H. T. : *Obituary* of Prof. Max Planck, 13
- Flockhart, N. B. : Appointed agricultural officer, North Borneo, 51
- Florence, Prof. P. Sargant : Recent Sociological Periodicals, 450
- Florey, Sir Howard : Awarded the Medal for Merit by the Government of the United States, 800
  - Appointed a member of the Advisory Council on Scientific Research and Technical Development, 924
- Fluegge, S. : An Introduction to Nuclear Physics, *review* by Sir John Cockcroft, 418
- Fogarty, M. P. : Plan your own Industries, 183
- Foinette, E. H. (Jenkins, C., and) : Chemistry for Schools, Part 3, *review* by Dr. S. H. Harper, 992
- Folkers, K., and others : Anti-Pernicious Anæmia Factor, 676
- Folley, Dr. S. J., and French, T. H. : Respiratory Quotient of the Mammary Gland, 933
- Food and Health, Ministries of : Awarded a Lasker Group Award by the American Public Health Association, 16
- Fooks, Dr. Ernest : X-Ray the City !, *review* by R. Brightman, 297
- Ford, Dr. Hugh : Appointed to the University of London readership in applied mechanics at the Imperial College of Science and Technology, 924
- Foreign Office : Publication and distribution of the first volumes of the F.I.A.T. Review of German Science, 389
- Forest Research Institute, Dehra Dun : Forest Leaflets dealing with the Vegetable Tanning Materials of India, 255
- Forest Research Institute of Sweden : *Meddelandan*, Vol. 35 (1946), 781
- Forestry Commission : Report of the New Forest Committee for 1947, 547

- Frankl, Dr. E. K. : Photo-Elasticity in Mechanical Engineering, 329
- Franklin (Benjamin) : A Descendant of, *review* by Lieut.-Colonel H. D. Anthony, 909
- Franklin, Prof. K. J. : Preparation of a biography of Sir Joseph Barcroft, 164
- Franklin, Prof. K. J., and others : Studies of the Renal Circulation, *review*, 663
- Franks, Sir Oliver : Elected a member of the Athenæum under Rule II, 125
- Franzinetti, C., and Payne, R. M. : Emission of Li^8 in the Explosive Disintegration of Nuclei, 735
- Fraser, Dr. Francis Charles : Appointed a deputy keeper in the Department of Zoology of the British Museum (Natural History), 270
- Fraser, H. : Appointed senior assistant conservator of forests, Tanganyika, 637
- Frazer, Prof. A. C. : Physiology and Biochemistry of Fats and Lipoids, 534
- Frazer, H., and others : Empirical Data on Hilbert's Inequality, 361
- Freeman, J. A., and Turtle, E. E. : Insect Pests of Flour, 554
- Freeman, Peter : Appointed research assistant to the professor of engineering in the University of Sheffield, 1007
- Freeman, S. M., and Weissenberg, K. : Some New Anisotropic Time Effects in Rheology, 324
- French, Eleanor : Social Studies of the Elderly, 253
- French, T. H. (Folley, Dr. S. J., and) : Respiratory Quotient of the Mammary Gland, 933
- French Association of Scientific Workers : Organization of an International Holiday Centre at Morzine, 1007
- French National Demographic Institute (French National Union for Prevention of Depopulation and the) : Conference on Scientific Research on Ageing in the Population of France, 163
- French National Institute of Agronomic Research : To organise the Seventh International Sericultural Congress, 307
- French National Union for Prevention of Depopulation and the French National Demographic Institute : Conference on Scientific Research on Ageing in the Population of France, 163
- Friedlander, Dr. G., and Grunberg, L. : 'Low-Temperature' Oxidation of Higher Hydrocarbons at Atmospheric Pressure, 360
- Frisch, Prof. O. R. : Elected a Fellow of the Royal Society, 467
  - Meet the Atoms, *review* by Prof. P. B. Moon, 582
- Fröhlich, Dr. H. : Superconductivity, *review*, 37
  - Appointed to the chair of theoretical physics in the University of Liverpool, 715 ; work of, 715

Fry, Dr. Dennis : The Borderline of Psychology, Physics and Music, 590
Fry, D. W., and others : 30-MeV. Electron Synchrotron, 504
Fryer, Sir John : Elected a Fellow of the Royal Society, 467
Fu, F. Y., and others : Pharmacology of Ch'ang Shan (*Dichroa febrifuga*), a Chinese Antimalarial Herb, 400
Fuchs, Dr. J. : Blackett's Hypothesis of the Magnetic Field of Rotating Bodies, 598
Fuel, Institute of (Institute of Petroleum and the) : Joint Conference on Modern Applications of Liquid Fuels, 677, 1007
Fuel and Power, Ministry of : Appointment of Dr. H. Roxbee Cox as chief scientist, 1007
  Acceptance by Sir Alfred Egerton of the chairmanship of the Scientific Advisory Council, 1007
Fuel Efficiency Committees : Reconstitution of the, 634
Fuller, B. R. : Appointed assistant conservator of forests, Nyasaland, 471
Fulton, A. : Appointed director of veterinary services, Sierra Leone/Gambia, 802
Fulton, Dr. J. D., and Joyner, J. P. : Natural Amœbic Infections in Laboratory Rodents, 66
Furnivall, J. S. : Colonial Policy and Practice, a Comparative Study of Burma and Netherlands India, *review* by Maurice Bruce, 908
Furse, Peggy : Awarded the Bronze Star by the Government of the United States, 716
Fussell, G. E. : Village Life in the Eighteenth Century, *review* by Sir John Russell, 701

GAARENSTROOM, J. H., and de Jongh, S. E. : Contribution to the Knowledge of the Influences of Gonadotrophic and Sex Hormones on the Gonads of Rats, *review* by Prof. S. Zuckerman, 221
Gabe, M., and others : Influence of Vitamin P (Vitamin C$_2$) upon the Amount of Ascorbic Acid in the Organs of the Guinea Pig, 557
Gabor, Dr. D. : A New Microscopic Principle, 777
Gabrielsen, Dr. E. K. : Threshold Value of Carbon Dioxide Concentration in Photosynthesis of Foliage Leaves, 138
Gaddum, Prof. J. H. : Probits, *review*, 417
Gaitskell, Hugh : Opening of the Wolverhampton Industrial Centenary Exhibition, 634
Gale, Dr. E. F. : The Chemical Activities of Bacteria, *review* by Dr. H. K. King, 78
Gale, Dr. E. F. (Elliott, W. H., and) : Glutamine-synthesizing System of *Staphylococcus aureus*, its Inhibition by Crystal Violet and Methionine-sulphoxide, 129
Gallop, J. W., and others : 30-Me-V. Electron Synchrotron, 504
Gamow, Prof. George : Atomic Energy in Cosmic and Human Life, *review* by Prof. J. A. Crowther, 4
Ganay, Mme. Solange de : Les Devises des Dogons, *review* by G. I. Jones, 622
Gardikas, C., and others : Choleglobin Formation in the Erythrocyte, 607
Garlick, Dr. G. F. J., and Gibson, A. F. : Luminescence Efficiency Changes in Zinc Sulphide Phosphors below Room Temperature, 359
Garlick, Dr. G. F. J. (Wilkins, Dr. M. H. F., and) : Relation between Photoconduction and Luminescence in Zinc Sulphide, 565
Garnett, Wilfred J. : Visual Aids, Notes on some Modern Apparatus, 124
Garnham, P. C. C. (Shortt, Prof. H. E., and) : Pre-erythrocytic Stage in Mammalian Malaria Parasites, 126
Garrod, Prof. D. A. E. : *Obituary* of Prof. G. C. MacCurdy, 47
Gärtner, August (1848–1934), 593
Gawn, R. W. L. : Aspects of the Locomotion of Whales, 44
Gaydon, Dr. A. G. : Dissociation Energies, 731
Gaydon, Dr. A. G. (Pannetier, Dr. G., and) : Band Spectrum of ClO in Flames, 242
General Register Office : Series of publications under the title of Studies on Medical and Population Subjects, 17
General Motors Corporation, and others : Conference on Mechanical Wear, 758
Genetical Society of Great Britain : Election of Prof. R. C. Punnett and Prof. A. H. Sturtevant as honorary members, 595
Genetical Society of Great Britain and the British Empire Cancer Campaign : Symposium on the Genetics of Cancer, 843
Geographic Society of Sweden : Award of the Vega Medal to Admiral Richard Byrd, 430
Geographical Society, Royal : Founder's Medal awarded to Wilfred Thesiger, 553
  Patron's Medal awarded to Thomas H. Manning, 553
  Victoria Medal awarded to Prof. Frank Debenham, 553
  Murchison Grant awarded to Robert W. Steel, 553
  Back Grant awarded to Alan J. Marshall, 553
  Cuthbert Peek Grant awarded to Dr. Donald F. Thomson, 553
  Gill Memorial awarded to William E. W. Williams, 553
Geological Society of London : Wollaston Medal awarded to Sir Edward Bailey, 122
  Murchison Medal awarded to Dr. J. Phemister, 122
  Lyell Medal awarded to Prof. A. H. Cox, 122
  Prestwich Medal awarded to the Abbé Henri Breuil, 122
  Wollaston Fund awarded to Dr. J. G. C. Anderson, 122
  Murchison Fund awarded to Dr. F. W. Cope, 122
  Lyell Fund (in two moieties) awarded to Dr. Dorothy Rayner and W. D. Ware, 122
  Awards from the Daniel-Pidgeon Fund made to Dr. J. S. Webb and to W. S. McKerrow, 1007
George, Dr. E. P., and Jason, A. C. : High-Altitude Measurements on Cosmic Rays—Penetrating Cosmic Ray Showers, 248
George, Dr. E. P., and Trent, P. T. : High-Altitude Measurements on Cosmic Rays—Penetrating Bursts, 248
German Chemists in the British Zone, Society of : Annual Meeting, 758
Géro, E., and others : Influence of Vitamin P (Vitamin C$_2$) upon the Amount of Ascorbic Acid in the Organs of the Guinea Pig, 557
Gerritsen, H. J. (Melchers, W. J., en) : Koper als onmisbaar element voor plant en dier, *review*, 624
Ghosh, S. N., and others : Abnormalities in the F-Region of the Ionosphere at Calcutta, 24
Gibson, A. G. (Garlick, Dr. G. F. J., and) : Luminescence Efficiency Changes in Zinc Sulphide Phosphors below Room Temperature, 359
Gibson, Dr. Henry J. C. : The Early Days of Dundee Royal Infirmary, 555
Giese, Arthur C., and others (edited by) : Annual Review of Physiology, Vol. 9, *review* by Dr. O. A. Trowell, 542
Gilbert, A. : Appointed lecturer in psychology in the University of Sheffield, 1007
Gilbert, J. C. : Appointed senior lecturer in economics in the University of Sheffield, 1007
Gillet, S. : Appointed director of agriculture, Kenya, 471
Gillin, John : Moche, a Peruvian Coastal Community, 697
Gilmour, J. S. L. : Wild Flowers of the Chalk, *review*, 188
  The Study of Critical British Groups, 733
Gils, G. E. van, and others : Complexity of Fresh *Hevea* Latex, 177
Gimpera, Prof. Pedro Bosch : Appointed director of the Philosophy and Humanistic Studies Section of U.N.E.S.C.O., 304
Giovanelli, R. G. : Emission of Enhanced Microwave Solar Radiation, 133
Giri, Dr. K. V. (Chak, I. M., and) : Regeneration of Prothrombin Activity by Carbon Dioxide, 354
Girls' Clubs and Mixed Clubs, National Association of : Summer School for Youth Leaders on the Club Programme and Informal Education, 924
Gisiger, Dr. L. : Trace Elements in Plant Physiology, 365
Glaciological Society, British, and others : Discussion on the Flow of Glaciers, 819
Glanville, Prof. S. R. K. : Growth and Nature of Egyptology, 346
Glascock, Raymond (Arrol, Dr. W. J., and) : Microsynthesis of C^{14}-Labelled Ethyl Iodide, 932
Glasgow Art Gallery and Museum : Publication of booklets on Habitat Groups, 90
Glendinning, W. G. (Drinkwater, Dr. J. W., and) : Awarded the George Taylor (of Australia) Gold Medal of the Royal Aeronautical Society, 593
Godding, Robert, and others : Colonial Administration by European Powers, 372
Godward, Dr. M. B. E. : The Iron Alum Acetocarmine Method for Algæ, 203
Godwin, Dr. H. : The Ecological Approach to Botany, 157
Gold, T. (Pumphrey, Dr. R. J., and) : Phase Memory of the Ear, a Proof of the Resonance Hypothesis, 640
Gold, Dr. V. (Baxter, E. G., and) : A Simple Moving-Boundary Apparatus, 403
Gold Coast Legislative Council (Martin Wight), 371
Goldschmidt, H. J. : Structure and Properties of Metals, 263
Goldsmith, Maurice : The Government Social Survey, 573
Gonville and Caius College, Cambridge : Pre-election of Sir James Chadwick as Master, 882, 964
Good, P. : Scientific Radio, 793
Good, Prof. Ronald : The Geography of the Flowering Plants, *review* by Sir Edward Salisbury, 704, 857
Goodacre, C. L., and others : *p*-Aminosalicylic Acid in the Treatment of Tuberculosis, 435
Goodall, Dr. D. W., and Gregory, Dr. F. G. : Chemical Composition of Plants as an Index of their Nutritional Status, 406
Goodeve, Sir Charles : Operational Research, 377, 609
  Operational Research in the Research Associations, 584
Goodstein, Dr. R. L. : Appointed to the chair of mathematics at University College, Leicester, 344
Goodwin, T. W., and Srisukh, S. : The Carotenoids of the Locust Integument, 525
Gordon, Seton : Gathered Nature Stories, *review*, 744
  Fisherman and Nature Lover, *review*, 951
Gorer, Dr. Peter A. : Awarded a grant from the Lady Tata Memorial Fund, 966
Gorter, Prof. C. J., and others : Magnetic Observations and Thermometry in the Region of Millidegrees Absolute, 678
Gorvin, John H. : *p*-Hydroxybenzil, 208
Gould, Dr. A. J. : Appointed senior lecturer in the Department of Glass Technology in the University of Sheffield, 307
Gould, F. A. : Use of Equivalent Metric Values in Scientific Papers, 144
Govaerts, Dr. J., and Dallemagne, Prof. M. J. : Influence of Folliculin on Bone Metabolism, Studied by Means of Radiophosphorus, $^{32}_{15}$P, 977
Goward, F. K., and others : 30-MeV. Electron Synchrotron, 504
Graham, Ernest S. : Honorary degree of doctor of laws of the University of Sheffield conferred on, 555
Graham, R. : The Study of Critical British Groups, 735
Grainger, Dr. John : Pastures and Pasture Research (C. M. Donald), second edition, *review*, 747
Grant, M. W. : Metabolic Aspects of Convalescence, 535
Gray, C. H., and Kekwick, Dr. R. A. : Bilirubin-Serum Protein Complexes and the van den Bergh Reaction, 274
Gray, Ernest : Ciliate Protozoan Fauna of Soil and Inland Waters, 854
Gray, Prof. J. : Aspects of the Locomotion of Whales, 199
Greaves, H. R. G. : The Civil Service in the Changing State, 496
Green, A. T. : Operational Research in the Research Associations, 584
Green, Harriet C., and others : Visible Speech, *review* by Dr. W. G. Radley, 334
Green, Dr. H. S. : Liquid Helium II, 391
Green, Ltd., J. Barcham : 105 Lens Tissue, 514
Greenkeeping Research, Board of : Reappearance of the *Journal* of the, 757
Greenly, Sir John : Elected a Fellow of the Institute of Metals, 16
Greenough, G. B. : Internal Stresses in Metals, 683
Greenslade, R. M., and others : New Formulation of D.D.T. with Selective Properties, 484
Greenstein, Dr. Jesse P. : *Obituary* of Prof. J. Masson Gulland, 87
Greenwood, A. N. : Appointed lecturer in electrical engineering in the University of Leeds, 1006
Greer, E. N., and others : Action of Nitrogen Trichloride on Proteins—Production of Toxic Derivative, 126
Gregory, Prof. F. G., and Purvis, Dr. O. N. : Reversal of Vernalization by High Temperature, 859
Gregory, Prof. F. G. (Goodall, Dr. D. W., and) : Chemical Composition of Plants as an Index of their Nutritional Status, 406
Gregory, Lewise W., and others : What People Are, a Study of Normal Young Men, *review*, 502
Gregory, P. H. : Cereal Rusts, *review*, 220
Greig, Prof. J. : Radio Research in Britain, 943
Greig, P. A. : Appointed agricultural development officer, Nigeria, 51

Greig, Sir Robert : *Obituary* by Dr. W. G. Ogg, 120
Gridgeman, N. T., and others : Units and Useful Range in Photo-electric Colorimetry, 247
Griffith, Sir William T. : Awarded the Simms Gold Medal of the Royal Aeronautical Society, 593
Griffiths, Dr. Ezer : Insulating Materials and Methods for Use at Low Temperatures, 323
  Microcalorimetry (Prof. W. Swietoslawski), *review*, 460
  Methods of Measuring Temperature, third edition, *review* by S. Weintroub, 624
Griffiths, H. V., and others : Meteor Whistles, 478
Griffiths, J. D. (Rose, L., and) : Stress-Strain Characteristics of Viscose Rayon in relation to Anisotropy, 737
Griffiths, Dr. J. H. E. : Radio Physics, 795
Gripenberg, Dr. J., and others : Effect of Ionic Charges on the Energy and Entropy of Activation of Heterolytic Reactions, 480
Gripenberg, Dr. J. (Erdtman, Prof. Holger, and) : Antibiotic Substances from the Heart Wood of *Thuja plicata* Don., 719
Groen, Dr. P. : Internal Waves in certain Types of Density Distribution, 92
Gross, Dr. George L., and others : Mathematical Theory of Rocket Flight, *review* by Dr. R. A. Rankin, 3
Grossbard, Erna : Production of an Antibiotic Substance on Wheat Straw and other Organic Materials and in the Soil, 614
Grummitt, Dr. W. E., and Wilkinson, Dr. G. : Fission Products of U^{233}, 520
Grunberg, L., and Nissan, Dr. A. H. : Critical Temperature and Molecular Weight of *n*-Paraffins, 170
Grunberg, L. (Friedlander, Dr. G., and) : 'Low-Temperature' Oxidation of Higher Hydrocarbons at Atmospheric Pressure, 360
Grüneberg, Dr. Hans : Animal Genetics and Medicine, *review* by Prof. C. H. Waddington, 543
Grunwald, Dr. Ernest M. : Awarded a Frank B. Jewett Fellowship for 1948–49 by the American Telephone and Telegraph Co., 429
Guerrero, A. H., and Williams, Dr. R. Tecwyn : The Tollens Naphthoresorcinol Reaction for Uronic Acids, 930
Gueterbock, Colonel P. G. : Internal Stresses in Metals and Alloys, 70
Guildford Health Committee : Attempt to combat infection of Food and Drink, 635
Gulland, Prof. J. Masson : *Obituary* by Dr. Jesse P. Greenstein, 87
Gulland, the late Prof. J. Masson, and Jordan, Dr. D. O. : Structure of Yeast Ribonucleic Acid, 561
Gunn, Dr. D. L. : Aircraft Attack on Locusts, 342
Gupta, Dr. M. C. Sen, and Sen, K. C. : A Text Book of Physical Chemistry, new edition, *review*, 460
Gupta, Dr. S. (Majumdar, R. C., and) : The Meson Field and the Equation of Motion of a Spinning Particle, 410
Gurjar, Prof. L. V. : Ancient Indian Mathematics and Vedha, *review* by Prof. E. H. Neville, 580
Gurney, C. : Delayed Fracture of Glass under Tension, Torsion and Radial Pressure, 729
  The Flow of Glaciers, 821
Gurton, O. A. (Bowden, Dr. F. P., and) : Birth and Growth of the Explosion in Solids initiated by Impact, 348
Guy's Hospital Medical School : Appointment of G. E. H. Foxon to the University of London readership in biology, 51
  Appointment of James Whillis to the University of London chair of anatomy, 924

HABERMAN, Dr. Sol (Hill, Dr. Joseph M., and): Two Examples of Sera containing the Anti-*d* Agglutinin Predicted by Fisher and Race, 688
Haddow, T. D. : Awarded a Commonwealth Fund Fellowship, 1006
Haig-Brown, Roderick : A River Never Sleeps, *review* by Seton Gordon, 951
Hailey, Lord, and others : Colonial Administration by European Powers, 372
Haissinsky, M. : Isotope Exchange and Molecular Structure, 901
Halban, Dr. H., and others : Comparison of Cross-sections for the Capture of 220 and 900 keV. Neutrons, 727
Halberstadt, E. S., and others : Formation of Hydroxy Peroxides, 172
Haldane, J. B. S. : Science Advances, *review* by R. Brightman, 747
Hall, Noel : Industrial Co-operation, 571
Hall, Victor E., and others (edited by), Annual Review of Physiology, Vol. 9, *review* by Dr. O. A. Trowell, 542
Hamburger, Dr. Viktor : Embryology of Monsters, 88
Hamilton, Prof. Donald R., and others : Klystrons and Microwave Triodes, *review* by Prof. J. T. Randall, 952
Hamilton, J. E. : Effect of Present-day Whaling on the Stock of Whales, 913
Hamlin, H. W. : Appointed assistant conservator of forests, Tanganyika, 802
Hammond, Dr. John : Presented by the Netherlands Ambassador with the insignia of Commander in the Order of Orange-Nassau (Civilian Division), 307
Hanby, W. E., and others : Synthetic Polyglutamic Acid, 132
Hancock, J. L., and others : Ovarian Activity in the Pregnant Mare, 355
Hanson, A. H. : Appointed lecturer in the Departments of Social Studies and Extra-Mural Studies in the University of Leeds, 16
Hanson, Jean : Formation and Breakdown of Serpulid Tubes, 610
Harden, D. B. : Geographical Approach to the History of the British Isles, *review*, 746
Harding, J. R. : South African Museums Association—Annual General Meeting, 984
Hardy, Prof. G. H. : *Obituary*, 797
Hardy, J. K. : Promoted to the grade of Senior Principal Scientific Officer, 195
Hargreaves, Dr. A. : Structure and Properties of Metals, 264
Hargreaves, Dr. G. R. : Sociology of Mental Disease, 407
Harper, Dr. S. H. : Chemistry from the School to the University, *review*, 992
Harpum, J. R. : Appointed geologist, Tanganyika, 51
Harris, Betty M. B. : Material for Visual Education, *review* by Colonel Eric Lowe, 40
Harris, Dr. E. J., and Bishop, P. O. : Low-Frequency Noise from Thermionic Valves working under Amplifying Conditions, 971
Harris, G. C. M., and others : A Method for Estimating Percentage Germination of Fungal Spores, 642
Harris, G. W. : Electrical Stimulation of the Neurohypophysis in the Conscious Animal, 739
Harris, Prof. H. A. : Man's Organs of Speech, 628
Harris, J. I., and Work, T. S. : Synthetic Pentapeptides related to Gramicidin-*S*, 804
Harris, Dr. J. O., and Robson, A. H. : Structure of Urea, 98
Harris, Percy W. : Elected president of the Royal Photographic Society, 471
Harris, Dr. R. J. C., and Thomas, J. F. : Isolation and Separation of the Pyrimidine Nucleosides of Yeast Ribosenucleic Acid, 931
Harris, Prof. T. M. : Elected a Fellow of the Royal Society, 467
Harris, jun., William J. : Comparison of Metallographic and X-Ray Measurements of Retained Austenite, 315
Harrison, Dr. E. P. : *Obituary*, 963
Harrison, John A. : Appointed director of the Educational Foundation for Visual Aids, 802
Harrison, Dr. R. G. : Vascular Patterns in the Testis, with particular reference to *Macropus*, 399
Hartley, F. R., and Wylie, Dr. A. W. : Preparation of Rare-Earth Chlorides, 241
Hartley, Dr. G. S. : Appointed research manager of Pest Control, Ltd., 595
Hartley, Dr. Harold : Engineers and the Community, 1005
Hartley, K., and others : Bond-Strength of C—Cd in Cadmium Methyl and of C—I in Methyl Iodide, 725
Hartley, R. L. : Appointed agricultural education officer, Fiji, 637
Hartogh-Katz, S. Lore, and others : Isolation of a New Androstenol-3(α)-on-17 from the Urine of a Patient with Adrenal Cancer, 848
Hartree, Prof. D. R. : Calculating Machines, 712
Hartridge, Prof. H. : Retirement from the University of London chair of physiology at St. Bartholomew's Hospital Medical College, 49
  Appointed director of the Medical Research Council's Research Unit on the Physiology of Vision, 49 ; work of, 49
Hartshorn, Dr. L. : Scientific Radio, 793
Hartshorne, Dr. N. H. : A Simple Universal Model for Representing the Optic Orientation of Biaxial Crystals, 94
  Appointed lecturer in chemical microscopy in the University of Leeds, 307
Harvard University : Retirement of Dr. E. D. Merrill from the Arnold professorship of botany, 964
Harwood, A. F. (edited by) : British Bee Plants, 470
Haskell, Gordon : Corn (*Zea Mays* L.) in the United States, 42
Haslewood, Dr. G. A. D., and Wootton, Veryan : Bile Acids of the Whale, 356
Hassall, C. H. : Subtilin *C*, an Antibiotic Concentrate from *Bacillus subtilis*, 317
Hassid, Dr. W. Z., and others : Arsenolysis and Phosphorolysis of the Amylose and Amylopectin Fractions of Starch, 96
Hat and Allied Feltmakers' Research Association, British : Grant of £1,000 for research in the Textile Industries Department of the University of Leeds, 1006
Hausmann, W., and Smith, Dr. A. E. Wilder : Isomerization of Dienœstrol, 892
Havas, L. J., and Kahan, J. : Hormone-Mimetic and other Responses of the Silkworm (*Bombyx mori* L.) to some Polyploidogenic Agents, 570
Hawk, Dr. Philip B., and others : Practical Physiological Chemistry, twelfth edition, *review*, 830
Hawkes, Prof. C. F. C. : Archæology and the History of Europe, *review* by Miles Burkitt, 459
  Archæology and Society (Grahame Clark), second edition, *review*, 583
Hawkes, Dr. Leonard : Title of University of London professor of geology conferred on, 637
Hawking, Dr. Frank : Pre-erythrocytic Stage in Mammalian Malaria Parasites, 175
Hawkins, Prof. H. L. : *Obituary* of Sir Franklin Sibly, 672
Hawkins, R. D., and others : Effect of Thyroid Deficiency on the Level of Pseudo-Cholinesterase in the Plasma of Rats, 639
Hawkins, T. H. : A Handbook of Sociology (Prof. William F. Ogburn and Prof. Meyer F. Nimkoff), *review*, 188
  Industrial Co-operation, 571
  The Psychology of Industry (Prof. James Drever), second edition, *review*, 955
  The Right Way to Understand the Countryside (Stanley A. Manning), *review*, 995
Haworth, Sir Norman : Retirement from the Mason chair of chemistry in the University of Birmingham, 1007
Hay-Barclay, H. A. : Appointed regional assistant director of veterinary services, Nigeria, 802
Haywood, R. W. : The Electricity Grid in Great Britain, 822
  Fundamentals of Heat Engines, *review*, 829
Health Education, Central Council for : Summer School in Health Education, 842
Heard, Brian E. : Appointed an assistant lecturer in pathology in the University of Sheffield, 1007
Heath, Clark W., and others : What People Are, a Study of Normal Young Men, *review*, 502
Heath, D. F., and Linnett, Dr. J. W. : Interaction Terms in Molecular Vibrations, 243
  A Suggested New Force Field for Molecular Vibrations, 314
Heath, J., and others : New Formulation of D.D.T. with Selective Properties, 484
Heath, Dr. O. V. S. : Studies in Stomatal Action—Control of Stomatal Movement by a Reduction in the Normal Carbon Dioxide Content of the Air, 179
Heath, Dr. O. V. S., and Williams, Dr. W. T. : Studies in Stomatal Action—Adequacy of the Porometer in the Investigation of Stomatal Aperture, 178
Heathcote, J. G., and others : Action of Nitrogen Trichloride on Proteins—Production of Toxic Derivative, 126
Heatley, Dr. N. G. : The Assaying of Penicillin, 285, 286
Hecht, Prof. Selig : *Death* of, 303 ; *Obituary* by Dr. M. H. Pirenne, 673
Heenan, J. N. D. : Awarded the Medal of Freedom with Bronze Palm by the Government of the United States, 215
Hegner, Prof. Robert, assisted by Hegner, Jane Z. : Parade of the Animal Kingdom, *review* by Dr. Edward Hindle, 501

Heidmann, J. (Leprince-Ringuet, L., and) : Anomalous Distribution of Nuclear Disintegration in Photographic Emulsions Exposed to Cosmic Rays—Double Stars, 844
Heilbron, Sir Ian : Awarded the Medal of Freedom with Bronze Palm by the Government of the United States, 215
  The Role of Chemistry in combating Tropical Diseases, 956
Heitler, Prof. W. H. : Elected a Fellow of the Royal Society, 467
  Radiation Damping and Velocity of Light, 678
Helson, G. A. H., and others : Plant Virus Diseases, 945
Hematology, International Society of : Bi-annual Meeting in Buffalo, 636
Hemke, Prof. Paul E. : Elementary Applied Aerodynamics, *review*, 544
Hemphill, R. E. (Reiss, Dr. M., and) : Cholinesterase Activity in Cerebro-Spinal Fluid, 18
Henbest, Dr. H. B. : Elected to a Beit Fellowship for Scientific Research at the Imperial College of Science and Technology, 51
  Synthesis of Dehydro-β-Ionone, 481
Henderson, R. : Appointed agricultural officer, Malaya, 51
Hendrix, W. C., and others : The Earth's Main Magnetic Field and its Secular Change 1905–1945, 161
  Final Values of Elements of the Geomagnetic Field at 5-Degree Intervals of Latitude and Longitude, Epoch 1945, 161
Henkin, Dr. Leon A. : Awarded a Frank B. Jewett Fellowship for 1948–49 by the American Telephone and Telegraph Co., 429
Henrici, Dr. A. T. (the late) : Molds, Yeasts and Actinomycetes, second edition by Dr. Charles E. Skinner, Dr. Chester W. Emmons and Dr. Henry M. Tsuchiya, *review*, 40
Henriques, Dr. F. : Appointed lecturer in social anthropology in the University of Leeds, 1006
Herbstreit, Jack W., and Johler, Joseph R. : Frequency Variation of the Intensity of Cosmic Radio Noise, 515
Herman, L., and Herman, R. : Mechanism of the Emission Spectrum of Active Nitrogen, 1018
Herring, H. R. : Appointed senior assistant conservator of forests, Tanganyika, 637
Herring, Prof. P. T. : *Obituary* of Prof. E. Waymouth Reid, 591
  Retirement from the Chandos chair of physiology in the University of St. Andrews, 922 ; work of, 922
Herz, Dr. R. H. : Electron Tracks in Photographic Emulsions, 928
Herzberg, Prof. G., and Herzberg, L. : Production of Nitrogen Atoms in the Upper Atmosphere, 283
Herzberg, Prof. G., and Walker, G. R. : Initiation of High Explosives, 647
Hetherington, Sir Hector : Honorary degree of the University of Cambridge conferred on, 965
Hevesy, Prof. G. v. : Isotope Exchange and Molecular Structure, 901
Hewitt, Dr. E. J. : Trace Elements in Plant Physiology, 364
  Relation of Manganese and some other Metals to the Iron Status of Plants, 489
Hewitt, Dr. E. J. (Wallace, Prof. T., and) : Effects of Calcium Deficiency on Potato Sets in Acid Soils, 28
Hewson, Dr. E. Wendell, and Longley, Richard W. : Meteorology, Theoretical and Applied, *review* by Prof. P. A. Sheppard, 625
Hey, J. S. : Radio Noise, 795
Hey, R. W., and others : Cambridge Archæological Expedition to Cyrenaica, 327
Heymann, Prof. E. (Buchanan, A. S., and) : Electrokinetic Potential and Surface Structure of Barium Sulphate, 649, 691
Heywood, R. B. : Some Modern Applications of Photo-Elasticity, 329
Heyworth, G. : Rebuilding Europe's Fat Supplies, 123
Hickling, Dr. C. F. : Fish Farming in the Middle and Far East, 748
Hickling, Prof. H. G. A. : Retirement from the chair of geology at King's College, Newcastle-upon-Tyne, 1003 ; work of, 1003
Hickman, M. J. : Insulating Materials and Methods for Use at Low Temperatures, 323
Hicks, J. S., assisted by Francis, R. J. : Low-Pressure Laminating of Plastics, *review* by J. M. J. Estevez, 788
Hieger, Dr. I. : Progress of Cancer Research, 385
Higson, L. E. : The Place of the History of Science in Education, 572
Hilger, Ltd., Adam : Amalgamation with E. R. Watts and Son, Ltd., 345
Hill, Dr. Joseph M., and Haberman, Dr. Sol : Two Examples of Sera containing the Anti-*d* Agglutinin Predicted by Fisher and Race, 688
Hill, Air Chief Marshal Sir Roderic : Appointed rector of the Imperial College of Science and Technology, 471
Hill, R. D. (Martin, Dr. L. H., and): A Manual of Vacuum Practice, *review*, 665
Hill, Dr. W. C. Osman : An Undescribed Structure in the Rodent Rhinarium, 276
Himsworth, Prof. H. P. : *Obituary* of Dr. Charles Bolton, 86
  Appointed a member of the Medical Research Council, 390
Hindle, Dr. Edward : Animal Parade, *review*, 501
Hindley, H. Rostron : Use of 'Calyx' Burner to Determine Combustion Conditions, 395
Hird, Dr. Alan J. : Demonstration of the Heart Beat, 321
Hirst, Prof. E. L., and others : Separation and Identification of Methylated Sugars on the Paper Chromatogram, 720
Historical Association, and others : Discussion on the Place of the History of Science in Education, 347, 572
History of Science, British Society for the, and others : Discussion on the Place of the History of Science in Education, 347, 572
Hobson, P. T., and Osmond, W. P. : Ferro-magnetic Structure of Cold-Worked Austenitic Stainless Steels, 562
Hoch-Ligeti, Cornelia : Effect of Feeding 2-Acetaminofluorene on the Adreno-Gonadal System of Rats, 58
Hockenhull, Donald : Mustard-gas Mutation in *Aspergillus nidulans*, 100
Hodgkin, A. L. : Elected a Fellow of the Royal Society, 467
Hogarth, C. A. : Variation of Thermo-electric Power of Electronic Semi-Conductors with Vapour Pressure, 60
Högland, Hans : Foraminifera in the Gullmar Fjord and the Skagerak, 513
Hollingsworth, D. T. : Awarded a Page Prize for 1947 of the Institution of Electrical Engineers, 90
Hollingworth, Prof. J. : Electronics in Industry, *review*, 582
Holman, Ralph T. (Bergström, Prof. Sune, and) : Total Conjugation of Linoleic Acid in Oxidation with Lipoxidase, 55
Holman, W. I. M. (Dean, R. F. A., and) : Nicotinic Acid in Human Blood Cells at Birth, 439
Holmberg, Dr. C. G., and Laurell, C.-B. : Histaminolytic Activity of a Copper Protein in Serum, 236
Holmyard, Dr. E. J. : Training for Chemists, 31
  The Place of the History of Science in Education, 572
Homans, L. N. S., and others : Complexity of Fresh *Hevea* Latex, 177
Honeycombe, R. W. K., and Boas, Dr. W. : The Disordering of β-Brass by Cold Work, 612
Hooper, Dr. Cyril J. W. : Appointed editor and general secretary of the Society of Dyers and Colourists, 347
Hooper, F. C. : Industrial Co-operation, 571
Hopkins, Donald P. : Chemicals, Humus and the Soil, *review*, 39
Hopwood, Dr. A. Tindell : The Royal Academy, 1948, 876
Horkheimer, Max : Eclipse of Reason, *review* by A. D. R., 664
Horner, R. G., and Purslow, E. T. : Dependence of Anomaloscope Matching on Viewing-Distance or Field-Size, 484
Horney, Dr. Karen : Our Inner Conflicts, *review* by Dr. Clifford Allen, 830
Horsley, R. R. H. : Appointed inspector of mines, Malaya, 966
Horváth, Dr. J. I. : An Asymptotic Solution of the Fundamental Equation of the Statistical Atom Theory, 26
Hothersall, A. W. : Promoted to the grade of Senior Principal Scientific Officer, 195
Hough, J. M. : Interpretation of Data from Electrical Resistivity Geophysical Surveys, 812
Hough, L., and others : Separation and Identification of Methylated Sugars on the Paper Chromatogram, 720
Hough, Romeyn Beck : Handbook of the Trees of the Northern States and Canada East of the Rocky Mountains, *review* by Sir Edward Salisbury, 497
House of Commons : University Representation in the, 259 ; (O. Peake), 468 ; (Herbert Morrison), 468 ; (Chuter Ede), 468
Houstoun, Dr. R. A. : A Simple Way of Photographing Spectra, 973
Howard, Dr. H. W. : Chromosome Number of *Cardamine pratensis*, 277
Howarth, Frank : A Radioactive Local Anæsthetic, 857
Howe, G. Melvyn : Agro-Climatic Analogues, 983
Howells, Prof. William : Mankind So Far, *review*, 579
Howes, Frank : A Proposed Institute of Recorded Sound, 493
Howitt, Dr. F. O. : Bibliography of the Technical Literature on Silk, *review* by Prof. J. B. Speakman, 790
Hoyle, S. T. : Appointed senior agricultural officer, Lilongwe Experimental Station, Nyasaland, 471
Huang, K. C., and others : Pharmacology of Ch'ang Shan (*Dichroa febrifuga*), a Chinese Antimalarial Herb, 400
Hubbard, C. E. : The Study of Critical British Groups, 735
Hubinont, Dr. P. O.: Action of Heating on *Rh*-Positive Human Red Cells, 642
Huddleston, Sir Arthur : *Death* of, 303
Hudson, Dr. Douglas Rennie : Amalgamation of some Alloys of Gold, Silver and Copper, 288
  Mechanics of Packings of Granular Material, 512
Hugh-Jones, Dr. P. : Human Factors in Industry, 791
Hughes, Dr. E. B. : Cleaning and Sterilizing of Plant in the Food Industry, 1025
Hughes, Prof. E. D. : Appointed to the University of London chair of chemistry at University College, London, 430, 511 ; work of, 511
  Electronic Theory and Chemical Reactions (R. W. Stott), second edition, *review*, 503
Hughes, Prof. E. D., and others : Effect of Ionic Charges on the Energy and Entropy of Activation of Heterolytic Reactions, 480
  Fractional Distillation and its Application in the Concentration of the Heavy Isotopes of Oxygen and Hydrogen, 858
Hughes, Dr. L. E. C. : Radio Engineering (Dr. E. K. Sandeman), Vol. 1, *review*, 706
Human Relations, No. 1, 450
Humphrey, G. F., and Mann, Dr. T. : Citric Acid in Semen, 352
Hunter, R. B. : Awarded a Commonwealth Fund Fellowship, 1006
Huntley, H. E. : Production of Helium by Cosmic Rays, 356
Huntsman, Dr. A. G. : Salmon and Animal Migration, 300
Hurst, Dr. C. C. : *Obituary* by Prof. R. C. Punnett, 46
Huskins, Prof. C. Leonard : Chromosome Multiplication and Reduction in Somatic Tissues, 80
Hussein, F. : The Study of Critical British Groups, 735
  Chromosome Number of *Cardamine pratensis*, 1015
Hutchinson, A. O., and others : Effect of Under-nutrition and Alterations in Diet on the Choline Esterase Activity of Serum, 56
Hutchinson, Dr. John : Retirement from the Royal Botanic Gardens, Kew, 799
Hutchinson, Dr. J. B., and others : Action of Nitrogen Trichloride on Proteins—Production of Toxic Derivative, 126
Hutchinson, Dr. William C. : Appointed a lecturer in physiological chemistry in the University of Glasgow, 16
Hutson, L. R. : Appointed veterinary officer, Department of Science and Agriculture, Barbados, 802
Hutton, Prof. J. H. : Exhibition of Indian Art, 119
  Archéologie du Pacifique-nord (Dr. André Leroi-Gourhan), *review*, 545
Huxley, Dr. L. G. H. : A Survey of the Principles and Practice of Wave Guides, *review* by Dr. R. L. Smith-Rose, 334
  Electrons (+ and —), Protons, Photons, Neutrons, Mesotrons and Cosmic Rays (Robert Andrews Millikan), revised edition, *review*, 789
Hydromechanics Research Association, British : Formation of the, 230
Hylean Amazon, International Institute of the : Conference for the creation of an, 879

ILAND, C. N. : Effect of Antibacterial Analogues of Vitamin K on *M. tuberculosis*, 1010
Imms, Dr. A. D. : Biology of the Louse, *review*, 418
Imperial Chemical Industries, Ltd. : Research Fellowships in the University of Cambridge, 90
Imperial College of Science and Technology, London : Election of Viscount Falmouth as chairman, 17
  Title of University of London reader in surveying conferred on Alfred Stephenson, 51
  Election of H. B. Henbest to a Beit Fellowship for Scientific Research under Sir Ian Heilbron, 51
  Degree of D.Sc. of the University of London conferred on Sir Alfred Egerton, 347

  Appointment of Air Chief Marshal Sir Roderic Hill as rector, 471
  Summer School in Relaxation Methods, 717
  Appointment of Dr. Hugh Ford to the University of London readership in applied mechanics, 924
  Title of reader in biochemistry in the University of London conferred on Dr. H. W. Buston, 924
Imperial Institute : Exhibition of War Office Teaching Aids, 164
  Annual Report for 1947, 985
India, Government of : Creation of a Department of Scientific Research, 1004
Indian Research Fund Association : Report of the Scientific Advisory Board for 1946, 696
Indian Society for Quality Control : Formation of the, 595
Industrial Association of Wales and Monmouthshire (Industrial Research Committee of the Federation of British Industries and the) : Joint regional conference on Industry and Research in Wales, 233
Ing, Dr. H. R. (Barlow, Dr. R. B., and) : Curare-like Action of Polymethylene *bis*-Quaternary Ammonium Salts, 718
Ingold, Prof. C. K. : Isotope Exchange and the Mechanism of Heterolytic Substitution, 901
Ingold, Prof. C. K., and others : Effect of Ionic Charges on the Energy and Entropy of Activation of Heterolytic Reactions, 480
Ingold, Prof. C. T. : Mycological Education, 508
Ingram, G. B., and Southern, H. K. : Polarographic Determination of the Gamma-isomer of Benzene Hexachloride, 437
Innes, Roy : Science in Social Affairs, 69
International Advisory Committee for Radio: Conference at Stockholm, 695
International Chamber of Commerce : Brochure No. 123, Economic Conditions of Germany To-day and its International Repercussions, 659
International Council of Scientific Unions : Report of the Executive Committee, July 1947, 677
International Institute of the Hylean Amazon : Conference for the creation of an, 879
International Joint Committee on Rheology : First Meeting, 104
  Officers for the Year 1947–48, 104
International Journal of Opinion and Attitude Research, Vol. 1, 450
International Scientific Radio Union : Conference at Stockholm, 695
International Society of Hematology : Bi-annual Meeting in Buffalo, 636
International Society of Zootechny (Meeting of the Swiss Zootechnical Society to discuss the formation of an), 322
International Understanding, British Society for (Allied Circle, Amsterdam, and the) : Study Conference on the Overseas Territories of Western Europe, 843
International Union of Biological Sciences : Symposium on Trace Elements in Plant Physiology, 364
International Union of Crystallography : First General Assembly and International Congress, 124, 390, 801
  Appointment of a Provisional Executive Committee of the American Section, 801
International Wool Secretariat : Gift of £10,000 to the University of Leeds for equipment for the new Textile Laboratories, 305
Inventors, Society of (Birmingham Branch) ; Second Annual Exhibition, 1007
Irish Chemical Association : Summer School in Chemistry at University College, Dublin, 390
Iron and Steel Institute : Bessemer Gold Medal for 1948 awarded to W. J. Dawson, 512
  Sir Robert Hadfield Medal for 1948 awarded to A. Preece, 512
  Williams Prize for 1947 awarded to R. Fowler, 512
  Hatfield Memorial Lecture (Prof. Robert E. Mehl), 592
Iron and Steel Institute, and others : Symposium on Internal Stresses in Metals and Alloys, 70
Iron and Steel Research Association, British : To erect accommodation in Sheffield, 307
  Retirement of R. H. Myers as head of the Steelmaking Division, 595
  Appointment of Dr. A. H. Leckie as head of the Steelmaking Division, 595
Irvine, Dr. F. R. : *Obituary* of Dr. J. M. Dalziel, 920
Irving, H. : Appointed agricultural chemist, Nigeria, 471
Irving, Dr. H., and others : Reversion, a New Procedure in Absorptiometry, 805
Italian Centre for Research in Nuclear Studies : New high-altitude research laboratory on Monte Rosa, 254
Iversen, Dr. Simon : Awarded a Scholarship from the Lady Tata Memorial Fund, 966

JABLONS, Dr. Benjamin : A Vasodilator, Adrenolytic Substance in Aglomerular Fish Kidney, 100
Jacchia, Luigi (Campbell, Leon, and) : The Story of Variable Stars, *review* by H. S. J., 460
Jackson, Prof. Cecil : Relationship of Glioma to Encephalitis in the Domestic Fowl, and an Associated Parasitic Agent, 441
Jackson, J. A. D. : Appointed assistant conservator of forests, Nigeria, 51
Jackson, Prof. Willis, and Saxton, Dr. J. A. : Radio Physics, 795
Jacob, H. : A Planned Auxiliary Language, *review*, 665
Jacobsen, C. F., and Christensen, L. Korsgaard : Influence of Temperature on the Urea Denaturation of β-Lactoglobulin, 30
Jacoby, Dr. F., and Darke, S. J. : Animal Tissue Culture with a Synthetic Medium, 768
Jakus, M. A. (Engström, Dr. A., and) : Intracellular Determination of Protein by X-Ray Microspectrography, 168
Jamalainen, Prof. E. A. : Trace Elements in Plant Physiology, 365
James, Prof. Hubert M., and others (edited by) : Theory of Servomechanisms, *review* by Prof. A. Porter, 994
James, Walter H., and others : Elements of Mechanism, sixth edition, revised by Prof. Venton Levy Doughtie, *review* by F. G. W. Brown, 79
James, Dr. W. O. : Demonstration and Separation of Noradrenaline, Adrenaline and Methyladrenaline, 851
Jameson, Sir Wilson : Honorary degree of the University of Cambridge conferred on, 965
Jang, Dr. C. S., and others : Pharmacology of Ch'ang Shan (*Dichroa febrifuga*), a Chinese Antimalarial Herb, 400
Jánossy, Prof. L. : Cosmic Rays, *review* by Prof. T. G. Cowling, 785
Japan, National Research Council of : Observations during the Annular Eclipse of the Sun on May 8–9, 196, 389, 879
Jason, A. C. (George, Dr. E. P., and) : High Altitude Measurements on Cosmic Rays—Penetrating Cosmic Ray Showers, 248
Jeans, Sir James : The Growth of Physical Science, *review* by Prof. J. A. Crowther, 260
  Request by Prof. E. A. Milne for letters or papers by, 677
Jech, C. : Surface Radiography with Alpha Rays, 314
Jeffrey, Fred P., and others : The Artificial Insemination of Farm Animals, edited by Enos J. Perry, *review* by Dr. Arthur Walton, 831
Jellyman, P. E., and Milne, A. J. : A Large Field Compensator for Measurement of Birefringence, 477
Jenkins, C., and Foinette, E. H. : Chemistry for Schools, Part 3, *review* by Dr. S. H. Harper, 992
Jenkins, H. G. : Biological Applications of Ultra-violet and Infra-red Radiation, *review*, 542
Jenkins, James A. : Awarded a Frank B. Jewett Fellowship for 1948–49 by the American Telephone and Telegraph Co., 429
Jennergren, Carl Gustav : Band Spectrum of Aluminium Bromide, 315
Jensen, Aage Bohus : Animal Tissue Cells in Protein-Free Media, 273
Jensen, Robert, and others : A New Extraction Procedure for the Preparation of Heparin, 639
Jerusalem Historical and Philosophical Society, 124
Jewett, Dr. F. B. : The Future of Scientific Research in the Post-War World, 35
Jewkes, Prof. J. : Appointed professor of economic organisation in the University of Oxford, 966
Joekes, A. M., and others : Colonial Administration by European Powers, 372
Johler, Joseph R. (Herbstreit, Jack W., and) : Frequency Variation of the Intensity of Cosmic Radio Noise, 515
John, Dr. D. Dilwyn : Echinoderm Fauna of Australia, 32
  Appointed a deputy keeper in the Department of Zoology of the British Museum (Natural History), 270
  Appointed director of the National Museum of Wales, 840 ; work of, 840
Johns, D. L. : Appointed research officer (entomologist), Tanganyika, 51
Johnson and Sons, Ltd. : Universal and Comparator Test-papers for the Measurement of *p*H Values, 823
Johnson, Dr. P., and others : Ultracentrifugation and Electron Microscope Studies of Tissues of Inbred Strains of Mice, 759
Joliot-Curie, Mme. : Isotope Exchange and Molecular Structure, 901
Jones, Sir B. Melvill : Awarded the Medal of Freedom with Silver Palm by the Government of the United States, 215
  Awarded the Gold Medal of the Royal Aeronautical Society, 593
Jones, Elwyn, and Mitchell, Dugald : Spread of Detonation in High Explosives, 98
Jones, E. W. Knight : *Elminius modestus*, another Imported Pest of East Coast Oyster Beds, 201
Jones, G. Carleton : Awarded the Gold Medal of the Institution of Mining and Metallurgy, 923
Jones, G. I. : Dogon Personality, *review*, 622
  Divination in Dahomey, *review*, 663
Jones, Dr. G. O. : Annealing of Glass, 813
Jones, Dr. G. P. : Appointed professor of economics in the University of Sheffield, 553 ; work of, 553
Jones, Dr. J. K. N., and others : Separation and Identification of Methylated Sugars on the Paper Chromatogram, 720
Jones, Park J. : Petroleum Production, Vol. 3, Oil Production by Water, *review* by H. B. Milner, 666
Jones, Dr. T. I. : Scientific Radio, 793
Jones, T. J. : Electron Emission from Oxide-coated Cathodes under Electron Bombardment, 846
Jones, W. M., and Barer, Dr. Robert : Electron Microscopy of the Sarcolemma, 1012
Jones, W. R., and others : *Streptococcus fæcalis* in *E. histolytica* Infections, 936
Jongh, S. E. de (Gaarenstroom, J. H., and) : Contribution to the Knowledge of the Influences of Gonadotrophic and Sex Hormones on the Gonads of Rats, *review* by Prof. S. Zuckerman, 221
Jonxis, Dr. J. H. P. : Fœtal Hæmoglobin and Erythroblastosis, 850
Jordan, A. : Appointed honorary lecturer in clinical biochemistry in the University of Sheffield, 307
Jordan, Dr. D. O. : Awarded a Commonwealth Fund Fellowship, 1006
Jordan, Dr. D. O. (Gulland, the late Prof. J. Masson, and) : Structure of Yeast Ribonucleic Acid, 561
Jordan, J., and Bobtelsky, Dr. M. : *p*H of Trisodium Citrate Solutions stored under Customary Laboratory Conditions, 240
Jørgensen, Dr. Holger : Studies on the Nature of the Bromate Effect, 294
Josephy, E., and Radt, F. (edited by) : Elsevier's Encyclopædia of Organic Chemistry, Series 3, Carboisocyclic Condensed Compounds, Vol. 13, Tricyclic Compounds, *review* by Prof. J. W. Cook, 415
Joshi, A. B. (Ramanujam, Dr. S., and) : Chromosome Number of *Sesamum laciniatum* Klein, 99
Journal of the Institute of Navigation, No. 1, 389
Jowitt, Lord : Elected a member of the Athenæum under Rule II, 125
Joyner, L. P. (Fulton, Dr. J. D., and) : Natural Amœbic Infections in Laboratory Rodents, 66
Judge, Arthur W. : Modern Gas Turbines, *review* by E. G. Sterland, 910
Jurva, Dr. Risto : Appointed director of the Finnish Institute for the Exploration of the Sea, 347

KABDEBÓ, Dr. Helene (Bálint, Dr. Peter, and) : Premortal Increase in the Output of Sodium and Chlorine in Fasting Rats, 57
Kahan, J. (Havas, L. J., and) : Hormone-Mimetic and other Responses of the Silkworm (*Bombyx mori* L.) to some Polyploidogenic Agents, 570
Kahane, Dr. M. : Physiology and Biochemistry of Fats and Lipoids, 535

Karády, Dr. S., and Kovács, Dr. A. : An Adaptation Mechanism of the Organism to Damage—the Role of 'Resistine', 688

Karagounis, Prof. G. : Separation of Polar from Non-Polar Molecules, 855

Karplus, Robert : Awarded a Frank B. Jewett Fellowship for 1948–49 by the American Telephone and Telegraph Co., 429

Kassanis, B. (Bawden, Dr. F. C., and) : Plant Virus Diseases, 945

Kastler, Prof. A., and Montarnal, R. : Phase-Contrast in Polarized Light, 357

Kastner, L. J. : Appointed to the chair of mechanical engineering at University College, Swansea, 1004 ; work of, 1004

Katz, Dr. Joseph, and others : Arsenolysis and Phosphorolysis of the Amylose and Amylopectin Fractions of Starch, 96

Kaufman, H. S., and others : Structure of Cyclo-octatetraene, 165

Kayas, G. (Süe, P., and) : The Behaviour of some perfect Cobalt Complexes in Szilard-Chalmers Reactions, 901

Keaney, George A. : Awarded an American Association for the Advancement of Science—George Westinghouse Science Writing Award for 1947, 125

Keen, R. : Wireless Direction Finding, fourth edition, *review* by Dr. R. L. Smith-Rose, 375

Keesing, Prof. Felix M. : Native Peoples of the Pacific World, *review* by M. C. B., 419

Kekwick, Dr. R. A. (Gray, C. H., and) : Bilirubin-Serum Protein Complexes and the van den Bergh Reaction, 274

Kelemen, Dr. Andrew : Awarded a grant from the Lady Tata Memorial Fund, 966

Kellogg, Dr. A. Remington : Appointed director of the U.S. National Museum, 965

Kemp, Philip : Alternating Current Electrical Engineering, seventh edition, *review* by J. G., 297

Kempster, J. W. : Our Rivers, *review* by Dr. A. T. Doodson, 911

Kench, Dr. J. E., and others : Choleglobin Formation in the Erythrocyte, 607

Kendall, David G. : Oscillatory Time-Series, *review*, 187

Kendall, J. T., and Yeo, D. : Magnetic Susceptibility of Mica, 476

Kendall, Maurice G. : Contributions to the Study of Oscillatory Time-Series, *review* by David G. Kendall, 187
  Sequential Analysis (Prof. Abraham Wald), *review*, 790

Keneford, J. R., and others : Cinnoline Derivatives as Chemotherapeutic Agents for *Trypanosoma congolense* Infections, 603, 758

Kennard, E. H. (Richtmyer, F. K., and) : Introduction to Modern Physics, fourth edition, *review* by Prof. L. F. Bates, 912

Kennedy, J. W., and others : Kinetic Studies on Isotopic Exchange Reactions, 901

Kenney, John F. : Mathematics of Statistics, Part 1, second edition, *review* by P. A. Moran, 544

Kenney, R. A., and others : Effect of Renin on Pulmonary Artery Pressure, 893

Kensler, Dr. C. J., and others : Nutrition in relation to Cancer, 106

Kent, Dr. P. W., and others : Conversion of *D*-Arabinose into 2-Deoxy *D*-Ribose and 3-Deoxy *D*-Xylose, 21

Kent-Jones, Dr. D. W., and Amos, Dr. A. J. : Modern Cereal Chemistry, fourth edition, *review* by A. L. Bacharach, 293

Keogh, Dr. E. V., and others : Adsorption of Bacterial Polysaccharides to Erythrocytes, 687

Kerkham, R. K. : Appointed senior agricultural officer, Uganda, 966

Kerkkonen, Heikki K. (Virtanen, Prof. Artturi I., and) : Structure of Plasteins, 888

Kermode, C. W. D. : Appointed assistant conservator of forests, Tanganyika, 637

Keyston, Dr. J. E. : Appointed research secretary to the Central African Council, 230
  Awarded the Medal of Freedom with Bronze Palm by the Government of the United States, 390

Keyworth, Dr. W. G. : Mycological Education, 507

Khanna, Nandoomal (Campbell, Dr. Neil, and) : Reduction of 1 : 4-Diketones, 54

Khorana, H. G., and others : The Melanin Problem—a Synthesis of 5 : 6-Dihydroxyindole, 525

Kidder, George W., and others : Nutrition in relation to Cancer, 106

Kidson, Dr. Edward : Meteorology of the Australasian Antarctic Expedition, 1911–14 (Scientific Reports, Series B; Vol. 7), 709

Kieffer, F., and others : Isotopic Exchange Reactions and Electronic Structure of Substituted Aromatic Hydrocarbons, 901

Kieser, Margaret E., and others : Effect of Ion-Exchange Treatment on the Stability of Apple Juice, 1023

Kimmins, Dr. C. W. : *Death* of, 122, 230

King, H.M. the : Birthday Honours List, 963

King, Dr. Alexander : Awarded the Medal of Freedom with Silver Palm by the Government of the United States, 215
  Operational Research in Government Departments, 585

King, Dr. Basil C. : Appointed lecturer in geology in the University of Glasgow, 16

King, Charles Glen, and others : Nutrition in relation to Cancer, 106

King, E. Bolton : Appointed director of the Science Department of the British Council, 674 ; work of, 674

King, Dr. H. K. : Enzymes in Bacteria, *review*, 78

King, J. M. B. : Mycological Education, 507
  Awarded an Agricultural Research Council Postgraduate Scholarship, 16

King, R., and others : Mechanical Behaviour of Crystal Boundaries in Metals, 682

King's College, London : Appointment of Dr. H. E. Rose to the University of London readership in mechanical engineering, 637

King's College, Newcastle-upon-Tyne : Post-graduate course in Chemical Engineering, 965
  Fuel Technology course, 965
  Retirement of Prof. H. G. A. Hickling from the chair of geology, 1003
  Appointment of Dr. T. S. Westoll to the chair of geology, 1003

Kipps, A., and others : Isolation in Chick Embryos of a Filtrable Agent possibly related etiologically to Lumpy Skin Disease of Cattle, 526

Kirk, J. A. : Awarded a Branch Prize of the Royal Aeronautical Society, 593

Kirk, R. : Extermination of *Aedes aegypti* in Khartoum, 139

Kirkbride, Chalmer G. : Chemical Engineering Fundamentals, *review* by Prof. H. E. Watson, 911

Lawrence, Dr. A. S. C. : War-time Rheological Investigations for the British Armed Services, 252
Lawrence, Prof. E. O. : Elected an honorary fellow of the Physical Society, 843
Lawrence, Peter : A Study of Japanese Culture, *review*, 77
Lawson, Dr. Robert W. : Blinking, its Role in Physical Measurements, 154
Lawson, Wilfrid : Title of reader in biochemistry in the University of London conferred on, 924
Lay, A. W. : Use of High-frequency Current in Surgery, 167
Le Breton, E. : Physiology and Biochemistry of Fats and Lipoids, 534, 535
Le Rütte, W. A. : Chromatic Aberration of Electrostatic Lenses, 392
Lea, Charles : Awarded the Medal of Freedom with Bronze Palm by the Government of the United States, 215
Leach, Dr. E. R. : Political Testament of an Anthropologist, *review*, 457
Leach, E. W. : Appointed director of agriculture, Trinidad, 637
Leaf, George : Appointed a lecturer in physiological chemistry in the University of Glasgow, 16
Leah, Dr. A. S., and David, Prof. W. T. : A Bunsen Flame as a Column of Luminous Gas, 524
Leckie, Dr. A. H. : Appointed head of the Steelmaking Division of the British Iron and Steel Research Association, 595
Lees, Dr. G. M. : Elected a Fellow of the Royal Society, 467
Lees, Dr. Howard, and Meiklejohn, Jane : Trace Elements and Nitrification, 398
Lees, Rev. John : Feeding Times of British Birds, 802
Lehany, F. J., and Yabsley, D. E. : A Solar Noise Outburst at 600 Mc./s. and 1200 Mc./s., 645
Leicester City Boys' School : Conference on Written Expression in Science, 533
Leigh, J. : Scientific Management, *review*, 910
Leighton, Dr. A. H. : The Governing of Men, 578
Leighton, Dorothea (Kluckhohn, Clyde, and) : The Navaho, *review* by Dr. G. H. S. Bushnell, 545
Lemberg, R., and Foulkes, E. C. : Reaction between Catalase and Hydrogen Peroxide, 131
Lenard, Prof. P. : *Addendum* to *obituary* of (Prof. E. N. da C. Andrade), 48
Leprince-Ringuet, L., and Heidmann, J. : Anomalous Distribution of Nuclear Disintegration in Photographic Emulsions Exposed to Cosmic Rays—Double Stars, 844
Leroi-Gourhan, Dr. André : Archéologie du Pacifique-nord, *review* by Prof. J. H. Hutton, 545
Lesnick, Robert, and others : Servo-mechanism Fundamentals, *review*, 294
Lester-Smith, Dr. E. : The Assaying of Penicillin, 285, 286
Purification of Anti-pernicious Anæmia Factors from Liver, 638, 676
Lester-Smith, Dr. E., and others : Studies with Radioactive Penicillin, 1009
Lett, Sir Hugh : Honorary degree of the University of Cambridge conferred on, 965
Lewis, D. : Awarded an Agricultural Research Council Postgraduate Scholarship, 16
Lewis, G. M. : Appointed a lecturer in natural philosophy in the University of Glasgow, 16
Lewis, S. E. : Inhibition of SH Enzymes by Methyl Bromide, 692
Lewis, Prof. W. C. McC. : Retirement from the Grant-Brunner chair of inorganic and physical chemistry in the University of Liverpool, 756 ; work of, 756
Lewis, Wilmarth S. : The Yale Collections, *review* by Dr. L. Harrison Matthews, 79
Lewis, W. V. : The Flow of Glaciers, 820
Li, T. T., and Perkins, D. H. : Anomalous Distribution of Nuclear Disintegration in Photographic Emulsions Exposed to Cosmic Rays—Double Stars, 844
Library, National Central : To compile a Union Catalogue of German Books and Periodicals, 1006
Library Association : First meeting of the Medical Sub-section, 90
Liempt, Dr. J. A. M. van : Brightness of the New Moon, 27
Liesegang, Prof. R. E. : *Obituary* by Prof. E. K. Rideal, 230
Lilongwe Experimental Station, Nyasaland : Appointment of S. T. Hoyle as senior agricultural officer, 471
Lima, Dr. Octavio Rodrigues, and Pereira, Dr. Oswaldo Geili : Pregnancy Test using the Male Toad, 676
Lincoln College, Oxford : Gift of £50,000 from Lord Nuffield for research fellowships in science and allied medicine, 16
Lindahl, Per Eric : Principle of a Counter-streaming Centrifuge for the Separation of Particles of Different Sizes, 648
Lindsay, J. K. : Consolidated Gold Fields of South Africa, Ltd. Gold Medal awarded jointly to Dr. Anthony Caplan and, 924
Linnean Society of London : Award of the Trail Award and Medal for 1942 to Dr. Honor B. Fell, 51, 882
Award of the Trail Award and Medal for 1947 to Dr. C. D. Darlington, 51, 882
Linnean Gold Medal for 1948 awarded to Dr. Agnes Arber, 272, 882
Synopses of the British Fauna, 594
Anniversary Meeting, 882
Election of officers for 1948–49, 882
Discussion on Orientation of Birds on Migratory and Homing Flights, 996
Linnett, Dr. J. W. (Heath, D. F., and) : Interaction Terms in Molecular Vibrations, 243
A Suggested New Force Field for Molecular Vibrations, 314
Linnett, Dr. J. W., and Wheatley, P. J. : A Correlation between Molecular Vibrations and Bond-forming Orbitals, 971
Linton, Prof. Ralph : The Cultural Background of Personality, *review* by Prof. T. H. Pear, 622
Lipson, Dr. H. : Structure and Physical Properties of Metals, 263
Lister, John : *Obituary*, 194
Little, W. J. C. : Appointed agricultural officer, Nigeria, 51
Liu, Y. H., and others : Stressed Aluminium, 681
Livingston, Prof. Burton E. : *Death* of, 230
Livingstone, Sir Richard : Honorary degree of the University of Cambridge conferred on, 965
Llewellyn, Dr. D. R., and others : Fractional Distillation and its Application in the Concentration of the Heavy Isotopes of Oxygen and Hydrogen, 858
Lloyd, Major-General Cyril : The Present Outlook in Army Education, 262
Lloyd, Dr. Ll. : Biological Aspects of Water Pollution, 876
Local Government Boundary Commission : Second Annual Report, 825
Lock, G. W. : Appointed senior research officer, Tanganyika, 802
Lockley, R. M. : Letters from Skokholm, *review* by Frances Pitt, 5
Lockyer (Norman) Observatory : Transfer to the University College of the South-West, Exeter, 15, 861
Lodge, A. S. : Capture of Negative Mesons by Nuclei, 809
Lodge, Prof. R. C. : Plato's Theory of Education, *review*, 376
Löhnis, Dr. Marie P. : Trace Elements in Plant Physiology, 365
London Passenger Transport Board : Fourteenth Annual Report, 942
Long Ashton Research Station : Annual Report for 1946, 862
Longley, Richard W. (Hewson, Dr. E. Wendell, and) : Meteorology, Theoretical and Applied, *review* by Prof. P. A. Sheppard, 625
Longuet-Higgins, M. S. (Barber, N., and) : Water Movements and Earth Currents—Electrical and Magnetic Effects, 192
Loring, Hubert S., and others (edited by) : Annual Review of Biochemistry, Vol. 16, *review*, 870
Loubser, J. H. N. (Bleaney, Dr. B., and) : Collision Broadening of the Ammonia Inversion Spectrum at High Pressures, 522
Loughnane, J. B., and others : Transmission of a Disease Resembling Virus Yellows through the 'Seed' of Sugar Beet, 28
Lourie, Dr. E. M., and others : Cinnoline Derivatives as Chemotherapeutic Agents for *Trypanosoma congolense* Infections, 603, 758
Lourie, Dr. E. M. (Williamson, J., and): 'Melarsen' and 'Melarsen Oxide', 103
Lousley, J. E. : Critical British Groups of Flowering Plants, 733
Lovell, Dr. A. C. B. : Combined Radar, Photographic and Visual Observations of the Perseid Meteor Shower of 1947, 280
Scientific Radio, 794
Lovell, Dr. Bernard (edited by) : Electronics and their Application in Industry and Research, *review* by Dr. T. E. Allibone, 702
Lowe, Lieut.-Colonel Eric : Material for Visual Education (Betty M. B. Harris), *review*, 40
Citizenship and Current Affairs in Army Education, 444
Audiovisual Aids in the U.S. Armed Forces, *review*, 745
An Introduction to Filmstrips (H. R. and I. W. Dance), *review*, 830
Local Government and the Citizen, *review*, 870
Lowe, Willoughby P. : The End of the Trail, *review* by Frances Pitt, 222
Lowenstein, Dr. Otto : Oscillographic Analysis of the Non-Acoustic Functions of the Vertebrate Ear, 652
Luck, J. Murray, and others (edited by) : Annual Review of Biochemistry, Vol. 16, *review*, 870
Luckiesh, Dr. Matthew : Light, Vision and Seeing, fourth printing, *review* by Dr. R. W. Pickford, 40
Applications of Germicidal, Erythemal and Infra-red Energy, *review* by H. G. Jenkins, 542
Lundegårdh, Prof. : Interaction of Water and Porous Materials, 630
Lundy Field Society : First Annual Report, 345
Luttinger, Dr. Joaquin M. : Awarded a Frank B. Jewett Fellowship for 1948–49 by the American Telephone and Telegraph Co., 429
Lynch, Dr. G. Roche : Elected president of the Royal Institute of Chemistry, 716
Lynn-Allen, E. (Brown, P. E., and) : Breeding of Avocets in Britain, 271
Lysgaard, L. : Recent Climatic Fluctuations, 442

MCARDLE, Dr. B. : Water Requirements under Desert Conditions, *review*, 744
Macaulay, J. W. : Appointed senior veterinary research officer, Northern Rhodesia, 802
Macbeath, A. M. : Awarded a Commonwealth Fund Fellowship, 1006
McBryde, Felix Webster : Cultural and Historical Geography of Southwest Guatemala, 697
McBurney, C. B. M., and others : Cambridge Archæological Expedition to Cyrenaica, 327
Maccabæans, Society of : Meldola Medal for 1947 awarded to Dr. J. Baddiley, 715
McCallum, A. M. : Awarded an Agricultural Research Council Postgraduate Scholarship, 16
McCance, Prof. R. A. : Elected a Fellow of the Royal Society, 467
McCance, Prof. R. A., and others : Effect of Under-nutrition and Alterations in Diet on the Choline Esterase Activity of Serum, 56
Maccoll, Allan (Craig, D. P., and) : The Non-Benzenoid Aromatic Hydrocarbon Pentalene, 481
MacCurdy, Prof. G. C. : *Obituary* by Prof. D. A. E. Garrod, 47
McCusker, C. B. A. : Apparent Emission of Positive Electrons from β-Emitters, 564
MacDonald, Dr. D. K. C. : Radio Noise, 794
MacDonald, Dr. D. K. C., and Mendelssohn, Dr. K. : Electrical Resistivity of Alkali Metals below 20° K., 972

Mace, Prof. C. A. : Incentives in Industry, 429
Macelwane, Rev. James B. : When the Earth Quakes, *review* by Lieut.-Colonel E. Tillotson, 459
McFarlane, Dr. A. S. (Dawson, Dr. I. M., and) : Structure of an Animal Virus, 464
Macfarlane, Dr. G. G. : Meteorological Factors in Radio-Wave Propagation, 146
McGaughey, C. A., and Sellers, K. C. : Microflora of the Rumen, 1014
Macgregor, A. G. : Appointed research assistant in the Department of Pharmacology and Therapeutics in the University of Sheffield, 471
MacGregor, J. J. : Forest Valuation (Prof. Herman H. Chapman and Prof. Walter H. Meyer), *review*, 831
Macheboeuf, Prof. M. : Physiology and Biochemistry of Fats and Lipoids, 534
McIntosh, A. E. S. : Appointed deputy director of agriculture, Federation of Malaya, 802
McIntosh, Prof. James : *Obituary* by Prof. E. C. Dodds, 713
MacIver, Prof. R. M. : The Web of Government, 579
Mackay, Dr. Ian F. S. : Demonstration of the Heart Beat, 771
Mackay, Margaret E., and Maycock, W. d'A. : Sodium Citrate Concentration in Ether-extracted Plasma, 235
McKay, R., and others : Transmission of a Disease Resembling Virus Yellows through the 'Seed' of Sugar Beet, 28
MacKenna, Dr. R. M. B. : Modern Trends in Dermatology, *review* by Dr. James Marshall, 788
MacKenzie, A. F. : Appointed senior agricultural officer, Sierra Leone, 51
McKerrow, W. S. : To receive an Award from the Daniel-Pidgeon Fund of the Geological Society of London, 1007
McKinley, Dr. D. W. R., and others : Combined Radar, Photographic and Visual Observations of the Perseid Meteor Shower of 1947, 278
Mackinney, Gordon, and others (edited by) : Annual Review of Biochemistry, Vol. 16, *review*, 870
McLean, Prof. Franklin C., and others : Failure of Sulphanilamide to Inhibit Calcification of Bone, 273
McLean, Dr. R. C., and Cook, Dr. W. R. Ivimey : Practical Field Ecology, 158
MacLellan, G. D. S. : Awarded a Commonwealth Fund Fellowship, 1006
Macmillan, R. H. : British Rocket Weapons Research, 329
  London's Transport System, 942
Macnab, Gwen M. : A Polysaccharide from Hydatid Cyst Fluid, 310
MacNair, A. J. : Appointed temporary agricultural (cocoa survey) officer, Gold Coast, 802
MacNalty, Sir Arthur : Local Government, *review* by Lieut.-Colonel Eric Lowe, 870
  Obituary of Sir George Newman, 1001
MacNeice, G. G. (Elliott, A., and) : Transmission of the Atmosphere in the 1-5 Micron Region, 516
McNeil, Dr. D. : Elected director of research at the Coal Tar Research Association, 757 ; work of, 757
Macpherson, D. F. : Appointed chief veterinary officer, Nyasaland, 471
Macpherson, Sir John : Development and Welfare in the West Indies, 181
Maddock, Dr. A. G. : Determination of Radioactive and Stable Tracer Isotopes, 693
Maeder, R., and Miescher, Prof. E. : Absorption Band Spectrum of S_2 in the Schumann Region, 393
Mahalanobis, Prof. P. C. : Scientific Research in India, 513
Mahler, Dr. K. : Elected a Fellow of the Royal Society, 467
Majumdar, R. C., and Gupta, Dr. S. : The Meson Field and the Equation of Motion of a Spinning Particle, 410
Majumdar, Prof. Subodh Kumar : Magnetic Susceptibility of Borax Glasses containing Crystallites of Alkali Metal Salts, Gold and Platinum, 684
Makar, R., and others : An Electrolytic Tank for Exploring Potential Field Distributions, 845
Maley, L. (Mellor, Dr. D. P., and): Order of Stability of Metal Complexes, 436
Malinowski, Bronislaw : Freedom and Civilization, *review* by Dr. E. R. Leach, 457
Management, British Institute of : Presidential Address (Sir Charles Renold), 675
Manchester College of Technology : Summer School in X-Ray Crystallography, 555
Manchester Joint Research Council : Election of Sir Raymond Streat as chairman, 272
  Election of Sir Charles Renold as honorary treasurer, 272
Manley, Gordon : Appointed to the University of London chair of geography at Bedford College, 430, 511 ; work of, 511
Manley, R. O. B. : Honey Farming, *review* by Dr. C. G. Butler, 544
Mann, Dr. T. (Humphrey, G. F., and) : Citric Acid in Semen, 352
Manning, Kenneth V., and others : College Technical Physics, *review* by S. Weintroub, 954
Manning, Stanley A. : The Right Way to Understand the Countryside, *review* by T. H. Hawkins, 995
Manning, Thomas H. : Awarded the Patron's Medal for 1948 of the Royal Geographical Society, 553
Manton, Prof. I. : Origins of Species and Migrations of Floras, *review*, 455
Manton, Dr. Sidnie M. : Elected a Fellow of the Royal Society, 467
Mardles, Dr. E. W. J. : War-time Rheological Investigations for the British Armed Services, 252
Mariani, Prof. Jean : Théorie des champs macroscopiques, 450
Mark, Prof. H., and others : Structure of Cyclo-octatetræne, 165
Markham, Dr. Roy, and others : Molecular Arrangement in Tobacco Necrosis Virus Crystals, 760
Markham, Dr. Roy (Cosslett, Dr. V. E., and) : Structure of Turnip Yellow Mosaic Virus Crystals in the Electron Microscope, 250
Marlow, G. S. W. : *Death* of, 387 ; *obituary* by Prof. Eric K. Rideal and F. I. G. Rawlins, 672
Marsh, Arnold : Smoke, *review* by F. I. G. Rawlins, 706
Marshall, Alan J. : Awarded the Back Grant for 1948 of the Royal Geographical Society, 553
Marshall, Dr. F. H. A. : Recent Advances in Sex and Reproductive Physiology (Dr. J. M. Robson), third edition, *review*, 790
  Internal Secretion, *review*, 953
Marshall, Dr. James : Dermatology, *review*, 788
Marshall, Dr. John : *Death* of, 122
Marshall, P. B. (Albert, Dr. Adrien, and) : Absence of Correlation between Respiratory Inhibition of Plasmodia by Acridines and Antimalarial Action, 1008
Marshall, Prof. T. H. : Science in Social Affairs, 69
Martin, Daniel : Appointed a lecturer in mathematics in the University of Glasgow, 16
Martin, D. D., and others : *p*-Aminosalicylic Acid in the Treatment of Tuberculosis, 435
Martin, G. R. : Modern Inorganic Chemistry, *review*, 335
Martin, Dr. L. H., and Hill, R. D. : A Manual of Vacuum Practice, *review*, 665
Martin, Paul S., and others : Indians before Columbus, *review* by Dr. G. H. S. Bushnell, 501
Martin, Dr. S. R. W. : Synthetic Resin Chemistry, *review* by Dr. P. D. Ritchie, 502
Martingell, S. E., and others : Meteor Whistles, 478
Masaryk, Dr. Jan : *Death* of, 427
Mason, I. L. : International Meeting on Animal Production, 322
Mason, R. R. : Appointed agricultural officer, Fiji, 51
Mass-Observation : Peace and the Public, 415
Massachusetts Institute of Technology : Summer Scholarships for European Students, 593, *erratum*, 637
Massachusetts Institute of Technology, and others : Conference on Mechanical Wear, 758
Massey, Y. : The Study of Critical British Groups, 735
Mather, Dr. K. : Significance of Nuclear Change in Differentiation, 872
  Appointed to the chair of genetics in the University of Birmingham, 1007
Matoltsy, A. G. : Electron Microscope Observation of Renosine, 353
Matson, Leslie E., and others : Servo-mechanism Fundamentals, *review*, 294
Mattauch, J. : Nuclear Physics Tables ; and An Introduction to Nuclear Physics, by S. Fluegge, *review* by Sir John Cockcroft, 418
Matthews : Textile Fibers, fifth edition, edited by Herbert R. Mauersberger, *review* by Dr. C. S. Whewell, 581
Matthews, Dr. L. Harrison : They Live in the Sea (Douglas P. Wilson), *review*, 40
  The Yale Collections (Wilmarth S. Lewis), *review*, 79
  The Swimming of Dolphins, 731
Matthews, R. E. F. : Plant Virus Proteins and Antibody-Antigen Reactions, 611
Matthias, Bernd T. : Dielectric Constant and Piezo-Electric Resonance of Barium Titanate Crystals, 325
Maude, John : The New Courageous, 414
Maupoil, Bernard : La Géomancie à l'ancienne Côte des Esclaves, *review* by G. I. Jones, 663
Maurice, D. (Drewe, E. C., and) : Solar Noise, 167
Mawson, C. A. : Honeydew on Lime Trees, 176
Maxted, Dr. E. B. : Modern Advances in Inorganic Chemistry, *review* by G. R. Martin, 335
Maxted, Dr. E. B., and others : Catalytic Poisons and Magnetic Susceptibility, 804
May, S., and others : Isotope Exchange and Molecular Structure, 901
Maycock, W. d'A. (Mackay, Margaret E., and) : Sodium Citrate Concentration in Ether-extracted Plasma, 235
Maynard, G., and Westlake, Aubrey T. : Mr. E. Westlake and the Geology of the Cantal Region, Central France, 485
Mayr, Ernst : Birds of the Southwest Pacific, *review* by Frances Pitt, 545
Meakins, R. J. (Dryden, J. S., and) : Treatment of Glass and Steatite Ceramic with Quaternary Ammonium Compounds for the Improvement of Electrical Insulation Resistance, 23
Mechanical Engineers, Institution of : Thomas Hawksley Lecture (Sir Alwyn Crow), 329
  Clayton Prize for 1947 awarded in two equal moieties to J. E. Sears and T. E. Beacham, 470
  Clayton Fellowships for 1948, 470
Mechanical Engineers, Institution of, and others : Symposium on Internal Stresses in Metals and Alloys, 70
Medical Association, British : First Annual Scientific Meeting since the War, 842
Medical Research Committee, Colonial : Second Annual Report, 143
Medical Research Council : Appointment of Prof. H. P. Himsworth as a member, 390
  Report for the Years 1939–45, Medical Research in War, 998
Medicine, Royal Society of, and the Scientific Film Association : Catalogue of Medical Films, 594
Meek, J. H. : Triple Splitting of Ionospheric Rays, 597
Mehl, Prof. Robert E. : Hatfield Memorial Lecture of the Iron and Steel Institute, 592 ; work of, 592
Mehrotra, B. C. : Volumetric Estimation of Thallium, 242
Mehrotra, R. C. : A New Dry Test for Gold, 321
Mehta, Rai Bahadur K. C. : Awarded the Barclay Memorial Medal of the Royal Asiatic Society of Bengal, 553
Meiklejohn, Jane (Lees, Dr. Howard, and) : Trace Elements and Nitrification, 398
Meinesz, Prof. Felix Andries Vening : Awarded the Agassiz Gold Medal and Honorarium for 1947 of the U.S. National Academy of Sciences, 861
Melchers, W. J., en Gerritsen, H. J. : Koper als onmisbaar element voor plant en dier, *review*, 624
Mellanby, Sir Edward : Sir Frederick Gowland Hopkins Memorial Lecture of the Chemical Society, 164
  Awarded the Medal of Freedom with Silver Palm by the Government of the United States, 215
Mellon Institute of Industrial Research : Establishment of a Department of Research in Physical Chemistry, 89
Mellor, Dr. D. P., and Maley, L. : Order of Stability of Metal Complexes, 436
Melville, Prof. H. W. : Appointed to the Mason chair of chemistry in the University of Birmingham, 1007
Melville, Prof. H. W., and Youngson, G. W. : Branched-Chain High Polymers, 803
Mendel, Prof. B., and others : Effect of Thyroid Deficiency on the Level of Pseudo-Cholinesterase in the Plasma of Rats, 639
Mendelssohn, Dr. K. : Low-Temperature Physics, 732
Mendelssohn, Dr. K. (MacDonald, Dr. D. K. C., and) : Electrical Resistivity of Alkali Metals below 20° K., 972
Mental Health, National Association for : Conference on Sociology of Mental Disease, 407
Menzel, Dr. Donald H., and Salisbury, Winfield W. : Audio-Frequency Radio Waves from the Sun, 91

Menzies, Gordon : Appointed director of administrative services of U.N.E.S.C.O., 304
Meredith, R. : Relaxation and Flow in Cellulose Fibres, 737
Méring, J. (Brindley, Dr. G. W., and) : Theory of the Structure of Clay Minerals—Banded X-Ray Reflexions from Clay Minerals, 774
Merrill, Allyne L., and others : Elements of Mechanism, sixth edition revised by Prof. Venton Levy Doughtie, *review* by F. G. W. Brown, 79
Merrill, Prof. E. D. : Discovery of a Living *Metasequoia* in China, 594
  Retirement from the Arnold professorship of botany at Harvard University, 964 ; work of, 964
Merriman, Dr. A. D. : Appointed registrar-secretary of the Institution of Metallurgists, 674 ; work of, 674
Metallurgists, Institution of : Appointment of Dr. A. D. Merriman as registrar-secretary, 674
Metals, Institute of : Election of Fellows and Honorary Members, 16
  Platinum Medal for 1948 awarded to Dr. Robert Crooks Stanley, 344
  Offer from Capper, Pass and Son, Ltd., of awards for papers on metallurgy, 347
  Past and Future of the, 468
  Election of Sir Arthur Smout as president, 468
Metals, Institute of, and others : Symposium on Internal Stresses in Metals and Alloys, 70
  Discussion on the Flow of Glaciers, 819
Meteorological Society, Royal : Election of officers, 197
Meyer, Prof. Walter H. (Chapman, Prof. Herman H., and) : Forest Valuation, *review* by J. J. MacGregor, 831
Miall, Dr. Stephen : *Obituary* by A. L. B. and P. J. V., 47
Michelson, A. M., and others : Synthesis of Adenosine Triphosphate, 761
Microbiological Research Institute, Colonial : Opening of the, 675
Middlesex Hospital Medical School : Title of professor of biology in the University of London conferred on Dr. J. H. Woodger, 51
  Title of reader in biochemistry in the University of London conferred on Wilfrid Lawson, 924
Mider, Dr. G. Burroughs, and others : Nutrition in relation to Cancer, 106
Miescher, Prof. E. (Maeder, R., and) : Absorption Band Spectrum of S_2 in the Schumann Region, 393
Miles, Dr. A. A. : The Assaying of Penicillin, 287
Miles, J. A. R., and Stoker, M. G. P. : Puffinosis, a Virus Epizootic of the Manx Shearwater (*Puffinus p. puffinus*), 1016
Miles, M. K. : Organisation, Meteorology and Weather Prediction, *review*, 540
Miller, D. H., and others : Effect of Renin on Pulmonary Artery Pressure, 893
Miller, Prof. Frederick R. : Appointed research professor of neurophysiology in the University of Western Ontario, 125
Miller, J., and others : Studies with Radioactive Penicillin, 1009
Miller, Dr. J. A., and others : Nutrition in relation to Cancer, 106
Miller, John Anderson : Men and Volts at War, the Story of General Electric in World War II, *review* by Sir Arthur Fleming, 113
Miller, J. L. : Modern Assembly Processes, second edition, *review* by H. W. G. H., 503
Miller, Prof. W. C. : Animal Health in British Guiana, 345
Miller, Dr. Zelma Baker, and others : Failure of Sulphanilamide to Inhibit Calcification of Bone, 273
Millikan, C. R. : Antagonism between Molybdenum and certain Heavy Metals in Plant Nutrition, 528
Millikan, Robert Andrews : Electrons (+ and —), Protons, Photons, Neutrons, Mesotrons and Cosmic Rays, revised edition, *review* by Dr. L. G. H. Huxley, 789
Millman, Dr. Peter M., and others : Combined Radar, Photographic and Visual Observations of the Perseid Meteor Shower of 1947, 278
Mills, Gervase L. : Particle-size Measurement, 313
Mills, John : The Engineer in Society, *review* by R. Brightman, 374
Milne, A. J. (Jellyman, P. E., and) : A Large Field Compensator for Measurement of Birefringence, 477
Milne, Prof. E. A. : Request for letters or papers written by Sir James Jeans, 677
  Obituary of Dr. H. W. Richmond, 877
Milne-Thomson, Prof. L. M. : Theoretical Aerodynamics, *review* by Prof. W. J. Duncan, 703
Milner, Dr. C. J., and others : Pinhole Radiography of Magnetrons, 244
Milner, H. B. : The Race for Oil, *review*, 186
  Petroleum Production, Vol. 3, Oil Production by Water (Park J. Jones), *review*, 666
  Progress in the Oil Industry during the War-Years, *review*, 703
Milton, J. G. : Awarded the Simms Gold Medal of the Society of Engineers, 346
Milward, G. E. : Skill and Management, *review* by J. Leigh, 910
Minganti, Dr. Antonio : Interspecific Fertilization in Ascidians, 643
Mining and Metallurgy, Institution of : Offer from Capper, Pass and Son, Ltd., of awards for papers on metallurgy, 347
  Gold Medal awarded to G. Carleton Jones, 923
  Honorary membership conferred on Dr. William Cullen, Dr. T. A. Rickard and Prof. S. J. Truscott, 923
  Consolidated Gold Fields of South Africa, Ltd. Gold Medal awarded jointly to Dr. Anthony Caplan and J. K. Lindsay, 924
  Symposium on the Refining of Non-ferrous Metals, 924
Minkoff, Dr. G. J., and others : Formation of Hydroxy Peroxides, 172
Misra, Dr. R. C. : Occurrence of Volcanic Bomb in the Agglomeratic Slates of Kashmir, 895
Mitchell, Dr. C. A. : *Death* of, 48
Mitchell, C. D. : Awarded the Bessemer Premium of the Society of Engineers, 346
Mitchell, Dugald (Jones, Elwyn, and) : Spread of Detonation in High Explosives, 98
Moggridge, J. I. : Appointed director, Tsetse Research Control Department, Tanganyika, 637
Moholy, Mrs. Lucia : Proposed Central Publication of Scientific Papers, 922
Montarnal, R. (Kastler, Prof. A., and) : Phase-Contrast in Polarized Light, 357
Mookerjee, Dr. Sivatosh : An Atypical Scale of *Sciæna coitor* (Hamilton), 64
Moon, J. T. : Appointed senior agricultural officer, Kenya, 471
Moon, Prof. P. B. : Atoms for the Layman, *review*, 582
Moore, W. C. : *Obituary* of Dr. George H. Pethybridge, 1002
Moran, P. A. : Mathematics of Statistics (John F. Kenney), Part I, second edition, *review*, 544
Moran, Dr. T., and others : Action of Nitrogen Trichloride on Proteins—Production of Toxic Derivative, 126
Morley, J. S., and others : Cinnoline Derivatives as Chemotherapeutic Agents for *Trypanosoma congolense* Infections, 603, 758
Morris, D. P., and others : Stressed Aluminium, 681
Morris, Harold P., and others : Nutrition in relation to Cancer, 106
Morrison, G. A., and others : Quantitative Paper Chromatography, 764
Morrison, Herbert : Address to the North Herts Labour Party, 214
  University Representation in the House of Commons, 468
Morrison, Prof. J. L. M. : Appointed a member of the Advisory Council on Scientific Research and Technical Development, 924
Morse, Prof. Frederick T. : Elements of Applied Energy, *review* by R. W. Haywood, 829
Mortensen, Dr. Theodor : Elected a *correspondant* for the Section of Anatomy and Zoology of the Paris Academy of Sciences, 272
Morton, J. : Appointed regional assistant director of veterinary services, Nigeria, 802
Morton, Prof. R. A. : *Obituary* of Prof. E. C. C. Baly, 120
Morton, Prof. R. A., and others : Chemistry of Visual Processes, 424
Morton, Prof. W. E., and Permanyer, F. : Torsional Relaxation in Textile Filaments, 737
Moss, T. S. : Spectral Sensitivity of Lead Telluride Layers, 766
Moss, T. S., and Chasmar, R. P. : Spectral Response of Lead Selenide, 244
Mott, Prof. N. F. : Appointed Henry Overton Wills professor of physics and director of the Wills Laboratory at the University of Bristol, 272
Mourant, Dr. A. E. : *Rh* Nomenclature, 492
Mozley, Alan (Taylor, E. L., and) : A Culture Method for *Lymnæa truncatula*, 894
Mudd, Dr. Stuart : Submicroscopic Structure of the Bacterial Cell, as shown by the Electron Microscope, 302
Muir, J. C. : Appointed director of agriculture, Tanganyika, 637
Muir, T. A. (Lambert, John, and): Practical Chemistry, *review* by Dr. S. H. Harper, 992
Mukherjee, Prof. J. N. : Scientific Research in India, 513
Mukherjee, R. R., and others : Some Tensile Properties of Jute, 737
Mulder, Dr. D. : Trace Elements in Plant Physiology, 365
Mulder, Dr. E. G. : Trace Elements in Plant Physiology, 364
Mullins, Dr. Lorin J. (Nickerson, Dr. Walter J., and) : Riboflavin Enhancement of Radioactive Phosphate Exchange by Yeasts, 939
Munro, Dr. H. N., and Cumming, M. C. : Nitrogen Metabolism after Fracture, 560
Munro, Prof. J. W. : The Field Study and Conservation of the British Fauna, 408
Munshi, S. K., and others : Ammonium Salts of Sulphanilamides and Sulphonic Acids, 55
Muralt, Prof. Alexander v. : Die Signalübermittlung im Nerven, *review* by Prof. J. Z. Young, 76
Murnaghan, Prof. Francis D. : Differential and Integral Calculus, Functions of One Variable, *review* by F. G. W. Brown, 261
Murphy Chemical Co., Ltd. : Insecticidal Smokes, 575
Murray (John) Expedition : Planktonic Copepods and Hydrocorals of the, 822
Murray, Dr. P. D. F. : Practical Biology for Medical and Intermediate Students (C. J. Wallis), second edition, *review*, 912
  Guide to the Study of the Anatomy of the Shark, *Necturus*, and the Cat (Prof. Samuel Eddy, Prof. Clarence P. Oliver and Prof. John P. Turner), second edition, *review*, 955
Murry, John Middleton : The Free Society, 538
Museums of Ceylon, National : Administration Report for 1946, 346
Muskett, Prof. A. E. : Mycological Education, 507
Muxart, R., and others : Isotope Exchange and Molecular Structure, 901
Mycological Society, British : Discussion on Mycological Education, 507
Myers, O. E., and others: Kinetic Studies on Isotopic Exchange Reactions, 901
Myers, R. H. : Retirement as head of the Steelmaking Division of the British Iron and Steel Research Association, 595
Myres, Sir John : Greek Fishes, *review*, 185, 272

NAFTALIN, Dr. L. : Quantitative Chromatographic Estimation of α-Amino-Acids, 763
Naples Zoological Station, 738
Naranjo V, Plutarco : Las heladas y la necrosis fria de las plantas, *review* by H. L. P., 706
Narayana Rao, D. A. A. S. (Bhagavantam, Prof. S., and) : Dielectric Constant of Diamond, 729
Nash, W. F., and others : X-Radiation from a 20-MeV. Betatron, 1022
Nath, Prof. M. C., and Brahmachari, H. D. : Relation of Intermediary Metabolites to the Lowering of the Potency of Pancreatic Insulin in the Animal System, 18
National Academy of Sciences of India : Second Symposium on the Age of the Saline Series of the Punjab, 265
National Advisory Council for Education in Industry and Commerce : Appointment of Sir Ronald Weeks as chairman, 801
  Elections to the Standing Committee, 923
National Association of Girls' Clubs and Mixed Clubs : Summer School for Youth Leaders on the Club Programme and Informal Education, 924
National Association for Mental Health : Conference on Sociology of Mental Disease, 407
National Central Library : To compile a Union Catalogue of German Books and Periodicals, 1006
National Coal Board : Scientific Aspects of the Work of the (John Crossland), 546
National Committee for Crystallography : British, 390
National Committee for Scientific Radio, British (Radio Section of the Institution of Electrical Engineers, and the) : Convention on Scientific Radio, 233
National Federation of Educational Film Groups : First Annual Conference, 965
National Foundation for Scientific Research, Brussels : Nineteenth Annual Report, 196

National Geographic Society of the United States : Observations during the Annular Eclipse of the Sun on May 8–9, 389
National Geographic Society, Smithsonian Institution and the Commonwealth of Australia : Scientific Expedition to Arnhem Land, 195
National Institute of Sciences of India : Election of new Fellows, 197
  Symposium on Scientific Research in India, 513
National Museum of Wales : Retirement of Sir Cyril Fox from the directorship, 840
  Appointment of Dr. D. Dilwyn John as director, 840
National Museums of Ceylon : Administration Report for 1946, 346
National Physical Laboratory : Meeting at the Royal Society to discuss the Use of Equivalent Metric Values in Scientific Papers, 144
  Appointment of D. G. Sopwith as superintendent of the Engineering Division, 552
  Film on the work of the Metrology Division, 717
  To have an 'Open Day' on June 21, 717
National Research Council of Canada : Thirteenth Annual Report, 491
  Formation of a Radio and Electrical Engineering Division under B. G. Ballard, 513
  Establishment of a Committee on Corrosion Research, 553
  Post-doctorate Fellowships in Pure Chemistry, 555
  Publications of the, second edition, 595
National Research Council of Japan : Observations during the Annular Eclipse of the Sun on May 8–9, 196, 389
National Research Development Corporation : Establishment of a, 700
Naval Architects, Institution of : To award a Research Scholarship offered by the Aluminium Development Association, 882
Navigation, Institute of : No. 1 of its quarterly *Journal*, 389
Neave, R. M. S. : Appointed veterinary officer, Kenya, 637
Needham, Dr. D. M. : Effects of Mustard Gas on Enzymes and Tissues, 225
  Elected a Fellow of the Royal Society, 467
Needham, Dr. Joseph : To return to his post at the University of Cambridge, 304
  Science and Society in Ancient China (Conway Memorial Lecture), 305
  Appointed honorary scientific adviser to UNESCO, 758
Nelmes, E. : The Study of Critical British Groups, 735
Nemec, Prof. B. : Trace Elements in Plant Physiology, 364
  Work of, 427
Netherlands Embassy, Royal : Insignia of Commander in the Order of Orange-Nassau (Civilian Division) presented to Sir George Beharrell, Sir Jack Drummond, Dr. John Hammond and Sir Raymond Streat, 307
Netherlands Physical Society : International Conference on the Physics of Metals, 389
Neukom, H., and others : Reaction of Boric Acid with Polysaccharides, 96
Neville, Prof. E. H. : "When the Pie was Opened ", *review*, 186
  Mathematics in India, *review*, 580
New York Academy of Sciences : Symposium on Nutrition in relation to Cancer, 106
  Conference on Physiological and Psychological Factors in Sex Behaviour, 124
New York University (Institute for Mathematics and Mechanics) : To issue a new journal entitled *Communications on Applied Mathematics*, 636
New Zealand Department of Scientific and Industrial Research : Annual Report for 1946–47, 365
Newbery, G. R., and Willshaw, W. E. : A Method of Feeding Micro-wave Power into a Resonator having a Fine Mode Structure, 519
Newhouse, J. P. (Calcutt, G., and) : Inhibition of the Photodynamic Action of 3 : 4 Benzpyrene, 53
Newitt, Prof. D. M. : Appointed a member of the Chemistry Research Board, 924
Newman, Sir George : *Obituary* by Sir Arthur MacNalty, 1001
Newman, Dr. I. V. : Aerobiology on Commercial Air Routes, 275
Newman, Prof. M. H. A. : Calculating Machines, 712
Newstead, Gordon : Triple Magneto Ionic Splitting of Rays Reflected from the F_2 Region, 312
Newton Tercentenary Celebrations, *review*, 375
Newton, R. G. : Orientation of Birds on Migratory and Homing Flights, 998
Newton, Dr. Robert R., and others : Mathematical Theory of Rocket Flight, *review* by Dr. R. A. Rankin, 3
Newton, Prof. W. H. : Introduction to Physiology, *review* by Prof. W. C. Cullis, 828
Nicholas, S. D., and Smith, Dr. F. : Acetylation of Sugars, 349
Nicholls, Mary J., and others : Starches of the Wrinkled and the Smooth Pea, 206
Nichols, Nathaniel B., and others (edited by) : Theory of Servomechanisms, *review* by Prof. A. Porter, 994
Nicholson, I. A. : Awarded an Agricultural Research Council Postgraduate Scholarship, 16
Nickerson, Dr. Walter J., and Mullins, Dr. Lorin J. : Riboflavin Enhancement of Radioactive Phosphate Exchange by Yeasts, 939
Nimkoff, Prof. Meyer F. (Ogburn, Prof. William F., and) : A Handbook of Sociology, *review* by T. H. Hawkins, 188
Nishikawara, M., and others : Effect of Thyroid Deficiency on the Level of Pseudo-Cholinesterase in the Plasma of Rats, 639
Nissan, Dr. A. H. (Grunberg, L., and) : Critical Temperature and Molecular Weight of *n*-Paraffins, 170
Noriot, Ch., et Alliot, H. : La lutte contre les termites, *review* by A. D. I., 544
Norris, D. O., and others : Plant Virus Diseases, 945
North, Dr. E. A., and others : Adsorption of Bacterial Polysaccharides to Erythrocytes, 687
Northern Ireland, Government of : Report on Sea and Inland Fisheries, 1942–44, 451
North-Western Naturalist, 923
Norwegian Polar Institute : Establishment of the, 987
Nuffield, Lord : Gift of £50,000 to Lincoln College, Oxford, for research fellowships in science and allied medicine, 16
Nye, J. F. : Internal Stresses in Metals and Alloys, 70
  Photo-elastic Investigation of Internal Stresses in Silver Chloride caused by Plastic Deformation, 367
  The Flow of Glaciers, 819

OCCHIALINI, Dr. G. P. S., and Powell, Dr. C. F. : The Artificial Production of Mesons, 551
Occhialini, Dr. G. P. S. (Bates, Dr. W. J., and) : Applications of the Reflecting Microscope to the Nuclear Plates Technique, 473
Occhialini, Dr. G. P. S. (Powell, Dr. C. F., and) : Nuclear Physics in Photographs, *review* by Prof. P. I. Dee, 333
Odell, Dr. N. E. : Exploration of the Lloyd George Mountains in the Northern Canadian Rockies, 327
Odgers, Merle M. : Alexander Dallas Bache, Scientist and Educator, 1806–1867, *review* by Lieut.-Colonel H. D. Anthony, 909
Odium, Dr. Doris M. : Sociology of Mental Disease, 408
Offord, Prof. A. C. : Appointed to the University of London chair of mathematics at Birkbeck College, 637, 757 ; work of, 757
Ogburn, Prof. William F., and Nimkoff, Prof. Meyer F. : A Handbook of Sociology, *review* by T. H. Hawkins, 188
Ogg, Prof. Alexander : *Death* of, 592 ; *obituary* by Dr. B. F. J. Schonland, 633
Ogg, Dr. W. G. : *Obituary* of Sir Robert Greig, 120
Ogston, Dr. A. G. : The Reactions of Mustard Gas in Aqueous Solution, 225
Oil Palm Research Station, Nigeria : Appointment of F. W. Toovey as officer-in-charge, 637
Oliphant, Prof. M. L. E. : Awarded the Faraday Medal of the Institution of Electrical Engineers, 122
Oliphant, Prof. M. L. E., and others : Atomic Challenge, a Symposium, *review*, 995
Oliver, Prof. Clarence P., and others : Guide to the Study of the Anatomy of the Shark, *Necturus*, and the Cat, second edition, *review* by Dr. P. D. F. Murray, 955
Oliver, J. P. : Appointed agricultural officer, Falkland Islands, 637
Olliver, C. W. : The Intelligent Use of the Microscope, *review*, 626
Olum, Dr. Paul : Awarded a Frank B. Jewett Fellowship for 1948–49 by the American Telephone and Telegraph Co., 429
Opinion and Attitude Research, International Journal of, Vol. 1, 450
Oppenheimer, Dr. J. R. : International Control of Atomic Energy, 291
O'Rahilly, R. : Appointed lecturer in anatomy in the University of Sheffield, 16
Ornithology, British Trust for : Fourteenth Annual Report, 841
Orowan, Dr. E. : The Flow of Glaciers, 820
Orton, Prof. J. H. : Elected a Fellow of the Royal Society, 467
Oser, Dr. Bernard L., and others : Practical Physiological Chemistry, twelfth edition, *review*, 830
Osmond, W. P. (Hobson, P. T., and) : Ferro-magnetic Structure of Cold-Worked Austenitic Stainless Steels, 562
Österlind, Sven : Influence of Low Bicarbonate Concentrations on the Growth of a Green Alga, 319
Overseas Scientific Relations, Inter-Departmental Committee on, 800
Overton, G. L. : *Death* of, 839 ; *obituary* by M. J. B. Davy, 921
Owen, Prof. E. A., and others : Stressed Aluminium, 681

PACHNER, Jaroslav: Discharge Tube for Nuclear Reactions with Improved Yield, 252
Page, Dr. A. : Algebra, *review*, 626
Pal, B. P., and others : Inheritance of Sex Forms of *Luffa acutangula* Roxb., 775
Palæontographical Society : One hundred and first Annual General Meeting, 717
Palais de la Découverte, Paris : Exhibition on the Life and Work of Davy and Faraday, 675
Palestine Board for Scientific and Industrial Research : Report for 1945–1948, 800
Paneth, Prof. F. A. : Scientific Research in the British Zone of Germany, 191
  Radioelements as a Tool in Scientific Research, *review*, 456
  Reactivity and Structure of Molecules, 901
Panikkar, N. Kesava, and Viswanathan, R. : Active Regulation of Chloride in *Metapenæus monoceros* Fabricius, 137
Pannetier, Dr. G., and Gaydon, Dr. A. G.: Band Spectrum of ClO in Flames, 242
Papp, G. (Bay, Z., and) : Coincidence Device of 10^{-8}-10^{-9} Sec. Resolving Power, 59
Paquot, Prof. C. : Physiology and Biochemistry of Fats and Lipoids, 535
Paris, Sheila K., and others : Pharmacological Activities in different Rodent Species of *d*-Tubocurarine Chloride and the Dimethyl Ether of *d*-Tubocurarine Iodide, 817
Paris Academy of Sciences : Election of André Boivin as a *correspondant* for the Section of Rural Economy, 272
  Election of Dr. Theodor Mortensen as a *correspondant* for the Section of Anatomy and Zoology, 272
  Election of Charles Dufraisse as a member of the Section of Chemistry, 514
  Election of Prof. Paul Fallot as a member of the Section of Mineralogy, 802
  Appointment of Robert Courrier as 'secrétaire perpétuel' for the physical sciences, 966
Parisionos, C. C. : Appointed agricultural officer, Cyprus, 471
Parker, Eric : Surrey, *review* by W. E. S., 912
Parker, H. W. : *Obituary* of J. L. Chaworth-Musters, 755
Parker, Dr. J. G. : *Death* of, 714 ; *obituary*, 838
Parmentier, R., and Dustin, jun., Dr. P. : Early Effects of Hydroquinone on Mitosis, 527
Parrot, Prof. J.-L., and others : Influence of Vitamin P (Vitamin C_2) upon the Amount of Ascorbic Acid in the Organs of the Guinea Pig, 557
Parry, Dr. D. A. : Aspects of the Locomotion of Whales, 200
Parson, Alfred Lauck : The Matter-Radiation Cycle in the Cosmos (and the Second 'Law')—the Sun's Equilibrium, 802
Parsons, D. S., and others : Quantitative Paper Chromatography, 764
Parsons, Sir Leonard : Elected a Fellow of the Royal Society, 467
Parthasarathy, Dr. N. : Origin of Noble Sugar-Canes (*Saccharum officinarum* L.), 608
Partington, Prof. J. R. : *Obituary* of Prof. Max Planck, 47
Pasquini, Prof. Pasquale : Le forze creatrici dell'uovo, *review* by C. H. W., 831

Passey, Prof. R. D., and others : Ultracentrifugation and Electron Microscope Studies of Tissues of Inbred Strains of Mice, 759
Paterson, Dr. Edith : Awarded a grant from the Lady Tata Memorial Fund, 966
Paterson, J. H. : Awarded a Commonwealth Fund Fellowship, 1006
Paterson, Dr. Ralston : Awarded a David Anderson-Berry Prize of the Royal Society of Edinburgh, 716
Paterson, T. T. : Earliest Known Prehistoric Industry, 278
Paton, Dr. W. D. M., and Zaimis, Dr. E. J. : Curare-like Action of Polymethylene *bis*-Quaternary Ammonium Salts, 718
Patterson, Miss S. J. : The Assaying of Penicillin, 285
Pauling, Prof. Linus : Nature of Forces between Large Molecules of Biological Interest, 707
    Structure of Complexes and the Influence of Structure on Exchange Reactions, 901
    Elected a foreign member of the Royal Society, 921 ; work of, 922
    General Chemistry, *review* by Dr. S. H. Harper, 992
    The Metallic State, 1019
Pawsey, Dr. J. L. : Radio Noise, 795
Payne, Bernard : Awarded the Bernays Premium of the Society of Engineers, 346
Payne, R. M., and others : X-Radiation from a 20-MeV. Betatron, 1022
Payne, R. M. (Franzinetti, C., and) : Emission of Li^8 in the Explosive Disintegration of Nuclei, 735
Peacock, Prof. A. D. : Ecological Problems of the Highlands and Hebrides, *review*, 457
Peake, O. : University Representation in the House of Commons, 468
Pear, Prof. T. H. : Personality, *review*, 622
Pearce, J. H. : Advanced Calculus (Prof. David V. Widder), *review*, 188
    Mechanics (Prof. John C. Slater and Prof. Nathaniel H. Frank), *review*, 376
Pearse, Dr. I. H. (edited by Williamson, Dr. G. Scott, and) : Biologists in Search of Material, second edition, *review* by Dr. G. Lapage, 336
Peat, Dr. Stanley : Elected a Fellow of the Royal Society, 467
Peat, Dr. Stanley, and others : Enzymic Conversion of Amylose into Amylopectin, 127
    Starches of the Wrinkled and the Smooth Pea, 206
    Photochemical Degradation of Starch, 762
Penketh, D. D. : Glycerol Dichlorhydrin and Vitamin A, 893
Penrose, Prof. Lionel, and others : The Trend of National Intelligence, *review* by Dr. Julian Blackburn, 37
Pentelow, F. T. K. : Biological Aspects of Water Pollution, 876
Pérard, Albert : Les mesures physiques, *review* by S. Weintroub, 955
Percival, Dr. F. G. : Elected a Fellow of the Royal Asiatic Society of Bengal, 553
Pereira, Dr. Oswaldo Gelli (Lima, Dr. Octavio Rodrigues, and) : Pregnancy Test using the Male Toad, 676
Perkins, D. H. : Disintegration of Highly Excited Nuclei, 486
    Awarded a Senior Scholarship by the Commissioners of the Exhibition of 1851, 966
Perkins, D. H. (Li, T. T., and) : Anomalous Distribution of Nuclear Disintegration in Photographic Emulsions Exposed to Cosmic Rays—Double Stars, 844
Perlmann, Gertrude E. : Electrophoretic Behaviour of Modified Ovalbumins, 720
Permanyer, F. (Morton, Prof. W. E., and) : Torsional Relaxation in Textile Filaments, 737
Permin, Per M. (Astrup, Dr. Tage, and) : Fibrinokinase and Fibrinolytic Enzymes, 689
Perrott, S. Wright : Surveying for Young Engineers, *review*, 79
Perry, Enos J. (edited by) : The Artificial Insemination of Farm Animals (by John W. Bartlett, George E. Taylor, Joseph Edwards, Clair E. Terrill, Victor Berliner and Fred P. Jeffrey), *review* by Dr. Arthur Walton, 831
Perry, S. V. : Awarded a Commonwealth Fund Fellowship, 1006
Perry, W. L. M. : An Improved Method for the Assay of Toxicity of Arsenicals, 975
Perutz, Dr. M. F. : Submicroscopic Structure of the Red Cell, 204
    The Flow of Glaciers, 819
Pest Control, Ltd. : Appointment of Dr. G. S. Hartley as research manager, 595
Peters, L. : Rheology in the Textile Industries, 737
Peters, L., and Speakman, Prof. J. B. : The Viscous-Elastic Properties of Wool Fibres, 737
Peters, Prof. R. A. : References in Scientific Literature, 731
Pethybridge, Dr. G. H. : *Death* of, 839 ; *obituary* by W. C. Moore, 1002
Petroleum, Institute of : Reviews of Petroleum Technology, Vol. 7 (covering 1941–45), *review* by H. B. Milner, 703
    Election of officers for 1948–49, 758
Petroleum, Institute of, and the Institute of Fuel : Joint Conference on Modern Applications of Liquid Fuels, 677, 1007
Petrow, Dr. V. : Appointed chief research chemist to British Drug Houses, Ltd., 555
Phemister, Dr. J. : Awarded the Murchison Medal of the Geological Society, 122
Philip, A. R. : Open-Hearth Furnace Models, 479
Phillips, D. M. P. : Use of Ultra-Violet Fluorescence in Paper Chromatography, 53
Phillips, F. J. S. : Appointed assistant conservator of forests, Nigeria, 51
Phillips, J. N., and Vincent, J. M. : Dosage/Response Relationships in Mould Inhibition, 210
Phillips, Prof. Ralph S., and others (edited by) : Theory of Servomechanisms, *review* by Prof. A. Porter, 994
Philp, Dr. James : Appointed director of the Vegetable Research Station, 715 ; work of, 715
Phipps, J. : Appointed entomological biologist, Tanganyika, 802
Photographic Society, Royal : Election of officers, 471
    Annual Exhibition, 801
Physical Society : Special volume on Meteorological Factors in Radio-Wave Propagation, 146
    Annual Summer Meeting, 430
    Duddell Medal for 1947 awarded to Dr. R. J. Van de Graaff, 511
    Thirty-second Exhibition of Scientific Instruments and Apparatus, 514, 732
    To arrange for separate publication of papers read before the International Conference on the Emission Spectra of the Night Sky and Auroras, 514
    Election of officers for 1948–49, 758
    Guthrie Lecture (Sir George Thomson), 800
    Election of Prof. E. O. Lawrence as an honorary fellow, 843
Physical Society (Acoustics Group) : Symposium on the Borderline of Psychology, Physics and Music, 589
Physical Society (Acoustics Group) and the Royal Institute of British Architects : International Symposium on Noise, 197
Physical Society (Low Temperature Group) : Discussion on Insulating Materials and Methods for Use at Low Temperatures, 323
Physical Society, and others : Symposium on Internal Stresses in Metals and Alloys, 70
Physics, Institute of, and others : Symposium on Internal Stresses in Metals and Alloys, 70
Physics, Institute of (Manchester and District Branch) : Conference on Semiconductors and their Applications, 430
Physics, Institute of (Manchester and District Branch) and others : Conference on the Rheological Properties of Textile Materials, 307, 737
Physics, Institute of (X-Ray Analysis Group) : Discussion on the Structure and Physical Properties of Metals, 263
Physics, Institute of (University of Bristol in co-operation with the) : Summer School in Theoretical Physics, 233
    Summer School in the Physics of Solids, 233, 636
Piaggio, Prof. H. T. H. : Magnetic Field of Massive Rotating Bodies, 450
    An Introduction to Analytical Geometry (A. Robson), Vol. 2, *review*, 705
    Algebraic Geometry, *review*, 787
Pick, W. H. : *Death* of, 48 ; *obituary*, 194
Pickford, Dr. R. W. : Darkening of Red in Protanopes, 27
    Light, Vision and Seeing (Dr. Matthew Luckiesh), fourth printing, *review*, 40
    The Borderline of Psychology, Physics and Music, 589
    Race, Pigmentation and Colour Vision, 687
Pickles, A. : Appointed entomologist, Nigeria, 471
Pierce, E. T. : Radio Noise, 794
Piggott, W. R., and others : Anomalous Effect of Ionospheric Absorption, 967
Pijper, Prof. Adrianus : Bacterial Flagella and Motility, 200
Pilot Papers : Issue for June 1947, 450
Pim, J. A. : Electrical Breakdown Strength of Air at Ultra High-Frequencies, 683
Pincus, Gregory (edited by) : Recent Progress in Hormone Research (Proceedings of the Laurentian Hormone Conference, Vol. 1), *review* by Prof. S. Zuckerman, 295
Pincus, Dr. Paul : Relation of Enamel Protein to Dental Caries, 1014
Pinder, A. R. : Awarded a Senior Scholarship by the Commissioners of the Exhibition of 1851, 966
Pinfield, G. H. : Appointed inspector of mines, Tanganyika, 471
Piper, Dr. S. H. : Appointed assistant director of the Wills Laboratory at the University of Bristol, 272
Pippard, A. B. : Radio Physics, 795
Pirenne, Dr. M. H. : *Obituary* of Prof. Selig Hecht, 673
    Chemistry of Visual Processes, 724
    Orientation of Birds on Migratory and Homing Flights, 998
Pirie, N. W. : Plant Virus Diseases, 945
Pissurlencar, Sir Panduranga S. S. : Awarded the Sir Jadunath Sarkar Gold Medal of the Royal Asiatic Society of Bengal, 553
Pitt, Frances : Day by Day on Skokholm Island, *review*, 5
    A Collector's Trail, *review*, 222
    Exploring our National Parks and Monuments (Devereux Butcher), *review*, 376

    Animals and the Laboratory, *review*, 664
    Bird Recognition, I, Sea-Birds and Waders (James Fisher), *review*, 831
Planck, Prof. Max : *Obituary* by Prof. H. T. Flint, 13 ; *obituary* by Prof. J. R. Partington, 47
    Memorial Ceremony in honour of, 347
    Memorial Ceremony at Göttingen (Prof. E. N. da C. Andrade), 751
Planck, Max (Prof. E. N. da C. Andrade), 284
Planck (Max) Society for the Advancement of Scientific Research, 427 ; *errata*, 555
Plant Breeding Institute, Cambridge : Transfer from its existing site, 714
    Appointment of Dr. G. D. H. Bell as director, 714
Plant Protection, Ltd. : Good Health to the Garden, *review*, 188
    Plant Disease Charts, 389
    Insecticidal Smokes, 575
    'Agrocide' Range of Insecticides, 595
Plato's Theory of Education (Prof. R. C. Lodge), *review*, 376
Platt, H. : Awarded an Agricultural Research Council Postgraduate Scholarship, 16
Playfair (Lyon) and Technical Education in Britain (W. H. G. Armytage), 752
Plesch, Dr. P. H. : Acetylation of Sugars, 637
Plesch, Dr. P. H., and Robertson, R. H. S. : Adsorption on to Ionogenic Surfaces, 1020
Plum, Dr. Claus F. M. : Awarded a Scholarship from the Lady Tata Memorial Fund, 966
Pol, Prof. Balth. van der : The Borderline of Psychology, Physics and Music, 589
Polanyi, Prof. M. : Appointed professor of social studies in the University of Manchester, 15 ; work of, 15
Polar Institute, Norwegian : Establishment of the, 987
Polishuk, Z., and others : Variations in Spermatogenesis of Oligospermic Men, 176
Political and Economic Planning : Broadsheet No. 276, Man-Power Movements, 453
    Broadsheet No. 272, Framework of Collective Bargaining, 453
    Broadsheet on Family and Nation, 539
    Report on the British Fuel and Power Industries, 669
    Broadsheet No. 14, The Human Factor in Industry, 780
    Broadsheet No. 274, Medical Group Practice in the United States, 841
Pollard, Dr. A., and others : Effect of Ion-Exchange Treatment on the Stability of Apple Juice, 1023
Pollock, Dr. M. R. : Unsaturated Fatty Acids in Cotton Wool Plugs, 853

Polson, A. : New Amino-Acids in Bacterial Hydrolysates, 351
Pontecorvo, B. : Promoted to the grade of Senior Principal Scientific Officer, 195
Pontifical Academy of Science : Appointment of new members, 922
Pool, Dr. A. G. : Appointed to the chair of economics at University College, Leicester, 514
Poole, Dr. H. G. : Title of reader in chemistry in the University of London conferred on, 637
Poole, Dr. J. H. J., and Bremner, J. W. : Investigation of the Radioactivity of Rocks by the Photographic Method, 884
Pope, Dr. C. G. : The Assaying of Penicillin, 286
Portal of Hungerford, Lord : To continue to act as controller of production (atomic energy) in the Ministry of Supply, 514
Porter, Prof. A. : Servomechanisms, *review*, 994
Postgraduate Medical School of London : Title of professor of bacteriology in the University of London conferred on Lord Stamp, 51
Potter, Prof. M. C. : *Death* of, 510 ; *obituary* by Prof. M. Thomas, 590 ; *obituary* by Prof. N. S. Alexander, 673
Potter, Ralph K., and others : Visible Speech, *review* by Dr. W. G. Radley, 334
Pound, F. J. : Appointed deputy director of agriculture (crop husbandry), Trinidad, 802
Poupa, Dr. Otakar : Effect of Antihistamines on *Daphnia*, 235
Powell, Dr. C. F. : Appointed Melville Wills professor of physics in the University of Bristol, 272
Powell, Dr. C. F., and Occhialini, Dr. G. P. S.: Nuclear Physics in Photographs, *review* by Prof. P. I. Dee, 333
Powell, Dr. C. F., and Rosenblum, Dr. S. : A New Method for the Determination of the Mass of Mesons, 473
Powell, Dr. C. F. (Occhialini, Dr. G. P. S., and) : The Artificial Production of Mesons, 551
Powell, H. M., and Riesz, P. : Beta-quinol, an Example of the Firm Union of Molecules without the Formation of Chemical Bonds between Them, 52
Powles, J. G. : Measurement of High Permittivity Values at Centimetre Wave-lengths, 25
Pratt, Prof. Robertson (Dufrenoy, Dr. Jean, and) : Evidence for an Electrostatic Field on Penicillin Assay Plates, 849
Preece, A. : Awarded the Sir Robert Hadfield Medal for 1948 of the Iron and Steel Institute, 512
Prentice, Dr. : Mycological Education, 508
Preston, M. M'E. : Amphibian Tissue Cultures for Biophysical Research, 203

RABINOVITCH, J. : A Rapid Method for the Estimation of Pregnanediol, 605
Race, Dr. R. R., and others : *Rh* Genes Allelomorphic to *C*, 316
Rachinger, W. A. (Wood, Dr. W. A., and) : X-Ray Diffraction Rings from Deformed Solid Metal and Metal Powders, 93
Radhakrishna Rao, Dr. M. V. : Dietetic Hepatic Lesions and Protein Deficiency, 446
Radio, International Advisory Committee for : Conference at Stockholm, 695
Radio (Scientific), British National Committee for (Radio Section of the Institution of Electrical Engineers, and the) : Convention on Scientific Radio, 233
Radio Research Establishment : Appointment of Dr. R. L. Smith-Rose as director of research, 125, 387
Radio Union, International Scientific : Conference at Stockholm, 695
Radiology, British Institute of : Silvanus Thompson Memorial Lecture (Prof. W. T. Astbury), 514
Radley, Dr. W. G. : Physical Patterns of Speech, *review*, 334
Radt, F. (edited by Josephy, E., and) : Elsevier's Encyclopædia of Organic Chemistry, Series 3, Carboisocyclic Condensed Compounds, Vol. 13, Tricyclic Compounds, *review* by Prof. J. W. Cook, 415
Raether, Dr. H. : Refraction Effects in Electron Diffraction and in Electron Microscopy, 311
Raffel, Sidney, and others (edited by) : Annual Review of Microbiology, *review* by Sir Paul Fildes, 995
Raffetto, Lloyd Andrew, and others : The Ice Cream Industry, second edition, *review* by Dr. L. H. Lampitt, 500
Raffles Museum, Singapore : First issue of the new series of the *Bulletin*, 842
Ralph, Patricia M. : Synonymy of the Nudibranch Genera *Pellibranchus* and *Okadaia*, 528
Raman, Sir C. V. : Infra-Red Absorption Spectra of Crystals, 165
Ramanujam, Dr. S., and Joshi, A. B. : Chromosome Number of *Sesamum laciniatum* Klein, 99
Ramanujam, Dr. S., and others : Inheritance of Sex Forms of *Luffa acutangula* Roxb., 775
Ramsay, J. A. : Meteorological Factors in Radio-Wave Propagation, 146
Ramsbottom, Dr. J. : *Obituary* of H. W. Pugsley, 121
  Mycological Education, 508
  Elected president of the Society for the Bibliography of Natural History, 1006
Randall, Prof. J. T. : Microwave Electronic Valves, *review*, 952
Rangaswami Aiyangar, Rao Bahadur K. V. : Elected a Fellow of the Royal Asiatic Society of Bengal, 553
Rankin, Dr. R. A. : Exterior Ballistics of Rockets, *review*, 3
Rao, B. Ramachandra (Bhagavantam, Prof. S., and) : Diffraction of Light by Very High Ultrasonic Waves, 927
Rao, D. A. A. S. Narayana (Bhagavantam, Prof. S., and) : Dielectric Constant of Diamond, 729
Rao, Dr. M. V. Radhakrishna : Dietetic Hepatic Lesions and Protein Deficiency, 446
Raphael, Mrs. W. : Science in Social Affairs, 68
Rassack, R. C. (Angyal, Dr. S. J., and) : The Sommelet Reaction, 723
Ratcliffe, J. A. : Scientific Radio, 794
Raven, Dr. C. E. : English Naturalists from Neckham to Ray, *review* by Prof. F. J. Cole, 373
  Awarded the James Tait Black Memorial Prize for 1947 of the University of Edinburgh, 390
Rawlins, F. Ian G. : Note on the late Prof. A. N. Whitehead, 268
  Petrographic Micro-technique (A. V. Weatherhead), *review*, 626
  Aristotelian Society Supplementary Vol. 21, Explanation in History and Philosophy, *review*, 665
  Mathematik, Logik und Erfahrung (Prof. Dr. Victor Kraft), *review*, 666
  Smoke (Arnold Marsh), *review*, 706
Rawlins, F. Ian G. (Rideal, Prof. Eric K., and) : *Obituary* of G. S. W. Marlow, 672
Ray, Prof. P. : The Theory of Valency and the Structure of Chemical Compounds, *review*, 460
Ray Society : One hundred and fourth Annual General Meeting, 555
Raymond, W. D. : Appointed Government chemist, Tanganyika, 966
Raymond, W. F. : Evaluation of Herbage for Grazing, 937
Rayner, Dr. Dorothy : Awarded a moiety of the Lyell Fund of the Geological Society, 122
Rayner, R. W. : Latent Infection in *Coffea arabica* L., 245
Raynor, Dr. G. V. : To receive a Beilby Memorial Award for 1947, 231, work of, 231
  Electron Theory of Metals, 264
Read, Prof. John : The Alchemist in Life, Literature and Art, *review* by T. I. W., 787
  Humour and Humanism in Chemistry, *review* by Denis I. Duveen, 869
Reaveley, C., and Winnington, J. : Democracy and Industry, 109
Recherche scientifique, Le Centre National de la : Symposium on Physiology and Biochemistry of Fats and Lipoids, 534
Recorded Sound, Institute of : Association of Special Libraries and Information Bureaux meeting to discuss the formation of a proposed, 493
Reed, Dr. R., and others : Ultracentrifugation and Electron Microscope Studies of Tissues of Inbred Strains of Mice, 759
Reed, Dr. R. I. (Badger, Dr. G. M., and) : Relative Reactivity of Aromatic Double Bonds, 238
Reid, D. M. : Occurrence of the Amphipod *Orchestia bottæ* and other Organisms in Britain, 609
Reid, Prof. E. Waymouth : *Death* of, 555 ; *obituary* by Prof. P. T. Herring, 591
Reiss, Dr. M., and Hemphill, R. E. : Cholinesterase Activity in Cerebro-Spinal Fluid, 18
Renard, Dr. Marcel : Raman Spectra of some Synthetic Mixtures of α-Chloroacids, 354
Renold, Sir Charles : Elected honorary treasurer of the Manchester Joint Research Council, 272
  Presidential Address to the British Institute of Management, 675
Research on Ageing, British Society for : Conference, 966
Research Associations, Committee of Directors of : Conference on Operational Research in the Research Associations, 584

Research Defence Society : Stephen Paget Memorial Lecture (Prof. P. A. Buxton), 802
Research Development Corporation, National : Establishment of a, 700
Rettie, R. S., and others : A 16-MeV. Metatron, 472
Reuter, G. E. H., and Sondheimer, E. H. : Theory of the Anomalous Skin Effect in Metals, 394
Reynolds, N. : Awarded a Senior Scholarship by the Commissioners of the Exhibition of 1851, 966
Rheologists' Club, British : Papers on War-time Rheological Investigations for the British Armed Services, 252
Rheologists' Club, British, and others : Conference on the Rheological Properties of Textile Materials, 307, 737
  Discussion on the Flow of Glaciers, 819
Rheology, International Joint Committee on : First Meeting, 104
  Officers for the Year 1947–48, 104
Rhind, D., and Tin, U. : Results of the Continuous Use of an Ammonium Phosphate Fertilizer on Rice in Lower Burma, 105
Richards, Dr. A. I. : Methodology in Ethnography, *review*, 111
Richards, Dr. T. Ll. : Structure and Properties of Metals, 264
Richardson, Dr. H. O. W. : Spin-Dependence of Magnetic Dipole Gamma Radiation and the Nuclear Level Scheme of Pb^{208}, 516
Richmond, Sir Daniel : *Death* of, 799
Richmond, Dr. H. W. : *Death* of, 674 ; *obituary* by Prof. E. A. Milne, 877
Richter, Dr. D., and Dawson, R. M. C. : Brain Lactate in Emotion, 205
Richtmyer, F. K., and Kennard, E. H. : Introduction to Modern Physics, fourth edition, *review* by Prof. L. F. Bates, 912
Rickard, Dr. T. A. : Honorary membership of the Institution of Mining and Metallurgy conferred on, 923
Rickes, E. L., and others : Anti-Pernicious Anæmia Factor, 676
Riddell, R. W. : Awarded a Commonwealth Fund Fellowship, 1006
Rideal, Prof. E. K. : *Obituary* of Prof. R. E. Liesegang, 230
  Adsorption and Heterogeneous Catalysis, 461
Rideal, Prof. E. K., and Rawlins, F. I. G. : *Obituary* of G. S. W. Marlow, 672
Ridenour, Prof. Louis N. (edited by) : Radar System Engineering, *review* by Sir Robert Watson-Watt, 867
Riesz, P. (Powell, H. M., and) : Beta-quinol, an Example of the Firm Union of Molecules without the Formation of Chemical Bonds between Them, 52
Riet Lowe, Dr. van : Tanged and Winged Arrow-heads, 881
Rigby, Dr. G. R. : To receive a Beilby Memorial Award for 1947, 231 ; work of, 231
Riley, N. D. : *Obituary* of Dr. A. S. Corbet, 1003
Ripper, Dr. W. E., and others : New Formulation of D.D.T. with Selective Properties, 484
Risdon, E. J., and others : Reversion, a New Procedure in Absorptiometry, 805
Ritchie, Prof. A. D. : Science and Politics, 6
  Logical Realism, *review*, 623
Ritchie, Dr. A. E. : Appointed to the Chandos chair of physiology in the University of St. Andrews, 922 ; work of, 922
Ritchie, Dr. P. D. : Synthetic Resin Chemistry (Dr. S. R. W. Martin), *review*, 502
Rivers, Rosalind Pitt : Formation of Derivatives of Thyroxine from Derivatives of Diiodotyrosine, 308
Rivlin, R. S. : Normal Stress Coefficient in Solutions of Macromolecules, 567
Road Research Laboratory : Road Research Technical Paper No. 7, 231
Robbins, Dr. William J., and others : Nutrition in relation to Cancer, 106
Roberts, Comdr. Elliott R. : World Magnetic Data, 677
Roberts, Dr. E. R. : Determination of Radioactive and Stable Tracer Isotopes, 694
Roberts, F. M. (Bawden, Dr. F. C., and) : Plant Virus Diseases, 945
Roberts, R. O. : Appointed mineralogist, Nigeria, 471
Robertson, Prof. A., and others : The Melanin Problem—a Synthesis of 5 : 6-Dihydroxyindole, 525
Robertson, Dr. A. J. B., and Yoffe, A. : Gases Liberated from Explosions Initiated by Impact, 806
Robertson, Sir Charles Grant : *Death* of, 387 ; *obituary* by Dr. G. A. Shakespear, 510
Robertson, Dr. Forbes W. (Begg, Dr. Michael, and) : Nutritional Requirements of *Drosophila melanogaster*, 769
Robertson, J. S. : Failure of Adrenal Cortical Extracts to cause Lysis of Living Lymphocytes *in vitro*, 814
Robertson, R. H. S. (Plesch, Dr. P. H., and) : Adsorption on to Ionogenic Surfaces, 1020
Robertson, Dr. R. N., and Wilkins, Marjorie : Quantitative Relation between Salt Accumulation and Salt Respiration in Plant Cells, 101
Robinson, Dr. Alice M., and Warren, Dr. F. L. : Presence of Substances Inhibitory to Acid Phosphatase in Normal Human Urine, 397
Robinson, Prof. G. W. : Elected a Fellow of the Royal Society, 467
Robinson, H. W. : Retirement from the office of librarian of the Royal Society, 388
Robinson, J. T. (Broom, Dr. R., and) : Size of the Brain in the Ape-Man, *Plesianthropus*, 438
Robinson, Sir Robert : Structure of Cyclopropane, 176
  Special meeting of the Industrial Research Committee of the Federation of British Industries at the Royal Institution in honour of, 508
  Scope of Organic Chemistry, 508
  Honorary degree of the University of Cambridge conferred on, 965
Robinson, Sir Robert (Bailey, Dr. A. S., and) : Relation of Vomicine to Strychnine and Brucine, 433
Robinson, Dr. Victor : Victory over Pain, *review* by Dr. G. Edwards, 458
Robson, A. : An Introduction to Analytical Geometry, Vol. 2, *review* by Prof. H. T. H. Piaggio, 705
Robson, A. H. (Harris, Dr. J. O., and) : Structure of Urea, 98
Robson, Dr. J. M. : Recent Advances in Sex and Reproductive Physiology, third edition, *review* by Dr. F. H. A. Marshall, 790
Robson, Dr. W. A. : Machinery of Government, 495
  Study of Public Administration, 879
Rocard, Prof. Yves : Awarded the Holweck Prize and Medal, 552
Roche, Prof. J. : Physiology and Biochemistry of Fats and Lipoids, 535
Rockefeller Foundation : Gift of £9,000 for research at the Neuropsychiatric Research Centre, Whitchurch Hospital, Cardiff, 346
Rodda, R. L. : Appointed Inspector of mines, Nigeria, 966
Roddan, G. M. : Appointed deputy director of agriculture, Kenya, 802
Rodger, Alec : Human Factors in Industry, 792
Rogers, Dr. H. J. : Bacterial Hydrolysis and Utilization of Polysaccharide-like Substances ('Mucin') in Saliva, 815
Rogers, M. A. T., and others : *Streptococcus fæcalis* in *E. histolytica* infections, 936
Rogers, W. S. : Degree of D.Sc. of the University of London conferred on, 233
Romanes, George John (1848–94), 757
Rose, Dr. H. E. : Appointed to the University of London readership in mechanical engineering at King's College, London, 637
Rose, L., and Griffiths, J. D. : Stress-Strain Characteristics of Viscose Rayon in relation to Anisotropy, 737
Rosenblum, Dr. S. (Powell, Dr. C. F., and) : A New Method for the Determination of the Mass of Mesons, 473
Rosenhead, Prof. L. : Appointed a member of the Advisory Council on Scientific Research and Technical Development, 924
Ross, D. J. (Brandt, C. W., and) : Podocarpic Acid as a Source of an Œstrogenic Hormone, 892
Ross, L. : Appointed assistant meteorologist, Nigeria, 637
Rosser, Prof. J. Barkley, and others : Mathematical Theory of Rocket Flight, *review* by Dr. R. A. Rankin, 3
Rothamsted Experimental Station : Report on the Department of Plant Pathology for the Years 1939–45 (Dr. F. C. Bawden), 676
  A new Nematology Department to take the place of the Institute of Agricultural Parasitology, 1006
Rothé, Prof. J.-P. : Séismes et volcans, *review* by Ernest Tillotson, 296
Rounthwaite, C., and others : Atomic Oxygen and Dissociation in Flame Gases, 726
Rowlands, Dr. I. W., and others: Ovarian Activity in the Pregnant Mare, 355
Rowlands, S., and others : Studies with Radioactive Penicillin, 1009
Rowley, Dr. D., and others : Studies with Radioactive Penicillin, 1009
Rowse, A. L. : The Use of History, 866
Roy, Dr. J. N. : Scientific Research in India, 513
Royal Academy, 1948 (Dr. A. Tindell Hopwood), 976
Royal Aeronautical Society : Gold Medal awarded to Sir Bennett Melvill Jones, 593
  Silver Medal awarded to I. I. Sikorsky, 593
  Bronze Medal awarded to Miss F. B. Bradfield, 593
  Simms Gold Medal awarded to Sir William T. Griffith, 593
  George Taylor (of Australia) Gold Medal awarded to Dr. J. W. Drinkwater and W. G. Glendinning, 593
  Edward Busk Memorial Prize awarded to Air Marshal the Hon. Sir Ralph Cochrane, 593
  R.38 Memorial Prize awarded to W. M. Widgery, 593
  Branch Prize awarded to A. N. Clifton and J. A. Kirk, 593
  Election of officers for 1948–49, 843
Royal Aeronautical Society, and others : Symposium on Internal Stresses in Metals and Alloys, 70
Royal Air Force : Opening of a new School of Education, 469
Royal Aircraft Establishment, Farnborough : New Chemical and Physical Laboratory at the, 212
Royal Anthropological Institute : Huxley Memorial Lecture for 1947 (Dr. W. L. H. Duckworth), 628
Royal Asiatic Society of Bengal : Barclay Memorial Medal awarded to Ra Bahadur K. C. Mehta, 553
  Joy Gobind Law Memorial Medal awarded to Dr. Lieven Ferdinand de Beaufort, 553
  Paul Johannes Bruhl Memorial Medal awarded to Prof. S. R. Bose, 553
  Dr. Bimala Churn Law Gold Medal awarded to Dr. B. M. Barua, 553
  Sir Jadunath Sarkar Gold Medal awarded to Sir Panduranga S. S. Pissurlencar, 553
  Election of members of Council for 1948, 553
  Election of Fellows, 553
Royal Astronomical Society : 'Geophysical Discussion on the Main Geomagnetic Field, 462
  Publication of papers for the Geophysical Supplement of the *Monthly Notices*, 924
Royal Botanic Garden, Calcutta : Early History of the (Dr. D. Chatterjee), 362
Royal Botanic Gardens, Kew : Collection of Bog-mosses (*Sphagnum*) presented by W. R. Sherrin, 716
  Retirement of Dr. John Hutchinson, 799
  Appointment of Dr. N. L. Bor as assistant director, 840
Royal Cancer Hospital (Free) : Appointment of Dr. Eric Boyland to the University of London chair of biochemistry, 347
Royal Geographical Society : Founder's Medal awarded to Wilfred Thesiger, 553
  Patron's Medal awarded to Thomas H. Manning, 553
  Victoria Medal awarded to Prof. Frank Debenham, 553
  Murchison Grant awarded to Robert W. Steel, 553
  Back Grant awarded to Alan J. Marshall, 553
  Cuthbert Peek Grant awarded to Dr. Donald F. Thomson, 553
  Gill Memorial awarded to William W. Williams, 553
Royal Institute of British Architects (Acoustics Group of the Physical Society and the) : International Symposium on Noise, 197
Royal Institute of Chemistry : Annual General Meeting, 347
  Anniversary Meeting, 716
Royal Institute of Chemistry (Leeds Area Local Section), and others : Conference on the Rheological Properties of Textile Materials, 307, 737
Royal Institution : Election of Lord Brabazon of Tara as president, 347
  Special meeting of the Industrial Research Committee of the Federation of British Industries in honour of Sir Robert Robinson and Sir Edward Appleton, 508
  Anniversary Meeting of the, 717
  To make an appointment to the Dewar Research Fellowship, 802
Royal Meteorological Society : Election of officers, 197
Royal Netherlands Embassy : Insignia of Commander in the Order of Orange-Nassau (Civilian Division) presented to Sir George Beharrell, Sir Jack Drummond, Dr. John Hammond and Sir Raymond Streat, 307
Royal Observatory, Greenwich : Presented with a Transit Circle by the Government of Victoria, 271
Royal Photographic Society : Election of officers, 471
  Annual Exhibition, 801

Royal Sanitary Institute : Annual Congress of the, 1025
Royal Sanitary Institute (Food Group of the Society of Chemical Industry and the) : Discussion on the Cleaning and Sterilizing of Plant in the Food Industry, 1025
Royal Scottish Museum, Edinburgh : Annual Report for 1946, 470
Royal Society : Newton Tercentenary Celebrations, 15–19 July 1946, *review*, 375
  Retirement of H. W. Robinson from the office of librarian, 388
  Formation of a British National Committee for Crystallography, 390
  Symposium on the Physiology of Resistance to Disease in Plants, 422
  New Fellows of the, 466
  Conference on Scientific Information Services, 469
  Discussion on Calculating Machines, 712
  Election of Sir Stafford Cripps as a Fellow under Statute 12, 843
  Election of new Foreign Members, 921
  Grants from the Browne Research Fund, 966
Royal Society of Edinburgh : Election of new Fellows, 390
  Keith Prize for 1945–47 awarded to Dr. Charlotte Auerbach, 716
  Neill Prize for 1945–47 awarded to Dr. Robert Broom, 716
  David Anderson-Berry Prizes presented to Dr. Ralston Paterson and Dr. P. C. Koller, 716
Royal Society of Medicine and the Scientific Film Association : Catalogue of Medical Films, 594
Royal Statistical Society : Offer of the Frances Wood Memorial Prize for 1948, 390
Royal Technical College, Glasgow : Coats Research Fellowship in Chemistry of Physics, 164
Royal Zoological Society of Scotland, 592
Rubber Development Board, British : Publication of No. 1 of *Rubber Developments*, 89
Rubber Developments, No. 1, 89
Rubber Industry, Institution of the : Conference on Rubber Technology, 51
Rumpf, P., and others : Isotopic Exchange Reactions and Electronic Structure of Substituted Aromatic Hydrocarbons, 901
Runcorn, S. K. : Variation of Geomagnetic Intensity with Depth, 52
  The Main Geomagnetic Field, 464
Ruse, Prof. H. S. : Appointed head of the Department of Mathematics in the University of Leeds, 307, 468 ; work of, 468
Rushton, Dr. W. A. H. : Elected a Fellow of the Royal Society, 467
Russell, Bertrand, and others : Atomic Challenge, a Symposium, *review*, 995
Russell, Sir John : Early English County Life, *review*, 701
  E. S. Beaven, a Great Barley Expert, *review*, 828
  The Land of Britain and How we Use It, *review*, 906
Russell, J. F. : Internal Stresses in Metals and Alloys, 70
Rutgers University, New Brunswick : Establishment of a Serological Museum, 428
Rutter, L. : A Modified Technique in Filter-Paper Chromatography, 435
Ryde, J. W. : Elected a Fellow of the Royal Society, 467
Ryle, M. : Solar Radio Emissions and Sunspots, 136
  Radio Noise, 795

SA, J. de, and others : A New Sulpha Compound ('6257') and its Use in Human Cholera Infection, 395
Saha, Prof. M. N. : Scientific Research in India, 513
Sahasrabuddhe, K. R. (Ekbote, R. B., and) : Shrivelled Wheat Grain from Rust-Affected Crop as Seed, 442
Sahlar, A. B. : A Doubly Charged Cosmic Ray Particle, 811
Saksena, Dr. Bishambhar Dayal : Calculation of the Piezo-electric Constants of α- and β-Quartz, 283
Salisbury, Sir Edward : Trees in Prose and Picture, *review*, 497
  Plant Geography, *review*, 704, 857
  Obituary of Prof. F. O. Bower, 754
Salisbury, Winfield W. (Menzel, Dr. Donald H., and) : Audio-Frequency Radio Waves from the Sun, 91
Salmon, Dr. W. D., and others : Nutrition in relation to Cancer, 106
Sampford, M. R. : Industrial Experimentation (K. A. Brownlee), third edition, *review*, 747
Samuels, Dr. Jules : Die hormonalen Aspekte des Fortpflanzungsprozesses, *review*, 297
  Die Hormonversorgung des Fœtus, *review*, 297
Sandeman, Dr. E. K. : Radio Engineering, Vol. I, *review* by Dr. L. E. C. Hughes, 706
Sanger, Dr. Ruth, and others : *Rh* Genes Allelomorphic to *C*, 316
Sanitary Institute, Royal : Annual Congress of the, 1025
Sanitary Institute, Royal (Food Group of the Society of Chemical Industry and the) : Discussion on the Cleaning and Sterilizing of Plant in the Food Industry, 1025
Sansome, Dr. F. W. : Natural Selection of *Drosophila*, 409
Sarton, Prof. George : The Place of the History of Science in Education, 572
Saul, A. P. H. : A Proposed Institute of Recorded Sound, 493
Sawyer, W. W., and others : Empirical Data on Hilbert's Inequality, 361
Saxton, Dr. J. A. : Meteorological Factors in Radio-Wave Propagation, 146
Saxton, Dr. J. A. (Jackson, Prof. Willis, and) : Radio Physics, 795
Scarborough, Dr. Harold : Appointed lecturer with title of reader in the Department of Medicine in the University of Birmingham, 233
Scarlott, C. A. (Bendz, W. I., with the assistance of) : Electronics for Industry, *review* by Prof. J. Hollingworth, 582
Schallamach, Dr. A. : Ultrasonic Dispersion in Organic Liquids, 476
Schatzman, Dr. Evry : Spectrum of White Dwarfs, 61
Schnurmann, Dr. Robert (Bezer, Henry James, and) : Rate of Wear in the Region of the Validity of Amontons' Law, 728
Schoental, Dr. R. (Cook, Prof. J. W., and) : Oxidation of Anthracene by Osmium Tetroxide, 237
Schofield, K., and Swain, T. : Nitration of Simple Heterocycles, 690
Schönberg, Prof. Alexander, and Barakat, Mohamed Zaki : Stereochemistry of Trimeric Thioaldehydes, 722
Schönberg, Prof. Alexander, and Sina, Aly : Xanthotoxin from the Fruits of *Ammi majus* L., 481
Schonland, Dr. B. F. J. : *Obituary* of Prof. Alexander Ogg, 633
Schuftan, Dr. P. M. : Insulating Materials and Methods for Use at Low Temperatures, 323
Schurer, H. : Public Libraries in Germany, 90
Schuster, Sir George : Human Factors in Industry, 791
Schwamb, Peter, and others : Elements of Mechanism, sixth edition revised by Prof. Venton Levy Doughtie, *review* by F. G. W. Brown, 79
Science and Religion, 428
Science Masters' Association : Forty-fifth Annual Meeting, 144
Science Masters' Association (Scottish Branch) : First Annual General Meeting, 655
Science Masters' Association, and others : Discussion on the Place of the History of Science in Education, 347, 572
Science Museum : Exhibition, Darkness into Daylight, 674, 821
Science Service, Washington, D. C. : Election of Dr. Karl Lark-Horovitz and Charles E. Scripps as trustees, 842
  Election of officers, 842
Science Writers (British), Association of : Open to accept Associate Members, 272
  Forum Discussion on Science and the Press, 882
Scientific Civil Service : Promotion of Individual Research Workers, 195
Scientific Exports (Great Britain), Ltd. : Technical Bulletin No. 1, 345
Scientific Film Association : Conference on Films in Agriculture, 17
Scientific Film Association (Royal Society of Medicine and the) : Catalogue of Medical Films, 594
Scientific and Industrial Research, Department of : Appointment of Dr. R. L. Smith-Rose as director of radio research work, 125
  Series of films on Science in the Service of the Nation, 717
Scientific and Industrial Research, Department of (University of Cambridge, in co-operation with the) : Summer Course in Food Science, 1007
Scientific Radio, British National Committee for (Radio Section of the Institution of Electrical Engineers, and the) : Convention on Scientific Radio, 233
Scientific Radio Union, International : Conference at Stockholm, 695
Scientific Relations (Overseas) : Inter-Departmental Committee on, 800
Scientific Research, India : Department of, 1004
Scientific Research in Industry and Agriculture, Institute for the Encouragement of : Annual Report for 1946, 634
Scientific Research and Technical Development, Advisory Council on : Appointment of Sir Howard Florey, Prof. J. L. M. Morrison and Prof. L. Rosenhead as members, 924
Scientific Societies, South-Eastern Union of : Fifty-second Annual Congress, 882
Scientific Unions, International Council of : Report of the Executive Committee, July 1947, 677
Scientific Workers, Association of : Conference on Science in Social Affairs, 68
Scientists and Physicians in the Netherlands, Christian Society of (Society of Calvinist Lawyers and the) : Discussion on Atomic Energy, 123
Scott, B. A. : Photometric Measurement of Specific Surface, 358
Scott, Dr. I. Martin : Mycological Education, 507
Scottish Council (Development and Industry) : Address by Sir Edward Appleton on Science and the Progress of Industry, 368
Scottish Museum, Royal : Annual Report for 1946, 470
Scottish Naturalist, 923
Scottish Society for the History of Medicine : Proposed establishment of a, 555
Scottish Zoo and Wild Life, 923
Scripps, Charles E. : Elected a trustee of Science Service, Washington, D.C., 842
Sears, J. E. : Awarded a moiety of the Clayton Prize for 1947 of the Institution of Mechanical Engineers, 470
Seekles, Prof. L. : Trace Elements in Plant Physiology, 365
  Fison Lectures of the Animal Health Trust, 637, 1005
Selényi, Dr. P. : Photography on Selenium, 522
Seligman, G. : Growth of Glacier Crystals, 485
  The Flow of Glaciers, 819
Seligman, Dr. Richard : The Flow of Glaciers, 819
Sellers, K. C. (McGaughey, C. A., and) : Microflora of the Rumen, 1014
Selman, I. W. : Plant Virus Diseases, 945
Seltzer, Carl C., and others : What People Are, a Study of Normal Young Men, *review*, 502
Selye, Prof. Hans : Textbook of Endocrinology, *review* by Dr. F. H. A. Marshall, 953
Sen, K. C. (Sen Gupta, Dr. N. C., and) : A Text Book of Physical Chemistry, new edition, *review*, 460
Sen, M. K., and others : Some Tensile Properties of Jute, 737
Sen, M. K., and Woods, H. J. : X-Ray Investigation of the Structure of Jute, 768
Sen Gupta, Dr. N. C., and Sen, K. C. : A Text Book of Physical Chemistry, new edition, *review*, 460
Serological Museum of Rutgers University, 428
Seshachar, B. R. : The Nucleolus of the Apodan Sertoli Cell, 558
Sewell, Lieut.-Colonel R. B. Seymour : The Free-Swimming Planktonic Copepoda, 822
Sexton, Dr. W. A., and Templeman, Dr. W. G. : Differential Effect of 2-Benzoylbenzoic Acid and its Derivatives upon Plant Species, 974
Seymour, Charles : Honorary degree of the University of Cambridge conferred on, 965
Seymour, D. E., and others : *p*-Aminosalicyclic Acid in the Treatment of Tuberculosis, 435
Shakespear, Dr. G. A. : *Obituary* of Sir Charles Grant Robertson, 510
Shapiro, B., and others : Active Penetration of Fat into Adipose Tissue, 482
Shapley, Dr. Harlow : Galaxies, *review* by H. S. J., 460
  Re-elected president of Science Service, Washington, D.C., 842
Shattock, Dr. P. M. F. : Serological Position of *Streptococcus bovis*, 318
Shaw, H. K. A. : The Study of Critical British Groups, 735
Shaw, J. J. : *Death* of, 839 ; *obituary* by Ernest Tillotson, 920
Shaw, Thomas : Marketing Agricultural Produce, 470
Sheffield, F. M. L. (Crook, E. M., and) : Plant Virus Diseases, 945
Sheppard, Prof. P. A. : Meteorology for the Professional Meteorologist, *review*, 625
Sheppard, Dr. S. E. : Retirement from the Eastman Kodak Research Laboratories, 270 ; work of, 270
Sheridan, Dr. J. : Mechanisms of Reactions at Carbon-Carbon Double Bonds (Prof. Charles C. Price), *review*, 626

Sherlock, Sheila, and Walshe, Veryan : Effect of Under-Nutrition in Man on Hepatic Structure and Function, 604
Sherrin, W. R. : Collection of Bog-mosses (*Sphagnum*) presented to the Royal Botanic Gardens, Kew, 716
Sherrington, Sir Charles, and Diphtheria Antitoxin (Dr. A. N. Drury), 266
Shoppee, Dr. C. W. : Nature of the *C/D*-ring Union in the Œstrogenic Hormones, 207
  Appointment to the chair of chemistry at University College, Swansea, 1004 ; work of, 1004
Shortt, Prof. H. E., and Garnham, P. C. C. : Pre-erythrocytic Stage in Mammalian Malaria Parasites, 126
Sibly, Sir Franklin : *Death* of, 634 ; *obituary* by Prof. H. L. Hawkins, 672
Sikorsky, I. I. : Awarded the Silver Medal of the Royal Aeronautical Society, 593
Simon, Prof. F. E. : Insulating Materials and Methods for Use at Low Temperatures, 324
Simon, Colonel Leslie E. : German Research in World War II, *review*, 219
Simpson, Charles : Foundations of Chemical Theory, *review*, 503
Simpson, J. C. E., and others : Cinnoline Derivatives as Chemotherapeutic Agents for *Trypanosoma congolense* Infections, 603, 758
Simpson, O., and others : Lead Telluride Cells for Infra-Red Spectroscopy, 281
Simpson, S. A., and Williams, P. C. : Improved Method of Getting Rats' Eggs from the Fallopian Tubes, 237
Sina, Aly (Schönberg, Prof. Alexander, and) : Xanthotoxin from the Fruits of *Ammi majus* L., 481
Sinclair, D. C., and others : Intravenous Methylene Blue, a New Method for Studying the Nervous System, 318
Sinclair, Dr. Hugh M. : Awarded the Medal of Freedom with Silver Palm by the Government of the United States, 215
Sinclair, J. : Appointed curator of the Herbarium, Singapore, 471
Singapore Herbarium : Appointment of J. Sinclair as curator, 471
Singh, Dr. B. N. : Degree of D.Sc. of the University of London conferred on, 233
Singh, Dr. B. N. (Anscombe, Dr. F. J., and) : Limitation of Bacteria by Micro-Predators in Soil, 140
Singh, H. B., and others : Inheritance of Sex Forms of *Luffa acutangula* Roxb., 775
Skinner, Dr. H. A., and others : Bond-Strength of C—Cd in Cadmium Methyl and of C—I in Methyl Iodide, 725
Slater, E. C. : A Factor in Heart Muscle required for the Reduction of Cytochrome *c* by Cytochrome *b*, 405
Slater, Prof. John C., and Frank, Prof. Nathaniel H. : Mechanics, *review* by J. H. Pearce, 376
Sloman, H. A. : Promoted to the grade of Senior Principal Scientific Officer, 195
Smart, Dr. G. A. : Awarded a Commonwealth Fund Fellowship, 1006
Smart, Dr. John : Lice, second edition, 389
Smart, R. Cecil : Awarded the Nursey Premium of the Society of Engineers, 346
Smart, Prof. W. M. : *Obituary* of Prof. Ludwig Becker, 161
Smith, Dr. A. E. Wilder (Hausmann, W., and) : Isomerization of Dienœstrol, 892
Smith, Eng.-Capt. Edgar C. : Scientific Centenaries in 1948, 11
Smith, Dr. F. (Nicholas, S. D., and) : Acetylation of Sugars, 349
Smith, H. C. : Appointed livestock officer, Tanganyika, 637
Smith, H. Williams : Calcium-Deficient Media—their Effect on Phage Action, 397
Smith, Dr. Kenneth M. : Plant Virus Research at Cambridge, 776
Smith, Dr. Kenneth M., and others : Molecular Arrangement in Tobacco Necrosis Virus Crystals, 760
Smith, Dr. M. S. : Persistence of *D.D.T.* and Benzene Hexachloride in Soil, 246
Smith, Dr. R. A. : Radio Aids to Navigation, *review* by Dr. R. L. Smith-Rose, 334
  Radio Physics, 796
Smith, Stuart : Bird Watching, 554
Smith, Webster : The Flow of Glaciers, 820
Smith, Dr. W. Campbell : *Obituary* of Prof. F. A. A. Lacroix, 962
Smith-Rose, Dr. R. L. : Appointed director of research at the Radio Research Establishment of the Department of Scientific and Industrial Research, 125, 387
  Meteorology and the Propagation of Radio Waves, 145
  Modern Radio Technique, *review*, 334
  Wireless Direction Finding, *review*, 375
  Scientific Radio, 793
Smithsonian Institution, Commonwealth of Australia, and the National Geographic Society : Scientific Expedition to Arnhem Land, 195
Smout, Sir Arthur : Elected president of the Institute of Metals, 468
  Past and Future of the Institute of Metals, 468
  The Flow of Glaciers, 819
Smuts, General : Elected chancellor of the University of Cambridge, 233
  Installed as chancellor of the University of Cambridge, 965
Smyth, Dr. J. D. : Development of Cestodes *in vitro*—Production of Fertile Eggs ; Cultivation of Plerocercoid Fragments, 138
Sneddon, Dr. I. N., and Touschek, B. F. : Nuclear Models, 61
Snellman, Olle, and Erdös, Thomas : Effect of Calcium Ions on the Charge of Myosin, 526
Snellman, Olle, and others : A New Extraction Procedure for the Preparation of Heparin, 639
Snoek, Dr. J. L. : New Developments in Ferromagnetic Materials, *review* by F. C. T., 666
Snoek, Dr. J. L., and Fast, J. F. : Metastable States of Nickel Characterized by a High Initial Permeability, 887
Snoek, Dr. J. L. (Dijkstra, Dr. L. J., and) : Effect of Lattice Distortions on the Mean Rate of Propagation of Large Barkhausen Discontinuities, 886
Snow, G. R. S. : Elected a Fellow of the Royal Society, 467
Snyder, L. H., and others : Nomenclature of the anti-*Rh* Typing Sera, 492
Social Hygiene Council, British : Ethics and Science Conference on Society and the Individual, 197
  Summer School on the Schools and the Land, 470
  Summer School on the International and Cultural Relations of Social Biology, 842
  Ethics and Science Conference on Where does Freedom End, 843
Social Hygiene Council, British, and the Town and Country Planning Association : Conference on the Family, 125
Social Science Research Council, Colonial : Third Annual Report, 142
Soddy, Dr. Kenneth : Sociology of Mental Disease, 408
Sols, Dr. A., and others : Effect of Insulin on Intestinal Glucose Absorption in Alloxan Diabetic Rats, 932
Sondheimer, E. H. (Reuter, G. E. H., and) : Theory of the Anomalous Skin Effect in Metals, 394
Sopwith, D. G. : Appointed superintendent of the Engineering Division of the National Physical Laboratory, 552 ; work of, 552
South African Council for Scientific and Industrial Research : Second Annual Report, 903
South African Institute for Medical Research : Annual Report for 1946, 162
South African Museums Association : Annual General Meeting (J. R. Harding), 984
South-Eastern Union of Scientific Societies : Fifty-second Annual Congress, 882
Southern, H. K. (Ingram, G. B., and) : Polarographic Determination of the Gamma-Isomer of Benzene Hexachloride, 437
Southgate, Dr. B. A. : Biological Aspects of Water Pollution, 874
Spaul, Prof. E. A. : The Field Study and Conservation of the British Fauna, 409
Spayne, A. J., and others : Pinhole Radiography of Magnetrons, 244
Speakman, Prof. J. B. : Bibliography of the Technical Literature on Silk (Dr. F. O. Howitt), *review*, 790
Speakman, Prof. J. B. (Farnworth, A. J., and) : Action of Sulphuryl Chloride on Wool, 850
  Chemical Mechanism of Permanent Set, 890
Speakman, Prof. J. B. (Peters, L., and) : The Viscous-Elastic Properties of Wool Fibres, 737
Special Libraries and Information Bureaux, Association of : Study Group on Special Librarianship, 430
  Meeting to discuss the formation of a proposed Institute of Recorded Sound, 493
Special Libraries and Information Bureaux, Association of, (Northern Branch) : Conference, 430
Speech Therapists, College of : Conference on Speech Therapy, 125
Speirs, Dr. L. : Surface Resistance of Metal Films at a Frequency of 24,000 Mc./s., 601
Spenceley, G. W. and R. M. : Smithsonian Elliptic Functions Tables, *review*, 747
Spencer, Steven M. : Awarded an American Association for the Advancement of Science—George Westinghouse Science Writing Award for 1947, 125
Sperber, I. : Specific and Non-Specific Competition in Tubular Excretion, 236
Spiers, J. A. : Angular Distribution of Radioactive Disintegration Products, 807
Sprague, Dr. T. A. : Forms of *Valeriana officinalis*, 734
Sprigg, Reg. C. : Newly Discovered Submarine Canyons of New Guinea and South Australia, 246
  Jellyfish from the Basal Cambrian in South Australia, 568
Spring, Prof. F. S., and others : *p*-Aminosalicylic Acid in the Treatment of Tuberculosis, 435
Srisukh, S. (Goodwin, T. W., and) : The Carotenoids of the Locust Integument, 525
St. Bartholomew's Hospital Medical College : Retirement of Prof. H. Hartridge from the University of London chair of physiology, 49
  Appointment of Prof. J. W. S. Blacklock to the University of London chair of pathology, 924
St. Mary's Hospital Medical School : Title of reader in morbid anatomy in the University of London conferred on Dr. D. M. Pryce, 924
St. Thomas's Hospital Medical School : Appointment of Dr. Leslie Young to the University of London chair of biochemistry, 233
  Appointment of Mary Barber to the University of London readership in bacteriology, 637
Stacey, Prof. M., and others : Conversion of *D*-Arabinose into 2-Deoxy *D*-Ribose and 3-Deoxy *D*-Xylose, 21
Stamp, Lord : Title of professor of bacteriology in the University of London conferred on, 51
Stamp, Prof. L. Dudley : Physical Planning in the South-West of England, *review*, 786
  Landscape Architecture, *review*, 868
  The Land of Britain, its Use and Misuse, *review* by Sir John Russell, 906
Stanley, G. J. (Bolton, J. G., and) : Variable Source of Radio Frequency Radiation in the Constellation of Cygnus, 312
Stanley, Dr. Robert Crooks : Awarded the Institute of Metals (Platinum) Medal for 1948, 344
Stanley, Dr. Wendell M. : Appointed professor of biochemistry in the University of California and director of a new Virus Laboratory, 49 ; work of, 49
Stanworth, J. E. : Transmission of Bactericidal Radiation through Glass, 856, *erratum*, 882
Statens Skogsforskningsinstitut : *Meddelandan* fran, Vol. 35 (1946), 781
Statistical Society, Royal : Offer of the Frances Wood Memorial Prize for 1948, 390
Stazione Zoologica di Napoli, 738
Steacie, Dr. E. W. R. : Elected a Fellow of the Royal Society, 467
Stebbing, Prof. E. P. : Practical British Forestry, *review*, 295
  World Forestry and Forest Products, 710
Steel, Robert W. : Awarded the Murchison Grant for 1948 of the Royal Geographical Society, 553
Steele, J. : Awarded a research grant by the Animal Health Trust, 924
Steenbjerg, Prof. F. : Trace Elements in Plant Physiology, 365
Steenland, M. J., and others : Magnetic Observations and Thermometry in the Region of Millidegrees Absolute, 678
Stein, Gabriel, and Weiss, Dr. Joseph : Chemical Effects of Ionizing Radiations, 650
Stenton, Sir Frank : Honorary degree of doctor of laws of the University of Sheffield conferred on, 555
Stephenson, Alfred : Title of reader in surveying in the University of London conferred on, 51
Stephenson, Rev. Dr. Thomas : *Death* of, 634 ; *obituary* by V. S. Summerhayes, 799
Stephenson, Prof. T. A. : Problems of Tidal Biology, 796

Sterland, E. G. : Gas Turbines, *review*, 910
Stern, E. S. (Braude, Dr. Ernest A., and) : Solvation of Hydrogen Ion in Oxygen-containing Solvents, 169
Stetson, Dr. Harlan True : Sunspots in Action, *review* by Dr. M. A. Ellison, 951
Steven, G. A. : The Fisheries School at Cronulla, New South Wales, 986
Steven, G. A. (Cooper, Dr. L. H. N., and) : An Experiment in Marine Fish Cultivation, 631
Stevens, G. W. W. : Resolution Testing in Autoradiography, 432
Stevens, Jun., Herbert H. : Roofs Supported by Air Pressure, 613
Stewart, Dr. Donald : Sociology of Mental Disease, 407
Stewart, Dr. G. T., and others : *Streptococcus fæcalis* in *E. histolytica* Infections, 936
Stewart, H. G. : Appointed senior veterinary officer, Uganda, 802
Stewart, I. G. : Awarded a Commonwealth Fund Fellowship, 1006
Stibbs, T. C. : Appointed mining inspector, Lands and Mines Department, British Guiana, 802
Stickland, Dr. A. C. : Meteorological Factors in Radio-Wave Propagation, 146
Stigant, S. Austen : Modern Electrical Engineering Mathematics, *review* by V. J. Francis, 541
Stockdale, Sir Frank : Factors of Agricultural Production in the British Colonial Empire, 337
Stocks, Dr. Percy : Regional and Local Differences in Cancer Death Rates, 17
Stoker, M. G. P. (Miles, J. A. R., and) : Puffinosis, a Virus Epizootic of the Manx Shearwater (*Puffinus p. puffinus*), 1016
Stokes, Dr. Alexander R. : Phase-Angle Determination in X-Ray Crystallography, 679
Stokes, P. E. : Awarded an Agricultural Research Council Postgraduate Scholarship, 16
Stonyhurst College Observatory (Rev. P. J. Treanor), 285
Störmer, Prof. Carl : Auroral Activity in Southern Norway from the Middle of August to the Middle of October 1947, 208
Storti, Prof. Edoardo : Awarded a grant from the Lady Tata Memorial Fund, 966
Stott, F. D., and Engel, Dr. A. von : Optical Transmission of a Colloidal Solution in a Magnetic Field, 728
Stott, R. W. : Electronic Theory and Chemical Reactions, second edition, *review* by Prof. E. D. Hughes, 503
Straiton, Prof. A. W., and Tolbert, C. W. : Dielectric Properties of Soils and Water at a Wave-length of 3·2 cm., 73
Stratton, Andrew : Awarded the Medal of Freedom with Bronze Palm by the Government of the United States, 215
Stratton, Prof. F. J. M. : Appointed deputy scientific adviser to the Army Council, 388
  Sons of Cambridge, *review*, 661
Streat, Sir Raymond : Elected chairman of the Manchester Joint Research Council, 272
  Presented by the Netherlands Ambassador with the Insignia of Commander in the Order of Orange-Nassau (Civilian Division), 307
Street, Dr. H. E. (Dormer, Dr. K. J., and) : Secondary Thickening in Excised Tomato Roots, 483
Stubbs, Dr. A. L., and others : Chemistry of Visual Processes, 424
Sturtevant, Prof. A. H. : Elected an honorary member of the Genetical Society of Great Britain, 595
Süe, P., and Kayas, G. : The Behaviour of some perfect Cobalt Complexes in Szilard-Chalmers Reactions, 901
Sugar Research Foundation : Third Annual Prize awarded to Dr. Leslie F. Wiggins, 756
Sugden, Prof. S. (Evans, C. C., and) : Exchange Reactions and Electrolytic Dissociation, 901
Sulman, Dr. Felix : Preparation of Œstrogens from Urine by Application of High Temperatures, 605
Summerhayes, V. S. : *Obituary* of Dr. Thomas Stephenson, 799
Summerhayes, V. S., and Turrill, Dr. W. B. : Vegetation after Draining, 421
Summerson, Dr. William H., and others : Practical Physiological Chemistry, twelfth edition, *review*, 830
Sumner, W. L. : Grammar School Science, *review*, 114
Supply, Ministry of : Appointment of Dr. F. J. Wilkins as principal director of scientific research (defence), 715
Surányi, Dr. Paul : The Fall Webworm of North America in Europe, 512
Sutherland, Dr. G. B. B. M., and others : Lead Telluride Cells for Infra-Red Spectroscopy, 281
Sutherland, Dr. Robert : The Health of the School Child, 960
Svensson, Harry : A Short-Focus Modification of the Lamm Scale Method for Measuring Refractive Index Gradients, 234
Swain, T. (Schofield, K., and) : Nitration of Simple Heterocycles, 690
Swainger, Dr. K. H. : A Coefficient of Viscous Extension, 650
Swainson, O. S. : Appointed director of agriculture, Zanzibar, 802
Swan, A. D. : Appointed assistant meteorologist, West Africa, 966
Swan, J. B. (Darby, J. F., and) : Scattering of D—D Neutrons by Deuterium, 22
Swarbrick, Dr. T. : Growth-promoting Substances in Horticulture, 656
Swietoslawski, Prof W. : Microcalorimetry, *review* by Dr. Ezer Griffiths, 460
Swiss Zootechnical Society : Meeting to discuss the formation of an International Society of Zootechny, 322
Sylvén, Dr. Bengt, and others : A New Extraction Procedure for the Preparation of Heparin, 639
Szwarc, Dr. M. : Energy of the Central C—C Bond in Diphenyl, 890

TANNENBAUM, Dr. Albert, and others : Nutrition in relation to Cancer, 106
Tanner, Prof. Väinö : *Death* of, 799
Tansley, A. G. : Introduction to Plant Ecology, 158
Tansley, A. G., and Evans, E. Price : Plant Ecology and the School, 158
Tar Confederation, British : Formation of a Coal Tar Research Association, 757
Tarrant, A. G. : Promoted to the grade of Senior Principal Scientific Officer, 195
Tarrant, Dr. G. T. P. : Electricity, Magnetism and Modern Physics, *review* by Prof. L. F. Bates, 829
Tata Memorial Fund : Grants and Scholarships, 233
  Awards for research in Blood Diseases, 966
Tate, G. H. H. : Mammals of Eastern Asia, *review* by T. C. S. M.-S., 188
Tate, Dr. P. : White-eyed Mutants of Diptera, 641
Tatum, Dr. E. L., and others : Nutrition in relation to Cancer, 106
Taylor, E. L., and Mozley, Alan : A Culture Method for *Lymnæa truncatula*, 894
Taylor, Dr. F. Sherwood : The Place of the History of Science in Education, 572
Taylor, G. : *Obituary* of Dr. Bernard S. Dyer, 386
Taylor, Sir Geoffrey : Elected an Honorary Member of the Institute o Metals, 16
Taylor, Dr. George : Plant Collecting in the Far East, 635
Taylor, George E., and others : The Artificial Insemination of Farm Animals, edited by Enos J. Perry, *review* by Dr. Arthur Walton, 831
Taylor, Prof. Griffith : Canada, *review*, 912
Taylor, H. Dennis : The Adjustment and Testing of Telescope Objectives, fourth edition, *review*, 419
Taylor, Dr. H. G. : Appointed director of the British Welding Research Association, 49 ; work of, 49
Taylor, M. K. : Awarded a Page Prize for 1947 of the Institution of Electrical Engineers, 90
Taylor, R. J., and others : Units and Useful Range in Photo-electric Colorimetry, 247
Taylor, T. W. J. : Awarded the Medal of Freedom with Bronze Palm by the Government of the United States, 215
Taylor, Dr. W. H. : Structure and Physical Properties of Metals, 263
Technical Publications in Sheffield, Organisation for the Interchange of : Report for 1947, 305
Telecommunications Research Establishment, Malvern : Exhibition of the work carried out at the, 918
Templeman, Dr. W. G. (Sexton, Dr. W. A., and) : Differential Effect of 2-Benzoylbenzoic Acid and its Derivatives upon Plant Species, 974
Tennyson, Sir Charles : Industrial Co-operation, 571
Terrill, Clair E., and others : The Artificial Insemination of Farm Animals, edited by Enos J. Perry, *review* by Dr. Arthur Walton, 831
Textile Institute : Annual Report of the, 635
  Conference on the Organisation of the Textile Industry, 842
Textile Institute, and others : Conference on the Rheological Properties of Textile Materials, 307, 737
Thesiger, Wilfred : Awarded the Founder's Medal for 1948 of the Royal Geographical Society, 553
Thijsse, Prof. J. Th. : Model Research in Hydraulics, *review*, 219
Thimann, Kenneth V., and Behnke, Jane : The Use of Auxins in the Rooting of Woody Cuttings, *review* by Prof. M. Thomas, 993
Thomas, D. G. : Appointed botanist, Uganda, 51
Thomas, D. R. O. : Conscription and Industry, 304
Thomas, F. W. : Appointed senior agricultural officer, Tanganyika, 471
Thomas, Dr. H. A. : Radio Noise, 795
Thomas, Dr. H. A., and Burgess, R. E. : Survey of Existing Information and Data on Radio Noise over the Frequency Range 1-30 Mc./s., 107
Thomas, J. F. (Harris, Dr. R. J. C., and) : Isolation and Separation of the Pyrimidine Nucleosides of Yeast Ribosenucleic Acid, 931
Thomas, Prof. M. : *Obituary* of Prof. M. C. Potter, 590
  Chemical Promotion of Rooting in Plants, *review*, 993
Thomas, Richard N. : Awarded a Frank B. Jewett Fellowship for 1948–49 by the American Telephone and Telegraph Co., 429
Thomas, Prof. W. Norman : Awarded the Medal of Freedom by the Government of the United States, 716
Thompson, Allyn J. : Making your own Telescope, *review*, 502
Thompson, Sir D'Arcy Wentworth : A Glossary of Greek Fishes, *review* by Sir John Myres, 185, 272
  Death of, 1003
Thompson, Dr. J. F. : Elected an Honorary Member of the Institute of Metals, 16
Thompson, K. F. : Awarded an Agricultural Research Council Postgraduate Scholarship, 16
Thompson, Dr. R. H. S. : Development of British Anti-Lewisite (*B.A.L.*), 226
Thomsen, Dr. Ellen : Effect of Removal of Neurosecretory Cells in the Brain of Adult *Calliphora erythrocephala Meig.*, 439
Thomsen, I. L. : Solar Radio Emissions and Sunspots, 134
Thomson, A. (Charlwood, P. A., and) : Electrophoretic Patterns of Lamb Serum Before and After Transfer of Colostrum, 59
Thomson, Amherst F. H. : Awarded the Medal of Freedom by the Government of the United States, 215
Thomson, Dr. A. Landsborough : Orientation of Birds on Migratory and Homing Flights, 998
Thomson, Dr. Donald F. : Awarded the Cuthbert Peek Grant for 1948 of the Royal Geographical Society, 553
Thomson, Sir George : Honorary degree of doctor of laws of the University of Aberdeen conferred on, 555
  The Growth of Crystals, 800
  Obituary of Prof. A. S. Eve, 838
  The Atom, third edition, *review* by P. B. M., 871
Thomson, Sir George, and Baker, Dr. John R. : Proposed Central Publication of Scientific Papers, 771
Thomson, Sir George, and others : Atomic Challenge, a Symposium, *review*, 995
Thomson, Prof. Godfrey : The Trend of National Intelligence (with a Symposium by Sir Alexander Carr-Saunders, Sir Cyril Burt, Prof. Lionel Penrose and Prof. Godfrey Thomson), *review* by Dr. Julian Blackburn, 37
Thomson, Dr. J. : Total Emission Damping, 847
Thomson, Prof. R. B. : *Death* of, 270
Thorne, A. L. C. : Appointed veterinary education officer, Nigeria, 637
Thorpe, Dr. W. H. : Interaction of Water and Porous Materials, 630
  Orientation of Birds on Migratory and Homing Flights, 996
Threlfall, H. R. : Appointed surveyor, Tanganyika, 51
Tilak, B. D., and others : Ammonium Salts of Sulphanilamides and Sulphonic Acids, 55
Tilley, Michael F. : Housing the Country Worker, *review* by R. B., 665

Tillotson, Ernest : Earthquakes and Volcanoes, *review*, 296
    Pure and Applied Seismology, *review*, 459
    Obituary of J. J. Shaw, 920
Tin, U. (Rhind, D., and) : Results of the Continuous Use of an Ammonium Phosphate Fertilizer on Rice in Lower Burma, 105
Tipper, Dr. C. F. : A 150-ton Universal Structure Testing Machine, 656
Tippett, —. : Operational Research in the Research Associations, 585
Tizard, Sir Henry : Honorary degree of doctor of laws of the University of Sheffield conferred on, 555
    Human Factors in Industry, 791
Todd, Prof. A. R., and others : Synthesis of Adenosine Triphosphate, 761
Todd, D. C. : Appointed agricultural officer, Uganda, 471
Todd, Dr. J. A. : Elected a Fellow of the Royal Society, 467
Tolansky, Prof. S., and Bardsley, W. : Application of Multiple-Beam Interferometry to the Study of Oscillating Quartz Crystals, 925
Tolbert, C. W. (Straiton, Prof. A. W., and) : Dielectric Properties of Soils and Water at a Wave-length of 3·2 cm., 73
Tomlinson, T. G. : Biological Aspects of Water Pollution, 875
Toovey, F. W. : Appointed officer-in-charge, Oil Palm Research Station, Nigeria, 637
Torkington, P. : Variation of the Force Constant with the Ionization Potential and the Polarizability for some Halogen Compounds, 724
Torriani, Annamaria : Behaviour of Gorini's Acid-Proteolytic Lactic Cocci with Penicillin, 275
Torrie, Brigadier A. : Sociology of Mental Disease, 408
Tötterman, Dr. Guido H. R. : Awarded a Scholarship from the Lady Tata Memorial Fund, 966
Touschek, B. F. (Sneddon, Dr. I. N., and) : Nuclear Models, 61
Towl, Asst. Prof. Andrew R. (Copeland, Melvin T., and) : The Board of Directors and Business Management, *review* by E. F. L. Brech, 869
Town and Country Planning Association (British Social Hygiene Council and the) : Conference on the Family, 125
Townend, Dr. D. T. A. : Britain's Fuel Problems, 669
Toy, Dr. F. C. : Operational Research in the Research Associations, 584
Toynbee, Arnold : Honorary degree of the University of Cambridge conferred on, 965
Toyne, S. M. : The Place of the History of Science in Education, 572
Tracy, Prof. Paul Hubert, and others : The Ice Cream Industry, second edition, *review* by Dr. L. H. Lampitt, 500
Trade, Board of : Reports on German War-time Industry and Science, 388
    Working Party Report on the Cutlery Industry, 448
    Working Party Report on Rubber-proofed Clothing, 448
    Working Party Report on Hand-blown Domestic Glassware, 449
Treanor, Rev. P. J. : Stonyhurst College Observatory, 285
Tredgold, Dr. R. F. : Human Factors in Industry, 791
Trent, P. T. (George, Dr. E. P., and) : High-Altitude Measurements on Cosmic Rays—Penetrating Bursts, 248
Trotman, Cyril G. : Awarded the Medal of Freedom with Silver Palm by the Government of the United States, 215
Trowell, Dr. O. A. : Brain and Mind, *review*, 498
    Advances in Physiology, *review*, 542
Trueta, Dr. Josep, and others : Studies of the Renal Circulation, *review*, 663
Truscott, Prof. S. J. : Honorary membership of the Institution of Mining and Metallurgy conferred on, 923
Tschopik, Jr., Harry : Highland Communities of Central Peru, 697
Tsetse Research Control Department, Tanganyika : Appointment of J. I. Moggridge as director, 637
Tuck, J. L., and others : A 16-MeV. Betatron, 472
Tucker, B. W. : Orientation of Birds on Migratory and Homing Flights, 998
Tulasne, Prof. R., and Vendrely, Dr. R. : Cytology of Staphylococci before and after Treatment with Penicillin, 316
Turnbow, Grover Dean, and others : The Ice Cream Industry, second edition, *review* by Dr. L. H. Lampitt, 500
Turner, E. E. : Elected president of the Society of Engineers, 346
Turner, Prof. John P. : Guide to the Study of the Anatomy of the Shark, *Necturus*, and the Cat, second edition, *review* by Dr. P. D. F. Murray, 955
Turrill, Dr. W. B. : Experimental Studies on British Species of Plants, 734
Turrill, Dr. W. B. (Summerhayes, V. S., and) : Vegetation after Draining, 421
Turtle, E. E. (Freeman, J. A., and) : Insect Pests of Flour, 554
Tutin, Prof. T. G. : The Study of Critical British Groups, 735
Twigg, Dr. G. H. : The Assaying of Penicillin, 286
Tyndall, Prof. A. M. : Retirement from the Henry Overton Wills chair of physics at the University of Bristol, 272, 755 ; work of, 755
Tyrrell, Dr. G. W. : The New Eruption from Hekla, 41
Tyrwhitt, Jaqueline (Colvin, Brenda, and) : Trees for Town and Country, *review* by Sir Edward Salisbury, 497

UBISCH, H. von : A New Hot-Wire Vacuum Gauge, 927
Ukil, Dr. A. C. : Scientific Research in India, 513
Unasylva, a Forestry and Forest Products Review, No. 1, 89
UNESCO : Second General Conference of, 159
    Science and, 159
    Appointment of Dr. Clarence E. Beeby as assistant director-general, 304
    Appointment of Prof. Emile Auger as head of the Natural Sciences Section, 304
    Appointment of Prof. Pedro Bosch Gimpera as director of the Philosophy and Humanistic Studies Section, 304
    Appointment of Gordon Menzies as director of administrative services, 304
    Appointment of Dr. Joseph Needham as honorary scientific adviser, 758
    Contribution of 3,000 dollars to the travelling expenses of the official members of the Union Radio Scientifique Internationale, and another 3,000 dollars to the publication of the Report of the General Assembly, 843
Union Radio Scientifique Internationale : Contribution from UNESCO of 3,000 dollars to the travelling expenses of the official members, and another 3,000 dollars to the publication of the Report of the General Assembly, 843
United Nations : Conference on the Conservation and Utilization of Resources, 617
United Nations (Food and Agriculture Organisation of the) : Publication of No. 1 of *Unasylva*, 89
    Energy-Yielding Components of Food and Computation of Calorie Values, 306
    Appointment of Norris E. Dodd as director-general, 637
    Appointment of Sir Herbert Broadley as deputy director-general, 637
    Forestry and Forest Products ; World Situation 1937–1946, 710
United States, Government of the : Awards to British Men of Science, 215, 390, 716, 800
United States National Academy of Sciences : Medal Awards, 49, 861
    Election of Officers and Members, 860
United States National Museum : Appointment of Dr. A. Remington Kellogg as director, 965
United States National Research Council : New programme of Atomic Energy Commission Fellowships, 593
United Steel Companies, Ltd. : Visit to branches by mechanical and production engineering professors from British Universities, 881
Universities of the British Empire : Congress of, 430
Universities Bureau of the British Empire : The Yearbook of the Universities of the Empire 1947, *review*, 583
University of Aberdeen : Honorary degree of doctor of laws conferred on Sir George Thomson and on Major-General D. N. Wimberley, 555
University of Birmingham : Appointment of Dr. Harold Scarborough as lecturer with title of reader in the Department of Medicine, 233
    Eighteenth Annual Report of the Joint Standing Committee for Research, 594
    Retirement of Sir Norman Haworth from the Mason chair of chemistry, 1007
    Appointment of Dr. K. Mather to the chair of genetics, 1007
    Appointment of Prof. H. W. Melville to the Mason chair of chemistry, 1007
University of Bristol : Retirement of Prof. A. M. Tyndall from the Henry Overton Wills chair of physics, 272, 755
    Appointment of Prof. N. F. Mott as Henry Overton Wills professor of physics and director of the Wills Laboratory, 272
    Appointment of Dr. C. F. Powell as Melville Wills professor of physics, 272
    Appointment of Dr. S. H. Piper as assistant director of the Wills Laboratory, 272
    Annual Report for 1946 of the Agricultural and Horticultural Research Station, Long Ashton, 862
University of Bristol in co-operation with the Institute of Physics : Summer School in Theoretical Physics, 233
    Summer School in the Physics of Solids, 233, 636
University of California : Appointment of Dr. Wendell M. Stanley as professor of biochemistry and director of a new Virus Laboratory, 49
University of Cambridge : Research Fellowships founded by Imperial Chemical Industries, Ltd., 90
    Election of General Smuts as chancellor, 233
    Gravity Survey in the English Channel to be made by the Department of Geodesy and Geophysics, 272
    Dr. Joseph Needham to return to his post, 304
    Installation of General Smuts as chancellor, 965
    Conferment of honorary degrees, 965
University of Cambridge, in co-operation with the Department of Scientific and Industrial Research : Summer Course in Food Science, 1007
University of Durham : Post-graduate course in chemical engineering at King's College, Newcastle-upon-Tyne, 965
    Fuel Technology course at King's College, Newcastle-upon-Tyne, 965
University of Edinburgh : James Tait Black Memorial Prize for 1947 awarded to Dr. C. E. Raven, 390
University of Glasgow : Appointment of Prof. Thomas Alty as deputy principal, 16
    Appointment of Dr. Basil C. King as lecturer in geology, 16
    Appointment of Daniel Martin and Walter Brown as lecturers in mathematics, 16
    Appointment of John B. Birks and G. M. Lewis as lecturers in natural philosophy, 16
    Appointment of Dr. William C. Hutchinson and George Leaf as lecturers in physiological chemistry, 16
    Coats Research Fellowship in Chemistry or Physics, 164
University of Hamburg : Amalgamation of the University Meteorological Institute, the Centre for Earthquake Research, and the University Institute for Oceanography to form the Geophysical Institute of the, 1006
University of Leeds : Appointment of Dr. W. Bradley as professor of colour chemistry and dyeing, 16
    Appointment of A. H. Hanson as lecturer in the Departments of Social Studies and Extra-Mural Studies, 16
    Appointment of H. D. Ursell as lecturer in mathematics, 16
    Gift of £10,000 from the International Wool Secretariat for equipment for the New Textile Laboratories, 305
    Appointment of Prof. H. S. Ruse as head of the Department of Mathematics, 307, 468
    Appointment of Prof. T. G. Cowling as professor of applied mathematics, 307, 468
    Appointment of Dr. N. H. Hartshorne as lecturer in chemical microscopy, 307
    Retirement of Prof. S. Brodetsky from the chair of applied mathematics and as head of the Department of Mathematics, 307, 467
    Appointment of Dr. J. W. Baker to the readership in the mechanism of organic reactions, 471
    Appointment of Dr. C. S. Whewell as honorary reader in textile finishing and lecturer in textile chemistry, 471
    Eleventh and Twelfth Reports of the Brotherton Collection Committee, 882
    Further grant of £10,000 from the Worshipful Company of Clothworkers to the Textile Industries Department, 1006
    Grant of £1,000 from the British Hat and Allied Feltmakers' Research Association for research in the Textile Industries Department, 1006
    Appointment of Dr. F. Henriques as lecturer in social anthropology, 1006

  Appointment of A. N. Greenwood as lecturer in electrical engineering, 1006
  Appointment of C. Kisby as lecturer in textile design, 1006
University of Liverpool : Appointment of Dr. C. E. H. Bawn to the Grant-Brunner chair of physical and inorganic chemistry, 715
  Appointment of Dr. H. Fröhlich to the chair of theoretical physics, 715
  Retirement of Prof. W. C. McC. Lewis from the Grant-Brunner chair of inorganic and physical chemistry, 756
  Pre-election of Sir James Chadwick as Master of Gonville and Caius College, Cambridge, 882, 964
University of London : Retirement of Prof. H. Hartridge from the University chair of physiology at St. Bartholomew's Hospital Medical College, 49
  Appointment of G. E. H. Foxon to the University readership in biology at Guy's Hospital Medical School, 51
  Title of University professor of bacteriology conferred on Lord Stamp, 51
  Title of University professor of biology conferred on Dr. J. H. Woodger, 51
  Title of University reader in surveying conferred on Alfred Stephenson, 51
  Degree of D.Sc. conferred on F. W. Andrews, 51
  Appointment of Dr. Leslie Young to the University chair of biochemistry at St. Thomas's Hospital Medical School, 233
  Degree of D.Sc. conferred on W. S. Rogers, Dr. B. N. Singh and F. L. Warren, 233
  Appointment of Dr. L. J. Audus to the Hildred Carlile chair of botany at Bedford College, 347, 427
  Appointment of Dr. Eric Boyland to the University chair of biochemistry at the Royal Cancer Hospital (Free), 347
  Degree of D.Sc. conferred on Sir Alfred Egerton, 347
  Appointment of K. de B. Codrington to the University chair of Indian archæology at the Institute of Archæology and the School of Oriental and African Studies, 430
  Appointment of Prof. E. D. Hughes to the University chair of chemistry at University College, 430, 511
  Appointment of Gordon Manley to the University chair of geography at Bedford College, 430, 511
  Appointment of Prof. A. C. Offord to the University chair of mathematics at Birkbeck College, 637, 757
  Appointment of Dr. R. E. Mortimer Wheeler to the University chair of the archæology of the Roman Provinces at the Institute of Archæology, 637, 674
  Appointment of Mary Barker to the University readership in bacteriology at St. Thomas's Hospital Medical School, 637
  Appointment of Dr. H. E. Rose to the University readership in mechanical engineering at King's College, 637
  Title of University professor of geology conferred on Dr. Leonard Hawkes, 637
  Title of University reader in organic chemistry conferred on Dr. A. H. Cook, 637
  Title of University reader in chemistry conferred on Dr. H. G. Poole, 637
  Title of University reader in agricultural chemistry conferred on Dr. R. L. Wain, 637
  Degree of D.Sc. conferred on Franz Bergel, 637
  Retirement of Prof. P. Dienes from the University chair of mathematics at Birkbeck College, 756
  Appointment of Prof. J. W. S. Blacklock to the University chair of pathology at St. Bartholomew's Hospital Medical College, 924
  Appointment of James Whillis to the chair of anatomy at Guy's Hospital Medical School, 924
  Appointment of Dr. Hugh Ford to the University readership in applied mechanics at the Imperial College of Science and Technology, 924
  Title of University professor of social studies conferred on Mrs. Barbara Wootton, 924
  Title of University reader in biochemistry conferred on Dr. H. W. Buston, 924
  Title of University reader in biochemistry conferred on Wilfrid Lawson, 924
  Title of University reader in morbid anatomy conferred on Dr. D. M. Pryce, 924
  Degree of D.Sc. conferred on B. H. Crawford, 924
University of London Institute of Archæology : Appointment of K. de B. Codrington to the chair of Indian archæology and at the School of Oriental and African Studies, 430
  Appointment of Dr. R. E. Mortimer Wheeler to the University chair of the archæology of the Roman Provinces, 637, 674
University of Madrid : Honorary degree conferred on Sir Alexander Fleming, 966
University of Manchester : Appointment of Prof. M. Polanyi as professor of social studies, 15
University of North Carolina : The Graduate School Research and Publications (edited by Prof. Edgar W. Knight and Agatha Boyd Adams), *review*, 705
University of Oxford : Appointment of D. G. Champernowne as professor of statistics, 966
  Appointment of Prof. J. Jewkes as professor of economic organisation, 966
University of Oxford Department of Education : Conference on the Education of the Young Worker, 801
University of Prague : Sexcentenary of the, 511
  Sexcentenary Celebrations (Dr. Gerald Druce), 670
University of St. Andrews : Retirement of Prof. P. T. Herring from the Chandos chair of physiology, 922
  Appointment of Dr. A. E. Ritchie to the Chandos chair of physiology, 922
University of Sheffield : Appointment of Dr. S. R. Elsden as senior lecturer in microbiology, 16
  Appointment of R. O'Rahilly as lecturer in anatomy, 16
  Appointment of T. F. Bamber as assistant lecturer in the Department of Mining, 16
  Appointment of Dr. J. L. Emery as honorary lecturer in pathology, 16
  Appointment of Dr. A. J. Gould as senior lecturer in the Department of Glass Technology, 307
  Appointment of Dr. J. S. D. Bacon as lecturer in biochemistry, 307
  Appointment of R. E. Davies as honorary lecturer in biochemistry, 307
  Appointment of A. Jordan as honorary lecturer in clinical biochemistry, 307
  Appointment of O. I. Butler as senior lecturer in charge of the Department of Electrical Engineering, 471
  Appointment of H. J. Cowan as lecturer in civil engineering, 471
  Appointment of G. Wiseman as assistant lecturer in physiology, 471
  Appointment of A. G. Macgregor as research assistant in the Department of Pharmacology and Therapeutics, 471
  Retirement of Prof. Douglas Knoop from the chair of economics, 471
  Gift of money from Prof. Douglas Knoop to endow an economics prize, 471
  Appointment of Dr. G. P. Jones as professor of economics, 553
  Honorary degrees of doctor of laws conferred on the Hon. Lewis W. Douglas, Anthony Eden, Lord Addison, Admiral of the Fleet Lord Cunningham, Sir Frank Stenton, Sir Henry Tizard and Ernest S. Graham, 555
  Appointment of J. C. Gilbert as senior lecturer in economics, 1007
  Appointment of A. Gilbert as lecturer in psychology, 1007
  Appointment of J. H. Davies and S. J. Langley as assistant lecturers in economics, 1007
  Appointment of Brian E. Heard as assistant lecturer in pathology, 1007
  Appointment of Peter Freeman as research assistant to the professor of engineering, 1007
University of Sydney : Appointment of Dr. J. Cymerman as lecturer in organic chemistry, 471
University of Western Ontario : Appointment of Prof. Frederick R. Miller as research professor of neuro-physiology, 125
University of Wisconsin : Symposium on Combustion and Flame and Explosion Phenomena, 307
University College, Dublin : Summer School in Chemistry arranged by the Irish Chemical Association, 390
  Sessional Inaugural Lecture (Prof. J. W. Cook), 554
University College, Dundee : Appointment of Dr. D. H. Everett to the chair of chemistry, 715
University College of the South-West, Exeter : Transfer of the Norman Lockyer Observatory to the, 15, 861
University College of the South-West, Exeter (Survey Committee of the) : Devon and Cornwall, a Preliminary Survey, *review* by Prof. L. Dudley Stamp, 786
University College, Leicester : Appointment of Dr. R. L. Goodstein to the chair of mathematics, 344
  Appointment of Dr. A. G. Pool to the chair of economics, 514
  Appointment of Dr. Z. P. Dienes to a lectureship in mathematics, 514
University College, London : Research in Surveying at, 50
  Appointment of Prof. E. D. Hughes to the University of London chair of chemistry, 430, 511
University College, Swansea : Retirement of Prof. J. E. Coates from the chair of chemistry, 1004
  Appointment of Dr. C. W. Shoppee to the chair of chemistry, 1004
  Appointment of L. J. Kastner to the chair of mechanical engineering, 1004
University Grants Committee : Appointment of a Sub-Committee on Higher Technological Education in Britain, 841
Urquhart, G. M. : Awarded an Agricultural Research Council Postgraduate Scholarship, 16
Ursell, H. D. : Appointed lecturer in mathematics in the University of Leeds, 16

VALENTINE, Dr. D. H. : Vegetative and Cytological Variation in *Viola Riviviana*, 734
Vallarta, Dr. M. S. : Cosmic Rays and the Magnetic Field of the Moon, 646
Van de Graaff, Dr. R. J. : Awarded the Duddell Medal for 1947 of the Physical Society, 511
Vand, Dr. V. : Method of Steepest Descents—Improved Formula for X-Ray Analysis, 600
Vanderplank, F. L. : Appointed entomologist, West African Institute for Trypanosomiasis, 471
Varjadebian, B. (Cottin, M., and) : Isotope Exchange and Molecular Structure, 901
Vassiliou, B., and White, Dr. J. : Relationships of Vapour Pressure, Capillarity and Temperature in Clays, 487
Vassy, Dr. A., and Vassy, E. : Ozone and Auroral Spectra, 566
Vegetable Research Station : Appointment of Dr. James Philip as director, 715
Veld, Leonora G. Huis in 't, and others : Isolation of a New Androstenol-3 (α)-on-17 from the Urine of a Patient with Adrenal Cancer, 848
Vendrely, Dr. R. (Tulasne, Prof. R., and) : Cytology of Staphylococci before and after Treatment with Penicillin, 316
Venkataraman, Prof. K., and others : Ammonium Salts of Sulphanilamides and Sulphonic Acids, 55
Venn, Dr. J. A. (compiled by) : Alumni Cantabrigienses, Part 2, From 1752 to 1900, Vol. 3, Gabb—Justamond, *review* by Prof. F. J. M. Stratton, 661
Verkade, Prof. P. E. : Physiology and Biochemistry of Fats and Lipoids, 534
Verzar, Prof. F. : Physiology and Biochemistry of Fats and Lipoids, 534
Vestine, E. H., and others : The Earth's Main Magnetic Field and its Secular Change 1905–1945, 161
  Final Values of Elements of the Geomagnetic Field at 5-Degree Intervals of Latitude and Longitude, Epoch 1945, 161
Veterinary Educational Trust : Plans to develop Research Stations, 254
Victoria, Government of : Presentation of a Transit Circle to the Royal Observatory, Greenwich, 271
Vidal, S., and others : Effect of Insulin on Intestinal Glucose Absorption in Alloxan Diabetic Rats, 932
Vincent, J. M. (Phillips, J. N., and) : Dosage/Response Relationships in Mould Inhibition, 210
Virtanen, Prof. Artturi I., and Csáky, Tihamer Z. : Formation of Oxime-Nitrogen in *Torula*-Yeast Fed with Potassium Nitrate, 814
Virtanen, Prof. Artturi I., and Kerkkonen, Heikki K. : Structure of Plasteins, 888

Visual Aids, Educational Foundation for : Appointment of John A. Harrison as director, 802
Viswanathan, R. (Panikkar, N. Kesava, and) : Active Regulation of Chloride in *Metapenæus monoceros* Fabricius, 137
Voelcker, O. J. : The West African Cacao Research Institute, 117
Vogel, Dr. Arthur I. : A Text-Book of Practical Organic Chemistry, *review* by Prof. J. W. Cook, 995
Volcani, Z., and Dowson, Dr. W. J. : A Plant Disease caused by a Spore-forming Bacterium under Natural Conditions, 980
Vologdin, Dr. Alexander G. : Awarded the Charles Doolittle Walcott Bronze Medal and Award for 1947 of the U.S. National Academy of Sciences, 861
Vries, Dr. Hl. de : Minimum Perceptible Energy and Brownian Motion in Sensory Processes, 63

WADDINGTON, Prof. C. H. : Operational Research, 404
  The Argument from Mouse to Man, *review*, 543
Wadia, Ardaser Sorabjee N. : The Romance of Rhodesia, *review*, 871
Wadia, D. N. : Scientific Research in India, 513
Wadman, H., and others : Separation and Identification of Methylated Sugars on the Paper Chromatogram, 720
Wain, Dr. R. L. : Title of University of London reader in agricultural chemistry conferred on, 637
Wald, Prof. Abraham : Sequential Analysis, *review* by M. G. Kendall, 790
Waldman, Dr. Jerome, and others : Failure of Sulphanilamide to Inhibit Calcification of Bone, 273
Waley, S. G., and others : Synthetic Polyglutamic Acid, 132
Walker, F. T. : Sublittoral Seaweed Survey—Relationship of Algal Growth and Depth, 977
Walker, G. R. (Herzberg, Prof. G., and) : Initiation of High Explosives, 647
Walker, Dr. James (Forrest, Dr. H. S., and) : Condensation of 2 : 4 : 5-Triamono-6-hydroxy-pyrimidine with Glucose and Fructose, 308
  Reductone and the Synthesis of Pteridines, 721
Walkley, Allan (Cowley, J. M., and) : Reaction between Manganous Ion and Manganese Dioxide, 173
Wallace, Henry, and others : Atomic Challenge, a Symposium, *review*, 995
Wallace, Prof. T. : Trace Elements in Plant Physiology, 364
Wallace, Prof. T., and Hewitt, E. J. : Effects of Calcium Deficiency on Potato Sets in Acid Soils, 28
Waller, E. G. : Appointed temporary agricultural survey officer (cocoa), Gold Coast, 966
Wallis, C. J. : Practical Biology for Medical and Intermediate Students, second edition, *review* by Dr. P. D. F. Murray, 912
Walsh, Dr. E. O'F., and Walsh, Mrs. G. : Inhibition of Hexosediphosphatase by Sulphhydryl Reagents and by Ascorbic Acid, 976
Walshe, Veryan (Sherlock, Sheila, and) : Effect of Under-Nutrition in Man on Hepatic Structure and Function, 604
Walter, W. H. : The Society for Psychical Research, an Outline of its History, 880
Walters, S. M. : The Study of Critical British Groups, 735
Walton, Dr. Arthur : The Artificial Insemination of Farm Animals (John W. Bartlett, George E. Taylor, Joseph Edwards, Clair E. Terrill, Victor Berliner and Fred P. Jeffrey), edited by Enos J. Perry, *review*, 831

Ward, A. G. : War-time Rheological Investigations for the British Armed Services, 252
Ward, F. Kingdon : War-time Explorations in Manipur, 636
Ward, J. F. : Appointed senior agricultural officer, Nigeria, 51
Ward, W. H. : The Flow of Glaciers, 821
Wardlaw, Prof. C. W. : The Natural Vegetation of Trinidad, 31
Wardrop, A. B., and Preston, Dr. R. D. : Organisation of the Cell Walls of Tracheids and Wood Fibres, *erratum*, 90
Ware, W. D. : Awarded a moiety of the Lyell Fund of the Geological Society, 122
Warne, Dr. L. G. G. : Bulb Formation in the Shallot, 935
Warren, Dr. F. L. : Degree of D.Sc. of the University of London conferred on, 233
Warren, Dr. F. L. (Robinson, Dr. Alice M., and) : Presence of Substances Inhibitory to Acid Phosphatase in Normal Human Urine, 397
Warren, I. H. : Appointed agricultural chemist, Tanganyika, 51
Warren, S. Hazzledine : Flint Flaking, 569
Wassermann, Dr. A. : Adsorption of Calcium Ions by an Acid-extracted Brown Alga under Continuous Flow Conditions, 562
Wataghin, Prof. G. : Showers of Penetrating Particles, 91
Waters, Brian : Severn Tide, *review* by A. T. D., 790
Waterton, F. W. : Effect of the Electron Beam on the Voltage Distribution of a High-Voltage Multi-Stage Electron Accelerator, 563
Watling, J. F. B. : Appointed principal produce inspector, Nigeria, 637
Watson, Dr. E. A. : Fuel Systems for the Aero-Gas Turbine, 196
Watson, Fletcher G. : Between the Planets, *review* by H. S. J., 460
Watson, H. : Mosses as Soil Indicators, 823
Watson, Prof. H. E. : Chemical Engineering, *review*, 911
Watson, H. S. H. : Appointed assistant conservator of forests, Northern Rhodesia, 802
Watson, J., and others : Synthetic Polyglutamic Acid, 132
Watson, T. Y. : Appointed deputy director of agriculture, Uganda, 966
Watson, W., and others : Cambridge Archæological Expedition to Cyrenaica, 327
Watson, W. C. R. : An Introduction to *Rubus*, 734
Watson-Watt, Sir Robert : Radio Noise, 794
  Development of Radar, *review*, 867
Watt, A. W. M. : Appointed assistant conservator of forests, Uganda, 51
Watt, C. H. (Bellamy, Dr. L. J., and) : Factors Involved in the Deactivation of Penicillin Solutions by Rubber Tubing, 940
Watts and Son, Ltd., E. R. : Amalgamation with Adam Hilger, Ltd., 345
Weatherhead, A. V. : Petrographic Micro-technique, *review* by F. I. G. Rawlins, 626
Webb, Dr. E. C. : Alkyl Fluorophosphonates, 226
Webb, Dr. J. S. : To receive an Award from the Daniel-Pidgeon Fund of the Geological Society of London, 1007
Weber, Alfred : Farewell to European History, or the Conquest of Nihilism, translated from the German by R. F. C. Hull, *review* by Maurice Bruce, 151
Weber, F., and others : Reaction of Boric Acid with Polysaccharides, 96
Weber, Max : Essays in Sociology (translated, edited and with an Introduction by H. H. Gerth and C. Wright Mills), *review* by Prof. D. W. Brogan, 950
Weber, Robert L., and others : College Technical Physics, *review* by S. Weintroub, 954
Webley, D. M. : Aerobic Mesophilic Bacteria in Composts, 174
Webley, D. P. : Awarded an Agricultural Research Council Postgraduate Scholarship, 16
Webster, Robert : The Gemmologists' Compendium, second edition, *review*, 297
Weddell, Dr. G., and others : Intravenous Methylene Blue, a New Method for Studying the Nervous System, 318
Wedel, W. R. : Prehistory and the Missouri Development Program, 636
Weeks, Sir Ronald : Industrial Co-operation, 572
  Appointed chairman of the National Advisory Council for Education in Industry and Commerce, 801
Weil, Prof. André : Foundations of Algebraic Geometry, *review* by Prof. H. T. H. Piaggio, 787
Weil, Dr. E. : Catalogue 10, From Alchemy to Chemistry and Pharmacology, 306
Weintroub, S. : Temperature Measurement, *review*, 624
  Optics in Holland, *review*, 704
  Britain's Scientific War Effort, *review*, 907
  College Physics, *review*, 954
  Les mesures physiques (Albert Perard), *review*, 955
Weiss, Dr. Joseph (Stein, Gabriel, and) : Chemical Effects of Ionizing Radiations, 650
Weissenberg, K. (Freeman, S. M., and) : Some New Anisotropic Time Effects in Rheology, 324
Weissmann, D., and others : Active Penetration of Fat into Adipose Tissue, 482
Weissman, Dr. S. I. : Mechanism of Conductance by Hydrogen and Hydroxyl Ions in Aqueous Solutions, 241
Welding Research Association, British : Offer from British Oxygen Co., Ltd., to provide a prize fund, 17
  Appointment of Dr. H. G. Taylor as director, 49
Wells, A. A. : A Large Field Compensator for Measurement of Birefringence, 602
Wells, Frederic L., and others : What People Are, a Study of Normal Young Men, *review*, 502
Wells (Horace) and Anæsthesia, 123
Wertheimer, E., and others : Active Penetration of Fat into Adipose Tissue, 482
West, Dr. T. F. (Acheson, G. G., and) : Reaction of β-Naphthol with *l*-α- and *l*-β-Phellandrene, 976
West, Dr. W. D. : Elected president for 1948 of the Royal Asiatic Society of Bengal, 553
West African Cacao Research Institute (O. J. Voelcker), 117
West African Institute for Trypanosomiasis : Appointment of F. L. Vanderplank as entomologist, 471
Westcott, J. H. : Awarded a Senior Scholarship by the Commissioners of the Exhibition of 1851, 966
Westlake, Aubrey T. (Maynard, G., and) : Mr. E. Westlake and the Geology of the Cantal Region, Central France, 485
Westoll, Dr. T. S. : Appointed to the chair of geology at King's College, Newcastle-upon-Tyne, 1003 ; work of, 1003
Weston, H. C. : Human Factors in Industry, 791
Whatley, F. R. (Comline, R. S., and) : Inactivation of Flavine Adenine Dinucleotide by Tissue Extracts, 350
Wheatley, P. J. (Linnett, Dr. J. W., and) : A Correlation between Molecular Vibrations and Bond-forming Orbitals, 971
Wheeler, Dr. R. E. Mortimer : Appointed to the University chair of the archæology of the Roman Provinces at the University of London Institute of Archæology, 637, 674 ; work of, 674
Whelan, W. J., and others : Photochemical Degradation of Starch, 762
Whewell, Dr. C. S. : Appointed honorary reader in textile finishing and lecturer in textile chemistry in the University of Leeds, 471
  Textile Fibres, *review*, 581
Whiddington, R. (Crowther, J. G., and) : Science at War, *review* by S. Weintroub, 907
Whillis, James : Appointed to the University of London chair of anatomy at Guy's Hospital Medical School, 924
Whitchurch Hospital, Cardiff : Gift of £9,000 from the Rockefeller Foundation for research at the Neuropsychiatric Research Centre, 346
White, Dr. Florence R., and others : Nutrition in relation to Cancer, 106
White, Dr. Julius, and others : Nutrition in relation to Cancer, 106
White, Dr. J. (Vassiliou, B., and) : Relationships of Vapour Pressure, Capillarity and Temperature in Clays, 487
White, Marsh W., and others : College Technical Physics, *review* by S. Weintroub, 954
White, Dr. Philip R., and others : Nutrition in relation to Cancer 106

Whitehead, Prof. A. N.: *Death* of, 15; *obituary* by Sir Edmund Whittaker, 267
Whitehead, Dr. S.: Operational Research in the Research Associations, 584
Whitmore, Dr. F. E.: Determination of Radioactive and Stable Tracer Isotopes, 694

Zondek, Prof. B., and others: Variations in Spermatogenesis of Oligospermic Men, 176
Zoological Society of Scotland: Now the Royal Zoological Society of Scotland, 592
Zoologists (British), Association of: Discussion on the Field Study and Conservation of the British Fauna, 408
Zootechny, International Society of (Meeting of the Swiss Zootechnical Society to discuss the formation of an), 322
Zuckerman, Prof. S.: Control of the Germinal Epithelium, *review*, 221
  The Laurentian Hormone Conference, *review*, 295
  Awarded the Medal of Freedom with Silver Palm by the Government of the United States, 716

TITLE INDEX

ABNORMALITIES in the *F*-Region of the Ionosphere at Calcutta (S. S. Baral, S. N. Ghosh and M. Debray), 24
Absorptiometry : Reversion—a New Procedure in (Dr. H. Irving, G. Andrew and E. J. Risdon), 805
Absorption of Protein and Bacteria from Normal and Infected Joints (Torbjörn Edlund), 102
Absorption Band Spectrum of S_2 in the Schumann Region (R. Maeder and Prof. E. Miescher), 393
Absorption Spectra of Crystals : Infra-Red (Sir C. V. Raman), 165
2-Acetaminofluorene on the Adreno-Gonadal System of Rats : Effect of Feeding (Cornelia Hoch-Ligeti), 58
Acetylation of Sugars (S. D. Nicholas and Dr. F. Smith), 349 ; (Dr. P. H. Plesch), 637
Acetylcholine and Body Temperature (Prof. J. H. Burn and N. K. Dutta), 19
Acid Phosphatase in Normal Human Urine : Presence of Substances Inhibitory to (Dr. Alice M. Robinson and Dr. F. L. Warren), 397
Acid Soils : Effects of Calcium Deficiency on Potato Sets in (Prof. T. Wallace and E. J. Hewitt), 28
Acid-extracted Brown Alga under Continuous Flow Conditions : Adsorption of Calcium Ions by an (Dr. A. Wassermann), 562
Acid-Proteolytic Lactic Cocci (Gorini's) : Behaviour of, with Penicillin (Annamaria Torriani), 275
Acoustics : Studio (H. L. Kirke), 732
Acridine Antibacterials : Mode of Action of (Dr. Adrien Albert and Reginald Goldacre), 95
Acridines and Antimalarial Action : Absence of Correlation between Respiratory Inhibition of Plasmodia by (Dr. Adrien Albert and P. B. Marshall), 1008
Actinomycetes : Molds, Yeasts and (the late Dr. A. T. Henrici), second edition by Dr. Charles E. Skinner, Dr. Chester W. Emmons and Dr. Henry M. Tsuchiya, *review*, 40
Action of Acridine Antibacterials : Mode of (Dr. Adrien Albert and Reginald Goldacre), 95
Action of Clover Juice on Isolated Muscle and 'Bloat' in Cattle : A Possible Relation between the (W. S. Ferguson), 816
Activation of Heterolytic Reactions : Effect of Ionic Charges on the Energy and Entropy of (J. Gripenberg, Prof. E. D. Hughes and Prof. C. K. Ingold), 480
Activator of Plasma Protease : Staphylokinase, an (Charles H. Lack), 559
Active Nitrogen : Mechanism of the Emission Spectrum of (L. Herman and R. Herman), 1018
Active Penetration of Fat into Adipose Tissue (B. Shapiro, D. Weissmann, V. Bentor and E. Wertheimer), 482
Adaptation Mechanism of the Organism to Damage—the Role of 'Resistine' (Dr. S. Karády and Dr. A. Kovács), 688
Adenosine Triphosphate : Synthesis of (J. Baddiley, A. M. Michelson and Prof. A. R. Todd), 761
Adenosine Triphosphate in Glutamine Synthesis (W. H. Elliott), 128
Adiabatic Compression of their own Vapour : Initiation of Explosives by (A. Yoffe), 349
Adipose Tissue : Active Penetration of Fat into (B. Shapiro, D. Weissmann, V. Bentor and E. Wertheimer), 482
Administration (Public) : Study of (Dr. W. A. Robson), 879
Administrations fédérales aus États-Unis : Méthodes statistiques modernes des (Pierre Thionet), *review* by Dr. F. Yates, 153
Adrenal Cancer : Isolation of a New Androstenol-3(α)-on-17 from the Urine of a Patient with (Dr. Elizabeth Dingemanse, Leonora G. Huis in 't Veld and S. Lore Hartogh-Katz), 848
Adrenal Cortical Extracts to cause Lysis of Living Lymphocytes *in vitro* : Failure of (J. S. Robertson), 814
Adrenaline and Methyladrenaline : Demonstration and Separation of Noradrenaline, (Dr. W. O. James), 851
Adreno-Gonadal System of Rats : Effect of Feeding 2-Acetaminofluorene on the (Cornelia Hoch-Ligeti), 58
Adrenolytic Substance in Aglomerular Fish Kidney : A Vasodilator, (Dr. Benjamin Jablons), 100
Adrostenol-3(α)-on-17 from the Urine of a Patient with Adrenal Cancer : Isolation of a New (Dr. Elizabeth Dingemanse, Leonora G. Huis in 't Veld and S. Lore Hartogh-Katz), 848
Adsorption of Bacterial Polysaccharides to Erythrocytes (Dr. E. V. Keogh, Dr. E. A. North and M. F. Warburton), 687
Adsorption of Calcium Ions by an Acid-extracted Brown Alga under Continuous Flow Conditions (Dr. A. Wassermann), 562
Adsorption on to Ionogenic Surfaces (Dr. P. H. Plesch and R. H. S. Robertson), 1020
Adsorption and Heterogeneous Catalysis (Prof. Eric K. Rideal), 461
Aëdes *aegypti* in Khartoum : Extermination of (R. Kirk), 139
Aero-Gas Turbine : Fuel Systems for the (Dr. E. A. Watson), 196
Aerobic Mesophilic Bacteria in Composts (D. M. Webley), 174
Aerobiology on Commercial Air Routes (Dr. I. V. Newman), 275
Aerodynamics : Elementary Applied (Prof. Paul E. Hemke), *review*, 544
Aerodynamics : Theoretical (Prof. L. M. Milne-Thomson), *review* by Prof. W. J. Duncan, 703
Aerofoils : Potential Theory of, *review* by Prof. W. J. Duncan, 703
Aeronautics : Busk Studentship in, 595
Afforestation as a World Problem (Prof. F. G. Champion), 902
Africa : Education for Citizenship in (Colonial Office Advisory Committee on Education in the Colonies), 948
Tsetse Flies and the Development of (Prof. P. A. Buxton), 802
Africa (Central) : Research in, 230
Africa (East) : Industrial Research in, 122
Africa (South) : Archæology in, 881
Medical Research in, 162
African Fossil Primates discovered during 1947 (Prof. W. E. Le Gros Clark), 667
Agassiz Gold Medal and Honorarium for 1947 of the U.S. National Academy of Sciences awarded to Prof. Felix Andries Vening Meinesz, 861
Ageing in the Population of France : Scientific Research on (French National Union for Prevention of Depopulation and the French National Demographic Institute conference on), 163
Agglomeratic Slates of Kashmir : Occurrence of Volcanic Bomb in the (Dr. R. C. Misra), 895
Agglutinin Predicted by Fisher and Race : Two Examples of Sera containing the Anti-*d* (Dr. Joseph M. Hill and Dr. Sol Haberman), 688
Aggression, a Component of Post-Epileptic Automatism in *Peromyscus* (M. R. A. Chance), 101
Aglomerular Fish Kidney : A Vasodilator, Adrenolytic Substance in (Dr. Benjamin Jablons), 100
Agricultural Economics, Statistics and Agricultural and Dairy Engineering : Postgraduate Scholarships in Husbandry, (Ministry of Agriculture and Fisheries and the Department of Agriculture for Scotland), 637
Agricultural Physiology : Co-operation between Medical and, *review*, 113
Agricultural Produce : Marketing (Thomas Shaw), 470
Agricultural Production in the British Colonial Empire : Factors of (Sir Frank Stockdale), 337
Agricultural and related Products of the British Colonies, 779
Agricultural and Dairy Engineering : Postgraduate Scholarships in Husbandry, Agricultural Economics, Statistics and (Ministry of Agriculture and Fisheries and the Department of Agriculture for Scotland), 637
Agriculture : Films in (Scientific Film Association conference on), 17
Reclamation Disease in, *review*, 624
'Agrocide' Generator, 575
'Agrocide' Range of Insecticides (Plant Protection, Ltd.), 595
Agro-Climatic Analogues (G. Melvyn Howe), 983
Air : Studies in Stomatal Action—Control of Stomatal Movement by a Reduction in the Normal Carbon Dioxide Content of the (Dr. O. V. S. Heath), 179
Air at Ultra High-Frequencies : Electrical Breakdown Strength of (J. A. Pim), 683
Air Pressure : Roofs Supported by (Herbert H. Stevens, Jun.), 613
Air Routes : Aerobiology on Commercial (Dr. I. V. Newman), 275
Air-depolarized Primary Cells (British Standard 1335 : 1946), 51
Aircraft Attack on Locusts (Dr. D. L. Gunn), 342
Aircraft Strength of Materials (Dr. H. D. Conway), *review*, 503
Alaska : Earthquake south-west of Fairbanks on October 16, 306
Alchemist in Life, Literature and Art (Prof. John Read), *review* by T. I. W., 787
Alchemists : Private Lives of the, *review* by T. I. W., 787
Alga (Acid-extracted Brown) : Adsorption of Calcium Ions by an, under Continuous Flow Conditions (Dr. A. Wassermann), 562
Alga (Green) : Influence of Low Bicarbonate Concentrations on the Growth of a (Sven Österlind), 319
Algæ : The Iron Alum Acetocarmine Method for (Dr. M. B. E. Godward), 203
Algal Growth and Depth : Sublittoral Seaweed Survey—Relationship of (F. T. Walker), 977
Algal Life-Histories : Genetics and (Dr. Kathleen M. Drew), 223
Algebra (Dr. A. Page), *review*, 626
Algebraic Geometry : Foundations of (Prof. André Weil), *review* by Prof. H. T. H. Piaggio, 787
Alkali Metal Salts, Gold and Platinum : Magnetic Susceptibility of Borax Glasses containing Crystallites of (Prof. Subodh Kumar Majumdar), 684
Alkali Metals below 20° K. : Electrical Resistivity of (Dr. D. K. C. MacDonald and Dr. K. Mendelssohn), 972
Alkaline Phosphatase in various Cell Types of the Anterior Pituitary of the Guinea Pig (Prof. Leo Abolins), 556
Alkaline Phosphatase in the Eggs of a Sea-urchin : Distribution of (Elsa Wicklund), 556
Alkaline Phosphatase in Fish Gut (A. H. Al-Hussaini), 274
Alkaline Phosphatase in Taste Buds and Nasal Mucosa (Dr. Geoffrey H. Bourne), 445
Alkaloidal Content of *Datura metel* : Effect of Colchicine Treatment on the (A. E. Beesley and Dr. G. E. Foster), 561
Alkyl Fluorophosphonates (Dr. E. C. Webb), 226
Allelomorphic to *C* : *Rh* Genes (Dr. R. R. Race, Dr. Ruth Sanger and Mrs. Sylvia D. Lawler), 316
Alloxan Diabetic Rats : Effect of Insulin on Intestinal Glucose Absorption in (Dr. A. Sols, S. Vidal and J. Larralde), 932
Alloy : 'Supermalloy', a New Magnetic (O. L. Boothby and R. M. Bozorth), 554
Alloys : Internal Stresses in Metals and (Institute of Metals, in association with the Faraday Society, the Institute of Physics, the Institution of Mechanical Engineers, the Iron and Steel Institute, the Physical Society and the Royal Aeronautical Society symposium on), 70
Alloys of Gold, Silver and Copper : Amalgamation of some (Dr. Douglas Rennie Hudson), 288
α-Particles from Polonium : Excitation Curves for the γ-Radiation from Light Elements Bombarded with (Prof. Hilding Slätis), 899
Alpha Rays : Surface Radiography with (C. Jech), 314
Alterations in Diet : Effect of Under-nutrition and, on the Choline Esterase Activity of Serum (Prof. R. A. McCance, E. M. Widdowson and A. O. Hutchinson), 56
Alternating Current Electrical Engineering (Philip Kemp), seventh edition, *review* by J. G., 297
Aluminium : Stressed (Prof. E. A. Owen, Y. H. Liu and D. P. Morris), 882
Aluminium Bromide : Band Spectrum of (Carl Gustav Jennergren), 315
Alumni Cantabrigienses (compiled by Dr. J. A. Venn), Part 2, From 1752 to 1900, Vol. 3, Gabb—Justamond, *review* by Prof. F. J. M. Stratton, 661

Amalgamation of some Alloys of Gold, Silver and Copper (Dr. Douglas Rennie Hudson), 288
America (Latin) : Forage Resources of (Hugo W. Alberts), 657
America (North) : The Fall Webworm of, in Europe (Dr. Paul Surányi), 512
American Academies : War-time Work of the, 304
American Awards to British Men of Science, 215, 390, 716, 800
American Awards for Work on Penicillin, 800
American Oil Operations Abroad (Leonard M. Fanning), *review* by H. B. Milner, 186
American Summer Scholarships for European Students (Massachusetts Institute of Technology), 593 ; *erratum*, 637
American (Central) Culture : Origins of, 594
American (Latin) Cultures (Dr. G. H. S. Bushnell), 697
American (North) Archæology, *review* by Dr. G. H. S. Bushnell, 501
American (South) Chemical Congress : The Fourth, 654
Ames des Dogons : Les (Mme. G. Dieterlen), *review* by G. I. Jones, 622
Amino-Acid Metabolism of Tissue Cells *in vitro* (Dr. Albert Fischer), 1008
Amino-Acids in Bacterial Hydrolysates : New (A. Polson), 351
α-Amino-Acids : Quantitative Chromatographic Estimation of (Dr. L. Naftalin), 763
p-Aminobenzoic Acid on the Leucocyte Count in Leukæmia : Effect of (Dr. J. Bichel), 353
Amino-Nitrogen and its Application to Paper Partition Chromatography : Micro-Estimation of (A. J. Wolwod), 169
p-Aminosalicylic Acid in the Treatment of Tuberculosis (D. D. Martin, Prof. F. S. Spring, Dr. T. G. Dempsey, C. L. Goodacre and D. E. Seymour), 435
Ammi majus L. : Xanthotoxin from the Fruits of (Prof. Alexander Schönberg and Aly Sina), 481
Ammonia Inversion Spectrum at High Pressures : Collision Broadening of the (Dr. B. Bleaney and J. H. N. Loubser), 522
Ammonium Phosphate Fertilizer on Rice in Lower Burma : Results of the Continuous Use of an (D. Rhind and U Tin), 105
Ammonium Salts : Curare-like Action of Polymethylene *bis*-Quaternary (Dr. R. B. Barlow and Dr. H. R. Ing), 718 ; (Dr. W. D. M. Paton and Dr. E. J. Zaimis), 718
Ammonium Salts of Sulphanilamides and Sulphonic Acids (S. K. Munshi, B. D. Tilak and Prof. K. Venkataraman), 55
Amœbic Infections in Laboratory Rodents : Natural (Dr. J. D. Fulton and L. P. Joyner), 66
Amontons' Law : Rate of Wear in the Region of the Validity of (Henry James Bezer and Dr. Robert Schnurmann), 728
Amphibia (Anuran) : Mauthner's Cells in the Larvæ of (A. G. Willis), 65
Amphibian Tissue Cultures for Biophysical Research (M. M'E. Preston), 203
Amphipod *Orchestia bottæ* A. Edwards in Britain : Second Occurrence and Persistence of the (A. J. Cain and D. H. Cushing), 483
Amphipod *Orchestia bottæ* and other Organisms in Britain : Occurrence of the (D. M. Reid), 609
Amplifying Conditions : Low-Frequency Noise from Thermionic Valves working under (Dr. E. J. Harris and P. O. Bishop), 971
Amylopectin : Enzymic Conversion of Amylose into (Dr. S. Peat, Dr. E. J. Bourne and S. A. Barker), 127
Amylopectin Fractions of Starch : Arsenolysis and Phosphorolysis of the Amylose and (Dr. Joseph Katz, Dr. W. Z. Hassid and Dr. Michael Doudoroff), 96
Amylose into Amylopectin : Enzymic Conversion of (Dr. S. Peat, Dr. E. J. Bourne and S. A. Barker), 127
Amylose and Amylopectin Fractions of Starch : Arsenolysis and Phosphorolysis of the (Dr. Joseph Katz, Dr. W. Z. Hassid and Dr. Michael Doudoroff), 96
Anæmia Factor : Anti-Pernicious (E. L. Rickes, N. G. Brink, F. R. Koniuszy, T. R. Wood and K. Folkers), 676 ; (Dr. E. Lester Smith), 676
Anæmia Factors from Liver : Purification of Anti-pernicious (Dr. E. Lester Smith), 638, 676
Anæsthesia : History of, *review* by Dr. G. Edwards, 458
  Horace Wells and, 123
Anæsthetic : A Radioactive Local (Frank Howarth), 857
Analysis : Sequential (Prof. Abraham Wald), *review* by M. G. Kendall, 790
Analysis of Political Behaviour (Harold D. Lasswell), *review* by Prof. D. W. Brogan, 950
Anatomy of the Renal Circulation, *review*, 663
Anatomy of the Shark, *Necturus*, and the Cat : Guide to the Study of the (Prof. Samuel Eddy, Prof. Clarence P. Oliver and Prof. John P. Turner), second edition, *review* by Dr. P. D. F. Murray, 955
Ancient China : Science and Society in (Dr. Joseph Needham), 305
Ancient Cliff near Plymouth : A Submerged (Dr. J. H. N. Cooper), 280
Ancient Indian Mathematics and Vedha (Prof. L. V. Gurjar), *review* by Prof. E. H. Neville, 580
Anderson-Berry (David) Prizes of the Royal Society of Edinburgh awarded to Dr. Ralston Paterson and Dr. P. C. Koller, 716
Androstenol-3 (α)-on-17 from the Urine of a Patient with Adrenal Cancer : Isolation of a New (Dr. Elizabeth Dingemanse, Leonora G. Huis in 't Veld and S. Lore Hartogh-Katz), 848
Anethole : Addition of Maleic Anhydride to (Prof. V. Bruckner and Dr. J. Kovács), 651
Angular Distribution of Radioactive Disintegration Products (J.A. Spiers), 807
Animal (Conscious) : Electrical Stimulation of the Neurohypophysis in the (G. W. Harris), 739
Animal Cells : Photo-electric Counting of Individual Microscopic Plant and (Carl Lagercrantz), 25
  Shrinkage of, due to Fixatives (Dr. Daya Krishna), 202
Animal Genetics and Medicine (Dr. Hans Grüneberg), *review* by Prof. C. H. Waddington, 543
Animal Health in British Guiana (Prof. W. C. Miller), 345
Animal Kingdom : Parade of the (Prof. Robert Hegner, assisted by Jane Z. Hegner), *review* by Dr. Edward Hindle, 501
Animal Migration : Salmon and (Dr. A. G. Huntsman), 300
Animal Parade, *review* by Dr. Edward Hindle, 501
Animal Production : International Meeting on (I. L. Mason), 322
Animal Production and on Artificial Insemination : First International Congress on the Physiology and Pathology of, 197
Animal System : Relation of Intermediary Metabolites to the Lowering of the Potency of Pancreatic Insulin in the (Prof. M. C. Nath and H. D. Brahmachari), 18
Animal Tissue Cells in Protein-Free Media (Aage Bohus Jensen), 273
Animal Tissue Culture with a Synthetic Medium (Dr. F. Jacoby and S. J. Darke), 768
Animal Virus : Structure of an (Dr. I. M. Dawson and Dr. A. S. McFarlane), 464
Animal and Human Sex Behaviour, 124
Animals and the Laboratory, *review* by Frances Pitt, 664
Animals (Farm) : The Artificial Insemination of (John W. Bartlett, George E. Taylor, Joseph Edwards, Clair E. Terrill, Victor Berliner and Fred P. Jeffrey), edited by Enos J. Perry, *review* by Dr. Arthur Walton, 831
Animals (Laboratory) : The UFAW Handbook on the Care and Management of (edited by Prof. Alastair N. Worden), *review* by Frances Pitt, 664
Anisotropic Time Effects in Rheology : Some New (S. M. Freeman and K. Weissenberg), 324
Annealing of Glass (S. M. Cox), 401, 813 ; (Dr. G. O. Jones), 813
Annual Review of Biochemistry (edited by J. Murray Luck, Hubert S. Loring and Gordon Mackinney), Vol. 16, *review*, 870
Annual Review of Microbiology (edited by Charles E. Clifton, Sidney Raffel and H. Albert Baker), Vol. 1, *review* by Sir Paul Fildes, 995
Annual Review of Physiology (edited by Victor E. Hall, Jefferson M. Crismon and Arthur C. Giese), Vol. 9, *review* by Dr. O. A. Trowell, 542
Annular Eclipse of the Sun on May 8–9, 196, 389, 879
Anomaloscope Matching on Viewing-Distance or Field-Size : Dependence of (R. G. Horner and E. T. Purslow), 484
Anomalous Distribution of Nuclear Disintegration in Photographic Emulsions Exposed to Cosmic Rays—Double Stars (L. Leprince-Ringuet and J. Heidmann), 844 ; (T. T. Li and D. H. Perkins), 844
Anomalous Effect of Ionospheric Absorption (Sir Edward Appleton, W. J. G. Beynon and W. R. Piggott), 967
Anomalous Skin Effect in Metals : Theory of the (G. E. H. Reuter and E. H. Sondheimer), 394
Anomaly in Electromagnetic Theory : An (Prof. E. G. Cullwick), 969
Antagonism between Molybdenum and certain Heavy Metals in Plant Nutrition (C. R. Millikan), 528
Antarctic : Synoptic Weather Maps for the, 709
Anterior Pituitary of the Guinea Pig : Alkaline Phosphatase in various Cell Types of the (Prof. Leo Abolins), 556
Anthocyanins and related Substances in Petal Extracts : Paper Chromatography of (E. C. Bate-Smith), 835
Anthracene : Oxidation of, by Osmium Tetroxide (Prof. J. W. Cook and Dr. R. Schoental), 237
Anthropological and Ethnological Sciences : International Congress of, 88
Anthropologist : Political Testament of an, *review* by Dr. E. R. Leach, 457
Anti-*d* Agglutinin Predicted by Fisher and Race : Two Examples of Sera containing the (Dr. Joseph M. Hill and Dr. Sol Haberman), 688
Anti-Anæmia Factors : B_T, a New Vitamin of the B-Group and its relation to the Folic Acid Group and other (Dr. G. Fraenkel, with the assistance of M. Blewett and M. Coles), 981
Antibacterial Analogues of Vitamin K on *M. tuberculosis* : Effect of (C. N. Iland), 1010
Antibacterials (Acridine) : Mode of Action of (Dr. Adrien Albert and Reginald Goldacre), 95
Antibiotic Concentrate from *Bacillus subtilis* : Subtilin *C*, an (C. H. Hassall), 317
Antibiotic Substance on Wheat Straw and other Organic Materials and in the Soil : Production of an (Erna Grossbard), 614
Antibiotic Substances from the Heart Wood of *Thuja plicata* Don. (Prof. Holger Erdtman and Dr. Jarl Gripenberg), 719
Antibody-Antigen Reactions : Plant Virus Proteins and (R. E. F. Matthews), 611
Antihistamines on *Daphnia* : Effect of (Dr. Otakar Poupa), 235
Antimalarial Action : Absence of Correlation between Respiratory Inhibition of Plasmodia by Acridines and (Dr. Adrien Albert and P. B. Marshall), 1008
Antimalarial Herb : Pharmacology of Ch'ang Shan (*Dichroa febrifuga*), a Chinese (Dr. C. S. Jang, F. Y. Fu, K. C. Huang and C. Y. Wang), 400 ; (T. S. Work), 401
Anti-Pernicious Anæmia Factor (E. L. Rickes, N. G. Brink, F. R. Koniuszy, T. R. Wood and K. Folkers), 676 ; (Dr. E. Lester Smith), 676
Anti-Pernicious Anæmia Factors from Liver : Purification of (Dr. E. Lester Smith), 638, 676
Anti-*Rh* Typing Sera : Nomenclature of the (W. B. Castle, M. W. Wintrobe and L. H. Snyder), 492
Anuran Amphibia : Mauthner's Cells in the Larvæ of (A. G. Willis), 65
Ape-Man, *Plesianthropus* : Size of the Brain in the (Dr. R. Broom and J. T. Robinson), 438
Apodan Sertoli Cell : The Nucleolus of the (B. R. Seshachar), 558
Apparent Emission of Positive Electrons from β-Emitters (C. B. A. McCusker), 564
Apple Canker Lesions with Plant-growth Substances : Treatment of (S. H. Crowdy), 320
Apple Juice : Effect of Ion-Exchange Treatment on the Stability of (Dr. S. W. Challinor, Margaret E. Kieser and Dr. A. Pollard), 1023
Applied Energy : Elements of (Prof. Frederick T. Morse), *review* by R. W. Haywood, 829
Applied Mechanics : Seventh International Congress of, 232
Approaches to Sociology, *review* by Prof. D. W. Brogan, 950
Aqueous Solution : The Reactions of Mustard Gas in (Dr. A. G. Ogston), 225
Aqueous Solutions : Mechanism of Conductance by Hydrogen and Hydroxyl Ions in (Dr. S. I. Weissman), 241
Aqueous Solutions of Soap : Bactericidal Activity of Phenols in (Prof. H. Berry and H. S. Bean), 396
Arabian Sea (south of Baluchistan) : Earthquake on August 5, 657
D-Arabinose into 2-Deoxy *D*-Ribose and 3-Deoxy *D*-Xylose : Conversion of (Dr. P. W. Kent, Prof. M. Stacey and Dr. L. F. Wiggins), 21
Arc Discharge : Transition from Glow to (Dr. Chas. E. R. Bruce), 521
Archæological Expedition to Cyrenaica : Cambridge (C. B. M. McBurney, R. W. Hey and W. Watson), 327
Archæology : North American, *review* by Dr. G. H. S. Bushnell, 501
Archæology of the Missouri Valley, 636
Archæology at Oxford, *review* by Miles Burkitt, 459
Archæology in South Africa, 881

Archæology in the University of London, 674
Archæology and the History of Europe (Prof. C. F. C. Hawkes), *review* by Miles Burkitt, 459
Archæology and Society (Grahame Clark), second edition, *review* by Prof. C. F. C. Hawkes, 583
Archéologie du Pacifique-nord (Dr. André Leroi-Gourhan), *review* by Prof. J. H. Hutton, 545
Architecture : Landscape, *review* by Prof. L. Dudley Stamp, 868
Argentine (northern) : Earthquake on July 25, 657
Argument from Mouse to Man, *review* by Prof. C. H. Waddington, 543
Armed Services (British) : 'War-time Rheological Investigations for the (British Rheologists' Club meeting on), 252
Armeria (Late-Glacial) : Significance of Pollen Dimorphism in (Dr. H. G. Baker), 770
Army Education : Citizenship and Current Affairs in (Lieut.-Colonel Eric Lowe), 444
  The Present Outlook in (Major-General Cyril Lloyd), 262
  Progress in, 257
Arnhem Land : Scientific Expedition to (National Geographic Society, Smithsonian Institution and the Commonwealth of Australia), 195
Aromatic Double Bonds : Relative Reactivity of (Dr. G. M. Badger and Dr. R. I. Reed), 238
Aromatic Hydrocarbon Pentalene : The Non-Benzenoid (D. P. Craig and Allan Maccoll), 481
Arrow-heads : Tanged and Winged (Dr. van Riet Lowe), 881
Arsenicals : An Improved Method for the Assay of Toxicity of (W. L. M. Perry), 975
Arsenolysis and Phosphorolysis of the Amylose and Amylopectin Fractions of Starch (Dr. Joseph Katz, Dr. W. Z. Hassid and Dr. Michael Doudoroff), 96
Art : The Alchemist in Life, Literature and (Prof. John Read), *review* by T. I. W., 787
Artery Pressure (Pulmonary) : Effect of Renin on (E. G. Brewin, R. A. Kenney and D. H. Miller), 893
Artificial Illumination : Progress in, 821
Artificial Insemination : First International Congress on the Physiology and Pathology of Animal Production and on, 197
Artificial Insemination of Farm Animals (John W. Bartlett, George E. Taylor, Joseph Edwards, Clair E. Terrill, Victor Berliner and Fred P. Jeffrey), edited by Enos J. Perry, *review* by Dr. John Walton, 831
Artificial Production of Mesons (Dr. G. P. S. Occhialini and Dr. C. F. Powell), 551
Ascidians : Interspecific Fertilization in (Dr. Antonio Minganti), 643
Ascorbic Acid : Inhibition of Hexosediphosphatase by Sulphhydryl Reagents and by (Dr. E. O'F. Walsh and Mrs. G. Walsh), 976
Ascorbic Acid in the Organs of the Guinea Pig : Influence of Vitamin P (Vitamin C.) upon the Amount of (H. Cotereau, M. Gabe, E. Géro and Prof. J.-L. Parrot), 557
Asia (Eastern) : Mammals of (G. H. H. Tate), *review* by T. C. S. M.-S., 188
Aspergillus : Production of Itaconic Acid and Kojic Acid by a Species of (John L. Yuill), 397
Aspergillus nidulans : Mustard-gas Mutation in (Donald Hockenhull), 100
Assay (Biological) : Primary and Secondary Responses in (R. E. Blackith), 20
Assay Procedure (Microbiological) : A Modified (Dr. Trevor I. Williams), 19 ; (Stanley A. Price), 20
Assay of Toxicity of Arsenicals : An Improved Method for the (W. L. M. Perry), 975
Assaying of Penicillin (Biological Methods and Physical Methods Groups of the Society of Public Analysts and other Analytical Chemists discussion on), 285
Assembly Processes : Modern (J. L. Miller), second edition, *review* by H. W. G. H., 503
Astronomia : I fondamenti scientifici della (Prof. G. Armellini), *review* by H. S. J., 419
Asymptotic Solution of the Fundamental Equation of the Statistical Atom Theory : An (Dr. J. I. Hórvath), 26
Atlantic (mid-) : Earthquake on August 9, 657
Atmosphere (Upper) : Production of Nitrogen Atoms in the (Prof. G. Herzberg and L. Herzberg), 283
Atmosphere of Mars (Dr. G. P. Kuiper), 594
Atmosphere in the 1–5 Micron Region : Transmission of the (A. Elliott and G. G. MacNeice), 516
Atmosphere over the Oceans : Sublimation in the (Dr. B. Cwilong), 62
Atmosphere (Solar) : Spontaneous Waves in Discharge Tubes and in the (Prof. V. A. Bailey), 599
Atmospheric Pressure : 'Low-Temperature' Oxidation of Higher Hydrocarbons at (Dr. G. Friedlander and L. Grunberg), 360
Atom : The (Sir George Thomson), third edition, *review* by P. B. M., 871
  The Church and the, a Study of the Moral and Theological Aspects of Peace and War (Church Assembly), 990
Atom and its Energy (Prof. E. N. da C. Andrade), *review* by Prof. P. B. Moon, 582
Atom Theory (Statistical) : An Asymptotic Solution of the Fundamental Equation of the (Dr. J. I. Hórvath), 26
Atomic Challenge (A Symposium by Prof. J. D. Cockcroft, Prof. M. L. Oliphant, Group-Capt. G. L. Cheshire, Dr. J. Bronowski, Sir George Thomson, Capt. Cyril Falls, Prof. P. M. S. Blackett, Sir Henry Dale, Bertrand Russell, Sir John Anderson and Henry Wallace), *review*, 995
Atomic Energy (Atomic Scientists' Association, London Branch, lectures on), 164 ; (Society of Calvinist Lawyers and the Christian Society of Scientists and Physicians in the Netherlands discussion on), 123
Atomic Energy : Control of, 123
  International Control of, 291
  Release of Information on, 146
Atomic Energy, its International Implications (Chatham House Study Group discussion on), 741
Atomic Energy in Cosmic and Human Life (Prof. George Gamow), *review* by Prof. J. A. Crowther, 4
Atomic Energy Control : Ethical Basis of, 989
Atomic Oxygen and Dissociation in Flame Gases (Prof. W. T. David, C. Rounthwaite and N. Carpenter), 726
Atomic Power : Peace and, 741
Atomic and Planetary Properties : Parallelism between, 780
Atoms : Meet the (O. R. Frisch), *review* by Prof. P. B. Moon, 582
Atoms for the Layman, *review* by Prof. P. B. Moon, 582
Atoms (Helium-like) : Energy of the Ground-State of (H. A. S. Eriksson), 393
Atypical Scale of *Sciæna coitor* (Hamilton) : An (Dr. Sivatosh Mookerjee), 64
Audio-Frequency Magnetic Fluctuations (H. F. Willis), 887
Audio-Frequency Radio Waves from the Sun (Dr. Donald H. Menzel and Winfield W. Salisbury), 91
Audiovisual Aids to Instruction (William Exton, Jr.), *review* by Lieut.-Colonel Eric Lowe, 745
Auroral Activity in Southern Norway from the Middle of August to the Middle of October 1947 (Prof. Carl Störmer), 208
Auroral Spectra : Ozone and (Dr. A. Vassy and E. Vassy), 566
Auroras : Emission Spectra of the Night Sky and (Physical Society to arrange for separate publication of papers read before the International Conference on the), 514
Austenite (Retained) : Comparison of Metallographic and X-Ray Measurements of (William J. Harris, jun.), 315
Austenitic Stainless Steels : Ferromagnetic Structure of Cold-Worked (P. T. Hobson and W. P. Osmond), 562
Australia : Echinoderm Fauna of (Dr. D. Dilwyn John), 32 ; (Dr. Hubert Lyman Clark), 32
Australia (South) : Jellyfish from the Basal Cambrian in (Reg. C. Sprigg), 568
  Newly Discovered Submarine Canyons of New Guinea and (Reg. C. Sprigg), 246
Australian Plague Grasshopper : Measurement of 'Environmental Resistance' in the (Dr. H. G. Andrewartha and L. C. Burch), 447
Automatism in *Peromyscus* : Aggression, a Component of Post-Epileptic (M. R. A. Chance), 101
Autoradiography : Resolution Testing in (G. W. W. Stevens), 432
Auxiliary Language : A Planned (H. Jacob), *review*, 665
Auxins in the Rooting of Woody Cuttings : The Use of (Kenneth V. Thimann and Jane Behnke), *review* by Prof. M. Thomas, 993
Avocets in Britain : Breeding of (P. E. Brown and E. Lynn-Allen), 271
Azo-Compounds and other Substances : Toxicity of, to the Fruit Tree Red Spider Mite (Dr. J. K. Eaton and R. G. Davies), 644

BACILLUS SUBTILIS : Subtilin C, an Antibiotic Concentrate from (C. H. Hassall), 317
Back Grant for 1948 of the Royal Geographical Society awarded to Alan J. Marshall, 553
Bacteria : The Chemical Activities of (Dr. Ernest F. Gale), *review* by Dr. H. K. King, 78
  Enzymes in, *review* by Dr. H. K. King, 78
  Limitation of, by Micro-Predators in Soil (Dr. F. J. Anscombe and Dr. B. N. Singh), 140
Bacteria in Composts : Aerobic Mesophilic (D. M. Webley), 174
Bacteria from Normal and Infected Joints : Absorption of Protein and (Torbjörn Edlund), 102
Bacterial Cell, as shown by the Electron Microscope : Submicroscopic Structure of the (Dr. Stuart Mudd), 302
Bacterial Flagella and Motility (Prof. Adrianus Pijper), 200
Bacterial Hydrolysates : New Amino-Acids in (A. Polson), 351
Bacterial Hydrolysis and Utilization of Polysaccharide-like Substances ('Mucin') in Saliva (Dr. H. J. Rogers), 815
Bacterial Polysaccharides to Erythrocytes : Adsorption of (Dr. E. V. Keogh, Dr. E. A. North and M. F. Warburton), 687
Bacterial Products on Human Red Cells : Enzymic Action of Viruses and (C. M. Chu), 606
Bactericidal Activity of Phenols in Aqueous Solutions of Soap (Prof. H. Berry and H. S. Bean), 396
Bactericidal Radiation through Glass : Transmission of (J. E. Stanworth), 856 ; *erratum*, 882
Bacterium (Spore-forming) : A Plant Disease caused by a, under Natural Conditions (Z. Volcani and Dr. W. J. Dowson), 980
Baffin Bay : Earthquake on July 10, 657
B.A.L. : Development of British Anti-Lewisite (Dr. R. H. S. Thompson), 226
Ballistics of Rockets : Exterior, *review* by Dr. R. A. Rankin, 3
Band Spectrum of Aluminium Bromide (Carl Gustav Jennergren), 315
Band Spectrum of ClO in Flames (Dr. G. Pannetier and Dr. A. G. Gaydon), 242
Bands in the Schumann-Runge System of the Oxygen Molecule : New (Lalji Lal), 477
Barclay Memorial Medal of the Royal Asiatic Society of Bengal awarded to Rai Bahadur K. C. Mehta, 553
Barium Sulphate : Electrokinetic Potential and Surface Structure of (A. S. Buchanan and Dr. E. Heymann), 649
Barium Titanate Crystals : Dielectric Constant and Piezo-Electric Resonance of (Bernd T. Matthias), 325
Barkhausen Discontinuities : Effect of Lattice Distortions on the Mean Rate of Propagation of Large (Dr. L. J. Dijkstra and Dr. J. L. Snoek), 886
Barley, Fifty Years of Observation and Experiment (Dr. E. S. Beaven), *review* by Sir John Russell, 828
Basal Cambrian in South Australia : Jellyfish from the (Reg. C. Sprigg), 568
Basidiomycetes with reference to some British Species : Distribution Patterns in European (R. W. G. Dennis), 1015
Bee Plants : British (edited by A. F. Harwood), 470
Behaviour (Human) : The Framework of (Dr. Julian Blackburn), *review*, 502
Behaviour of Crystal Boundaries in Metals : Mechanical (R. King, R. W. Cahn and Dr. B. Chalmers), 682
Beilby Memorial Awards, 231
Belgium : Grants for Scientific Research in, 634
Benzene Hexachloride : Polarographic Determination of the Gamma-Isomer of (G. B. Ingram and H. K. Southern), 437
Benzene Hexachloride in Soil : Persistence of D.D.T. and (Dr. M. S. Smith), 246
2-Benzoylbenzoic Acid and its Derivatives upon Plant Species : Differential Effect of (Dr. W. A. Sexton and Dr. W. G. Templeman), 974
3 : 4 Benzpyrene : Inhibition of the Photodynamic Action of (G. Calcutt and J. P. Newhouse), 53
Berek Type : A Large Field Compensator of the (W. A. P. Fisher), 848
Bernays Premium of the Society of Engineers awarded to Bernard Payne, 346

essemer Gold Medal for 1948 of the Iron and Steel Institute awarded to W. J. Dawson, 512
essemer Premium of the Society of Engineers awarded to C. D. Mitchell, 346
etatron : A 16-MeV. (K. J. R. Wilkinson, J. L. Tuck and R. S. Rettie), 472
  X-Radiation from a 20-MeV. (W. Bosley, Dr. J. D. Craggs, W. F. Nash and R. M. Payne), 1022
iaxial Crystals : A Simple Universal Model for Representing the Optic Orientation of (Dr. N. H. Hartshorne), 94
ibliographic Classification : A (Henry Evelyn Bliss), Vol. 2, Classes H–K, the Human Sciences, *review* by R. B., 705
ibliography of the Technical Literature on Silk (Dr. F. O. Howitt), *review* by Prof. J. B. Speakman, 790
icarbonate Concentrations : Influence of Low, on the Growth of a Green Alga (Sven Österlind), 319
ikini Bomb and the Seismology of the Pacific Region (Prof. K. E. Bullen), 62
ile Acids of the Whale (Dr. G. A. D. Haslewood and Veryan Wootton), 356
ilirubin-Serum Protein Complexes and the van den Bergh Reaction (C. H. Gray and Dr. R. A. Kekwick), 274
inley Lake : The Draining of, and its Ecological Consequences (Wing-Comdr. T. R. Cave-Browne-Cave), 420
inuclear Metallic Carbonyls and Nitrosyls : Constitution of certain (Dr. R. V. G. Ewens), 530
iochemical Reactions of Chemical Warfare Agents (Biochemical Society symposium on), 225
iochemistry : Annual Review of (edited by J. Murray Luck, Hubert S. Loring and Gordon Mackinney), Vol. 16, *review*, 870
iochemistry of Brain Tissue : Research on the, 346
iochemistry of Fats and Lipoids : Physiology and (Le Centre National de la Recherche scientifique symposium on), 534
iochemistry in Progress, *review*, 870
iochemistry in the University of California, 49
iological Applications of Ultra-violet and Infra-red Radiation, *review* by H. G. Jenkins, 542
iological Aspects of Water Pollution (Association of Applied Biologists symposium on), 874
iological Assay : Primary and Secondary Responses in (R. E. Blackith), 20
iological Interest : Nature of Forces between Large Molecules of (Prof. Linus Pauling), 707
iological Tissues as revealed by X-Ray Diffraction Analysis and Electron Microscopy : The Structure of (Prof. W. T. Astbury), 514
iologists in Search of Material (edited by Dr. G. Scott Williamson and Dr. I. H. Pearse), second edition, *review* by Dr. G. Lapage, 336
iology : Radioactive Tracers in (Prof. Martin D. Kamen), *review* by Prof. F. A. Paneth, 456
iology (Marine) : Recent Research in (Dr. N. B. Eales), 737
iology (Social) : The International and Cultural Relations of (British Social Hygiene Council Summer School on), 842
iology (Tidal) : Problems of (Prof. C. M. Yonge), 796
iology in Colonial Universities (Dr. E. B. Edney), 506
iology of Lice, 389
iology of the Louse, *review* by Dr. A. D. Imms, 418
iology for Medical and Intermediate Students : Practical (C. J. Wallis), second edition, *review* by Dr. P. D. F. Murray, 912
iophysical Research : Amphibian Tissue Cultures for (M. M'E. Preston), 203
.I.O.S. Overall Reports, 388
ird Recognition, I, Sea-Birds and Waders (James Fisher), *review* by Frances Pitt, 831
ird Watching (Stuart Smith), 554
irds : Edibility of the Eggs of (Dr. Hugh B. Cott), 8
irds, (British) : Feeding Times of (Rev. John Lees), 802
irds on Migratory and Homing Flights : Orientation of (Linnean Society discussion on), 996
irds of the Southwest Pacific (Ernst Mayr), *review* by Frances Pitt, 545
irefringence : A Large Field Compensator for Measurement of (P. E. Jellyman and A. J. Milne), 477 ; (A. A. Wells), 602
irth : Nicotinic Acid in Human Blood Cells at (R. F. A. Dean and W. I. M. Holman), 439
irth and Growth of the Explosion in Solids Initiated by Impact (Dr. F. P. Bowden and O. A. Gurton), 348
lack (James Tait) Memorial Prize for 1947 of the University of Edinburgh awarded to Dr. C. E. Raven, 390
lackett's Hypothesis of the Magnetic Field of Rotating Bodies (Dr. Niels Arley), 598 ; (Dr. J. Fuchs), 599
linking, its Role in Physical Measurements (Dr. Robert W. Lawson), 154
loat' in Cattle : A Possible Relation between the Action of Clover Juice on Isolated Muscle and (W. S. Ferguson), 816
lood of Malaria-infected Monkeys : Hæmolytic System in the (Dr. H. Laser), 560
lood Cells at Birth : Nicotinic Acid in Human (R. F. A. Dean and W. I. M. Holman), 439
lood Parasite of the Hagfish : *Trypanosoma heptatretæ* sp. n., a (Marshall Laird), 440
luteiweisskörper des Menschen : Die (Dr. F. Wuhrmann und Dr. Ch. Wunderly), *review*, 376
oard of Directors and Business Management (Melvin T. Copeland and Asst. Prof. Andrew R. Towl), *review* by E. F. L. Brech, 869
ody Temperature : Acetylcholine and (Prof. J. H. Burn and N. K. Dutta), 18
ond-forming Orbitals : A Correlation between Molecular Vibrations and (Dr. J. W. Linnett and P. J. Wheatley), 971
ond-Strength of C—Cd in Cadmium Methyl and of C—I in Methyl Iodide (A. S. Carson, K. Hartley and Dr. H. A. Skinner), 725
one : Failure of Sulphanilamide to Inhibit Calcification of (Dr. Zelma Baker Miller, Dr. Jerome Waldman and Prof. Franklin C. McLean), 274
  The Theory of Primary Calcification in (Dr. Marcel J. Dallemagne), 115
one Metabolism : Influence of Folliculin on, Studied by Means of Radio-phosphorus, $^{32}_{15}$P (Dr. J. Govaerts and Prof. M. J. Dallemagne), 977
ooks : Imports of Scientific and Technical, 75
  Importation of, into Britain : (Lord Balfour of Inchrye), 304 ; (Lord Chorley), 304
  Old Scientific and Natural History, 305
  Recent Scientific and Technical, Supp. ii, January 31 ; Supp. ii, February 28 ; Supp. ii, March 27 ; Supp. ii, April 24 ; Supp. ii, May 29 ; Supp. ii, June 26
Books, Periodicals and Newspapers : German (European Periodicals Publicity and Advertising Co., Ltd., First Post-War Exhibition of), 595
Borax Glasses containing Crystallites of Alkali Metal Salts, Gold and Platinum : Magnetic Susceptibility of (Prof. Subodh Kumar Majumdar), 684
Borderline of Psychology, Physics and Music (Acoustics Group of the Physical Society symposium on), 589
Boric Acid with Polysaccharides : Reaction of (Dr. H. Deuel, H. Neukom and F. Weber), 96
Botanical Nomenclature of the Shaddock or Pomelo (Dr. D. Chatterjee), 770
Botany : The Ecological Approach to (Dr. H. Godwin), 157
Botany at Bedford College, London, 427
Botany of the Living Plant (Prof. F. O. Bower), fourth edition, *review* by Prof. F. T. Brooks, 153
Bottom Deposits of Lake Windermere in relation to the Quaternary History of the British Isles (Dr. H. G. Baker), 987
Botulinum Toxin : Peripheral Action of (Dr. N. Ambache), 482
Boulder Clays : Long-Distance Correlation of (D. F. W. Baden-Powell), 287
Brain of Adult *Calliphora erythrocephala* Meig. : Effect of Removal of Neurosecretory Cells in the (Dr. Ellen Thomsen), 439
Brain in the Ape-Man, *Plesianthropus* : Size of the (Dr. R. Broom and J. T. Robinson), 438
Brain Lactate in Emotion (Dr. D. Richter and R. M. C. Dawson), 205
Brain Tissue : Research on the Biochemistry of, 346
Brain and Mind, *review* by Dr. O. A. Trowell, 498
Branched-Chain High Polymers (Prof. H. W. Melville and G. W. Youngson), 803
β-Brass by Cold Work : The Disordering of (R. W. K. Honeycombe and Dr. W. Boas), 612
Breakdown of Serpulid Tubes : Formation and (Jean Hanson), 610
Breeding of Avocets in Britain (P. E. Brown and E. Lynn-Allen), 271
Bridge Networks discriminating between Positive and Negative Sequences in Polyphase Supply (N. F. Barber), 685
Brightness of the New Moon (Dr. J. A. M. van Liempt), 27
Britain : Breeding of Avocets in (P. E. Brown and E. Lynn-Allen), 271
  The Deployment of Scientific Effort in, 1
  The Gas Industry in (Dr. E. V. Evans), 832
  Government Research in, 214
  Higher Technological Education in, 217 ; (University Grants Committee Sub-Committee on), 841
  Importation of Books into (Lord Balfour of Inchrye), 304 ; (Lord Chorley), 304
  The Land of—its Use and Misuse (Prof. L. Dudley Stamp), *review* by Sir John Russell, 906
  Land Use and Service Requirements in, 149
  Local Government in, 825
  Lyon Playfair and Technical Education in (W. H. G. Armytage), 752
  Mobility of Man-Power in, 453
  National Parks in, 783
  Radio Research in (Prof. J. Greig), 943
  Occurrence of the Amphipod *Orchestia bottæ* and other Organisms in (D. M. Reid), 609
  Second Occurrence and Persistence of the Amphipod *Orchestia bottæ* M. Edwards in (A. J. Cain and D. H. Cushing), 483
  Potato Blight and the Weather in (A. Beaumont), 429
  Regional Development Organisations in, 183
  See *also under* Great Britain
Britain's Fuel Problems (Dr. D. T. A. Townend), 669
Britain's Scientific War Effort, *review* by S. Weintroub, 907
British Anti-Lewisite (*B.A.L.*): Development of (Dr. R. H. S. Thompson), 226
British Armed Services : War-time Rheological Investigations for the (British Rheologists' Club meeting on), 252
British Bee Plants (edited by A. F. Harwood), 470
British Birds : Feeding Times of (Rev. John Lees), 802
British Civilization : Some Aspects of (Prof. H. J. Fleure), *review* by D. B. Harden, 746
British Colonial Development, 331
British Colonial Empire : Factors of Agricultural Production in the (Sir Frank Stockdale), 337
British Colonial Territories : Research and Development in, 141
British Colonies : Agricultural and related Products of the, 779
British Commonwealth Entomological Conference, 429
British Empire Forestry Conference : Fifth (Summary Report and Results and Reports of Committees), 449
British Fauna : The Field Study and Conservation of the (Association of British Zoologists discussion on), 408
  Synopses of the (Linnean Society), 594
British Fishes : The Trematoda of (Dr. Ben Dawes), *review* by Dr. G. Lapage, 222
British Forces : The Rocket as a Weapon of War in the (Sir Alwyn Crow), 329
British Forestry : Practical (C. P. Ackers), second edition, *review* by Prof. E. P. Stebbing, 295
British Fuel and Power Industries (Political and Economic Planning Report on), 669
British Grid System : Load Dispatching and the (A. R. Cooper), 822
British Groups : The Study of Critical (Botanical Society of the British Isles conference on), 514, 733
British Guiana : Animal Health in (Prof. W. C. Miller), 345
British International Plastics Annual 1947, *review* by Dr. S. R. Carter, 581
British Isles : Bottom Deposits of Lake Windermere in relation to the Quaternary History of the (Dr. H. G. Baker), 987
  Geographical Approach to the History of the, *review* by D. B. Harden, 746
British Laminariales : Seasonal Variation in Chemical Constitution of some Common (Dr. W. A. P. Black), 174
British Men of Science : American Awards to, 215, 390, 716, 800
British Research in the Radio Field (Research Committee of the Institution of Electrical Engineers), 943
British Rocket Weapons Research (R. H. Macmillan), 329
British Scientific Instruments (Dr. A. B. Wood), 732
  Export Organisation for, 345

British Scientific Workers : American Awards to, 215, 390, 716, 800
British Seismological Observatories, 923
British Somali Place Names : A Gazetteer of, 195
British Somaliland : Report on the General Survey of (1945), 195
British Sources of Reference and Information (edited by Theodore Besterman), *review* by R. Brightman, 789
British Standard 1313 : 1947, Quality Control, 50
British Standard 1335 : 1946, Air-depolarized Primary Cells, 51
British Waters : Occurrence of *Elminius modestus* (Darwin) in (D. J. Crisp and P. N. J. Chipperfield), 64
British Zone of Germany : Scientific Research in the (Prof. F. A. Paneth), 191
Bromate Effect : Studies on the Nature of the (Dr. Holger Jørgensen), 294
Bronze Medal of the Royal Aeronautical Society awarded to Miss F. B. Bradfield, 593
Bronze Star awarded to Peggy Furse by the Government of the United States, 716
Brown Alga under Continuous Flow Conditions : Adsorption of Calcium Ions by an Acid-extracted (Dr. A. Wassermann), 562
Brownian Motion in Sensory Processes : Minimum Perceptible Energy and (Dr. Hl. de Vries), 63
Brucine : Relation of Vomicine to Strychnine and (Dr. A. S. Bailey and Sir Robert Robinson), 433
Bruhl (Paul Johannes) Memorial Medal of the Royal Asiatic Society of Bengal awarded to Prof. S. R. Bose, 553
Bulb Formation in the Shallot (Dr. L. G. G. Warne), 935
Bunsen Flame as a Column of Luminous Gas (Dr. A. S. Leah and Prof. W. T. David), 524
Burma (Lower) : Results of the Continuous Use of an Ammonium Phosphate Fertilizer on Rice in (D. Rhind and U Tin), 105
Burma and Netherlands India : Colonial Policy and Practice, a Comparative Study of (J. S. Furnivall), *review* by Maurice Bruce, 908
Business Management : The Board of Directors and (Melvin T. Copeland and Asst. Prof. Andrew R. Towl), *review* by E. F. L. Brech, 869
Busk (Edward) Memorial Prize of the Royal Aeronautical Society awarded to Air Marshal the Hon. Sir Ralph Cochrane, 593
Busk Studentship in Aeronautics, 595
Butterflies : Natural History of, 636
Butterfly Migration (Dr. C. B. Williams), 636

CADMIUM Methyl : Bond-Strength of C—Cd in, and of C—I in Methyl Iodide (A. S. Carson, K. Hartley and Dr. H. A. Skinner), 725
Calcification of Bone : Failure of Sulphanilamide to Inhibit (Dr. Zelma Baker Miller, Dr. Jerome Waldman and Prof. Franklin C. McLean), 274
Calcification in Bone (Primary) : The Theory of (Dr. Marcel J. Dallemagne), 115
Calcium Deficiency on Potato Sets in Acid Soils : Effects of (Prof. T. Wallace and E. J. Hewitt), 28
Calcium Ions : Adsorption of, by an Acid-extracted Brown Alga under Continuous Flow Conditions, (Dr. A. Wassermann), 562
Calcium Ions on the Charge of Myosin : Effect of (Olle Snellman and Thomas Erdös), 526
Calcium Fluoride Films Evaporated on Polished Glass Surfaces : Structure of (J. Bannon and C. E. Curnow), 136
Calcium-Deficient Media—their Effect on Phage Action (H. Williams Smith), 397
Calculating Machines (Royal Society discussion on), 712
Calculus : Advanced (Prof. David V. Widder), *review* by J. H. Pearce, 188
    Differential and Integral, Functions of One Variable (Prof. Francis D. Murnaghan), *review* by F. G. W. Brown, 261
Calculus based on the Fundamental Concept of Number, *review* by F. G. W. Brown, 261
Calcutta : Abnormalities in the *F*-Region of the Ionosphere at (S. S. Baral, S. N. Ghosh and M. Debray), 24
Calliphora erythrocephala Meig. : Effect of Removal of Neurosecretory Cells in the Brain of Adult (Dr. Ellen Thomsen), 439
Calorie Values : Energy-Yielding Components of Food and Computation of (Food and Agriculture Organisation of the United Nations), 306
Calories : Food, 306
'Calyx' Burner to Determine Combustion Conditions : Use of (H. Rostron Hindley), 395
Cambrian (Basal): Jellyfish from the, in South Australia (Reg. C. Sprigg), 568
Cambridge : Plant Virus Research at (Dr. Kenneth M. Smith), 776
    Sons of, *review* by Prof. F. J. M. Stratton, 661
Cambridge Archæological Expedition to Cyrenaica (C. B. M. McBurney, R. W. Hey and W. Watson), 327
Canada (Prof. Griffith Taylor), *review*, 912
Canada : Corrosion Research in, 553
    Radio and Electrical Research in, 513
Canada East of the Rocky Mountains : Handbook of the Trees of the Northern States and (Romeyn Beck Hough), *review* by Sir Edward Salisbury, 497
Canadian Mathematical Congress, Montreal 1945 : Proceedings of the First, *review* by H. T. H. P., 666
Canadian Rockies (Northern) : Exploration of the Lloyd George Mountains in the (Dr. N. E. Odell), 327
Cancer : The Genetics of (Genetical Society of Great Britain and the British Empire Cancer Campaign symposium on), 843
    Nutrition in relation to (New York Academy of Sciences symposium on), 106
Cancer (Adrenal) : Isolation of a New Androstenol-3(α)-on-17 from the Urine of a Patient with (Dr. Elizabeth Dingemanse, Leonora G. Huis in 't Veld and S. Lore Hartogh-Katz), 848
Cancer Death Rates: Regional and Local Differences in (Dr. Percy Stocks), 17
Cancer et hormones : Radiophysiologie expérimentale, 6, Étude de la cancérisation par les substances chimiques exogènes (Antoine Lacassagne), *review* by Prof. E. Boyland, 621
Cancer Research : Progress of (Dr. I. Hieger), 385
Cancérisation par les substances chimiques exogènes : Radiophysiologie expérimentale, cancer et hormones, 6, Étude de la (Antoine Lacassagne), *review* by Prof. E. Boyland ,621

Cantabrigienses : Alumni (compiled by Dr. J. A. Venn), Part 2, From 1752 to 1900, Vol. 3, Gabb—Justamond, *review* by Prof. F. J. M. Stratton, 661
Cantal Region, Central France : Mr. E. Westlake and the Geology of the (G. Maynard and Aubrey T. Westlake), 485
Capillarity and Temperature in Clays : Relationships of Vapour Pressure, (B. Vassiliou and Dr. J. White), 487
Capillary Distribution in Cow Skin (Dr. J. D. Findlay and S. H. Yang), 1012
Capture of Negative Mesons by Nuclei (A. S. Lodge), 809
Capture of 220 and 900 keV. Neutrons : Comparison of Cross-sections for the (R. Allen, G. R. Bishop, P. Demers and Dr. H. Halban), 727
C^{14}-Labelled Ethyl Iodide : Microsynthesis of (Dr. W. J. Arrol and Raymond Glascock), 932
C—C Bond in Diphenyl : Energy of the Central (Dr. M. Szwarc), 890
C—Cd in Cadmium Methyl and of C—I in Methyl Iodide : Bond-Strength of (A. S. Carson, K. Hartley and Dr. H. A. Skinner), 725
Carbon–Carbon Double Bonds : Mechanisms of Reactions at (Prof. Charles C. Price), *review* by Dr. J. Sheridan, 626
Carbon Dioxide : Regeneration of Prothrombin Activity by (I. M. Chak and Dr. K. V. Giri), 354
Carbon Dioxide Concentration in Photosynthesis of Foliage Leaves : Threshold Value of (Dr. E. K. Gabrielsen), 138
Carbon Dioxide Content of the Air : Studies in Stomatal Action—Control of Stomatal Movement by a Reduction in the Normal (Dr. O. V. S. Heath), 179
C—I in Methyl Iodide : Bond-Strength of C—Cd in Cadmium Methyl and of (A. S. Carson, K. Hartley and Dr. H. A. Skinner), 725
Carbonyls and Nitrosyls (Binuclear Metallic) : Constitution of certain (Dr. R. V. G. Ewens), 530
Cardamine pratensis : Chromosome Number of (Dr. H. W. Howard), 277 ; (F. Hussein), 1015
Care and Management of Laboratory Animals : The UFAW Handbook on the (edited by Prof. Alastair N. Worden), *review* by Frances Pitt, 664
Caribbean : Democracy and Empire in the (Paul Blanshard), 948
Carotenoids of the Locust Integument (T. W. Goodwin and S. Srisukh), 525
Casein (Iodinated) : Stimulation of Growth in Pigs by, and Stilbœstrol (Dr. R. Braude), 856
Cat Guide to the Study of the Anatomy of the Shark, *Necturus*, and the (Prof. Samuel Eddy, Prof. Clarence P. Oliver and Prof. John P. Turner), second edition, *review* by Dr. P. D. F. Murray, 955
Catalase and Hydrogen Peroxide : Reaction between (R. Lemberg and E. C. Foulkes), 131
Catalase and Peroxides : The Enzyme-Substrate Compounds of (Britton Chance), 914
Catalysis (Heterogeneous) : Adsorption and (Prof. Eric K. Rideal), 461
Catalytic Poisons and Magnetic Susceptibility (M. H. Dilke, Dr. D. D. Eley and Dr. E. B. Maxted), 804
Cathode : The Thermionic, *review* by D. A. Wright, 500
Cathode Surface Area : Electron Multiplier Tube of Large Effective (P. S. Faragó), 60
Cathodes chaudes : Les (Charles Biguenet), *review* by D. A. Wright, 500
Cathodes under Electron Bombardment : Electron Emission from Oxide-coated (T. J. Jones), 846
Cattle : Isolation in Chick Embryos of a Filtrable Agent possibly related etiologically to Lumpy Skin Disease of (Prof. M. van den Ende, P. Don, A. Kipps and R. Alexander), 526
    A Possible Relation between the Action of Clover Juice on Isolated Muscle and 'Bloat' in (W. S. Ferguson), 816
Cattle Health and Milk Production, 1005
Cattle Trypanosomiasis : Control of (R. N. T.-W.-Fiennes), 602
Caves : My (Norbert Casteret), translated by R. L. G. Irving, *review*, 830
Cell Counts : Economy in (Dr. B. Woolf), 361
Cell Walls of Tracheids and Wood Fibres : Organisation of the (A. B. Wardrop and Dr. R. D. Preston), *erratum*, 90
Cells (Plant and Animal) : Photo-electric Counting of Individual Microscopic (Carl Lagercrantz), 25
Cellulose Acetate Moulds : Recording Crevices in Plane Surfaces by Pigment-fillings held in (Dr. A. T. J. Dollar), 358
Cementiferous Paints and their Uses (Prof. G. Wesley Austin), 569
Centenaries in 1948 : Scientific (Eng.-Capt. Edgar C. Smith), 11
Centimetre Wave-lengths : Electrical Properties of Soil and Water at, 73
    Gas discharges at (W. A. Prowse and R. Cooper), 310
    Measurement of High Permittivity Values at (J. G. Powles), 25
Central Africa : Research in, 230
Central American Culture : Origins of, 594
Central Government : The Efficiency of the (D. N. Chester), 496
Centrifuge (Counter-streaming) : Principle of a, for the Separation of Particles of Different Sizes (Per Eric Lindahl), 648
Ceramic Complex of La Venta : Some Implications of the (Dr. Philip Drucker), 594
Cereal Chemistry : Modern (Dr. D. W. Kent-Jones and Dr. A. J. Amos), fourth edition, *review* by A. L. Bacharach, 293
Cereal Rusts as Exemplified in the Leaf Rust of Wheat : The Nature and Prevention of (Dr. K. Starr Chester), *review* by P. H. Gregory, 220
Cerebro-Spinal Fluid : Cholinesterase Activity in (Dr. M. Reiss and R. E. Hemphill), 18
Cestodes *in vitro* : Development of—Production of Fertile Eggs ; Cultivation of Plerocercoid Fragments (Dr. J. D. Smyth), 138
Cetacea : Hearing in (Robert Clarke), 979
Chaetomium-like Thermophile Fungus (C. J. La Touche), 320
Chalk : Wild Flowers of the (John Gilmour), *review*, 188
Champs macroscopiques : Théorie des (Prof. Jean Mariani), 450
Ch'ang Shan (*Dichroa febrifuga*), a Chinese Antimalarial Herb (Dr. C. S. Jang, F. Y. Fu, K. C. Huang and C. Y. Wang), 400 ; (T. S. Work), 401
Charge of Myosin : Effect of Calcium Ions on the (Olle Snellman and Thomas Erdös), 526
Chemical Activities of Bacteria (Dr. Ernest F. Gale), *review* by Dr. H. K. King, 78
Chemical Bonds between Them : Beta-quinol, an Example of the Firm Union of Molecules without the Formation of (H. M. Powell and P. Riesz), 52
Chemical Breakage of Chromosomes (C. B. Allsopp and Dr. D. G. Catcheside), 1011
Chemical Composition of Plants as an Index of their Nutritional Status (Dr. D. W. Gooda and Dr. F. G. Gregory), 406

Chemical Compounds : Induction of Tumours by, *review* by Prof. E. Boyland, 621
  The Theory of Valency and the Structure of (Prof. P. Ray), *review*, 460
Chemical Congress : The Fourth South American, 654
Chemical Constitution of some Common British Laminariales : Seasonal Variation in (Dr. W. A. P. Black), 174
Chemical Effects of Ionizing Radiations (Gabriel Stein and Dr. Joseph Weiss), 650
Chemical Engineering Fundamentals (Chalmer G. Kirkbride), *review* by Prof. H. E. Watson, 911
Chemical Engineering and Fuel Technology at the University of Durham, 965
Chemical Mechanism of Permanent Set (A. J. Farnworth and Prof. J. B. Speakman), 890
Chemical Promotion of Rooting in Plants, *review* by Prof. M. Thomas, 993
Chemical Reactions : Electronic Theory and (R. W. Scott), second edition, *review* by Prof. E. D. Hughes, 503
Chemical Research : Ramsay Memorial Fellowships for, 272
Chemical Theory : Foundations of (Charles Simpson), *review*, 503
Chemical Warfare Agents : Biochemical Reactions of (Biochemical Society symposium on), 225
Chemicals, Humus and the Soil (Donald P. Hopkins), *review*, 39
Chemistry : Education in—the Teaching of Chemistry in Schools and the Training of Chemists and Chemical Technicians for Industry (British Association of Chemists), 31
  Fundamental (Prof. Horace G. Deming), second edition, *review* by Dr. S. H. Harper, 992
  General (Prof. Linus Pauling), *review* by Dr. S. H. Harper, 992
  Humour and Humanism in (Prof. John Read), *review* by Denis I. Duveen, 869
  Modern Cereal (Dr. D. W. Kent-Jones and Dr. A. J. Amos), fourth edition, *review* by A. L. Bacharach, 293
  Practical (John Lambert and T. A. Muir), *review* by Dr. S. H. Harper, 992
  Practical Physiological (Dr. Philip B. Hawk, Dr. Bernard L. Oser and Dr. William H. Summerson), twelfth edition, *review*, 830
  Summer School in, 390
  Synthetic Resin (Dr. S. R. W. Martin), *review* by Dr. P. D. Ritchie, 502
Chemistry (Inorganic) : Modern Advances in (E. B. Maxted), *review* by G. R. Martin, 335
Chemistry (Organic) : Elsevier's Encyclopædia of (edited by E. Josephy and F. Radt), Series 3, Carboisocyclic Condensed Compounds, Vol. 13, Tricyclic Compounds, *review* by Prof. J. W. Cook, 415
  Scope of (Sir Robert Robinson), 508
Chemistry (Physical) : A Text Book of (Dr. N. C. Sen Gupta and K. C. Sen), new edition, *review*, 460
Chemistry (Practical Organic) : A Text-Book of (Dr. Arthur I. Vogel), *review* by Prof. J. W. Cook, 995
Chemistry for Matriculation (Dr. G. H. Bailey and H. W. Bausor), fourth edition, *review* by Dr. S. H. Harper, 992
Chemistry from the School to the University, *review* by Dr. S. H. Harper, 992
Chemistry for Schools (C. Jenkins and E. H. Foinette), Part 3, *review* by Dr. S. H. Harper, 992
Chemistry in combating Tropical Diseases : The Role of (Sir Ian Heilbron), 956
Chemistry at Dublin : Summer School in, 390
Chemistry at the University of Liverpool, 715
Chemistry at University College, Dundee, 715
Chemistry at University College, London, 511
Chemistry at University College, Swansea, 1004
Chemistry of Visual Processes (S. Ball, F. D. Collins, Prof. R. A. Morton and Dr. A. L. Stubbs), 424 ; (Dr. M. H. Pirenne), 724
Chemists : Training for (Dr. E. J. Holmyard), 31
Chemotherapeutic Agents for *Trypanosoma congolense* Infections : Cinnoline Derivatives as (J. R. Keneford, Dr. E. M. Lourie, J. S. Morley, J. C. E. Simpson, J. Williamson and P. H. Wright), 603, 758
Cherán, a Sierra Tarascan Village (Ralph L. Beals), 697
Chick Embryos : Isolation in, of a Filtrable Agent possibly related etiologically to Lumpy Skin Disease of Cattle (Prof. M. van den Ende, P. Don, A. Kipps and R. Alexander), 526
Child (School) : The Health of the (Dr. Robert Sutherland), 960
Chimie organique (Prof. A. Kirrmann), 1, Chimie organique générale, 2, Fonctions simples, *review* by Dr. S. H. Harper, 992
China : Discovery of a Living *Metasequoia* in (Prof. E. D. Merrill), 594
China (Ancient) : Science and Society in (Dr. Joseph Needham), 305
Chinese Antimalarial Herb : Pharmacology of Ch'ang Shan (*Dichroa febrifuga*), a (Dr. C. S. Jang, F. Y. Fu, K. C. Huang and C. Y. Wang), 400 ; (T. S. Work), 401
Chloride in *Metapenæus monoceros* Fabricius : Active Regulation of (N. Kesava Panikkar and R. Viswanathan), 137
Chlorides (Rare-Earth) : Preparation of (F. R. Hartley and A. W. Wylie), 241
Chlorine in Fasting Rats : Premortal Increase in the Output of Sodium and (Dr. Peter Bálint and Dr. Helene Kabdebó), 57
ClO in Flames : Band Spectrum of (Dr. G. Pannetier and Dr. A. G. Gaydon), 242
α-Chloroacids : Raman Spectra of some Synthetic Mixtures of (Dr. Marcel Renard), 354
Choleglobin Formation in the Erythrocyte (C. Gardikas, Dr. J. E. Kench and Prof. J. F. Wilkinson), 607
Cholera Infection (Human) : A New Sulpha Compound ('6257') and its Use in (Dr. S. S. Bhatnagar, F. Fernandes, J. de Sa and P. V. Divekar), 395
Cholinesterase Activity in Cerebro-Spinal Fluid (Dr. M. Reiss and R. E. Hemphill), 18
Choline Esterase Activity of Serum : Effect of Under-nutrition and Alterations in Diet on the (Prof. R. A. McCance, E. M. Widdowson and A. O. Hutchinson), 56
Chromatic Aberration of Electrostatic Lenses (W. A. Le Rütte), 392
Chromatogram (Paper) : Separation and Identification of Methylated Sugars on the (F. Brown, Prof. E. L. Hirst, L. Hough, Dr. J. K. N. Jones and H. Wadman), 720
Chromatographic Estimation of α-Amino-Acids : Quantitative (Dr. L. Naftalin), 763
Chromatographical Study of Meristematic Plant Tissues (Dr. A. Allsopp), 833
Chromatography : A Modified Technique in Filter-Paper (L. Rutter), 435
  Micro-Estimation of Amino-Nitrogen and its Application to Paper Partition (A. J. Woiwod), 169
  Quantitative Paper (R. B. Fisher, D. S. Parsons and G. A. Morrison), 764
  Use of Ultra-Violet Fluorescence in Paper (D. M. P. Phillips), 53
Chromatography of Anthocyanins and related Substances in Petal Extracts : Paper (E. C. Bate-Smith), 835
Chromatography of Flavine Nucleotides : Paper (Dr. J. L. Crammer), 349
Chromatography of Sugars : Colour Reagents for the Paper (Dr. W. G. C. Forsyth), 239
Chromosomal Evolution in the European Mole-Cricket (Tuviah Kushnir), 531
Chromosome Multiplication and Reduction in Somatic Tissues (Prof. C. Leonard Huskins), 80
Chromosome Number of *Cardamine pratensis* (Dr. H. W. Howard), 277 ; (F. Hussein), 1015
Chromosome Number of *Sesamum laciniatum* Klein (Dr. S. Ramanujam and A. B. Joshi), 99
Chromosomes : Chemical Breakage of (C. B. Allsopp and Dr. D. G. Catcheside), 1011
Chronicle and Commentary, *review* by Maurice Bruce, 151
Chronometric Observations of the Song of *Fringilla coelebs* Linn. (D. R. Barber), 277
Chrysanthemum and the Sword (Ruth Benedict), *review* by Peter Lawrence, 77
Church and the Atom, a Study of the Moral and Theological Aspects of Peace and War (Church Assembly), 990
Ciliate Protozoan Fauna of Soil and Inland Waters (Ernest Gray), 854
Cinnoline Derivatives as Chemotherapeutic Agents for *Trypanosoma congolense* Infections (J. R. Keneford, Dr. E. M. Lourie, J. S. Morley, J. C. E. Simpson, J. Williamson and P. H. Wright), 603, 758
Circulation (Renal) : Studies of the (Dr. Josep Trueta, Dr. Alfred E. Barclay, Dr. Kenneth J. Franklin, Peter M. Daniel, Marjorie M. L. Prichard), *review*, 663
Citizen : Local Government and the, *review* by Lieut.-Colonel Eric Lowe, 870
Citizenship in Africa : Education for (Colonial Office Advisory Committee on Education in the Colonies), 948
Citizenship and Current Affairs in Army Education (Lieut.-Colonel Eric Lowe), 444
Citric Acid in Semen (G. F. Humphrey and Dr. T. Mann), 352
City ! : X-Ray the (Dr. Ernest Fooks), *review* by R. Brightman, 297
Civil Service in the Changing State (H. R. G. Greaves), 496
Civilization : Freedom and (Bronislaw Malinowski), *review* by Dr. E. R. Leach, 457
Civilization (British) : Some Aspects of (Prof. H. J. Fleure), *review* by D. B. Harden, 746
Clanship among the Tallensi : The Dynamics of (Dr. Meyer Fortes), *review* by Dr. A. I. Richards, 111
Classification : A Bibliographic (Henry Evelyn Bliss), Vol. 2, Classes H—K, the Human Sciences, *review* by R. B., 705
Clay Minerals : Theory of the Structure of—Tailed X-Ray Reflexions from Random Layer Lattices (Dr. A. J. C. Wilson), 773 ; Banded X-Ray Reflexions from Clay Minerals (Dr. G. W. Brindley and J. Méring), 774
Clays : Relationships of Vapour Pressure, Capillarity and Temperature in (B. Vassiliou and Dr. J. White), 487
Clayton Fellowships for 1948 (Institution of Mechanical Engineers), 470
Clayton Prize for 1947 of the Institution of Mechanical Engineers awarded in two equal moieties to J. E. Sears and T. E. Beacham, 470
Cleaning and Sterilizing of Plant in the Food Industry (Royal Sanitary Institute and the Food Group of the Society of Chemical Industry discussion on), 1025
Cliff near Plymouth : A Submerged Ancient (Dr. L. H. N. Cooper), 280
Climates (Hot) : Medical Diseases in, *review* by Dr. N. Hamilton Fairley, 499
Climatic Fluctuations : Recent (L. Lysgaard), 442
Climatic Fluctuations and Vegetation Growth in Northern Finland : Northern Hemisphere Surface Pressure and (G. W. Brier), 730
Climatic and Ecological Changes in Northern Waters, 428
Cloches : Crop Production in Frames and (Ministry of Agriculture Bulletin 65), 196
Cloud Chamber Investigation of Straggling of Short-Range Particles produced by Slow Neutron Reactions (Dr. J. K. Bøggild), 810
Clover Juice on Isolated Muscle and 'Bloat' in Cattle : A Possible Relation between the Action of (W. S. Ferguson), 816
Coats Fellowships at Glasgow, 164
Coefficient of Viscous Extension (Dr. K. H. Swainger), 650
Coefficients of Viscosity and Thermal Conduction in Dense Gases and Liquids (L. M. Yang), 523
Coelom-Dwelling Trematode : A Rare (Dr. Ben Dawes), 642
Coffea arabica L. : Latent Infection in (R. W. Rayner), 245
Coincidence Device of 10^{-8}–10^{-9} Sec. Resolving Power (Z. Bay and G. Papp), 59
Colchicine, its Chemical and Biological Properties (Prof. J. W. Cook), 554
Colchicine Treatment on the Alkaloidal Content of *Datura metel* : Effect of (A. E. Beesley and Dr. G. E. Foster), 561
Cold : The Common (Dr. G. Lapage), 328 ; (Dr. C. H. Andrews), 328
Cold Work : The Disordering of β-Brass by (R. W. K. Honeycombe and Dr. W. Boas), 612
Cold-Worked Austenitic Stainless Steels : Ferromagnetic Structure of (P. T. Hobson and W. P. Osmond), 562
Collector's Trail : A, *review* by Frances Pitt, 222
Collision Broadening of the Ammonia Inversion Spectrum at High Pressures (Dr. B. Bleaney and J. H. N. Loubser), 522
Colloidal Solution in a Magnetic Field : Optical Transmission of a (F. D. Stott and Dr. A. von Engel), 728
Colombia : Earthquake at Pasto on July 15, 657
Colonial Administration by European Powers (José de Almada, Robert Godding, Lord Hailey, A. M. Joekes and H. Laurentie), 372
Colonial Development : British, 331
  Education and, 947
Colonial Development and International Co-operation, 371
Colonial Empire, 1939–1947 (Colonial Office), 332
Colonial Empire (British) : Factors of Agricultural Production in the (Sir Frank Stockdale), 337

Colonial Geological Survey Service, 50
Colonial Policy and Practice, a Comparative Study of Burma and Netherlands India (J. S. Furnivall), *review* by Maurice Bruce, 908
Colonial Research 1946–47, 14
Colonial Territories (British) : Research and Development in, 141
Colonial Universities : Biology in (Dr. E. B. Edney), 506
Colonies (British) : Agricultural and related Products of the, 779
Colorimetry (Photo-electric) : Units and Useful Range in (Dr. Walter Koch and Dr. Deborah Kaplan), 247 ; (Dr. J. R. Edisbury, R. J. Taylor and N. T. Gridgeman), 247
Colostrum : Electrophoretic Patterns of Lamb Serum Before and After Transfer of (P. A. Charlwood and A. Thomson), 59
Colour Reagents for the Paper Chromatography of Sugars (Dr. W. G. C. Forsyth), 239
Colour Vision : Race, Pigmentation and (Dr. R. W. Pickford), 687
Columbus : Indians before (Paul S. Martin, George I. Quimby and Donald Collier), *review* by Dr. G. H. S. Bushnell, 501
Combustion Conditions : Use of 'Calyx' Burner to determine (H. Rostron Hindley), 395
Combustion and Flame and Explosion Phenomena (University of Wisconsin symposium on), 307
Combustion and Ignition Reactions in the Gas Phase : The Kinetics and Mechanism of (International symposium on), 347
Comet 1947*n* : Orbit and Ephemeris for, 17
Commentary : Chronicle and, *review* by Maurice Bruce, 151
Commerce : Education in Industry and, 801
Commercial Air Routes : Aerobiology on (Dr. I. V. Newman), 275
Common Sense : Time Study and (Abraham Cohen), *review* by J. Leigh, 910
Commonwealth Entomological Conference : Fifth British, 429
Community : Engineers and the (Dr. Harold Hartley), 1005
Compensator of the Berek Type : A Large Field (W. A. P. Fisher), 848
Compensator for Measurement of Birefringence : A Large Field (P. E. Jellyman and A. J. Milne), 477 ; (A. A. Wells), 602
Competition in Tubular Excretion : Specific and Non-specific (I. Sperber), 236
Complexities of Human Structure : Some (Dr. W. L. H. Duckworth), 628
Complexity of Fresh *Hevea* Latex (L. N. S. Homans, J. W. van Dalfsen and G. E. van Gils), 177
Composts : Aerobic Mesophilic Bacteria in (D. M. Webley), 174
Concentration of the Heavy Isotopes of Oxygen and Hydrogen : Fractional Distillation and its Application in the (Dr. I. Dostrovsky, Prof. E. D. Hughes and Dr. D. R. Llewellyn), 858
Condensation of 2 : 4 : 5-Triamono-6-hydroxypyrimidine with Glucose and Fructose (H. S. Forrest and Dr. James Walker), 308
Conditional Disposition to Infectious Diseases : Thyroid Gland as a Special Factor Influencing the (Dr. S. Zimanyi), 57
Conductance by Hydrogen and Hydroxyl Ions in Aqueous Solutions : Mechanism of (Dr. S. I. Weissman), 241
Configuration of Synthetic Œstrogens (H. P. Koch), 309
Conflicts : Our Inner (Dr. Karen Horney), *review* by Dr. Clifford Allen, 830
Conjugation of Linoleic Acid in Oxidation with Lipoxidase : Total (Prof. Sune Bergström and Ralph T. Holman), 55
Conscious Animal : Electrical Stimulation of the Neurohypophysis in the (G. W. Harris), 739
Conscription and Industry (D. R. O. Thomas), 304
Conservation of the British Fauna : The Field Study and (Association of British Zoologists discussion on), 408
Conservation and Utilization of Resources (United Nations conference on the), 617
Consolidated Gold Fields of South Africa, Ltd. Gold Medal awarded jointly to Dr. Anthony Caplan and J. K. Lindsay, 924
Constitution of certain Binuclear Metallic Carbonyls and Nitrosyls (Dr. R. V. G. Ewens), 530
Constitution of Monazite (Dr. A. W. Wylie), 97
Contact Laminated Plastics, *review* by J. M. J. Estevez, 788
Continents and Ocean Bottoms : Ground Blocks of the (Prof. H. Cloos), 71
Continuous Flow Conditions : Adsorption of Calcium Ions by an Acid-extracted Brown Alga under (Dr. A. Wassermann), 562
Continuous Spectra : Smoothing Periodograms from Time-Series with (Prof. M. S. Bartlett), 686
Convalescence : Metabolic Aspects of (M. W. Grant), 535
Conversion of *D*-Arabinose into 2-Deoxy *D*-Ribose and 3-Deoxy *D*-Xylose (Dr. P. W. Kent, Prof. M. Stacey and Dr. L. F. Wiggins), 21
Conway Memorial Lecture (Dr. Joseph Needham), 305
Co-operation between Medical and Agricultural Physiology, *review*, 113
Co-operation in Science : World (Prof. J. D. Bernal), 840
Co-operation (Industrial) : The Short Road to (British Association for Commercial and Industrial Education), 571
Coopers Hill War Memorial Prize and Medal for 1946 of the Institution of Electrical Engineers awarded to E. C. Cherry, 90
Copepoda : The Free-Swimming Planktonic (Lieut.-Colonel R. B. Seymour Sewell), 822
Copepods : Sex Reversal in (J. G. Cattley), 937
Copper : Amalgamation of some Alloys of Gold, Silver and (Dr. Douglas Rennie Hudson), 288
Copper Protein in Serum : Histaminolytic Activity of a (Dr. C. G. Holmberg and C.-B. Laurell), 236
Corn (*Zea Mays* L.) Genetics in the United States (Gordon Haskell), 42
Cornwall : Devon and (Survey Committee of the University College of the South-West, Exeter), *review* by Prof. L. Dudley Stamp, 786
Correlation of Boulder Clays : Long-Distance (D. F. W. Baden-Powell), 287
Correlation between Molecular Vibrations and Bond-forming Orbitals (Dr. J. W. Linnett and P. J. Wheatley), 971
Correlation between Respiratory Inhibition of Plasmodia by Acridines and Antimalarial Action : Absence of (Dr. Adrien Albert and P. B. Marshall), 1008
Corrosion : Stress (J. C. Chaston), 891
Corrosion Research in Canada, 553
Cosmic and Human Life : Atomic Energy in (Prof. George Gamow), *review* by Prof. J. A. Crowther, 4
Cosmic Radio Noise : Frequency Variation of the Intensity of (Jack W. Herbstreit and Joseph R. Johler), 515
Cosmic Ray Particle : A Doubly Charged (A. B. Sahiar), 811
Cosmic Rays (Colston Research Society symposium on), 125
Cosmic Rays (Prof. L. Jánossy), *review* by Prof. T. G. Cowling, 785
  Electrons (+ and —), Protons, Photons, Neutrons, Mesotrons and (Robert Andrews Millikan), revised edition, *review* by Dr. L. G. H. Huxley, 789
  High-Altitude Measurements on—Penetrating Bursts (Dr. E. P. George and P. T. Trent), 248
  High-Altitude Measurements on—Penetrating Cosmic Ray Showers (Dr. E. P. George and A. C. Jason), 248
  Production of Helium by (H. E. Huntley), 356
Cosmic Rays—Double Stars : Anomalous Distribution of Nuclear Disintegration in Photographic Emulsions Exposed to (L. Leprince-Ringuet and J. Heidmann), 844 ; (T. T. Li and D. H. Perkins), 844
Cosmic Rays and the Magnetic Field of the Moon (Dr. M. S. Vallarta), 646
Cosmos : The Matter-Radiation Cycle in the (and the Second 'Law')—the Sun's Equilibrium (Alfred Lauck Parson), 802
Cote des Esclaves : La Géomancie à l'ancienne (Bernard Maupoil), *review* by G. I. Jones, 663
Cotton Wool Plugs : Unsaturated Fatty Acids in (Dr. M. R. Pollock), 853
Counter-streaming Centrifuge for the Separation of Particles of Different Sizes : Principle of a (Per Eric Lindahl), 648
Counting of Individual Microscopic Plant and Animal Cells : Photo-electric (Carl Lagercrantz), 25
Country : Trees for Town and (Brenda Colvin and Jaqueline Tyrwhitt), *review* by Sir Edward Salisbury, 497
Country Life : Early English, *review* by Sir John Russell, 701
Country Worker : Housing the (Michael F. Tilley), *review* by R. B., 665
Countryside : The Right Way to Understand the (Stanley A. Manning), *review* by T. H. Hawkins, 995
Courageous : The New (John Maude), 414
Cow Skin : Capillary Distribution in (Dr. J. D. Findlay and S. H. Yang), 1012
Creep in Metals : Theories of, 233
Crepis : The Genus (Ernest Brown Babcock), *review* by Prof. I. Manton, 455
Crevices in Plane Surfaces by Pigment-fillings held in Cellulose Acetate Moulds : Recording (Dr. A. T. J. Dollar), 358
Critical British Groups : The Study of (Botanical Society of the British Isles conference on), 514, 733
Critical Temperature and Molecular Weight of *n*-Paraffins (L. Grunberg and Dr. A. H. Nissan), 170
Cronulla, New South Wales : The Fisheries School at (G. A. Steven), 986
Crop Production in Frames and Cloches (Ministry of Agriculture Bulletin 65), 196
Cross-Linking in Polymeric Systems (Dr. G. F. Bloomfield), 298
Cross-Sections for the Capture of 220 and 900 keV. Neutrons : Comparison of (R. Allen, G. R. Bishop, P. Demers and Dr. H. Halban), 727
Crystal Boundaries in Metals : Mechanical Behaviour of (R. King, R. W. Cahn and Dr. B. Chalmers), 682
Crystal Structure of Polyvinyl Alcohol (C. W. Bunn), 929
Crystal Structure Analysis : The Fourier Method of (Dr. W. Cochran), 765
Crystallites of Alkali Metal Salts, Gold and Platinum : Magnetic Susceptibility of Borax Glasses containing (Prof. Subodh Kumar Majumdar), 684
Crystallization of Proteins : Use of Solubility Curves at Varying *p*H and Constant Ionic Strength for the Precipitation and (A. Distèche), 130
Crystallography : International Congress of, 124
Crystals : The Growth of (Sir George Thomson), 800
  Infra-Red Absorption Spectra of (Sir C. V. Raman), 165
Crystals (Biaxial) : A Simple Universal Model for Representing the Optic Orientation of (Dr. N. H. Hartshorne), 94
Crystals (Glacier) : Growth of (G. Seligman), 485
Cultural Background of Personality (Prof. Ralph Linton), *review* by Prof. T. H. Pear, 622
Cultural Relations of Social Biology : The International and (British Social Hygiene Council Summer School on), 842
Culture (Japanese) : A Study of, *review* by Peter Lawrence, 77
Culture Method for *Lymnæa truncatula* (E. L. Taylor and Alan Mozley), 894
Curare-like Action of Polymethylene *bis*-Quaternary Ammonium Salts (Dr. R. B. Barlow and Dr. H. R. Ing), 718 ; (Dr. W. D. M. Paton and Dr. E. J. Zaimis), 718
Current Affairs in Army Education : Citizenship and (Lieut.-Colonel Eric Lowe), 444
Currents : Lightning Arrester Discharge (Robert C. Cuffe), 885
Cutlery Industry : Working Party Report on the (Board of Trade), 448
Cuttings (Woody) : The Use of Auxins in the Rooting of (Kenneth V. Thimann and Jane Behnke), *review* by Prof. M. Thomas, 993
Cyclo-octatetraene : Structure of (H. S. Kaufman, Dr. I. Fankuchen and Prof. H. Mark), 165
Cyclopropane : Structure of (Sir Robert Robinson), 176
Cygnus : Variable Source of Radio Frequency Radiation in the Constellation of (J. G. Bolton and G. J. Stanley), 312
Cyrenaica : Cambridge Archæological Expedition to (C. B. M. McBurney, R. W. Hey and W. Watson), 327
Cytochemical Study of the Perinuclear Lipidic Layer in the Liver Cell (Dr. C. A. Baud), 559
Cytochrome *c* by Cytochrome *b* : A Factor in Heart Muscle required for the Reduction of (E. C. Slater), 405
Cytology of Staphylococci before and after Treatment with Penicillin (Prof. R. Tulasne and Dr. R. Vendrely), 316

D-LAYER (Ionospheric) : Electrical Conductivity of the (Prof. T. G. Cowling and R. Borger), 515
Dahomey : Divination in, *review* by G. I. Jones, 663
Daily Variation of the Horizontal Magnetic Force at the Magnetic Equator (J. Egedal), 443
Dairy Engineering : Postgraduate Scholarships in Husbandry, Agricultural Economics, Statistics and Agricultural and (Ministry of Agriculture and Fisheries and the Department of Agriculture for Scotland), 637
Dairy Farming (V. C. Fishwick), *review* by S. B., 544
Damage : An Adaptation Mechanism of the Organism to—the Role of 'Resistine' (Dr. S. Karády and Dr. A. Kovács), 688
Damping : Total Emission (Dr. J. Thomson), 847
Daniel-Pidgeon Fund of the Geological Society of London : Awards made to Dr. J. S. Webb and to W. S. McKerrow, 1007

Daphnia : Effect of Antihistamines on (Dr. Otakar Poupa), 235
Darkening of Red in Protanopes (Dr. R. W. Pickford), 27
Darkness into Daylight (Science Museum Exhibition), 674, 821
Data from Electrical Resistivity Geophysical Surveys : Interpretation of (J. M. Hough), 812
Data on Hilbert's Inequality : Empirical (E. H. Copsey, H. Frazer and W. W. Sawyer), 361
Datura metel : Effect of Colchicine Treatment on the Alkaloidal Content of (A. E. Beesley and Dr. G. E. Foster), 561
Davy and Faraday Exhibition at the Palais de la Découverte, Paris, 675
Day by Day on Skokholm Island, *review* by Frances Pitt, 5
Daylight : Darkness into (Science Museum Exhibition), 674, 821
D.D.T. with Selective Properties : New Formulation of (Dr. W. E. Ripper, R. M. Greenslade, J. Heath and K. Barker), 484
D.D.T. and Benzene Hexachloride in Soil : Persistence of (Dr. M. S. Smith), 246
Deactivation of Penicillin Solutions by Rubber Tubing : Facts involved in the (Dr. L. J. Bellamy and C. H. Watt), 940
Deaths from Cancer : Geographical Distribution of, 17
Deformed Solid Metal and Metal Powders : X-Ray Diffraction Rings from (Dr. W. A. Wood and W. A. Rachinger), 93
Degradation of Starch : Photochemical (Dr. S. Peat, Dr. E. J. Bourne and W. J. Whelan), 763
Dehydro-β-ionone : Synthesis of (Dr. H. B. Henbest), 481
Dehydrogenase of Mammalian Liver : Higher Fatty Acid (K. Burton), 606
Delayed Fracture of Glass under Tension, Torsion and Radial Pressure (C. Gurney), 729
Democracy and Empire in the Caribbean (Paul Blanshard), 948
Democracy and Industry (C. Reaveley and J. Winnington), 109
Democracy in Industry, 109
Demonstration of the Heart Beat (Dr. C. A. Beevers), 65, 321 ; (Dr. Alan J. Hird), 321 ; (Dr. Ian F. S. Mackay), 771
Denning Report on Procedure in Matrimonial Causes, 539
Density Distribution : Internal Waves in certain Types of (Dr. P. Groen), 92
Dental Caries : Relation of Enamel Protein to (Dr. Paul Pincus), 1014
Deployment of Scientific Effort in Britain, 1
Depth : Variation of Geomagnetic Intensity with (Prof. Sydney Chapman), 52 ; (S. K. Runcorn), 52
Derivatives of Diiodotyrosine : Formation of Derivatives of Thyroxine from (Rosalind Pitt Rivers), 308
Derivatives of Thyroxine from Derivatives of Diiodotyrosine : Formation of (Rosalind Pitt Rivers), 308
Dermatology : Modern Trends in (edited by Dr. R. M. B. MacKenna), *review* by Dr. James Marshall, 788
Descendant of Benjamin Franklin : A, *review* by Lieut.-Colonel H. D. Anthony, 909
Descents (Steepest) : Method of—Improved Formula for X-Ray Analysis (Dr. V. Vand), 600
Desert : Physiology of Man in the (E. F. Adolph and associates), *review* by Dr. B. McArdle, 744
Desert Conditions : Water Requirements under, *review* by Dr. B. McArdle, 744
Design for Europe (Design for Freedom Committee), 413
Design for Recovery (Design for Freedom Committee), 660
Determination of the Mass of Mesons : A New Method for the (Dr. C. F. Powell and Dr. S. Rosenblum), 473
Detonation in High Explosives : Spread of (Elwyn Jones and Dugald Mitchell), 98
Deuterium : Scattering of D—D Neutrons by (J. F. Darby and J. B. Swan), 22
Development in British Colonial Territories : Research and, 141
Development of Inventions Bill, 700
Development Organisations in Britain : Regional, 183
Development and Welfare in the West Indies (Sir John Macpherson), 181
Devises des Dogons : Les (Mme. Solange de Ganay), *review* by G. I. Jones, 622
Devon and Cornwall, a Preliminary Survey (Survey Committee of the University College of the South-West, Exeter), *review* by Prof. L. Dudley Stamp, 786
Dewar Research Fellowship, 802
Diabetic Rats (Alloxan) : Effect of Insulin on Intestinal Glucose Absorption in (Dr. A. Sols, S. Vidal and J. Larralde), 932
Dialysate ? : What is a (Eric G. Ball), 404
Diamond : Dielectric Constant of (Prof. S. Bhagavantam and D. A. A. S. Narayana Rao), 729
Dichroa febrifuga, a Chinese Antimalarial Herb : Pharmacology of Ch'ang Shan, (Dr. C. S. Jang, F. Y. Fu, K. C. Huang and C. Y. Wang), 400 ; (T. S. Work), 401
Dicumarol Poisoning and Vitamin K Deficiency in relation to Quick's Concept of the Composition of Prothrombin (Prof. Henrik Dam), 1010
Dielectric Constant of Diamond (Prof. S. Bhagavantam and D. A. A. S. Narayana Rao), 729
Dielectric Constant and Piezo-Electric Resonance of Barium Titanate Crystals (Bernd T. Matthias), 325
Dielectric Properties of Soils and Water at a Wave-length of 3·2 cm. (Prof. A. W. Straiton and C. W. Tolbert), 73
Dielectric Relaxation of Molecules containing Rotating Polar Groups (Prof. A. Budó), 133
Dielectrics (Highly Insulating) : Fluorescence of, produced by X- and γ-Radiations (Dr. C. W. Wilson), 520
Dienoestrol : Isomerization of (W. Hausmann and Dr. A. E. Wilder Smith), 892
Diet : Effect of Under-nutrition and Alterations in, on the Choline Esterase Activity of Serum (Prof. R. A. McCance, E. M. Widdowson and A. O. Hutchinson), 56
Dietetic Hepatic Lesions and Protein Deficiency (Dr. M. V. Radhakrishna Rao), 446
Differential Effect of 2-Benzoylbenzoic Acid and its Derivatives upon Plant Species (Dr. W. A. Sexton and Dr. W. G. Templeman), 974
Differentiation : Significance of Nuclear Change in (Dr. K. Mather), 872
Diffraction of Light by Very High Frequency Ultrasonic Waves (Prof. S. Bhagavantam and B. Ramachandra Rao), 927
Diffraction of Radio Waves from Trails during Formation : Velocity of Meteors Measured by (C. D. Ellyett and J. G. Davies), 596
5 : 6-Dihydroxyindole : The Melanin Problem—a Synthesis of (Dr. R. J. S. Beer, K. Clarke, H. G. Khorana and Prof. A. Robertson), 525
5 : 6-Dihydroxyindole and its Derivatives : The Melanin Problem—Synthesis of (Prof. H. Burton and J. A. Duffield), 725
Diiodotyrosine : Formation of Derivatives of Thyroxine from Derivatives of (Rosalind Pitt Rivers), 308
1 : 4-Diketones : Reduction of (Dr. Neil Campbell and Nandoomal Khanna), 54
Dimethyl Ether of *d*-Tubocurarine Iodide : Pharmacological Activities in Different Rodent Species of *d*-Tubocurarine Chloride and the (Dr. H. O. J. Collier, Sheila K. Paris and Dr. L. I. Woolf), 817
Diphenyl : Energy of the Central C—C Bond in (Dr. M. Szwarc), 890
Diphtheria Antitoxin : Sir Charles Sherrington and (Dr. A. N. Drury), 266
Diptera : White-eyed Mutants of (Dr. P. Tate), 641
Direction Finding : Wireless (R. Keen), fourth edition, *review* by Dr. R. L. Smith-Rose, 375
Directors and Business Management : The Board of (Melvin T. Copeland and Asst. Prof. Andrew R. Towl), *review* by E. F. L. Brech, 869
Discharge Currents : Lightning Arrester (Robert C. Cuffe), 885
Discharge Tube for Nuclear Reactions with Improved Yield (Jaroslav Pachner), 252
Discharge Tubes : Spontaneous Waves in, and in the Solar Atmosphere (Prof. V. A. Bailey), 599
Discovery of the Electron : Jubilee of the, 16
Discovery of Radioactivity (Prof. Jean Becquerel), 609 ; (Prof. J. A. Crowther), 609
Disease in Plants : Physiology of Resistance to (Royal Society symposium on), 422
Disease Resembling Virus Yellows through the 'Seed' of Sugar Beet : Transmission of a (Dr. Phyllis E. M. Clinch, J. B. Loughnane and R. McKay), 28
Diseases (Infectious) : Thyroid Gland as a Special Factor influencing the Conditional Disposition to (Dr. S. Zimanyi), 57
Diseases (Tropical) : The Role of Chemistry in combating (Sir Ian Heilbron), 956
Disintegration of Highly Excited Nuclei (D. H. Perkins), 486
Disintegration of Nuclei : Emission of Li^8 in the Explosive (C. Franzinetti and R. M. Payne), 735
Disintegration Products : Angular Distribution of Radioactive (J. A. Spiers), 807
Disordering of β-Brass by Cold Work (R. W. K. Honeycombe and Dr. W. Boas), 612
Dispersion in Organic Liquids : Ultrasonic (Dr. A. Schallamach), 476
Disposal of Effluents from Harwell, 163
Disposition to Infectious Diseases : Thyroid Gland as a Special Factor influencing the Conditional (Dr. S. Zimanyi), 57
Dissociation in Flame Gases : Atomic Oxygen and (Prof. W. T. David, C. Rounthwaite and N. Carpenter), 726
Dissociation Energies (Dr. A. G. Gaydon), 731
Distillation and its Application in the Concentration of the Heavy Isotopes of Oxygen and Hydrogen : Fractional (Dr. I. Dostrovsky, Prof. E. D. Hughes and Dr. D. R. Llewellyn), 858
Distribution of Nuclear Disintegration in Photographic Emulsions Exposed to Cosmic Rays—Double Stars ; Anomalous (L. Leprince-Ringuet and J. Heidmann), 844 ; (T. T. Li and D. H. Perkins), 844
Distribution of Radioactive Disintegration Products : Angular (J. A. Spiers), 807
Distribution Patterns in European Basidiomycetes with reference to some British Species (R. W. G. Dennis), 1015
Divination in Dahomey, *review* by G. I. Jones, 663
Documentation of Organic Chemistry, *review* by Prof. J. W. Cook, 415
Dogons : Les Ames des (Mme. G. Dieterlen), *review* by G. I. Jones, 622
Dogons : Les Devises des (Mme. Solange de Ganay), *review* by G. I. Jones, 622
Dolphins : The Swimming of (Alfred H. Woodcock), 602 ; (Dr. L. Harrison Matthews), 731
Domestic Fowl : Relationship of Glioma to Encephalitis in the, and an Associated Parasitic Agent (Prof. Cecil Jackson), 441
Dosage/Response Relationships in Mould Inhibition (J. N. Phillips and J. M. Vincent), 210
Double Bonds : Relative Reactivity of Aromatic (Dr. G. M. Badger and Dr. R. I. Reed), 238
Doubly Charged Cosmic Ray Particle (A. B. Sahiar), 811
Draining : Vegetation after (V. S. Summerhayes and Dr. W. B. Turrill), 421
Draining of Binley Lake and its Ecological Consequences (Wing-Comdr. T. R. Cave-Browne-Cave), 420
Draper (Henry) Medal for 1947 of the U.S. National Academy of Sciences awarded to Prof. Hans Albrecht Bethe, 861
Drosophila : Natural Selection of (Dr. F. W. Sansome), 409
Drosophila Egg : Ribose Nucleic Acid in the (H. G. Callan), 440
Drosophila melanogaster : Nutritional Requirements of (Dr. Michael Begg and Dr. Forbes W. Robertson), 769
Duddell Medal for 1947 of the Physical Society awarded to Dr. R. J. Van de Graaff, 511
Dwarfs (White) : Spectrum of (Dr. Evry Schatzman), 61
Dynamics of Clanship among the Tallensi (Dr. Meyer Fortes), *review* by Dr. A. I. Richards, 111
Dynamics of Power and Personality (Prof. H. D. Lasswell), 654

EAR : Phase Memory of the, a Proof of the Resonance Hypothesis (Dr. R. J. Pumphrey and T. Gold), 640
Ear (Vertebrate) : Oscillographic Analysis of the Non-Acoustic Functions of the (Dr. Otto Lowenstein), 652
Earliest Known Prehistoric Industry (T. T. Paterson), 278
Earth Currents : Water Movement and—Electrical and Magnetic Effects (N. Barber and M. S. Longuet-Higgins), 192
Earth Quakes : When the (Rev. James B. Macelwane), *review* by Ernest Tillotson, 459
Earth's Main Magnetic Field and its Secular Change, 1905–1945 (E. H. Vestine, Lucile Laporte, Caroline Cooper, Isabelle Lange and W. C. Hendrix), 161
Earth's Surface Magnetic Field and its Secular Change (Prof. Sydney Chapman), 160

Fat into Adipose Tissue : Active Penetration of (B. Shapiro, D. Weissmann, V. Bentor and E. Wertheimer), 482
Fat Supplies : Rebuilding Europe's (G. Heyworth), 123
Fats : World Supplies of Oils and, 123
Fats and Lipoids : Physiology and Biochemistry of (Le Centre National de le Recherche scientifique symposium on), 534
Fatty Acid Dehydrogenase of Mammalian Liver : Higher (K. Burton), 606
Fatty Acids in Cotton Wool Plugs : Unsaturated (Dr. M. R. Pollock), 853
Fauna (British) : The Field Study and Conservation of the (Association of British Zoologists discussion on), 408
  Synopses of the (Linnean Society), 594
Fauna of Soil and Inland Waters : Ciliate Protozoan (Ernest Gray), 854
Fauna and Flora of Palestine, 902
Feeding 2-Acetaminofluorene on the Adreno-Gonadal System of Rats : Effect of (Cornelia Hoch-Ligeti), 58
Feeding Micro-Wave Power into a Resonator having a Fine Mode Structure: A Method of (G. R. Newbery and W. E. Willshaw), 519
Feeding Times of British Birds (Rev. John Lees), 802
Fellowship : Dewar Research, 802
Fellowship Awards for 1948–49 : Frank B. Jewett (American Telephone and Telegraph Co.), 429
Fellowships : Atomic Energy Commission, 593
  Clayton, for 1948 (Institution of Mechanical Engineers), 470
  Commonwealth Fund, 1006
  Nuffield (Penicillin) Research, 16
  Postdoctorate, in Pure Chemistry (National Research Council of Canada), 555
  Ramsay Memorial, for Chemical Research, 272
  Research, in the University of Cambridge (Imperial Chemical Industries, Ltd.), 90
  Research, in Chemistry or Physics at the University of Glasgow and the Royal Technical College, Glasgow (J. and P. Coats, Ltd.), 164
Ferromagnetic Materials : New Developments in (J. L. Snoek), *review* by F. C. T., 666
Ferromagnetic Structure of Cold-Worked Austenitic Stainless Steels (P. T. Hobson and W. P. Osmond), 562
Fertility : The Problem of (Proceedings of the Conference on Fertility held under the auspices of the National Committee on Maternal Health, edited by Earl T. Engle), *review*, 113
  Soil, *review*, 39
Fertilization in Ascidians : Interspecific (Dr. Antonio Minganti), 643
Fertilized Rabbit Ova : Transplantation of—the Effect on Viability of Age, *in vitro* Storage Period, and Storage Temperature (Dr. Min-Chueh Chang), 978
Fertilizer Requirements : Plant Analysis and, 406
F.I.A.T. Review of German Science, 389
Fibers : Textile (Matthews), fifth edition, edited by Herbert R. Mauersberger, *review* by Dr. C. S. Whewell, 581
Fibres : Industrial (Commonwealth Economic Committee), 961
  Textile, *review* by Dr. C. S. Whewell, 581
Fibrinokinase and Fibrinolytic Enzymes (Dr. Tage Astrup and Per M. Permin), 689
Fibrinolytic Enzymes : Fibrinokinase and (Dr. Tage Astrup and Per M. Permin), 689
Field Distributions : An Electrolytic Tank for Exploring Potential (R. Makar, A. R. Boothroyd and E. C. Cherry), 845
Field Ecology : Practical (Dr. R. C. McLean and Dr. W. R. Ivimey Cook), 158
Field Study and Conservation of the British Fauna (Association of British Zoologists discussion on), 408
Field-Size : Dependence of Anomaloscope Matching on Viewing-Distance or (R. G. Horner and E. T. Purslow), 484
Fiji Islands (east of the) : Earthquake on July 13, 657
Films (Medical) : Catalogue of (Royal Society of Medicine and the Scientific Film Association), 594
Films in Agriculture (Scientific Film Association conference on), 17
Filmstrips : An Introduction to (H. R. and I. W. Dance), *review* by Lieut.-Colonel Eric Lowe, 830
Filter-Paper Chromatography : A Modified Technique in (L. Rutter), 435
Filtrable Agent possibly related etiologically to Lumpy Skin Disease of Cattle : Isolation in Chick Embryos of a (Prof. M. van den Ende, P. Don, A. Kipps and R. Alexander), 526
Finland (Northern) : Northern Hemisphere Surface Pressure and Climatic Fluctuations and Vegetation Growth in (G. W. Brier), 730
Fires (Petrol) : Extinction of, by Methyl Iodide (Dr. Oliver C. de C. Ellis), 402
Fish Cultivation : An Experiment in Marine (L. H. N. Cooper and G. A. Steven), 631
Fish Farming in the Middle and Far East (Dr. C. F. Hickling), 748
Fish Gut : Alkaline Phosphatase in (A. H. Al-Hussaini), 274
Fish Kidney (Aglomerular) : A Vasodilator, Adrenolytic Substance in (Dr. Benjamin Jablons), 100
Fisher and Race : Two Examples of Sera containing the Anti-*d* Agglutinin predicted by (Dr. Joseph M. Hill and Dr. Sol Haberman), 688
Fisheries : Report on Sea and Inland (Government of Northern Ireland), 451
Fisherman and Nature Lover, *review* by Seton Gordon, 951
Fishes (British) : The Trematoda of (Dr. Ben Dawes), *review* by Dr. G. Lapage, 222
Fishes (Greek) : A Glossary of (Sir D'Arcy Wentworth Thompson), *review* by Sir John Myres, 185, 272
Fishing Industry Developments during the War Years : Northern Ireland, 451
Fison Lectures of the Animal Health Trust (Prof. L. Seekles), 637, 1005
Fission Products of U^{238} (Dr. W. E. Grummitt and Dr. G. Wilkinson), 520
Fixatives : Shrinkage of Animal Cells due to (Dr. Daya Krishna), 202
Flagella and Motility : Bacterial (Prof. Adrianus Pijper), 200
Flame Gases : Atomic Oxygen and Dissociation in (Prof. W. T. David, C. Rounthwaite and N. Carpenter), 726
Flame and Explosion Phenomena : Combustion and (University of Wisconsin symposium on), 307
Flames : Band Spectrum of ClO in (Dr. G. Pannetier and Dr. A. G. Gaydon), 242
Flavine Adenine Dinucleotide : Inactivation of, by Tissue Extracts (R. S. Comline and F. R. Whatley), 350
Flavine Nucleotides : Paper Chromatography of (Dr. J. L. Crammer), 349
Fleas' and 'Lesser Fleas' : 'Little, *review* by Dr. G. Lapage, 662
Flights (Migratory and Homing) : Orientation of Birds on (Linnean Society discussion on), 996
Flint Flaking (S. Hazzledine Warren), 569
Floating Thread, a Surface Phenomenon on Flowing Water (I. Kuscer), *erratum*, 51
Flora of Palestine : Fauna and, 902
Floras : Origins of Species and Migrations of, *review* by Prof. I. Manton, 455
Flour : Insect Pests of (J. A. Freeman and E. E. Turtle), 554
Flow of Glaciers (British Glaciological Society, the British Rheologists' Club and the Institute of Metals discussion on), 819
Flowering Plants : Critical British Groups of (J. E. Lousley), 733
  The Geography of the (Prof. Ronald Good), *review* by Sir Edward Salisbury, 704, 857
Flowers of the Chalk : Wild (John Gilmour), *review*, 188
Flowing Water : The Floating Thread, a Surface Phenomenon on (I. Kuscer), *erratum*, 51
Fluoranthene Derivatives : A Synthesis of (Dr. E. Bergmann), 889
Fluorescence (Ultra-Violet) : Use of, in Paper Chromatography (D. M. P. Phillips), 53
Fluorescence of Highly Insulating Dielectrics produced by X- and γ-Radiations (Dr. C. W. Wilson), 520
Fœtal Hæmoglobin and Erythroblastosis (Dr. J. H. P. Jonxis), 850
Fœtus : Die Hormonversorgung des (Dr. Jules Samuels), *review*, 297
Foliage Leaves : Threshold Value of Carbon Dioxide Concentration in Photosynthesis of (Dr. E. K. Gabrielsen), 138
Folic Acid Group, and other Anti-Anæmia Factors : B_T, a New Vitamin of the B-Group and its relation to the (Dr. G. Fraenkel, with the assistance of M. Blewett and M. Coles), 981
Folliculin on Bone Metabolism, Studied by means of Radiophosphorus, $^{32}_{15}P$: Influence of (Dr. J. Govaerts and Prof. M. J. Dallemagne), 977
Food : Energy-Yielding Components of, and Computation of Calorie Values (Food and Agriculture Organisation of the United Nations), 306
Food Calories, 306
Food of Humming-Birds (Frank Bené), 881
Food Industry : Cleaning and Sterilizing of Plant in the (Royal Sanitary Institute and the Food Group of the Society of Chemical Industry discussion on), 1025
Food Poisoning (Elliot B. Dewberry), second edition, *review*, 540
Food Production from Hill Grazing Land (Dr. George Dunlop), 585
Food Production and Land Utilization, 905
Food Science : Summer Course in, 1007
Forage Resources of Latin America (Hugo W. Alberts), 657
Foraminifera in the Gullmar Fjord and the Skagerak (Hans Högland), 513
Force Constant with the Ionization Potential and the Polarizability for some Halogen Compounds : Variation of the (P. Torkington), 724
Force Field for Molecular Vibrations : A Suggested New (D. F. Heath and Dr. J. W. Linnett), 314
Forces between Large Molecules of Biological Interest : Nature of (Prof. Linus Pauling), 707
Foreign Universities : Scholarships for 1948–49 at (British Council), 347
Forest (New) : The Future of the (Prof. H. G. Champion), 547
Forest Products : Forestry and ; World Situation 1937–1946 (Food and Agriculture Organisation of the United Nations), 710
Forest Valuation (Prof. Herman H. Chapman and Prof. Walter H. Meyer), *review* by J. J. MacGregor, 831
Forestry : Practical British (C. P. Ackers), second edition, *review* by Prof. E. P. Stebbing, 295
Forestry in Trinidad and Tobago, 147
Forestry Conference : Fifth British Empire (Summary Report and Results and Reports of Committees), 449
Forestry and Forest Products ; World Situation 1937–1946 (Food and Agriculture Organisation of the United Nations), 710
Formation of Oxime-Nitrogen in *Torula*-Yeast Fed with Potassium Nitrate (Prof. Artturi I. Virtanen and Tihamér Z. Csáky), 814
Formation and Breakdown of Serpulid Tubes (Jean Hanson), 610
Formulation of D.D.T. with Selective Properties : New (Dr. W. E. Ripper, R. M. Greenslade, J. Heath and K. Barker), 484
Fortpflanzungsprozesses : Die hormonalen Aspekte des (Dr. Jules Samuels), *review*, 297
Forze creatrici dell'uovo : Le (Prof. Pasquale Pasquini), *review* by C. H. W., 831
Fossil Primates discovered during 1947 : African (Prof. W. E. Le Gros Clark), 667
Foundations of Chemical Theory (Charles Simpson), *review*, 503
Founder's Medal for 1948 of the Royal Geographical Society awarded to Wilfred Thesiger, 553
Fourier Method of Crystal Structure Analysis (Dr. W. Cochran), 765
Fourier Refinement Technique : A New (Andrew D. Booth), 765
Fowl (Domestic) : Relationship of Glioma to Encephalitis in the, and an Associated Parasitic Agent (Prof. Cecil Jackson), 441
Fractional Distillation and its Application in the Concentration of the Heavy Isotopes of Oxygen and Hydrogen (Dr. I. Dostrovsky, Prof. E. D. Hughes and Dr. D. R. Llewellyn), 858
Fracture : Nitrogen Metabolism after (Dr. H. N. Munro and M. C. Cumming), 560
Fracture of Glass under Tension, Torsion and Radial Pressure : Delayed (C. Gurney), 729
Frames and Cloches : Crop Production in (Ministry of Agriculture Bulletin 65), 196
Framework of Human Behaviour (Dr. Julian Blackburn), *review*, 502
Frazer Lecture for 1947 (Prof. H. J. Fleure), 746
Free Society : The (John Middleton Murry), 538
Free-living Nematodes in Genetic Research : Possible Significance of (Dr. Ellsworth C. Dougherty and Hermione Grant Calhoun), 29
Free-Swimming Planktonic Copepoda (Lieut.-Colonel R. B. Seymour Sewell), 822
Freedom : The European Tradition of, 413
  Science and (Dr. Lyman Bryson), 577
Freedom in the Good Society, 577
Freedom End : Where does (British Social Hygiene Council Ethics and Science conference on), 843
Freedom and Civilization (Bronislaw Malinowski), *review* by Dr. E. R. Leach, 457

Freedom and Loyalty, 537
Freedom and Social Responsibility : Individual (Conference on), 843
French Conference on Ageing of Population, 163
French Scientific Periodicals : Photocopies of, 429
Frequency Range 1–30 Mc./s. : Survey of Existing Information and Data on Radio Noise over the (Dr. H. A. Thomas and R. E. Burgess), 107
Frequency Variation of the Intensity of Cosmic Radio Noise (Jack W. Herbstreit and Joseph R. Johler), 515
Fringilla coelebs Linn. : Chronometric Observations of the Song of (D. R. Barber), 277
Fructose : Condensation of 2 : 4 : 5-Triamino-6-hydroxy-pyrimidine with Glucose and (H. S. Forrest and Dr. James Walker), 308
Fruit Tree Red Spider Mite : Toxicity of Azo-Compounds and other Substances to the (Dr. J. K. Eaton and R. G. Davies), 644
Fruits of *Ammi majus* L. : Xanthotoxin from the (Prof. Alexander Schönberg and Aly Sina), 481
Fuel Economy in Switzerland, 253
Fuel Problems : Britain's (Dr. D. T. A. Townend), 669
Fuel Systems for the Aero-Gas Turbine (Dr. E. A. Watson), 196
Fuel Technology at the University of Durham : Chemical Engineering and, 965
Fuel and Power Industries : The British (Political and Economic Planning Report on), 669
Fuels (Liquid) : Modern Applications of (Institute of Petroleum and the Institute of Fuel joint conference on), 677, 1007
Fundamental Concept of Number : Calculus based on the, *review* by F. G. W. Brown, 261
Fundamental Equation of the Statistical Atom Theory : An Asymptotic Solution of the (Dr. J. I. Hórvath), 26
Fungal Spores : A Method for Estimating Percentage Germination of (O. L. Davies, R. B. Duckworth and G. C. M. Harris), 642
Fungi : Type Cultures of, 16
Fungus : A *Chaetomium*-like Thermophile (C. J. La Touche), 320
Furnace Models : Open Hearth (A. J. Philip), 479

GALAXIES (Harlow Shapley), *review* by H .S. J., 460
Gamma-Isomer of Benzene Hexachloride : Polarographic Determination of the (G. B. Ingram and H. K. Southern), 437
Gamma Radiation (Magnetic Dipole) : Spin-Dependence of, and the Nuclear Level Scheme of Pb^{208} (Dr. H. O. W. Richardson), 516
γ-Radiation from Light Elements Bombarded with α-Particles from Polonium : Excitation Curves for the (Prof. Hilding Slätis), 899
γ-Radiations : Fluorescence of Highly Insulating Dielectrics produced by X- and (Dr. C. W. Wilson), 520
Garden : Good Health to the (Plant Protection, Ltd.), *review*, 188
Garden Pests : The Detection and Control of (G. Fox Wilson), *review* by A. D. I., 419
Gas (Luminous) : A Bunsen Flame as a Column of (Dr. A. S. Leah and Prof. W. T. David), 524
Gas Discharges at Centimetre Wave-lengths (W. A. Prowse and R. Cooper), 310
Gas Industry in Britain (Dr. E. V. Evans), 832
Gas Phase : The Kinetics and Mechanism of Combustion and Ignition Reactions in the (International symposium on), 347
Gas Turbines : Modern (Arthur W. Judge), *review* by E. G. Sterland, 910
Gaseous Elements : Mass-Spectrographic Separation of Isotopes of (Dr. J. Koch), 566
Gases (Flame) : Atomic Oxygen and Dissociation in (Prof. W. T. David, C. Rounthwaite and N. Carpenter), 726
Gases Liberated from Explosions Initiated by Impact (Dr. A. J. B. Robertson and A. Yoffe), 806
Gases and Liquids (Dense) : Coefficients of Viscosity and Thermal Conduction in (L. M. Yang), 523
Gazetteer of British Somali Place Names, 195
Gemmologists' Compendium (Robert Webster), second edition, *review*, 297
General Electric in World War II : Men and Volts at War, the Story of (John Anderson Miller), *review* by Sir Arthur Fleming, 113
Generation of Electricity from Wind Power, 162
Genes Allelomorphic to *C* : *Rh* (Dr. R. R. Race, Dr. Ruth Sanger and Mrs. Sylvia D. Lawler), 316
Genetic Research : Possible Significance of Free-living Nematodes in (Dr. Ellsworth C. Dougherty and Hermione Grant Calhoun), 29
Genetics : Congress of (To be held at the Centro di Genetica del Consiglio Nazionale delle Ricerche in Pavia), 429, 966
  Corn (*Zea Mays* L.), in the United States (Gordon Haskell), 42
Genetics of Cancer (Genetical Society of Great Britain and the British Empire Cancer Campaign symposium on), 843
Genetics and Algal Life-Histories (Dr. Kathleen M. Drew), 223
Genetics and Medicine : Animal (Dr. Hans Grüneberg), *review* by Prof. C. H. Waddington, 543
Genus Crepis : The (Ernest Brown Babcock), *review* by Prof. I. Manton, 455
Geodesy : Eclipse Observations for, 196, 389, 879
Geographical Approach to the History of the British Isles, *review* by D. B. Harden, 746
Geographical Distribution of Deaths from Cancer, 17
Geography : Plant, *review* by Sir Edward Salisbury, 704 ; (Prof. Ronald Good), 857
Geography at Bedford College, London, 511
Geography of the Flowering Plants (Prof. Ronald Good), *review* by Sir Edward Salisbury, 704, 857
Geography of Southwest Guatemala : Cultural and Historical (Felix Webster McBryde), 697
Geological Congress : International, 88
Geological Survey Service: Colonial, 50
Geological Time : The Succession of Life through (British Museum (Natural History) exhibits), 429
Geology of the Cantal Region, Central France : Mr. E. Westlake and the (G. Maynard and Aubrey T. Westlake), 485
Geology at Newcastle-upon-Tyne, 1003
Geology of the Salt Range of the Punjab (Sir Edward Bailey), 265
Geomagnetic Field : Final Values of the Elements of the, at 5-Degree Intervals of Latitude and Longitude, Epoch 1945 (L. Laporte, C. Cooper, I. Lange, W. C. Hendrix and E. H. Vestine), 161
  The Main (Royal Astronomical Society Geophysical Discussion on), 462
Geomagnetic Intensity with Depth : Variation of (Prof. Sydney Chapman), 52 ; (S. K. Runcorn), 52
Géomancie à l'ancienne Cote des Esclaves (Bernard Maupoil), *review* by G. I. Jones, 663
Geometry (Algebraic) : Foundations of (Prof. André Weil), *review* by Prof. H. T. H. Piaggio, 787
Geometry (Analytical) : An Introduction to (A. Robson), Vol. 2, *review* by Prof. H. T. H. Piaggio, 705
Geophysical Surveys (Electrical Resistivity) : Interpretation of Data from (J. M. Hough), 812
Geophysics at Hamburg, 1006
German Books and Periodicals : Union Catalogue of (National Central Library), 1006
German Books, Periodicals and Newspapers : First Post-war Exhibition of (European Periodicals Publicity and Advertising Co., Ltd.); 595
German Educational Reconstruction Series, No. 5, Public Libraries in Germany (H. Schurer), 90
German Research in World War II (Colonel Leslie E. Simon), *review*, 219
German Scientific and Technical Papers : Photostat Copies of, 90
German War-time Industry and Science : Reports on. 388
Germany : Public Libraries in (H. Schurer), 90
  Scientific Research in the British Zone of (Prof. F. A. Paneth), 191
Germany To-day : Economic Conditions of, and its International Repercussions (International Chamber of Commerce), 659
Germicidal, Erythemal and Infra-red Energy : Applications of (Dr. Matthew Luckiesh), *review* by H. G. Jenkins, 542
Germinal Epithelium : Control of the, *review* by Prof. S. Zuckerman, 221
Germination of Fungal Spores : A Method for Estimating Percentage (O. L. Davies, R. B. Duckworth and G. C. M. Harris), 642
Gibbs (Willard) Medal for 1948 of the Chicago Section of the American Chemical Society awarded to Prof. Carl F. Cori, 388
Gill Memorial for 1948 of the Royal Geographical Society awarded to William W. Williams, 553
Glacier Crystals : Growth of (G. Seligman), 485
Glaciers : The Flow of (British Glaciological Society, the British Rheologists' Club and the Institute of Metals discussion on), 819
Glass : Annealing of (S. M. Cox), 401, 813 ; (Dr. G. O. Jones), 813
  Transmission of Bactericidal Radiation through (J. E. Stanworth), 856 ; *erratum*, 882
Glass under Tension, Torsion and Radial Pressure : Delayed Fracture of (C. Gurney), 729
Glass Surfaces (Polished) : Structure of Calcium Fluoride Films Evaporated on (J. Bannon and C. E. Curnow), 136
Glass and Steatite Ceramic with Quaternary Ammonium Compounds for the Improvement of Electrical Insulation Resistance : Treatment of (J. S. Dryden and R. J. Meakins), 23
Glassware : Hand-blown Domestic (Working Party Report on the), 449
Glioma to Encephalitis in the Domestic Fowl : Relationship of, and an Associated Parasitic Agent (Prof. Cecil Jackson), 441
Glossary of Greek Fishes (Sir D'Arcy Wentworth Thompson), *review* by Sir John Myres, 185, 272
Glow to Arc Discharge : Transition from (Dr. Chas E. R. Bruce), 521
Glucose Absorption (Intestinal) : Effect of Insulin on, in Alloxan Diabetic Rats (Dr. A. Sols, S. Vidal and J. Larralde), 932
Glucose and Fructose : Condensation of 2 : 4 : 5-Triamino-6-hydroxy-pyrimidine with (H. S. Forrest and Dr. James Walker), 308
Glutamine Synthesis : Adenosinetriphosphate in (W. H. Elliott), 128
Glutamine-synthesizing System of *Staphylococcus aureus*, its Inhibition by Crystal Violet and Methionine-sulphoxide (W. H. Elliott and Dr. E. F. Gale), 129
Glycerol Dichlorhydrin and Vitamin A (D. D. Penketh), 893
Gold : A New Dry Test for (R. C. Mehrotra), 321
Gold Medal of the Institution of Mining and Metallurgy awarded to G. Carleton Jones, 923
Gold Medal for 1948 of the Linnean Society of London awarded to Dr. Agnes Arber, 272, 882
Gold Medal of the Royal Aeronautical Society awarded to Sir Bennett Melvill Jones, 593
Gold and Platinum : Magnetic Susceptibility of Borax Glasses containing Crystallites of Alkali Metal Salts, (Prof. Subodh Kumar Majumdar), 684
Gold, Silver and Copper : Amalgamation of some Alloys of (Dr. Douglas Rennie Hudson), 288
Gonadotrophic and Sex Hormones on the Gonads of Rats : Contribution to the Knowledge of the Influences of (J. H. Gaarenstroom and S. E. de Jongh), *review* by Prof. S. Zuckerman, 221
Gonads of Rats : Contribution to the Knowledge of the Influences of Gonadotrophic and Sex Hormones on the (J. H. Gaarenstroom and S. E. de Jongh), *review* by Prof. S. Zuckerman, 221
Gorini's Acid-Proteolytic Lactic Cocci with Penicillin : Behaviour of (Annamaria Torriani), 275
Governing of Men : The (Dr. A. H. Leighton), 578
Government : Local (Sir A. S. MacNalty), *review* by Lieut.-Colonel Eric Lowe, 870
  Local and Regional (G. D. H. Cole), 825
  Machinery of, 495
  The Web of (Prof. R. M. MacIver), 579
Government (Central) : The Efficiency of the (D. N. Chester), 496
Government in Britain : Local, 825
Government and the Citizen : Local, *review* by Lieut.-Colonel Eric Lowe, 870
Government Reform : Local (J. Blackburn), 825
Government Research in Britain, 214
Government Social Survey (Maurice Goldsmith), 573
Gramicidin-S : Synthetic Pentapeptides related to (J. I. Harris and T. S. Work), 804
Grammar School Science, *review* by W. L. Sumner, 114
Grand Cross of Alfonso X awarded to Sir Alexander Fleming, 966
Granular Material : Mechanics of Packings of (D. R. Hudson), 512
Grass Seedlings : Resistance to Inanition in (H. G. Chippindale), 65 ; (J. P. Cooper), 894
Grasshopper (Australian Plague) : Measurement of 'Environmental Resistance' in the (Dr. H. G. Andrewartha and L. C. Birch), 447
Gravity Survey in the English Channel : Submarine, 272

Gray (John) Jubilee Scholarship of the Society of Chemical Industry, 595
Grazing : Evaluation of Herbage for (W. F. Raymond), 937
Grazing Land (Hill) : Food Production from (Dr. George Dunlop), 585
Great Britain : The Electricity Grid in (R. W. Haywood), 822
  Seismological Research in, 615
  See also under Britain
Greece (southern) : Earthquake at Coroni on October 6, 306
Greek Fishes : A Glossary of (Sir D'Arcy Wentworth Thompson), *review* by Sir John Myres, 185, 272
Green Alga : Influence of Low Bicarbonate Concentrations on the (Sven Österlind), 319
Greenkeeping Research, 757
Grid System (British) : Load Dispatching and the (A. R. Cooper), 822
Ground Blocks of the Continents and Ocean Bottoms (Prof. H. Cloos), 71
Ground-State of Helium-like Atoms: Energy of the (H. A. S. Eriksson), 393
Growth of Crystals (Sir George Thomson), 800
Growth of the Explosion in Solids Initiated by Impact : Birth and (Dr. F. P. Bowden and O. A. Gurton), 348
Growth of Glacier Crystals (G. Seligman), 485
Growth of a Green Alga : Influence of Low Bicarbonate Concentrations on the (Sven Österlind), 319
Growth in Pigs by Iodinated Casein and Stilbœstrol : Stimulation of (Dr. R. Braude), 856
Growth and Nature of Egyptology (Prof. S. R. K. Glanville), 346
Growth-promoting Substances in Horticulture (Dr. T. Swarbrick), 656
Guatemala : Education in (Cameron D. Ebaugh), 945
Guatemala (southwest) : Cultural and Historical Geography of (Felix Webster McBryde), 697
Guiana (British) : Animal Health in (Prof. W. C. Miller), 345
Guildford : Health Education in, 635
Guinea Pig : Alkaline Phosphatase in various Cell Types of the Anterior Pituitary of the (Prof. Leo Abolins), 556
  Influence of Vitamin P (Vitamin C2) upon the Amount of Ascorbic Acid in the Organs of the (H. Cotereau, M. Gabe, E. Géro and Prof. J.-L. Parrot), 557
Gullmar Fjord and the Skagerak : Foraminifera in the (Hans Högland), 513
Guthrie Lecture of the Physical Society (Sir George Thomson), 800

HABITAT Groups : Booklets on (Glasgow Art Gallery and Museum), 90
Hadfield (Sir Robert) Medal for 1948 of the Iron and Steel Institute awarded to A. Preece, 512
Hæmoglobin and Erythroblastosis : Fœtal (Dr. J. H. P. Jonxis), 850
Hæmolytic System in the Blood of Malaria-infected Monkeys (Dr. H. Laser), 560
Hagfish : *Trypanosoma heptatretæ* sp. n., a Blood Parasite of the (Marshall Laird), 440
Halogen Compounds : Variation of the Force Constant with the Ionization Potential and the Polarizability for some (P. Torkington), 724
Harrison Memorial Prize for 1947 awarded to Dr. D. H. R. Barton, 270
Harwell : Disposal of Effluents from, 163
Hatfield Memorial Lecture of the Iron and Steel Institute (Prof. Robert E. Mehl), 592
Hawksley (Thomas) Lecture (Sir Alwyn Crow), 329
Head : Wounds of the (*British Journal of Surgery* War Surgery Supplement No. 1), 635
Health (Human) : Experimental Study of, *review* by Dr. G. Lapage, 336
Health to the Garden : Good (Plant Protection, Ltd.), *review*, 188
Health of the School Child (Dr. Robert Sutherland), 960
Health Education (Central Council for Health Education Summer School in), 842
Health Education in Guildford, 635
Hearing in Cetacea (Robert Clarke), 979
Heart Beat : Demonstration of the (Dr. C. A. Beevers), 65, 321 ; (Dr. Alan J. Hird), 321 ; (Dr. Ian F. S. Mackay), 771
Heart Muscle required for the Reduction of Cytochrome *c* by Cytochrome *b* : A Factor in (E. C. Slater), 405
Heart Wood of *Thuja plicata* Don. : Antibiotic Substances from the (Prof. Holger Erdtman and Dr. Jarl Gripenberg), 719
Heat Engines : Fundamentals of, *review* by R. W. Haywood, 829
Heating on *Rh*-Positive Human Red Cells : Action of (Dr. P. O. Hubinont), 642
Heavy Isotopes : Mass-Defects of the (A. H. Wapstra), 529
Heavy Isotopes of Oxygen and Hydrogen : Fractional Distillation and its Application in the Concentration of the (Dr. I. Dostrovsky, Prof. E. D. Hughes and Dr. D. R. Llewellyn), 858
Heavy Metals in Plant Nutrition : Antagonism between Molybdenum and certain (C. R. Millikan), 528
Hebrides : Ecological Problems of the Highlands and, *review* by Prof. A. D. Peacock, 457
Height of Meson Formation (Dr. A. Duperier), 645
Hekla : The New Eruption from (Dr. G. W. Tyrrell), 41
Heladas y la necrosis fria de las plantas (Plutarco Naranjo V), *review* by H. L. P., 706
Helium by Cosmic Rays : Production of (H. E. Hentley), 356
Helium II : Liquid (Dr. H. S. Green), 391
Helium Films (Liquid) : Transfer Rates in (K. R. Atkins), 925
Helium-like Atoms : Energy of the Ground-State of (H. A. S. Eriksson), 393
Helminthes : Parasites (animaux et végétaux) des (Dr. Robert Ph. Dollfus), *review* by Dr. G. Lapage, 662
Heparin : A New Extraction Procedure for the Preparation of (Olle Snellman, Robert Jensen and Dr. Bengt Sylvén), 639
Hepatic Lesions and Protein Deficiency : Dietetic (Dr. M. V. Radhakrishna Rao), 446
Hepatic Structure and Function : Effect of Under-Nutrition in Man on (Sheila Sherlock and Veryan Walshe), 604
Herbage for Grazing : Evaluation of (W. F. Raymond), 937
Heterocycles (Simple) : Nitration of (K. Schofield and T. Swain), 690
Heterogeneous Catalysis : Adsorption and (Prof. Eric K. Rideal), 461
Heterolytic Reactions : Effect of Ionic Charges on the Energy and Entropy of (J. Gripenberg, Prof. E. D. Hughes and Prof. C. K. Ingold), 480
Hevea Latex (Fresh) : Complexity of (L. N. S. Thomas, J. W. van Dalfsen and G. E. van Gils), 177
Hexosediphosphatase : Inhibition of, by Sulphhydryl Reagents and by Ascorbic Acid (Dr. E. O'F. Walsh and Mrs. G. Walsh), 976
High Explosives : Initiation of (Prof. G. Herzberg and G. R. Walker), 647
  Spread of Detonation in (Elwyn Jones and Dugald Mitchell), 98
High Altitude Measurements on Cosmic Rays—Penetrating Bursts (Dr. E. P. George and P. T. Trent), 248
High Altitude Measurements on Cosmic Rays—Penetrating Cosmic Ray Showers (Dr. E. P. George and A. C. Jason), 248
High-Frequencies (Ultra) : Electrical Breakdown Strength of Air at (J. A. Pim), 683
High-Frequency Characteristics of Lead Sulphide and Lead Selenide Layers (R. P. Chasmar), 281
High-Frequency Current in Surgery : Use of (A. W. Lay), 167
High-Frequency Ultrasonic Waves : Diffraction of Light by Very (Prof. S. Bhagavantam and B. Ramachandra Rao), 927
High Initial Permeability : Metastable States of Nickel Characterized by a (Dr. J. L. Snoek and J. F. Fast), 887
High Permittivity Values at Centimetre Wave-lengths : Measurement of (J. G. Powles), 25
High Polymers : Branched-Chain (Prof. H. W. Melville and G. W. Youngson), 803
High Pressures : Collision Broadening of the Ammonia Inversion Spectrum at (Dr. B. Bleaney and J. H. N. Loubser), 522
High Temperature : Reversal of Vernalization by (Prof. F. G. Gregory and Dr. O. N. Purvis), 859
High Temperatures : Preparation of Œstrogens from Urine by Application of (Dr. Felix Sulman), 605
High-Vacuum Equipment (W. Edwards and Co., Ltd.), 676
High-Voltage Multi-Stage Electron Accelerator : Effect of the Electron Beam on the Voltage Distribution of a (F. W. Waterton), 563
Higher Fatty Acid Dehydrogenase of Mammalian Liver (K. Burton), 606
Highland Communities of Central Peru (Harry Tschopik, Jr.), 697
Highlands and Hebrides : Ecological Problems of the, *review* by Prof. A. D. Peacock, 457
Highlands and Islands : Natural History in the (Dr. F. Fraser Darling), *review* by Prof. A. D. Peacock, 457
Hilbert's Inequality : Empirical Data on (E. H. Copsey, H. Frazer and W. W. Sawyer), 361
Hill Grazing Land : Food Production from (Dr. George Dunlop), 585
Histaminolytic Activity of a Copper Protein in Serum (Dr. C. G. Holnberg and C.-B. Laurell), 236
History : The Use of (A. L. Rowse), 866
  Science and, 865
History (European) : Farewell to, or the Conquest of Nihilism (Alfred Weber), translated from the German by R. F. C. Hull, *review* by Maurice Bruce, 151
History of the British Isles : Geographical Approach to the, *review* by D. B. Harden, 746
History and Philosophy : Explanation in (Aristotelian Society Supplementary Vol. 21), *review* by F. I. G. Rawlins, 665
History of Science in Education : The Place of the (British Society for the History of Science, the Science Masters' Association, the Historical Association and the Association of Women Science Teachers joint discussion on), 347, 572
Holiday Centre : International (To be organised by the French Association of Scientific Workers), 1007
Holland : Optics in, *review* by S. Weintroub, 704
Holweck Prize and Medal awarded to Prof. Yves Rocard, 552
Homing Flights : Orientation of Birds on Migratory and (Linnean Society discussion on), 996
Honey Farming (R. O. B. Manley), *review* by Dr. C. G. Butler, 544
Honeydew on Lime Trees (C. A. Mawson), 176
Honours : New Year, 48
Honours List : The King's Birthday, 963
Hopkins (Sir Frederick Gowland) Memorial Lecture of the Chemical Society (Sir Edward Mellanby), 164
Horizontal Magnetic Force at the Magnetic Equator : Daily Variation of the (J. Egedal), 443
Hormonalen Aspekte des Fortpflanzungsprozesses : Die (Dr. Jules Samuels), *review*, 297
Hormone (Œstrogenic) : Podocarpic Acid as a Source of (C. W. Brandt and D. J. Ross), 892
Hormone Research : Recent Progress in (Proceedings of the Laurentian Hormone Conference, Vol. I, edited by Gregory Pincus), *review* by Prof. S. Zuckerman, 295
Hormone-Mimetic and other Responses of the Silkworm (*Bombyx mori* L.) to some Polyploidogenic Agents (L. J. Havas and J. Kahan), 570
Hormones : Radiophysiologie expérimentale, cancer et, 6, Étude de la cancérisation par les substances chimiques exogènes (Antoine Lacassagne), *review* by Prof. E. Boyland, 621
Hormones (Œstrogenic) : Nature of the *C*/*D* Ring Union in the (Dr. C. W. Shoppee), 207
Hormonversorgung des Fœtus : Die (Dr. Jules Samuels), *review*, 297
Horticulture : Growth-promoting Substances in (Dr. T. Swarbrick), 656
Hot Climates : Medical Diseases in, *review* by Dr. N. Hamilton Fairley, 499
Hot-Wire Vacuum Gauge : A New (H. von Ubisch), 927
Housing the Country Worker (Michael F. Tilley), *review* by R. B., 665
Human Behaviour : The Framework of (Dr. Julian Blackburn), *review*, 502
Human Blood Cells at Birth : Nicotinic Acid in (R. F. A. Dean and W. I. M. Holman), 439
Human Cholera Infection : A New Sulpha Compound ('6257') and its Use in (Dr. S. S. Bhatnagar, F. Fernandes, J. de Sa and P. V. Divekar), 395
Human Evolution : Story of, *review*, 579
Human Factor in Industry (P.E.P. Broadsheet No. 14), 780
Human Factors in Industry (British Association, Division for Social and International Relations of Science, conference on), 514, 791
Human Health : Experimental Study of, *review* by Dr. G. Lapage, 336
Human Life : Atomic Energy in Cosmic and (Prof. George Gamow), *review* by Prof. J. A. Crowther, 4
Human Red Cells : Action of Heating on *Rh*-Positive (Dr. P. O. Hubinont), 642
  Enzymic Action of Viruses and Bacterial Products on (C. M. Chu), 606
Human Sex Behaviour : Animal and, 124
Human Structure : Some Complexities of (Dr. W. L. H. Duckworth), 628

Human Urine : Isolation of Stilbœstrol Monoglucuronide from (K. S. Dodgson and Dr. R. Tecwyn Williams), 604
  Presence of Substances Inhibitory to Acid Phosphatase in Normal (Dr. Alice M. Robinson and Dr. F. L. Warren), 397
Humanism in Chemistry : Humour and (Prof. John Read), *review* by Denis I. Duveen, 869
Humming-Birds : The Food of (Frank Bené), 881
Humour and Humanism in Chemistry (Prof. John Read), *review* by Denis I. Duveen, 869
Humus and the Soil : Chemicals, (Donald P. Hopkins), *review*, 39
Husbandry, Agricultural Economics, Statistics and Agricultural and Dairy Engineering : Postgraduate Scholarships in (Ministry of Agriculture and Fisheries and the Department of Agriculture for Scotland), 637
Huxley Memorial Lecture for 1947 (Dr. W. L. H. Duckworth), 628
Hydatid Cyst Fluid : A Polysaccharide from (Gwen M. Macnab), 310
Hydraulic Engineering : Scale Models in (Prof. J. Allen), *review* by Prof. J. Th. Thijsse, 219
Hydraulic Measurements (Prof. Herbert Addison), second edition, *review* by B. C., 79
Hydraulics : Model Research in, *review* by Prof. J. Th. Thijsse, 219
Hydrocarbon Compounds : Encyclopedia of (compiled by Dr. Joseph Escott Faraday), Vol. 4, C_9, *review*, 583
Hydrocarbon Pentalene : The Non-Benzenoid Aromatic (D. P. Craig and Allan Maccoll), 481
Hydrocarbons (Higher) : 'Low-Temperature' Oxidation of, at Atmospheric Pressure (Dr. G. Friedlander and L. Grunberg), 360
Hydrocorals of the John Murray Expedition to the Indian Ocean (Dr. Hjalmar Broch), 822
Hydrogen : Fractional Distillation and its Application in the Concentration of the Heavy Isotopes of Oxygen and (Dr. I. Dostrovsky, Prof. E. D. Hughes and Dr. D. R. Llewellyn), 858
Hydrogen and Hydroxyl Ions in Aqueous Solutions : Mechanism of Conductance by (Dr. S. I. Weissman), 241
Hydrogen Ion in Oxygen-containing Solvents : Solvation of (Dr. Ernest A. Braude and E. S. Stern), 169
Hydrogen Peroxide : Reaction between Catalase and (R. Lemberg and E. C. Foulkes), 131
Hydrolysates (Bacterial) : New Amino-Acids in (A. Polson), 351
Hydrolysis and Utilization of Polysaccharide-like Substances ('Mucin') in Saliva : Bacterial (Dr. H. J. Rogers), 815
Hydroquinone on Mitosis : Early Effects of (R. Parmentier and Dr. P. Dustin, jun.), 527
Hydroxy Peroxides : Formation of (C. A. Bunton, E. S. Halberstadt, A. J. Everett and Dr. G. J. Minkoff), 172
p-Hydroxybenzil (John H. Gorvin), 208
Hydroxyl Ions in Aqueous Solutions : Mechanism of Conductance by Hydrogen and (Dr. S. I. Weissman), 241
Hymenoptera (Social) : Regulation of Oviposition in (M. V. Brian and A. D. Brian), 854

ICE Cream Industry (Grover Dean Turnbow, Prof. Paul Hubert Tracy and Lloyd Andrew Raffetto), second edition, *review* by Dr. L. H. Lampitt, 500
Identification of Important Indian Timbers, 881
Identification of Methylated Sugars on the Paper Chromatogram : Separation and (F. Brown, Prof. E. L. Hirst, L. Hough, Dr. J. K. N. Jones and H. Wadman), 720
Ignition Reactions in the Gas Phase : The Kinetics and Mechanism of Combustion and (International symposium on), 347
Illumination (Artificial) : Progress in, 821
Impact : Birth and Growth of the Explosion in Solids Initiated by (Dr. F. P. Bowden and O. A. Gurton), 348
  Gases Liberated from Explosions Initiated by (Dr. A. J. B. Robertson and A. Yoffe), 806
Importation of Books into Britain (Lord Balfour of Inchrye), 304 ; (Lord Chorley), 304
Imports of Scientific and Technical Books, 75
Inactivation of Flavine Adenine Dinucleotide by Tissue Extracts (R. S. Comline and F. R. Whatley), 350
Inanition in Grass Seedlings : Resistance to (H. G. Chippindale), 65 ; (J. P. Cooper), 894
Inbred Strains of Mice : Ultracentrifugation and Electron Microscope Studies of Tissues of (Prof. R. D. Passey, Dr. L. Dmochowski, Prof. W. T. Astbury, Dr. R. Reed and Dr. P. Johnson), 759
Incentives in Industry (Prof. C. A. Mace), 429
Incidents and Reflections (J. B. Atkin), 866
India : Mathematics in, *review* by Prof. E. H. Neville, 580
  Scientific Research in (National Institute of Sciences of India symposium on), 513
  Vegetable Tanning Materials of, 255
India (Netherlands) : Colonial Policy and Practice, a Comparative Study of Burma and (J. S. Furnivall), *review* by Maurice Bruce, 908
Indian Art : Exhibition of (Prof. J. H. Hutton), 119
Indian Mathematics and Vedha : Ancient (Prof. L. V. Gurjar), *review* by Prof. E. H. Neville, 580
Indian Timbers : Identification of Important, 881
Indians before Columbus (Paul S. Martin, George I. Quimby and Donald Collier), *review* by Dr. G. H. S. Bushnell, 501
Indium : Interaction of Fast Neutrons with (S. G. Cohen), 475
Individual : Society and the (British Social Hygiene Council Ethics and Science conference on), 197
Individual Freedom and Social Responsibility : Conference on, 843
Inductance : Thermal Mutual (Dr. R. C. L. Bosworth), 166
Induction of Tumours by Chemical Compounds, *review* by Prof. E. Boyland, 621
Industrial Co-operation : The Short Road to (British Association for Commercial and Industrial Education), 571
Industrial Development : Scientific Research and, 699
Industrial Experimentation (K. A. Brownlee), third edition, *review* by M. R. Sampford, 747
Industrial Fibres (Commonwealth Economic Committee), 961
Industrial Research, 1947 (edited by Dr. Percy Dunsheath), *review* by R. Brightman, 705
Industrial Research in East Africa, 122
Industrial Research in Palestine : Scientific and, 800
Industries : Plan your Own (M. P. Fogarty), 183
Industries (Nationalized) : Responsibility in, 619
Industry : Conscription and (D. R. O. Thomas), 304
  Democracy and (C. Reaveley and J. Winnington), 109
  Democracy in, 109
  Electronics for (W. I. Bendz, with the assistance of C. A. Scarlott), *review* by Prof. J. Hollingworth, 582
  The Human Factor in (P.E.P. Broadsheet No. 14), 780
  Human Factors in (British Association, Division for Social and International Relations of Science, conference on), 514, 791
  Incentives in (Prof. C. A. Mace), 429
  Learning and, 881
  The Psychology of (Prof. James Drever), second edition, *review* by T. H. Hawkins, 955
  Research in—Working Party Reports, 448
  Science and the Progress of (Sir Edward Appleton), 368
  Scientific Research and, 368
  The Scientist in (Sir Edward Appleton), 508, 537
Industry and Commerce : Education in, 801
Industry and Research : Electronics and their Application in (edited by Dr. Bernard Lovell), *review* by Dr. T. E. Allibone, 702
Industry and Research in Wales (Industrial Research Committee of the Federation of British Industries and the Industrial Association of Wales and Monmouthshire joint regional conference on), 233
Industry to Science : A Tribute of, 508
Industry and Society : Men of Science in, *review* by R. Brightman, 374
Infection in *Coffea arabica* L. : Latent (R. W. Rayner), 245
Infections : Natural Amœbic, in Laboratory Rodents (Dr. J. D. Fulton and J. P. Joyner), 66
Infectious Diseases : Thyroid Gland as a Special Factor Influencing the Conditional Disposition to (Dr. S. Zimanyi), 57
Influence of Temperature on the Urea Denaturation of β-Lactoglobulin (C. F. Jacobsen and L. Korsgaard Christensen), 30
Influence of Vitamin P (Vitamin C_2) upon the Amount of Ascorbic Acid in the Organs of the Guinea Pig (H. Cotereau, M. Gabe, E. Géro and Prof. J.-L. Parrot), 557
Information : British Sources of Reference and (edited by Theodore Besterman), *review* by R. Brightman, 789
Information on Atomic Energy : Release of, 146
Infra-Red Absorption Spectra of Crystals (Sir C. V. Raman), 165
Infra-Red Energy : Applications of Germicidal, Erythemal and (Dr. Matthew Luckiesh), *review* by H. G. Jenkins, 542
Infra-Red Radiation : Biological Applications of Ultra-violet and, *review* by H. G. Jenkins, 542
Infra-Red Spectroscopy : Lead Telluride Cells for (O. Simpson, Dr. G. B. B. M. Sutherland and Dr. D. E. Blackwell), 281
Inheritance of Sex Forms in *Luffa acutangula* Roxb. (H. B. Singh, S. Ranmanujam and B. P. Pal), 775
Inhibition of SH Enzymes by Methyl Bromide (S. E. Lewis), 692
Inhibition of Hexosediphosphatase by Sulphhydryl Reagents and by Ascorbic Acid (Dr. E. O'F. Walsh and Mrs. G. Walsh), 976
Inhibition of the Photodynamic Action of 3 : 4 Benzpyrene (G. Calcutt and J. P. Newhouse), 53
Initiation of Explosives by Adiabatic Compression of their own Vapour (A. Yoffe), 349
Initiation of High Explosives (Prof. G. Herzberg and G. R. Walker), 647
Inland Fisheries : Report on Sea and (Government of Northern Ireland), 451
Inland Waters : Ciliate Protozoan Fauna of Soil and (Ernest Gray), 854
Inner-Complex Salts of Trivalent Thallium (Prof. Fr. Feigl), 436
Insect Pests of Flour (J. A. Freeman and E. E. Turtle), 554
Insecticidal Smokes, 574
Insecticides : 'Agrocide' Range of (Plant Protection, Ltd.), 595
Insects : Simple Experiments with (Dr. H. Kalmus), *review* by Dr. V. B. Wigglesworth, 955
Insemination (Artificial) : First International Congress on the Physiology and Pathology of Animal Production and on, 197
Insemination of Farm Animals : The Artificial (John W. Bartlett, George E. Taylor, Joseph Edwards, Clair E. Terrill, Victor Berliner and Fred P. Jeffrey), edited by Enos J. Perry, *review* by Dr. John Walton, 831
Instruction : Audiovisual Aids to (William Exton Jr.), *review* by Lieut.-Colonel Eric Lowe, 745
Instruments : British Scientific (Dr. A. B. Wood), 732
  Export Organisation for, 345
Insulating Materials and Methods for Use at Low Temperatures (Low Temperature Group of the Physical Society discussion on), 323
Insulation Resistance (Electrical) : Treatment of Glass and Steatite Ceramic with Quaternary Ammonium Compounds for the Improvement of (J. S. Dryden and R. J. Meakins), 23
Insulin (Pancreatic) : Relation of Intermediary Metabolites to the Lowering of the Potency of, in the Animal System (Prof. M. C. Nath and H. D. Brahmachari), 18
Insulin on Intestinal Glucose Absorption in Alloxan Diabetic Rats : Effect of (Dr. A. Sols, S. Vidal and J. Larralde), 932
Intelligence (National) : The Trend of (Prof. Godfrey Thomson, with a Symposium by Sir Alexander Carr-Saunders, Sir Cyril Burt, Prof. Lionel Penrose and Prof. Godfrey Thomson), *review* by Dr. Julian Blackburn, 37
Intelligent Man's Guide to the Post-War World (G. D. H. Cole), *review* by Maurice Bruce, 151
Intensity of Cosmic Radio Noise : Frequency Variation of the (Jack W. Herbstreit and Joseph R. Johler), 515
Interaction of Fast Neutrons with Indium (S. G. Cohen), 475
Interaction of Water and Porous Materials (Faraday Society General discussion on), 307, 629
Interaction Terms in Molecular Vibrations (D. F. Heath and Dr. J. W. Linnett), 243
Interferometry (Multiple-Beam) : Application of, to the Study of Oscillating Quartz Crystals (Prof. S. Tolansky and W. Bardsley), 925
Intermediary Metabolites : Relation of, to the Lowering of the Potency of Pancreatic Insulin in the Animal System (Prof. M. C. Nath and H. D. Brahmachari), 18

Internal Secretion, *review* by Dr. F. H. A. Marshall, 953
Internal Stresses in Metals (W. A. Wood and N. Dewsnap), 682 ; (G. B. Greenough), 683
Internal Stresses in Metals and Alloys (Institute of Metals, in association with the Faraday Society, the Institute of Physics, the Institution of Mechanical Engineers, the Iron and Steel Institute, the Physical Society and the Royal Aeronautical Society symposium on), 70
Internal Stresses in Silver Chloride caused by Plastic Deformation : Photo-elastic Investigation of (J. F. Nye), 367
Internal Waves in certain Types of Density Distribution (Dr. P. Groen), 92
International Aspects of the Radio-Frequency Spectrum, 863
International Colloquium on Isotope Exchange and Molecular Structure, 901
International Conference on Large Electric Systems, 163
International Conference on the Emission Spectra of the Night Sky and Auroras : Physical Society to arrange for separate publication of papers read before the, 514
International Conference on the Physics of Metals (Netherlands Physical Society), 389
International Conference on Powder Metallurgy (Steirmark Branch of the Association of Austrian Chemists), 307
International Conference on Sleeping Sickness, 306
International Congress of Anthropological and Ethnological Sciences, 88
International Congress of Applied Mechanics : Seventh, 232
International Congress of Crystallography, 124
International Congress on the Physiology and Pathology of Animal Production and of Artificial Insemination : First, 197
International Congress on Population and World Resources in relation to the Family (Planning Association of Great Britain), 882
International Congress of Zoology : Thirteenth, 924
International Control of Atomic Energy, 291
International Co-operation : Colonial Development and, 371
International Geological Congress, 88
International Holiday Centre (To be organised by the French Association of Scientific Workers), 1007
International Meeting on Animal Production (I. L. Mason), 322
International Pharmacopœia : Towards an, 33
International Plastics Annual 1947 : The British, *review* by Dr. S. R. Carter, 581
International Radio Conferences in Stockholm, 695
International Radio and Telecommunication Conferences at Atlantic City, 863
International Repercussions : Economic Conditions of Germany To-day and its (International Chamber of Commerce), 659
International Rheological Congress at Scheveningen, 105, 636
International Seismological Summary, 923
International Sericultural Congress : Seventh (French National Institute of Agronomic Research), 307
International Study of Rheology, 104
International Symposium on the Kinetics and Mechanism of Combustion and Ignition Reactions in the Gas Phase, 347
International Symposium on Noise (Acoustics Group of the Physical Society and the Royal Institute of British Architects), 197
International Telecommunication and Radio Conferences at Atlantic City, 863
International and Cultural Relations of Social Biology (British Social Hygiene Council Summer School on), 842
Interspecific Fertilization in Ascidians (Dr. Antonio Minganti), 643
Intestinal Glucose Absorption in Alloxan Diabetic Rats : Effect of Insulin on (Dr. A. Sols, S. Vidal and J. Larralde), 932
Intracellular Determination of Protein by X-Ray Microspectrography (Dr. A. Engström and M. A. Jakus), 168
Intravenous Methylene Blue, a New Method for Studying the Nervous System (W. H. Feindel, D. C. Sinclair and Dr. G. Weddell), 318
Inventions Bill : Development of, 700
Iodinated Casein and Stilbœstrol : Stimulation of Growth in Pigs by (Dr. R. Braude), 856
Ion-Exchange Treatment on the Stability of Apple Juice : Effect of (Dr. S. W. Challinor, Margaret E. Kieser and Dr. A. Pollard), 1023
Ion-Exchangers (Synthetic Resin) : Separation of Pyrimidine Nucleosides by (D. T. Elmore), 931
Ionic Charges on the Energy and Entropy of Activation of Heterolytic Reactions : Effect of (J. Gripenberg, Prof. E. D. Hughes and Prof. C. K. Ingold), 480
Ionic Splitting of Rays Reflected from the F_2 Region : Triple Magneto (Gordon Newstead), 312
Ionization Potential and the Polarizability for some Halogen Compounds : Variation of the Force Constant with the (P. Torkington), 724
Ionizing Radiations : Chemical Effects of (Gabriel Stein and Dr. Joseph Weiss), 650
Ionogenic Surfaces : Adsorption on to (Dr. P. H. Plesch and R. H. S. Robertson), 1020
Dehydro-β-Ionone : Synthesis of (Dr. H. B. Henbest), 481
Ionosphere at Calcutta : Abnormalities in the *F*-Region of the (S. S. Baral, S. N. Ghosh and M. Debray), 24
Ionospheric Absorption : Anomalous Effect of (Sir Edward Appleton, W. J. G. Beynon and W. R. Piggott), 967
Ionospheric *D*-Layer : Electrical Conductivity of the (Prof. T. G. Cowling and R. Borger), 515
Ionospheric Rays : Triple Splitting (J. H. Meek), 597 ; (T. L. Eckersley), 597
Ireland : Megalithic Tombs in Scotland and (Prof. V. Gordon Childe), 841
Ireland (Northern) : Scientific Research and Development in, 162
Iron Alum Acetocarmine Method for Algæ (Dr. M. B. E. Godward), 203
Iron Status of Plants : Relation of Manganese and some other Metals to the (Eric J. Hewitt), 489
Irrigation (Ministry of Agriculture Bulletin 138), 196
Islands : Natural History in the Highlands and (Dr. F. Fraser Darling), *review* by Prof. A. D. Peacock, 457
Isolation in Chick Embryos of a Filtrable Agent possibly related etiologically to Lumpy Skin Disease of Cattle (Prof. M. van den Ende, P. Don, A. Kipps and R. Alexander), 526
Isolation of a New Androstenol-3(α)-on-17 from the Urine of a Patient with Adrenal Cancer (Dr. Elizabeth Dingemanse, Leonora G. Huis in 't Veld and S. Lore Hartogh-Katz), 848
Isolation of Stilbœstrol Monoglucuronide from Human Urine (K. S. Dodgson and Dr. R. Tecwyn Williams), 604
Isomerization of Dienœstrol (W. Hausmann and Dr. A. E. Wilder Smith), 892
Isotope Exchange and Molecular Structure : International Colloquium on, 901
Isotopes (Radioactive and Stable Tracer) : Determination of (Physical Methods Group of the Society of Public Analysts and other Analytical Chemists symposium on), 693
Isotopes of Gaseous Elements : Mass-Spectrographic Separation of (Dr. J. Koch), 566
Isotopes of Oxygen and Hydrogen : Fractional Distillation and its Application in the Concentration of the Heavy (Dr. I. Dostrovsky, Prof. E. D. Hughes and Dr. D. R. Llewellyn), 858
Isotopes (Heavy) : Mass-Defects of the (A. H. Wapstra), 529
Itaconic Acid and Kojic Acid : Production of, by a Species of *Aspergillus* (John L. Yuill), 397
Italy : Earthquake at Lado d'Iseo on December 25, 306

JADE : Adventure in (James Lewis Kraft), *review*, 786
Japanese Culture : A Study of, *review* by Peter Lawrence, 77
Jellyfish from the Basal Cambrian in South Australia (Reg. C. Sprigg), 568
Jewett (Frank B.) Fellowship Awards for 1948–49 (American Telephone and Telegraph Co.), 429
Joints (Normal and Infected) : Absorption of Protein and Bacteria from (Torbjörn Edlund), 102
Journalism (Scientific) : Awards for, 125
Jubilee of the Discovery of the Electron, 16
Juice (Apple) : Effect of Ion-Exchange Treatment on the Stability of (Dr. S. W. Challinor, Margaret E. Kieser and Dr. A. Pollard), 1023
Jute : X-Ray Investigation of the Structure of (M. K. Sen and H. J. Woods), 768

KASHMIR : Occurrence of Volcanic Bomb in the Agglomeratic Slates of (Dr. R. C. Misra), 895
Kauri in New Zealand : Preservation of the (Prof. V. J. Chapman), 72 ; (Prof. H. G. Champion), 72
Keith Prize for 1945–47 of the Royal Society of Edinburgh awarded to Dr. Charlotte Auerbach, 716
Khartoum : Extermination of *Aedes aegypti* in (R. Kirk), 139
Kidney (Aglomerular Fish) : A Vasodilator, Adrenolytic Substance in (Dr. Benjamin Jablons), 100
Kinetics and Mechanism of Combustion and Ignition Reactions in the Gas Phase : International symposium on, 347
Klystrons and Microwave Triodes (Prof. Donald R. Hamilton, Prof. Julian K. Knipp and J. B. Horner Kuper), *review* by Prof. J. T. Randall, 952
Kojic Acid : Production of Itaconic Acid and, by a Species of *Aspergillus* (John L. Yuill), 397
Koper als onmisbaar element voor plant en dier (W. J. Melchers en H. J. Gerritsen), *review*, 624

LA Venta : Some Implications of the Ceramic Complex of (Dr. Philip Drucker), 594
Laboratory Animals : The UFAW Handbook on the Care and Management of (edited by Prof. Alastair N. Worden), *review* by Frances Pitt, 664
Laboratory Conditions (Customary) : pH of Trisodium Citrate Solutions stored under (J. Jordan and Dr. M. Bobtelsky), 240
Laboratory Rodents : Natural Amœbic Infections in (Dr. J. D. Fulton and J. P. Joyner), 66
Lachrymators with Enzymes and Proteins : Reactions of (Dr. M. Dixon), 226
Lactic Cocci (Gorini's Acid-Proteolytic) : Behaviour of, with Penicillin (Annamaria Torriani), 275
β-Lactoglobulin : Influence of Temperature on the Urea Denaturation of (C. F. Jacobsen and L. Korsgaard Christensen), 30
Lake Windermere in relation to the Quaternary History of the British Isles : Bottom Deposits of (Dr. H. G. Baker), 987
Lamb Serum Before and After Transfer of Colostrum : Electrophoretic Patterns of (P. A. Charlwood and A. Thomson), 59
Lamellibranchia : Formation of Siphons in (Prof. C. M. Yonge), 198
Laminariales (Common British) : Seasonal Variation in Chemical Constitution of some (Dr. W. A. P. Black), 174
Laminating of Plastics : Low-Pressure (J. S. Hicks, assisted by R. J. Francis), *review* by J. M. J. Estevez, 788
Lamm Scale Method for Measuring Refractive Index Gradients : A Short-Focus Modification of the (Harry Svensson), 234
Land : The Schools and the (British Social Hygiene Council Summer School on), 470
Land and Landscape (Brenda Colvin), *review* by Prof. L. Dudley Stamp, 868
Land Use and Service Requirements in Britain, 149
Land Utilization : Food Production and, 905
Land of Britain, its Use and Misuse : The (Prof. L. Dudley Stamp), *review* by Sir John Russell, 906
Landscape : Land and (Brenda Colvin), *review* by Prof. L. Dudley Stamp, 868
Landscape Architecture, *review* by Prof. L. Dudley Stamp, 868
Langley Memorial Prize for 1948, 233
Language : A Planned Auxiliary (H. Jacob), *review*, 665
Larvæ of Anuran Amphibia : Mauthner's Cells in the (A. G. Willis), 65
Lasker Group Award for 1947 presented by the American Public Health Association to the British Ministries of Food and Health, 16
Late-Glacial *Armeria* : Significance of Pollen Dimorphism in (Dr. H. G. Baker), 770
Latent Infection in *Coffea arabica* L. (R. W. Rayner), 245
Latex (Fresh *Hevea*) : Complexity of (L. N. S. Homans, J. W. van Dalfsen and G. E. van Gils), 177
Latin America : Forage Resources of (Hugo W. Alberts), 657
Latin American Cultures (Dr. G. H. S. Bushnell), 697
Lattice Distortions on the Mean Rate of Propagation of Large Barkhausen Discontinuities : Effect of (Dr. L. J. Dijkstra and Dr. J. L. Snoek), 886

Laurentian Hormone Conference, *review* by Prof. S. Zuckerman, 295
Law (Dr. Bimala Churn) Gold Medal of the Royal Asiatic Society of Bengal awarded to Dr. B. M. Barua, 553
Law (Joy Gobind) Memorial Medal of the Royal Asiatic Society of Bengal awarded to Dr. Lieven Ferdinand de Beaufort, 553
Layman: Atoms for the, *review* by Prof. P. B. Moon, 582
Lead : Scattering of Neutrons by (R. Latham and J. M. Cassels), 282
Pb^{208} : Spin-Dependence of Magnetic Dipole Gamma Radiation and the Nuclear Level Scheme of (Dr. H. O. W. Richardson), 516
Lead Selenide : Spectral Response of (T. S. Moss and R. P. Chasmar), 244
Lead Selenide Layers : High-Frequency Characteristics of Lead Sulphide and (R. P. Chasmar), 281
Lead Sulphide and Lead Selenide Layers : High-Frequency Characteristics of (R. P. Chasmar), 281
Lead Telluride Cells for Infra-Red Spectroscopy (O. Simpson, Dr. G. B. B. M. Sutherland and Dr. D. E. Blackwell), 281
Lead Telluride Layers : Spectral Sensitivity of (T. S. Moss), 766
Leadership (Personal) : Power and, 654
Leaf Rust of Wheat : The Nature and Prevention of Cereal Rusts as Exemplified in the (Dr. K. Starr Chester), *review* by P. H. Gregory, 220
Learning and Industry, 881
Leaves (Foliage) : Threshold Value of Carbon Dioxide Concentration in Photosynthesis of (Dr. E. K. Gabrielsen), 138
Lens-cleaning Tissues (J. Barcham Green, Ltd.), 514
Lenses (Electrostatic) : Chromatic Aberration of (W. A. Le Rütte), 392
Letters from Skokholm (R. M. Lockley), *review* by Frances Pitt, 5
Leucocyte Count in Leukæmia : Effect of *p*-Aminobenzoic Acid on the (Dr. J. Bichel), 353
Leukæmia : Effect of *p*-Aminobenzoic Acid on the Leucocyte Count in (Dr. J. Bichel), 353
Lewis Acids : Olefine Reactions Catalysed by (Dr. John W. Baker), 171
Libraries : Public, in Germany (H. Schurer), 90
Lice (Dr. John Smart), second edition, 389
Life : Controlling the Staff of, *review* by A. L. Bacharach, 293
Life (Cosmic and Human) : Atomic Energy in (Prof. George Gamow), *review* by Prof. J. A. Crowther, 4
Life (Volitional) : An Analysis of (C. Lambek), translated from the Danish by Agnete Kortsen, *review* by Dr. Clifford Allen, 789
Life through Geological Time : The Succession of (British Museum (Natural History) exhibits), 429
Life, Literature and Art : The Alchemist in (Prof. John Read), *review* by T. I. W., 787
Light : Diffraction of, by Very High Frequency Ultrasonic Waves (Prof. S. Bhagavantam and B. Ramachandra Rao), 927
  Radiation Damping and Velocity of (Prof. W. Heitler), 678
Light, Vision and Seeing (Dr. Matthew Luckiesh), fourth printing, *review* Dr. R. W. Pickford, 40
Light Elements Bombarded with α-Particles from Polonium : Excitation Curves for the γ-Radiation from (Prof. Hilding Slätis), 899
Lighting : Exhibition of the Development of (Science Museum), 674, 821
Lightning Arrester Discharge Currents (Robert C. Cuffe), 885
Lime Trees : Honeydew on (C. A. Mawson), 176
Limitation of Bacteria by Micro-Predators in Soil (Dr. F. J. Anscombe and Dr. B. N. Singh), 140
Linnean Gold Medal for 1948 awarded by the Linnean Society of London to Dr. Agnes Arber, 272, 882
Linoleic Acid in Oxidation with Lipoxidase : Total Conjugation of (Prof. Sune Bergström and Ralph T. Holman), 55
Lipidic Layer in the Liver Cell : A Cytochemical Study of the Perinuclear (Dr. C. A. Baud), 559
Lipoids : Physiology and Biochemistry of Fats and (Le Centre National de le Recherche scientifique symposium on), 534
Lipoxidase : Total Conjugation of Linoleic Acid in Oxidation with (Prof. Sune Bergström and Ralph T. Holman), 55
Liquid Fuels : Modern Applications of (Institute of Petroleum and the Institute of Fuel joint conference on), 677, 1007
Liquid Helium II (Dr. H. S. Green), 391
Liquid Helium Films : Transfer Rates in (K. R. Atkins), 925
Liquids : Coefficients of Viscosity and Thermal Conduction in Dense Gases and (L. M. Yang), 523
Liquids (Organic) : Ultrasonic Dispersion in (Dr. A. Schallamach), 476
Literature (Scientific) : References in (Prof. R. A. Peters), 731
Literature on Silk : Bibliography of the Technical (Dr. F. O. Howitt), *review* by Prof. J. B. Speakman, 790
Literature and Art : The Alchemist in Life, (Prof. John Read), *review* by T. I. W., 787
Li^8 in the Explosive Disintegration of Nuclei : Emission of (C. Franzinetti and R. M. Payne), 735
Live in the Sea : They (Douglas P. Wilson), *review* by Dr. L. Harrison Matthews, 40
Liver : Purification of Anti-pernicious Anæmia Factors from (Dr. E. Lester Smith), 638, 676
Liver (Mammalian) : Higher Fatty Acid Dehydrogenase of (K. Burton), 606
Liver Cell : A Cytochemical Study of the Perinuclear Lipidic Layer in the (Dr. C. A. Baud), 559
Lives of the Alchemists : Private, *review* by T. I. W., 787
Living Lymphocytes *in vitro* : Failure of Adrenal Cortical Extracts to cause Lysis of (J. S. Robertson), 814
Living Plant : Botany of the (Prof. F. O. Bower), fourth edition, *review* by Prof. F. T. Brooks, 153
Lloyd George Mountains in Northern Canadian Rockies : Exploration of the (Dr. N. E. Odell), 327
Load Dispatching and the British Grid System (A. R. Cooper), 822
Local Government (Sir A. S. MacNalty), *review* by Lieut.-Colonel Eric Lowe, 870
Local Government in Britain, 825
Local Government and the Citizen, *review* by Lieut.-Colonel Eric Lowe, 870
Local Government Reform (J. Blackburn), 825
Local and Regional Government (G. D. H. Cole), 825
Locomotion of Whales : Aspects of the (R. W. L. Gawn), 44 ; (Prof. J. Gray), 199 ; (Dr. D. A. Parry), 200
Locust Integument : The Carotenoids of the (T. W. Goodwin and S. Srisukh), 525
Locusts : Aircraft Attack on (Dr. D. L. Gunn), 342
Logic : A Preface to (Morris R. Cohen), *review* by Prof. A. D. Ritchie, 623
Logical Realism, *review* by Prof. A. D. Ritchie, 623
Logik und Erfahrung : Mathematik, (Prof. Dr. Victor Kraft), *review* by F. I. G. Rawlins, 666
London's Transport System (R. H. Macmillan), 942
Long-Distance Correlation of Boulder Clays (D. F. W. Baden-Powell), 287
Lorentz-like Transformations (P. T. Landsberg), 208 ; (Prof. Herbert Dingle), 209
Louse : The (Prof. Patrick A. Buxton), second edition, *review* by Dr. A. D. Imms, 418
Low-Frequency Noise from Thermionic Valves working under Amplifying Conditions (Dr. E. J. Harris and P. O. Bishop), 971
Low-Pressure Laminating of Plastics (J. S. Hicks, assisted by R. J. Francis), *review* by J. M. J. Estevez, 788
Low-Temperature Oxidation of Higher Hydrocarbons at Atmospheric Pressure (Dr. G. Friedlander and L. Grunberg), 360
Low-Temperature Physics (Dr. K. Mendelssohn), 732
Low Temperatures : Insulating Materials and Methods for Use at (Low Temperature Group of the Physical Society discussion on), 323
Lowering of the Potency of Pancreatic Insulin in the Animal System : Relation of Intermediary Metabolites to the (Prof. M. C. Nath and H. D. Brahmachari), 18
Loyalty : Freedom and, 537
Luffa acutangula Roxb. : Inheritance of Sex Forms of (H. B. Singh, S. Ramanujam and B. P. Pal), 775
Luminescence in Zinc Sulphide : Relation between Photoconduction and (Dr. M. H. F. Wilkins and Dr. G. F. J. Garlick), 565
Luminescence Efficiency Changes in Zinc Sulphide Phosphors below Room Temperature (Dr. G. F. J. Garlick and A. F. Gibson), 359
Luminous Gas : A Bunsen Flame as a Column of (Dr. A. S. Leah and Prof. W. T. David), 524
Lumpy Skin Disease of Cattle : Isolation in Chick Embryos of a Filtrable Agent possibly related etiologically to (Prof. M. van den Ende, P. Don, A. Kipps and R. Alexander), 526
Lyell Fund of the Geological Society awarded to Dr. Dorothy Rayner and W. D. Ware, 122
Lyell Medal of the Geological Society awarded to Prof. A. H. Cox, 122
Lymnæa truncatula : A Culture Method for (E. L. Taylor and Alan Mozley), 894
Lymphocytes *in vitro* : Failure of Adrenal Cortical Extracts to cause Lysis of Living (J. S. Robertson), 814
Lysis of Living Lymphocytes *in vitro* : Failure of Adrenal Cortical Extracts to cause (J. S. Robertson), 814

MACHINERY of Government, 495
Macromolecules : Normal Stress Coefficient in Solutions of (R. S. Rivlin), 567
Macropus : Vascular Patterns in the Testis, with particular reference to (Dr. R. G. Harrison), 399
Magnetic Alloy : "Supermalloy," a New (O. L. Boothby and R. M. Bozorth), 554
Magnetic Data : World (Comdr. Elliott B. Roberts), 677
Magnetic Dipole Gamma Radiation and the Nuclear Level Scheme of Pb^{208} : Spin-Dependence of (Dr. H. O. W. Richardson), 516
Magnetic Equator : Daily Variation of the Horizontal Magnetic Force at the (J. Egedal), 443
Magnetic Field : Optical Transmission of a Colloidal Solution in a (F. D. Stott and Dr. A. von Engel), 728
Magnetic Field of Massive Rotating Bodies (Prof. H. T. H. Piaggio), 450
Magnetic Field of the Moon : Cosmic Rays and the (Dr. M. S. Vallarta), 646
Magnetic Field of Rotating Bodies : Blackett's Hypothesis of the (Dr. Niels Arley), 598 ; (Dr. J. Fuchs), 599
Magnetic Fluctuations : Audio-Frequency (H. F. Willis), 887
Magnetic Force at the Magnetic Equator : Daily Variation of the Horizontal (J. Egedal), 443
Magnetic Observations and Thermometry in the Region of Millidegrees Absolute (D. de Klerk), M. J. Steenland and Prof. C. J. Gorter), 678
Magnetic Susceptibility : Catalytic Poisons and (M. H. Dilke, Dr. D. D. Eley and Dr. E. B. Maxted), 804
Magnetic Susceptibility of Borax Glasses containing Crystallites of Alkali Metal Salts, Gold and Platinum (Prof. Subodh Kumar Majumdar), 684
Magnetic Susceptibility of Mica (J. T. Kendall and D. Yeo), 476
Magnetism : Elementary Theory of Electricity and, *review* by Prof. L. F. Bates, 829
  Modern (Prof. L. F. Bates), second edition, *review* by E. C. S., 871
Magnetism and Modern Physics : Electricity, (Dr. G. T. P. Tarrant), *review* by Prof. L. F. Bates, 829
Magneto Ionic Splitting of Rays Reflected from the F_2 Region : Triple (Gordon Newstead), 312
Magnetrons : Pinhole Radiography of (Dr. R. Dunsmuir, Dr. C. J. Milner and A. J. Spayne), 244
Malaria Parasites (Mammalian) : Pre-erythrocytic Stage in (Prof. H. E. Shortt and P. C. C. Garnham), 126 ; (Dr. Frank Hawking), 175
Malaria-infected Monkeys : Hæmolytic System in the Blood of (Dr. H. Laser), 560
Maleic Anhydride to Anethole : Addition of (Prof. V. Bruckner and Dr. J. Kovács), 651
Mammalian Liver : Higher Fatty Acid Dehydrogenase of (K. Burton), 606
Mammalian Malaria Parasites : Pre-erythrocytic Stage in (Prof. H. E. Shortt and P. C. C. Garnham), 126 ; (Dr. Frank Hawking), 175
Mammals of Eastern Asia (G. H. H. Tate), *review* by T. C. S. M.-S., 188
Mammary Gland : Respiratory Quotient of the (Dr. S. J. Folley and T. H. French), 933
Man : The Argument from Mouse to, *review* by Prof. C. H. Waddington, 543
  Effect of Under-Nutrition in, on Hepatic Structure and Function (Sheila Sherlock and Veryan Walshe), 604
Man in the Desert : Physiology of (E. F. Adolph and associates), *review* by Dr. B. McArdle, 744
Man's Guide to the Post-War World : The Intelligent (G. D. H. Cole), *review* by Maurice Bruce, 151
Man's Organs of Speech (Prof. H. A. Harris), 628

Man-Power in Britain : Mobility of, 453
Management : Research on, *review* by E. F. L. Brech, 869
  Scientific, *review* by J. Leigh, 910
  Skill and (G. E. Milward), *review* by J. Leigh, 910
Management (Business) : The Board of Directors and (Melvin T. Copeland and Asst. Prof. Andrew R. Towl), *review* by E. F. L. Brech, 869
Management of Laboratory Animals : The UFAW Handbook on the Care and (edited by Prof. Alastair N. Worden), *review* by Frances Pitt, 664
Manganese and some other Metals : Relation of, to the Iron Status of Plants (Eric J. Hewitt), 489
Manganese Dioxide : Reaction between Manganous Ion and (J. M. Cowley and Allan Walkley), 173
Manganous Ion and Manganese Dioxide : Reaction between (J. M. Cowley and Allan Walkley), 173
Manipur : War-time Explorations in (F. Kingdon Ward), 636
Mankind So Far (Prof. William Howells), *review*, 579
Manx Shearwater (*Puffinus p. puffinus*) : Puffinosis, a Virus Epizootic of the (J. A. R. Miles and M. G. P. Stoker), 1016
Mare (Pregnant) : Ovarian Activity in the (Prof. E. C. Amoroso, J. L. Hancock and Dr. I. W. Rowlands), 355
Marine Biology : Recent Research in (Dr. N. B. Eales), 737
Marine Fish Cultivation : An Experiment in (L. H. N. Cooper and G. A. Steven), 631
Marketing Agricultural Produce (Thomas Shaw), 470
Mars : Atmosphere of (Dr. G. P. Kuiper), 594
Mass of Mesons : A New Method for the Determination of the (Dr. C. F. Powell and Dr. S. Rosenblum), 473
Mass of σ-Mesons (S. Lattimore), 518
Mass-Defects of the Heavy Isotopes (A. H. Wapstra), 529
Mass-Spectrographic Separation of Isotopes of Gaseous Elements (Dr. J. Koch), 566
Massive Rotating Bodies: Magnetic Field of (Prof. H. T. H. Piaggio), 450
Material (Granular) : Mechanics of Packings of (D. R. Hudson), 512
Materials : Aircraft Strength of (Dr. H. D. Conway), *review*, 503
Materials (Porous) : Interaction of Water and (Faraday Society discussion on), 629
Mathematical Congress, Montreal 1945 : Proceedings of the First Canadian, *review* by H. T. H. P., 666
Mathematical Journal : A New, 636
Mathematical Theory of Rocket Flight (Prof. J. Barkley Rosser, Dr. Robert R. Newton and Dr. George L. Gross), *review* by Dr. R. A. Rankin, 3
Mathematical Theory of Tetraploidy (Prof. R. A. Fisher), 758
Mathematics : Modern Electrical Engineering (S. Austen Stigant), *review* by V. J. Francis, 541
Mathematics at Birkbeck College, London, 756
Mathematics for Electrical Engineering, *review* by V. J. Francis, 541
Mathematics in India, *review* by Prof. E. H. Neville, 580
Mathematics of Statistics (John F. Kenney), Part I, second edition, *review* by P. A. Moran, 544
Mathematics at the University of Leeds, 467
Mathematics at University College, Leicester, 344
Mathematics and Mechanics : Manual of (Prof. Guy Roger Clements and Prof. Levi Thomas Wilson), second edition, *review*, 789
Mathematics and Vedha : Ancient Indian (Prof. L. V. Gurjar), *review* by Prof. E. H. Neville, 580
Mathematik, Logik und Erfahrung (Prof. Dr. Victor Kraft), *review* by F. I. G. Rawlins, 666
Mathematische Werke (Johann Heinrich Lambert), Band I, Arithmetik, Algebra und Analysis, I, herausgegeben von Andreas Speiser, *review* by Prof. E. H. Neville, 186
Matrimonial Causes : Final Report of the Committee on Procedure in, 539
Matter-Radiation Cycle in the Cosmos (and the Second 'Law')—the Sun's Equilibrium (Alfred Lauck Parson), 802
Mauthner's Cells in the Larvæ of Anuran Amphibia (A. G. Willis), 65
Measurement : Temperature, *review* by S. Weintroub, 624
Measurement of Birefringence : A Large Field Compensator for (P. E. Jellyman and A. J. Milne), 477 ; (A. A. Wells), 602
Measurement for Engineers : Precise (Film on the work of the Metrology Division of the National Physical Laboratory), 717
Measurement of High Permittivity Values at Centimetre Wave-lengths (J. G. Powles), 25
Measuring Temperature : Methods of (Dr. Ezer Griffiths), third edition, *review* by S. Weintroub, 624
Mechanical Admittances and their Applications to Oscillation Problems (Prof. W. J. Duncan), *review* by Prof. W. G. Bickley, 954
Mechanical Behaviour of Crystal Boundaries in Metals (R. King, R. W. Cahn and Dr. B. Chalmers), 682
Mechanical Engineering : Photo-Elasticity in (Dr. E. K. Frankl), 329 ; (W. A. P. Fisher), 329
Mechanical Vibration Problems : A Technique for, *review* by Prof. W. G. Bickley, 954
Mechanical Vibrations (Prof. J. P. Den Hartog), third edition, *review* by A. L. P., 503
Mechanical Wear (Massachusetts Institute of Technology, the American Society of Mechanical Engineers, the General Motors Corporation and the Chrysler Corporation conference on), 758
Mechanics (Prof. John C. Slater and Prof. Nathaniel H. Frank), *review* by J. H. Pearce, 376
  Manual of Mathematics and (Prof. Guy Roger Clements and Prof. Levi Thomas Wilson), second edition, *review*, 789
Mechanics of Packings of Granular Material (D. R. Hudson), 512
Mechanism : Elements of (Peter Schwamb, Allyne L. Merrill and Walter H. James), sixth edition revised by Prof. Venton Levy Doughtie, *review* by F. G. W. Brown, 79
Mechanism of Combustion and Ignition Reactions in the Gas Phase : The Kinetics and (International symposium on), 347
Mechanism of Conductance by Hydrogen and Hydroxyl Ions in Aqueous Solutions (Dr. S. I. Weissman), 241
Mechanism of the Emission Spectrum of Active Nitrogen (L. Herman and R. Herman), 1018
Mechanism of Substitution in the Naphthalene Nucleus (Dr. N. M. Cullinane and S. J. Chard), 690
Mechanisms of Reactions at Carbon-Carbon Double Bonds (Prof. Charles C. Price), *review* by Dr. J. Sheridan, 626
Medal of Freedom awarded by the Government of the United States to Dr. James Craigie and Amherst F. H. Thomson, 215 ; to Prof. W. Norman Thomas, 716
Medal of Freedom with Bronze Palm awarded by the Government of the United States to Sir Charles Darwin, J. N. D. Heenan, Sir Ian Heilbron, Charles Lea, Andrew Stratton and T. W. J. Taylor, 215
Medal of Freedom with Silver Palm awarded by the Government of the United States to Sir Henry Dale, Sir Jack Drummond, Sir Alfred Egerton, Sir Melvill Jones, Dr. Alexander King, Sir Edward Mellanby, Dr. Hugh M. Sinclair, Cyril G. Trotman and Dr. Hector F. Willis, 215 ; to Prof. S. Zuckerman, 716
Medal for Merit awarded by the Government of the United States to Sir Alexander Fleming and Sir Howard Florey, 800
Medical Diseases in Tropical and Sub-Tropical Areas : Memoranda on (War Office), eighth edition, *review* by Dr. N. Hamilton Fairley, 499
Medical Films : Catalogue of (Royal Society of Medicine and the Scientific Film Association), 594
Medical Group Practice in the United States (P.E.P. Broadsheet No. 274), 841
Medical Research in South Africa, 162
Medical Research during War-time (Dr. G. Lapage), 998
Medical and Agricultural Physiology : Co-operation between, *review*, 113
Medicine : Animal Genetics and (Dr. Hans Grüneberg), *review* by Prof. C. H. Waddington, 543
Megalithic Tombs in Scotland and Ireland (Prof. V. Gordon Childe), 841
Melanin Problem—a Synthesis of 5 : 6–Dihydroxyindole (Dr. R. J. S. Beer, K. Clarke, H. G. Khorana and Prof. A. Robertson), 525 ; (Prof. H. Burton and J. A. Duffield), 725
'Melarsen' and 'Melarsen Oxide' (J. Williamson and Dr. E. M. Lourie), 103
'Melarsen Oxide' : 'Melarsen' and (J. Williamson and Dr. E. M. Lourie), 103
Meldola Medal for 1947 of the Society of Maccabæans awarded to Dr. J. Baddiley, 715
Men : The Governing of (Dr. A. H. Leighton), 578
Men (Oligospermic) : Variations in Spermatogenesis of (Prof. B. Zondek, Y. M. Bromberg and Z. Polishuk), 176
Men of Science in Industry and Society, *review* by R. Brightman, 370
Men and Volts at War, the Story of General Electric in World War II (John Anderson Miller), *review* by Sir Arthur Fleming, 113
Menschen : Die Bluteiweisskörper des (Dr. F. Wuhrmann und Dr. Ch. Wunderly), *review*, 376
Mental Disease : Sociology of (National Association for Mental Health conference on), 407
Meristematic Plant Tissues: Chromatographical Study of (Dr. A. Allsopp), 833
Meson Field and the Equation of Motion of a Spinning Particle (R. C. Majumdar and Dr. S. Gupta), 410
Meson Formation : Height of (Dr. A. Duperier), 645
Meson Scattering with Nuclear Excitation (Dr. H. J. Bhabha and R. R. Daniel), 883
Mesons : The Artificial Production of (Dr. G. P. S. Occhialini and Dr. C. F. Powell), 551
  A New Method for the Determination of the Mass of (Dr. C. F. Powell and Dr. S. Rosenblum), 473
σ-Mesons : The Mass of (S. Lattimore), 518
Mesons (Negative) : Capture of, by Nuclei (J. A. Lodge), 809
Mesons of Different Masses (Prof. J. Barnothy), 681
Mesons and Nucleons (Prof. O. Klein), 897
Mesophilic Bacteria in Composts : Aerobic (D. M. Webley), 174
Mesotrons and Cosmic Rays : Electrons (+ and −), Protons, Photons, Neutrons, (Robert Andrews Millikan), revised edition, *review* by Dr. L. G. H. Huxley, 789
Mesures physiques : Les (Albert Pérard), *review* by S. Weintroub, 955
Metabolic Aspects of Convalescence (M. W. Grant), 535
Metabolism of Tissue Cells *in vitro* : Amino-acid (Dr. Albert Fischer), 1008
Metabolites (Intermediary) : Relation of, to the Lowering of the Potency of Pancreatic Insulin in the Animal System (Prof. M. C. Nath and H. D. Brahmachari), 18
Metal and Metal Powders (Deformed Solid) : X-Ray Diffraction Rings from (Dr. W. A. Wood and W. A. Rachinger), 93
Metal Complexes: Order of Stability of (Dr. D. P. Mellor and L. Maley), 436
Metal Films at a Frequency of 24,000 Mc./s. : Surface Resistance of (Dr. L. Speirs), 601
Metal Physics : Summer School in (Cavendish Laboratory), 637
Metal Powders : X-Ray Diffraction Rings from Deformed Solid Metal and (Dr. W. A. Wood and W. A. Rachinger), 93
Metal Salts (Alkali), Gold and Platinum : Magnetic Susceptibility of Borax Glasses containing Crystallites of (Prof. Subodh Kumar Majumdar), 684
Metallic Carbonyls and Nitrosyls : Constitution of certain Binuclear (Dr. R. V. G. Ewens), 530
Metallic State : The (Prof. Linus Pauling), 1019
Metallographic and X-Ray Measurements of Retained Austenite : Comparison of (William J. Harris, jun.), 315
Metallurgy (Powder) : International Conference on (Steirmark of the Association of Austrian Chemists), 307
Metals : Electron Theory of (Dr. G. V. Raynor), 264
  Internal Stresses in (W. A. Wood and N. Dewsnap), 682 ; (G. B. Greenough), 683
  International Conference on the Physics of (Netherlands Physical Society), 389
  Relation of Manganese and some other, to the Iron Status of Plants (Eric J. Hewitt), 489
  Mechanical Behaviour of Crystal Boundaries in (R. King, R. W. Cahn and Dr. B. Chalmers), 682
  Structure and Physical Properties of (X-Ray Analysis Group of the Institute of Physics discussion on), 263
  Theory of the Anomalous Skin Effect in (G. E. H. Reuter and E. H. Sondheimer), 395
  Theories of Creep in, 233
Metals (Alkali) : Electrical Resistivity of, below 20° K. (Dr. D. K. C. MacDonald and Dr. K. Mendelssohn), 972
Metals (Heavy) : Antagonism between Molybdenum and certain, in Plant Nutrition (C. R. Millikan), 528
Metals (Non-ferrous) : Refining of (Institution of Mining and Metallurgy symposium on), 924

Metals and Alloys : Internal Stresses in (Institute of Metals, in association with the Faraday Society, the Institute of Physics, the Institution of Mechanical Engineers, the Iron and Steel Institute, the Physical Society and the Royal Aeronautical Society symposium on), 70
Metapenæus monoceros Fabricius : Active Regulation of Chloride in (N. Kesava Panikkar and R. Viswanathan), 137
Metasequoia in China : Discovery of a Living (Prof. E. D. Merrill), 594
Metastable States of Nickel Characterized by a High Initial Permeability (Dr. J. L. Shoek and J. F. Fast), 887
Meteor Whistles (H. V. Griffiths, S. E. Martingell and R. W. Bayliff), 478
Meteorologist (Professional) : Meteorology for the, *review* by Prof. P. A. Sheppard, 625
Meteorology of the Australasian Antarctic Expedition, 1911–14 (Dr. Edward Kidson), 709
Meteorology for the Professional Meteorologist, *review* by Prof. P. A. Sheppard, 625
Meteorology, Theoretical and Applied (Dr. E. Wendell Hewson and Richard W. Longley), *review* by Prof. P. A. Sheppard, 625
Meteorology and the Propagation of Radio Waves (Dr. R. L. Smith-Rose), 145
Meteorology and Weather Prediction : Organisation, *review* by M. K. Miles, 540
Meteors Measured by Diffraction of Radio Waves from Trails during Formation : Velocity of (C. D. Ellyett and J. G. Davies), 596
Méthodes statistiques modernes des administrations fédérales aus États-Unis (Pierre Thionet), *review* by Dr. F. Yates, 153
Methodology in Ethnography, *review* by Dr. A. I. Richards, 111
Methyl Bromide : Inhibition of SH Enzymes by (S. E. Lewis), 692
Methyl Iodide : Bond-Strength of C—Cd in Cadmium Methyl and of C—I in (A. S. Carson, K. Hartley and Dr. H. A. Skinner), 725
  Extinction of Petrol Fires by (Dr. Oliver C. de C. Ellis), 402
Methyladrenaline : Demonstration and Separation of Noradrenaline, Adrenaline and (Dr. W. O. James), 851
Methylated Sugars on the Paper Chromatogram : Separation and Identification of (F. Brown, Prof. E. L. Hirst, L. Hough, Dr. J. K. N. Jones and H. Wadman), 720
Methylene Blue : Intravenous—a New Method for Studying the Nervous System (W. H. Feindel, D. C. Sinclair and Dr. G. Weddell), 318
Metric Values in Scientific Papers : Use of Equivalent, 144
Mica : Magnetic Susceptibility of (J. T. Kendall and D. Yeo), 476
Mice : Ultracentrifugation and Electron Microscope Studies of Tissues of Inbred Strains of (Prof. R. D. Passey, Dr. L. Dmochowski, Prof. W. T. Astbury, Dr. R. Reed and Dr. P. Johnson), 759
Michigan (southern) : Earthquake on August 10, 657
Microbiological Assay Procedure : A Modified (Dr. Trevor I. Williams), 19 ; (Stanley A. Price), 20
Microbiology : Annual Review of (edited by Charles E. Clifton, Sidney Raffel and H. Albert Baker), Vol. I, *review* by Sir Paul Fildes, 995
Microcalorimetry (Prof. W. Swietoslawski), *review* by Dr. Ezer Griffiths, 460
Micro-Chemical Techniques : Summer School in (Queen's University, Belfast), 125
Microdiffusion Analysis and Volumetric Error (Prof. Edward J. Conway), revised edition, *review*, 583
Micro-Estimation of Amino-Nitrogen and its Application to Paper Partition Chromatography (A. J. Woiwod), 169
Micro-film Technique : Standardization of (British Standard Specification 1371 : 1947), 346
Microflora of the Rumen (C. A. McGaughey and K. C. Sellers), 1014
Micro-Predators in Soil : Limitation of Bacteria by (Dr. F. J. Anscombe and Dr. B. N. Singh), 140
Microsynthesis of C^{14}-Labelled Ethyl Iodide (Dr. W. J. Arrol and Raymond Glascock), 932
Micro-technique : Petrographic (A. V. Weatherhead), *review* by F. I. G. Rawlins, 626
Microscope : The (J. H. Wredden), *review*, 626
  The Electron (Dr. V. E. Cosslett), *review* by G. D. P., 955
  The Intelligent Use of the (C. W. Olliver), *review*, 626
  The Reflecting (Dr. C. R. Burch), 732
Microscope (Reflecting) : Applications of the, to the Nuclear Plates Technique (Dr. W. J. Bates and Dr. G. P. S. Occhialini), 473
Microscopic Plant and Animal Cells : Photo-electric Counting of Individual (Carl Lagercrantz), 25
Microscopic Principle : A New (Dr. D. Gabor), 777
Microspectrography (X-Ray) : Intracellular Determination of Protein by (Dr. A. Engström and M. A. Jakus), 168
Microwave Electronic Valves, *review* by Prof. J. T. Randall, 952
Microwave Power into a Resonator having a Fine Mode Structure : A Method of Feeding (G. R. Newbery and W. E. Willshaw), 519
Microwave Solar Radiation (Enhanced) : Emission of (R. G. Giovanelli), 133
Microwave Triodes : Klystrons and (Prof. Donald R. Hamilton, Prof. Julian K. Knipp and J. B. Horner Kuper), *review* by Prof. J. T. Randall, 952
Middle and Far East : Fish Farming in the (Dr. C. F. Hickling), 748
Migration : Butterfly (Dr. C. B. Williams), 636
Migrations of Floras : Origins of Species and, *review* by Prof. I. Manton, 455
Migratory and Homing Flights : Orientation of Birds on (Linnean Society discussion on), 996
Milk Production : Cattle Health and, 1005
Millidegrees Absolute : Magnetic Observations and Thermometry in the Region of (D. de Klerk, M. J. Steenland and Prof. C. J. Gorter), 678
Mind : Brain and, *review* by Dr. O. A. Trowell, 498
Mineral Resources of the United States (Staffs of the Bureau of Mines and Geological Survey), *review* by Dr. K. C. Dunham, 991
Minimum Perceptible Energy and Brownian Motion in Sensory Processes (Dr. Hl. de Vries), 63
Missouri Development Program : Prehistory and the (W. R. Wedel), 636
Missouri Valley : Archæology of the, 636
Mitosis : Early Effects of Hydroquinone on (R. Parmentier and Dr. P. Dustin, jun.), 527
Mobility of Man-Power in Britain, 453
Moche, a Peruvian Coastal Community (John Gillin), 697
Model for Representing the Optic Orientation of Biaxial Crystals : A Simple Universal (Dr. N. H. Hartshorne), 94
Model Research in Hydraulics, *review* by Prof. J. Th. Thijsse, 219
Models : Nuclear (Dr. I. N. Sneddon and B. F. Touschek), 61
Modern World : Reason in the, *review*, 664
Molds, Yeasts and Actinomycetes (the late Dr. A. T. Henrici), second edition by Dr. Charles E. Skinner, Dr. Chester W. Emmons and Dr. Henry M. Tsuchiya, *review*, 40
Mole-Cricket (European) : Chromosomal Evolution in the (Tuviah Kushnir), 531
Molecular Arrangement in Tobacco Necrosis Virus Crystals (Roy Markham, Dr. Kenneth M. Smith and Dr. Ralph W. G. Wyckoff), 760
Molecular Structure : Isotope Exchange and (International Colloquium on), 901
Molecular Vibrations : Interaction Terms in (D. F. Heath and Dr. J. W. Linnett), 243
  A Suggested New Force Field for (D. F. Heath and Dr. J. W. Linnett), 314
Molecular Vibrations and Bond-forming Orbitals : A Correlation between (Dr. J. W. Linnett and P. J. Wheatley), 971
Molecular Weight of *n*-Paraffins : Critical Temperature and (L. Grunberg and Dr. A. H. Nissan) 170
Molecules : Reactivity and Structure of (Prof. F. A. Paneth), 901
  Separation of Polar from Non-Polar (Prof. G. Karagounis), 855
Molecules of Biological Interest : Nature of Forces between Large (Prof. Linus Pauling), 707
Molecules without the Formation of Chemical Bonds between Them : Beta-quinol, an Example of the Firm Union of (H. M. Powell and P. Riesz), 52
Molecules containing Rotating Polar Goups : Dielectric Relaxation of (Prof. A. Budó), 133
Molybdenum and certain Heavy Metals in Plant Nutrition : Antagonism between (C. R. Millikan), 528
Monazite : Constitution of (Dr. A. W. Wylie), 97
Monkeys (Malaria-infected) : Hæmolytic System in the Blood of (Dr. H. Laser), 560
Monsters : Embryology of (Dr. Viktor Hamburger), 88 ; (Dr. Wolfgang Born), 88
Monuments : Exploring our National Parks and (Devereux Butcher), *review* by Frances Pitt, 376
Moon : Cosmic Rays and the Magnetic Field of the (Dr. M. S. Vallarta), 646
Moon (New) : Brightness of the (Dr. J. A. M. van Liempt), 27
Mosquito Eradication Campaigns : Recent (Dr. J. R. Busvine), 189
Mosses as Soil Indicators (H. Watson), 823
Motility : Bacterial Flagella and (Prof. Adrianus Pijper), 200
Motion of a Spinning Particle : The Meson Field and the Equation of (R. C. Majumdar and Dr. S. Gupta), 410
Mould Inhibition : Dosage/Response Relations in (J. N. Phillips and J. M. Vincent), 210
Mouse to Man : The Argument from, *review* by Prof. C. H. Waddington, 543
Moving-Boundary Apparatus : A Simple (E. G. Baxter and Dr. V. Gold), 403 ; (R. H. Davies), 1021
Mucosa (Nasal) : Alkaline Phosphatase in Taste Buds and (Dr. Geoffrey H. Bourne), 445
Multiple-Beam Interferometry to the Study of Oscillating Quartz Crystals : Application of (Prof. S. Tolansky and W. Bardsley), 925
Murchison Fund of the Geological Society awarded to Dr. F. W. Cope, 122
Murchison Grant for 1948 of the Royal Geographical Society awarded to Robert W. Steel, 553
Murchison Medal of the Geological Society awarded to Dr. J. Phemister, 122
Muscle (Isolated) : A Possible Relation between the Action of Clover Juice on, and 'Bloat' in Cattle (W. S. Ferguson), 816
Museum in Education : The (Cleveland Museum of Natural History), 677
Music : The Borderline of Psychology, Physics and (Acoustics Group of the Physical Society symposium on), 589
Mustard Gas in Aqueous Solution : The Reactions of (Dr. A. G. Ogston), 225
Mustard Gas on Enzymes and Tissues : Effects of (Dr. D. M. Needham), 225
Mustard Gas with Proteins : Reaction of (Dr. J. C. Boursnell), 225
Mustard-gas Mutation in *Aspergillus nidulans* (Donald Hockenhull), 100
Mustards : Nitrogen (Dr. E. Boyland), 226
Mutants of Diptera : White-eyed (Dr. P. Tate), 641
Mutation in *Aspergillus nidulans* : Mustard-gas (Donald Hockenhull), 100
Mycobacterium tuberculosis : Effect of Antibacterial Analogues of Vitamin K on (C. N. Iland), 1010
Mycological Education (British Mycological Society discussion on), 507
Myosin : Effect of Calcium Ions on the Charge of (Olle Snellman and Thomas Erdös), 526

NAPHTHALENE Nucleus : Mechanism of Substitution in the (Dr. N. M. Cullinane and S. J. Chard), 690
β-Naphthol with l-α and l-β-Phellandrene : Reaction of (G. G. Acheson and Dr. T. F. West), 976
Naphthoresorcinol Reaction for Uronic Acids : The Tollens (A. H. Guerrero and Dr. R. Tecwyn Williams), 930
Nasal Mucosa : Alkaline Phosphatase in Taste Buds and (Dr. Geoffrey H. Bourne), 445
Nation : Family and (P.E.P. Broadsheet), 539
National Intelligence : The Trend of (Prof. Godfrey Thomson, with a Symposium by Sir Alexander Carr-Saunders, Sir Cyril Burt, Prof. Lionel Penrose and Prof. Godfrey Thomson), *review* by Dr. Julian Blackburn, 37
National Parks in Britain, 783
National Parks and Monuments : Exploring our (Devereux Butcher , *review* by Frances Pitt, 376
Nationalized Industries : Responsibility in, 619
Native Peoples of the Pacific World (Prof. Felix M. Keesing), *review* by M. C. B., 419
Natural Amœbic Infections in Laboratory Rodents (Dr. J. D. Fulton and L. P. Joyner), 66
Natural History of Butterflies, 636
Natural History in the Highlands and Islands (Dr. F. Fraser Darling), *review* by Prof. A. D. Peacock, 457
Natural History Books : Old Scientific and, 305
Natural History Journals, 923
Natural Selection of *Drosophila* (Dr. F. W. Sansome), 409
Natural Vegetation of Trinidad (Prof. C. W. Wardlaw), 31 ; (Dr. J. S. Beard), 31
Naturalists from Neckam to Ray : English (Dr. Charles E. Raven), *review* by Prof. F. J. Cole, 373
Nature of the Bromate Effect : Studies on the (Dr. Holger Jørgensen), 294

Nature of Egyptology : Growth and (Prof. S. R. K. Glanville), 346
Nature of Forces between Large Molecules of Biological Interest (Prof. Linus Pauling), 707
Nature Lover : Fisherman and, *review* by Seton Gordon, 951
Nature Stories : Gathered, *review* by Seton Gordon, 744
Nature's Own Zoo (C. M. Beadnell), *review* by Seton Gordon, 744
Navaho : The (Clyde Kluckhohn and Dorothea Leighton), *review* by Dr. G. H. S. Bushnell, 545
Navigation : Radio Aids to (Dr. R. A. Smith), *review* by Dr. R. L. Smith-Rose, 334
Neckam to Ray : English Naturalists from (Dr. Charles E. Raven), *review* by Prof. F. J. Cole, 373
Necrosis Virus Crystals (Tobacco) : Molecular Arrangement in (Roy Markham, Dr. Kenneth M. Smith and Dr. Ralph W. G. Wyckoff), 760
Necturus, and the Cat : Guide to the Study of the Anatomy of the Shark, (Prof. Samuel Eddy, Prof. Clarence P. Oliver and Prof. John P. Turner), second edition, *review* by Dr. P. D. F. Murray, 955
Negative Mesons by Nuclei : Capture of (A. S. Lodge), 809
Negative Sequences in Polyphase Supply : Bridge Networks discriminating between Positive and (N. F. Barber), 685
Neill Prize for 1945–47 of the Royal Society of Edinburgh awarded to Dr. Robert Broom, 716
Nematodes in Genetic Research : Possible Significance of Free-living (Dr. Ellsworth C. Dougherty and Hermione Grant Calhoun), 29
Nematology : Research on, 1006
Nerven : Die Signalübermittlung im (Prof. Alexander v. Muralt), *review* by Prof. J. Z. Young, 76
Nerves : Transmission in, *review* by Prof. J. Z. Young, 76
Nervous System : Intravenous Methylene Blue—a New Method for Studying the (W. H. Feindel, D. C. Sinclair and Dr. G. Weddell), 318
Netherlands : *Elminius modestus* in the (Prof. H. Boschma), 403
Netherlands India : Colonial Policy and Practice, a Comparative Study of Burma and (J. S. Furnivall), *review* by Maurice Bruce, 908
Neurohypophysis in the Conscious Animal : Electrical Stimulation of the (G. W. Harris), 739
Neurosecretory Cells in the Brain of Adult *Calliphora erythrocephala* Meig. : Effect of Removal of (Dr. Ellen Thomsen), 439
Neutron Reactions : Cloud Chamber Investigation of Straggling of Short-Range Particles produced by Slow (Dr. J. K. Bøggild), 810
Neutrons : Scattering of, by Lead (R. Latham and J. M. Cassels), 282
Neutrons (D—D) : Scattering of, by Deuterium (J. F. Darby and J. B. Swan), 22
Neutrons (100-MeV.) : Scattering of, by Protons (F. C. Barker), 726
Neutrons (220 and 900 keV.) : Comparison of Cross-sections for the Capture of (R. Allen, G. R. Bishop, P. Demers and Dr. H. Halban), 727
Neutrons (Fast) : Interaction of, with Indium (S. G. Cohen), 475
Neutrons, Mesotrons and Cosmic Rays : Electrons (+ and −), Protons, Photons, (Robert Andrews Millikan), revised edition, *review* by Dr. L. G. H. Huxley, 789
New Forest : The Future of the (Prof. H. G. Champion), 547
New Guinea and South Australia : Newly Discovered Submarine Canyons of (Reg. C. Sprigg), 246
New Moon : Brightness of the (Dr. J. A. M. van Liempt), 27
New Year Honours, 48
New Zealand : Earthquakes during October 1947, 306
  Earthquakes registered in, during February 1948, 1006
  Preservation of the *Kauri* in (Prof. V. J. Chapman), 72 ; (Prof. H. G. Champion), 72
Newspapers : German Books, Periodicals and (European Periodicals Publicity and Advertising Co., Ltd., First Post-War Exhibition of), 595
Nickel Characterized by a High Initial Permeability : Metastable States of (Dr. J. L. Snoek and J. F. Fast), 887
Nicotinic Acid in Human Blood Cells at Birth (R. F. A. Dean and W. I. M. Holman), 439
Nigerian Freedom : Path to (Obafemi Awolowo), 332
Nihilism : Farewell to European History, or the Conquest of (Alfred Weber), translated from the German by R. F. C. Hull, *review* by Maurice Bruce, 151
Nitration of Simple Heterocycles (K. Schofield and T. Swain), 690
Nitrification : Trace Elements and (Dr. Howard Lees and Jane Meiklejohn), 398
Nitrogen (Active) : Mechanism of the Emission Spectrum of (L. Herman and R. Herman), 1018
Nitrogen Atoms in the Upper Atmosphere : Production of (Prof. G. Herzberg and L. Herzberg), 283
Nitrogen Metabolism after Fracture (Dr. H. N. Munro and M. C. Cumming), 560
Nitrogen Mustards (Dr. E. Boyland), 226
Nitrogen Trichloride on Proteins : Action of—Production of Toxic Derivative (H. R. Bentley, Dr. R. G. Booth, E. N. Greer, J. G. Heathcote, Dr. J. B. Hutchinson and Dr. T. Moran), 126
Nitrogenous Constituents of the Potato (Dr. E. B. Slack), 211
Nitrosyls : Constitution of certain Binuclear Metallic Carbonyls and (Dr. R. V. G. Ewens), 530
Noble Sugar-Canes (*Saccharum officinarum* L.) : Origin of (Dr. N. Parthasarathy), 608
Noise : International Symposium on (Acoustics Group of the Physical Society and the Royal Institute of British Architects), 197
Nomenclature : *Rh* (Dr. A. E. Mourant), 492
Nomenclature of the anti-*Rh* Typing Sera (W. B. Castle, M. W. Wintrobe and L. H. Snyder), 492
Nomenclature of the Shaddock or Pomelo : Botanical (Dr. D. Chatterjee), 770
Non-Acoustic Functions of the Vertebrate Ear : Oscillographic Analysis of the (Dr. Otto Lowenstein), 652
Non-Benzenoid Aromatic Hydrocarbon Pentalene (D. P. Craig and Allan Maccoll), 481
Non-Ferrous Metals : Refining of (Institution of Mining and Metallurgy symposium on), 924
Non-Polar Molecules : Separation of Polar from (Prof. G. Karagounis), 855
Non-Specific Competition in Tubular Excretion : Specific and (I. Sperber), 236
Noradrenaline, Adrenaline and Methyladrenaline : Demonstration and Separation of (Dr. W. O. James), 851
North America : The Fall Webworm of, in Europe (Dr. Paul Surányi), 512
North American Archæology, *review* by Dr. G. H. S. Bushnell, 501
Northern Hemisphere Surface Pressure and Climatic Fluctuations and Vegetation Growth in Northern Finland (G. W. Brier), 730
Northern Ireland : Scientific Research and Development in, 162
Northern Ireland Fishing Industry Developments during the War Years, 451
Northern States and Canada East of the Rocky Mountains : Handbook of the Trees of the (Romeyn Beck Hough), *review* by Sir Edward Salisbury, 497
Northern Waters : Climatic and Ecological Changes in, 428
Norway (southern) : Auroral Activity in, from the Middle of August to the Middle of October 1947 (Prof. Carl Störmer), 208
Nuclear Change in Differentiation : Significance of (Dr. K. Mather), 872
Nuclear Disintegration in Photographic Emulsions Exposed to Cosmic Rays—Double Stars : Anomalous Distribution of (L. Leprince-Ringuet and J. Heidmann), 844 ; (T. T. Li and D. H. Perkins), 844
Nuclear Excitation : Meson Scattering with (Dr. H. J. Bhabha and R. R. Daniel), 883
Nuclear Level Scheme of Pb^{208} : Spin-Dependence of Magnetic Dipole Gamma Radiation and the (Dr. H. O. W. Richardson), 516
Nuclear Models (Dr. I. N. Sneddon and B. F. Touschek), 61
Nuclear Physics : Data for, *review* by Sir John Cockcroft, 418
  An Introduction to (S. Fluegge), *review* by Sir John Cockcroft, 418
Nuclear Physics in Photographs (Dr. C. F. Powell and Dr. G. P. S. Occhialini), *review* by Prof. P. I. Dee, 333
Nuclear Physics Tables (J. Mattauch), and An Introduction to Nuclear Physics, by S. Fluegge, *review* by Sir John Cockcroft, 418
Nuclear Plates Technique : Applications of the Reflecting Microscope to the (Dr. W. J. Bates and Dr. G. P. S. Occhialini), 473
Nuclear Reactions with Improved Yield : Discharge Tube for (Jaroslav Pachner), 252
Nuclei : Capture of Negative Mesons by (A. S. Lodge), 809
  Emission of Li^8 in the Explosive Disintegration of (C. Franzinetti and R. M. Payne), 735
Nuclei (Highly Excited) : Disintegration of (D. H. Perkins), 486
Nucleic Acid in the *Drosophila* Egg : Ribose (H. G. Callan), 440
Nucleolus of the Apodan Sertoli Cell (B. R. Seshachar), 558
Nucleons : Mesons and (Prof. O. Klein), 897
Nucleotides (Flavine) : Paper Chromatography of (Dr. J. L. Crammer), 349
Nudibranch Genera *Pellibrancus* and *Okadaia* : Synonymy of the (Patricia M. Ralph), 528
Nuffield (Penicillin) Research Fellowships, 16
Number : Calculus based on the Fundamental Concept of, *review* by F. G. W. Brown, 261
Numerals : 'Semaphore' (Prof. W. G. Bickley), 807
Nursey Premium of the Society of Engineers awarded to R. Cecil Smart, 346
Nutrition in relation to Cancer (New York Academy of Sciences symposium on), 106
Nutritional Requirements of *Drosophila melanogaster* (Dr. Michael Begg and Dr. Forbes W. Robertson), 769
Nutritional Status : Chemical Composition of Plants as an Index of their (Dr. D. W. Goodall and Dr. F. G. Gregory), 406

OAK Mildew : Perithecia of (J. Mary Knoyle), 938
Ocean Bottoms : Ground Blocks of the Continents and (Prof. H. Cloos), 71
Oceans : Sublimation in the Atmosphere over the (Dr. B. Cwilong), 62
Œstrogenic Hormone : Podocarpic Acid as a Source of (C. W. Brandt and D. J. Ross), 892
Œstrogenic Hormones : Nature of the *C/D* Ring Union in the (Dr. C. W. Shoppee), 207
Œstrogens from Urine by Application of High Temperatures : Preparation of (Dr. Felix Sulman), 605
Œstrogens (Synthetic) : Configuration of (H. P. Koch), 309
Œstrone and Equilenin : The *C/D* Ring Union in (Dr. W. Klyne), 434 ; *errata*, 514
Oil : The Race for, *review* by H. B. Milner, 186
Oil Industry during the War-Years : Progress in the, *review* by H. B. Milner, 703
Oil Operations Abroad : American (Leonard M. Fanning), *review* by H. B. Milner, 186
Oils and Fats : World Supplies of, 123
Okadaia : Synonymy of the Nudibranch Genera *Pellibranchus* and (Patricia M. Ralph), 528
Olefine Reactions Catalysed by Lewis Acids (Dr. John W. Baker), 171
Oligospermic Men : Variations in Spermatogenesis of (Prof. B. Zondek, Y. M. Bromberg and Z. Polishuk), 176
Onmisbaar element voor plant en dier : Koper als (W. J. Melchers en H. J. Gerritsen), *review*, 624
Open-Hearth Furnace Models (A. R. Philip), 479
Operational Research (Sir Charles Goodeve), 377, 609 ; (Prof. C. H. Waddington), 404 ; (Dr. F. Yates), 609
Operational Research in the Research Associations (Committee of Directors of Research Associations conference on), 584
Optic Orientation of Biaxial Crystals : A Simple Universal Model for Representing the (Dr. N. H. Hartshorne), 94
Optical Transmission of a Colloidal Solution in a Magnetic Field (F. D. Stott and Dr. A. von Engel), 728
Optics : Achievements in (A. Bouwers), *review* by S. Weintroub, 704
Optics in Holland, *review* by S. Weintroub, 704
Orbitals (Bond-forming) : A Correlation between Molecular Vibrations and (Dr. J. W. Linnett and P. J. Wheatley), 971
Orchestia bottae M. Edwards in Britain : Second Occurrence and Persistence of the Amphipod (A. J. Cain and D. H. Cushing), 483
Orchestia bottae and other Organisms in Britain : Occurrence of the Amphipod (D. M. Reid), 609
Order of Stability of Metal Complexes (Dr. D. P. Mellor and L. Maley), 436
Organ : The Electronic (L. E. A. Bourne), 196
Organic Liquids : Ultrasonic Dispersion in (Dr. A. Schallamach), 476
Organic Materials : Production of an Antibiotic Substance on Wheat Straw and other, and in the Soil (Erna Grossbard), 614
Organisation of the Cell Walls of Tracheids and Wood Fibres (A. B. Wardrop and Dr. R. D. Preston), *erratum*, 90
Organisation of the Textile Industry (Textile Institute conference on), 842
Organisation, Meteorology and Weather Prediction, *review* by M. K. Miles, 540

TITLE INDEX

Organism : An Adaptation Mechanism of the, to Damage—the Role of 'Resistine' (Dr. S. Karády and Dr. A. Kovács), 688
Organisms in Britain : Occurrence of the Amphipod *Orchestia bottae* and other (D. M. Reid), 609
Organs of Speech : Man's (Prof. H. A. Harris), 628
Oribatid Mites and their Economic Importance (M. Anantaraman), 409
Orientation of Biaxial Crystals : A Simple Universal Model for Representing the Optic (Dr. N. H. Hartshorne), 94
Orientation of Birds on Migratory and Homing Flights (Linnean Society discussion on), 996
Origins of Species and Migrations of Flora, *review* by Prof. I. Manton, 455
Oscillating Quartz Crystals : Application of Multiple-Beam Interferometry to the Study of (Prof. S. Tolansky and W. Bardsley), 925
Oscillation Problems : Mechanical Admittances and their Applications to (Prof. W. J. Duncan), *review* by Prof. W. G. Bickley, 954
Oscillatory Time-Series : Contributions to the Study of (Maurice G. Kendall), *review* by David G. Kendall, 187
Oscillograph Signals : Reproduction of Photographically Recorded (R. L. F. Boyd), 227
Oscillograph Traces : Simultaneous Recording of Related, 89
Oscillographic Analysis of the Non-Acoustic Functions of the Vertebrate Ear (Dr. Otto Lowenstein), 652
Osmium : Reported Radioactivity of (A. H. W. Aten, Jun.), 1019
Osmium Tetroxide : Oxidation of Anthracene by (Prof. J. W. Cook and Dr. R. Schoental), 237
Osmotic Work performed by the Renal Tubules (David F. Cole), 640
Output of Sodium and Chlorine in Fasting Rats : Premortal Increase in the (Dr. Peter Bálint and Dr. Helene Kabdebó), 57
Ovalbumins (Modified) : Electrophoretic Behaviour of (Gertrude E. Perlmann), 720
Ovalene : Synthesis of (Dr. E. Clar), 238
Ovarian Activity in the Pregnant Mare (Prof. E. C. Amoroso, J. L. Hancock and Dr. I. W. Rowlands), 355
Overseas Territories of Western Europe (Allied Circle, Amsterdam, and the British Society for International Understanding, Study Conference on), 843
Oviposition in Social Hymenoptera : Regulation of (M. V. Brian and A. D. Brian), 854
Oxford : Archæology at, *review* by Miles Burkitt, 459
Oxidation of Anthracene by Osmium Tetroxide (Prof. J. W. Cook and Dr. R. Schoental), 237
Oxidation with Lipoxidase : Total Conjugation of Linoleic Acid in (Prof. Sune Bergström and Ralph T. Holman), 55
Oxide-coated Cathodes under Electron Bombardment : Electron Emission from (T. J. Jones), 846
Oxime-Nitrogen in *Torula*-Yeast Fed with Potassium Nitrate : Formation of (Prof. Artturi I. Virtanen and Tihamér Z. Csáky), 814
Oxygen Molecule : New Bands in the Schumann-Runge System of the (Lalji Lal), 477
Oxygen and Dissociation in Flame Gases : Atomic (Prof. W. T. David, C. Rounthwaite and N. Carpenter), 726
Oxygen and Hydrogen : Fractional Distillation and its Application in the Concentration of the Heavy Isotopes of (Dr. I. Dostrovsky, Prof. E. D. Hughes and Dr. D. R. Llewellyn), 858
Oxygen-containing Solvents : Solvation of Hydrogen Ion in (Dr. Ernest A. Braude and E. S. Stern), 169
Oyster Beds (East Coast) : *Elminius modestus*, another Imported Pest of (E. W. Knight Jones), 201
Ozone and Auroral Spectra (Dr. A. Vassy and E. Vassy), 566

PACIFIC (Southwest) : Birds of the (Ernst Mayr), *review* by Frances Pitt, 545
Pacific Region : The Bikini Bomb and the Seismology of the (Prof. K. E. Bullen), 62
Pacific World : Native Peoples of the (Prof. Felix M. Keesing), *review* by M. C. B., 419
Pacifique-nord : Archéologie du (Dr. André Leroi-Gourhan), *review* by Prof. J. H. Hutton, 545
Packings of Granular Material : Mechanics of (D. R. Hudson), 512
Page Prizes for 1947 of the Institution of Electrical Engineers awarded to D. T. Hollingsworth and M. K. Taylor, 90
Paget (Stephen) Memorial Lecture of the Research Defence Society (Prof. P. A. Buxton), 802
Pain : Victory over (Dr. Victor Robinson), *review* by Dr. G. Edwards, 458
Paints and their Uses : Cementiferous (Prof. G. Wesley Austin), 569
Palæobotany : An Introduction to (Prof. Chester A. Arnold), *review* by Prof. John Walton, 623
Palestine : Fauna and Flora of, 902
    Scientific and Industrial Research in, 800
Pancreatic Insulin in the Animal System : Relation of Intermediary Metabolites to the Lowering of the Potency of (Prof. M. C. Nath and H. D. Brahmachari), 18
Paper Chromatogram : Separation and Identification of Methylated Sugars on the (F. Brown, Prof. E. L. Hirst, L. Hough, Dr. J. K. N. Jones and H. Wadman), 720
Paper Chromatography : Quantitative (R. B. Fisher, D. S. Parsons and G. A. Morrison), 764
    Use of Ultra-Violet Fluorescence in (D. M. P. Phillips), 53
Paper Chromatography of Anthycyanins and related Substances in Petal Extracts (E. C. Bate-Smith), 835
Paper Chromatography of Flavine Nucleotides (Dr. J. L. Crammer), 349
Paper Chromatography of Sugars : Colour Reagents for the (Dr. W. G. C. Forsyth), 239
Paper Partition Chromatography : Micro Estimation of Amino-Nitrogen and its Application to (A. J. Wolwod), 169
Parade of the Animal Kingdom (Prof. Robert Hegner, assisted by Jane Z. Hegner), *review* by Dr. Edward Hindle, 501
n-Paraffins : Critical Temperature and Molecular Weight of (L. Grunberg and Dr. A. H. Nissan), 170
Parallelism between Atomic and Planetary Properties, 780
Parasites (animaux et végétaux) des helminthes (Dr. Robert Ph. Dollfus), *review* by Dr. G. Lapage, 662
Parasites (Mammalian Malaria) : Pre-erythrocytic Stage in (Prof. H. E. Shortt and P. C. C. Garnham), 126 ; (Dr. Frank Hawking), 175
Parasitic Agent : Relationship of Glioma to Encephalitis in the Domestic Fowl, and an Associated (Prof. Cecil Jackson), 441
Parks in Britain : National, 783
Parks and Monuments : Exploring our National (Devereux Butcher), *review* by Frances Pitt, 376
Particle (Spinning) : The Meson Field and the Equation of Motion of a (R. C. Majumdar and Dr. S. Gupta), 410
Particle-size Measurement (Gervase L. Mills), 313
Particles (Penetrating) : Showers of (Prof. G. Wataghin), 91
Particles (Thibaud's) : Electronic Waves and (W. E. Benham), 93
Particles of Different Sizes : Principle of a Counter-streaming Centrifuge for the Separation of (Per Eric Lindahl), 648
Partition Chromatography (Paper) : Micro Estimation of Amino-Nitrogen and its Application to (A. J. Wolwod), 169
Pastures and Pasture Research (C. M. Donald), second edition, *review* by Dr. John Grainger, 747
Pathology of Animal Reproduction and on Artificial Insemination : First International Congress on the Physiology and, 197
Patient with Adrenal Cancer : Isolation of a New Androstenol-3(α)-on-17 from the Urine of a (Dr. Elizabeth Dingemanse, Leonora G. Huis in 't Veld and S. Lore Hartogh-Katz), 848
Patron's Medal for 1948 of the Royal Geographical Society awarded to Thomas H. Manning, 553
Pea (Wrinkled and the Smooth) : Starches of the (Dr. S. Peat, Dr. E. J. Bourne and Mary J. Nicholls), 206
Peace and Atomic Power, 741
Peace or Power (Sir Harold Butler), 414
Peace and the Public (Mass-Observation), 415
Peek (Cuthbert) Grant for 1948 of the Royal Geographical Society awarded to Dr. Donald F. Thomson, 553
Pellibranchus and *Okadaia* : Synonymy of the Nudibranch Genera (Patricia M. Ralph), 528
Penetrating Particles : Showers of (Prof. G. Wataghin), 91
Penetrating Showers : Extensive (B. Chaudhuri), 680
Penetration of Fat into Adipose Tissue : Active (B. Shapiro, D. Weissmann, V. Bentor and E. Wertheimer), 482
Penicillin : American Awards for Work on, 800
    The Assaying of (Biological Methods and Physical Methods Groups of the Society of Public Analysts and other Analytical Chemists discussion on), 285
    Behaviour of Gorini's Acid-Proteolytic Lactic Cocci with (Annamaria Torriani), 275
    Cytology of Staphylococci before and after Treatment with (Prof. R. Tulasne and Dr. R. Vendrely), 316
Penicillin (Radioactive) : Studies with (Dr. D. Rowley, J. Miller, S. Rowlands and Dr. E. Lester-Smith), 1009
Penicillin Assay Plates : Evidence for an Electrostatic Field on (Dr. Jean Dufrenoy and Prof. Robertson Pratt), 849
Penicillin Research Fellowships : Nuffield, 16
Penicillin Solutions : Factors involved in the Deactivation of, by Rubber Tubing (Dr. L. J. Bellamy and C. H. Watt), 940
Pentalene : The Non-Benzenoid Aromatic Hydrocarbon (D. P. Craig and Allan Maccoll), 481
Pentapeptides related to Gramicidin-*S* : Synthetic (J. I. Harris and T. S. Work), 804
People Are : What (Clark W. Heath, in collaboration with Lucien Brouha, Lewise W. Gregory, Carl C. Seltzer, Frederic L. Wells and William L. Woods), *review*, 502
Peoples of the Pacific World : Native (Prof. Felix M. Keesing), *review* by M. C. B., 419
Percentage Germination of Fungal Spores : A Method for Estimating (O. L. Davies, R. B. Duckworth and G. C. M. Harris), 642
Perceptible Energy and Brownian Motion in Sensory Processes : Minimum (Dr. Hl. de Vries), 63
Perception : The Physical Background of (Prof. E. D. Adrian), *review* by Dr. O. A. Trowell, 498
Perinuclear Lipidic Layer in the Liver Cell : A Cytochemical Study of the (Dr. C. A. Baud), 559
Periodicals : Recent Sociological (Prof. P. Sargant Florence), 450
Periodicals (French Scientific) : Photocopies of; 429
Periodicals and Newspapers : German Books, (European Periodicals Publicity and Advertising Co., Ltd., First Post-War Exhibition of), 595
Periodograms from Time-Series with Continuous Spectra : Smoothing (Prof. M. S. Bartlett), 686
Peripheral Action of Botulinum Toxin (Dr. N. Ambache), 482
Perithecia of Oak Mildew (J. Mary Knoyle), 938
Permanent Set : Chemical Mechanism of (A. J. Farnworth and Prof. J. B. Speakman), 890
Permeability (High Initial) : Metastable States of Nickel Characterized by a (Dr. J. L. Snoek and J. F. Fast), 887
Permittivity Values (High) : Measurement of, at Centimetre Wavelengths (J. G. Powles), 25
Peromyscus : Aggression, a Component of Post-Epileptic Automatism in (M. R. A. Chance), 101
Peroxides : The Enzyme-Substrate Compounds of Catalase and (Britton Chance), 914
Perseid Meteor Shower of 1947 : Combined Radar, Photographic and Visual Observations of the (Dr. Peter M. Millman, Dr. D. W. R. McKinley and Miriam S. Burland), 278 ; (Dr. A. C. B. Lovell), 280
Personal Leadership : Power and, 654
Personality, *review* by Prof. T. H. Pear, 622
    The Cultural Background of (Prof. Ralph Linton), *review* by Prof. T. H. Pear, 622
    The Dynamics of Power and (Prof. H. D. Lasswell), 654
Peru : Earthquake north-east of Lima on November 1, 306
Peru (Central) : Highland Communities of (Harry Tschopik, Jr.), 697
Pests (Garden) : The Detection and Control of (G. Fox Wilson), *review* by A. D. I., 419
Pests of Flour : Insect (J. A. Freeman and E. E. Turtle), 554
Petal Extracts : Paper Chromatography of Anthocyanins and related Substances in (E. C. Bate-Smith), 835
Petrographic Micro-technique (A. V. Weatherhead), *review* by F. I. G. Rawlins, 626

Petrol Fires : Extinction of, by Methyl Iodide (Dr. Oliver C. de C. Ellis), 402
Petroleum Production (Park J. Jones), Vol. 3, Oil Production by Water, *review* by H. B. Milner, 666
Petroleum Technology : Reviews of, Vol. 7 (covering 1941–45), *review* by H. B. Milner, 703
*p*H of Trisodium Citrate Solutions stored under Customary Laboratory Conditions (J. Jordan and Dr. M. Bobtelsky), 240
*p*H Values : Universal and Comparator Test-papers for the Measurement of (Johnson and Sons, Ltd.), 823
Phage Action : Calcium-Deficient Media—their Effect on (H. Williams Smith), 397
Pharmacological Activities in Different Rodent Species of *d*-Tubocurarine Chloride and the Dimethyl Ether of *d*-Tubocurarine Iodide (Dr. H. O. J. Collier, Sheila K. Paris and Dr. L. I. Woolf), 817
Pharmacology of Ch'ang Shan (*Dichroa febrifuga*), a Chinese Antimalarial Herb (Dr. C. S. Jang, F. Y. Fu, K. C. Huang and C. Y. Wang), 400 ; (T. S. Work), 401
Pharmacopœia (International) : Towards an, 33
Phase Memory of the Ear, a Proof of the Resonance Hypothesis (Dr. R. J. Pumphrey and T. Gold), 640
Phase-Angle Determination in X-Ray Crystallography (Dr. Alexander R. Stokes), 679
Phase-Contrast in Polarized Light (Prof. A. Kastler and R. Montarnal), 357
l-α- and *l*-β-Phellandrene : Reaction of β-Naphthol with (G. G. Acheson and Dr. T. F. West), 976
Phenols in Aqueous Solutions of Soap : Bactericidal Activity of (Prof. H. Berry and H. S. Bean), 396
Philippines : Earthquake on January 25, 232
Philosophy : Explanation in History and (Aristotelian Society Supplementary Vol. 21), *review* by F. I. G. Rawlins, 665
Philosophy (Contemporary) : The Revival of Realism, Critical Studies in (James Feibleman), *review* by Prof. A. D. Ritchie, 623
Phosphate Exchange by Yeasts : Riboflavin Enhancement of Radioactive (Dr. Walker J. Nickerson and Dr. Lorin J. Mullins), 939
Phosphorolysis of the Amylose and Amylopectin Fractions of Starch : Arsenolysis and (Dr. Joseph Katz, Dr. W. Z. Hassid and Dr. Michael Doudoroff), 96
Photochemical Degradation of Starch (Dr. S. Peat, Dr. E. J. Bourne and W. J. Whelan), 763
Photoconduction and Luminescence in Zinc Sulphide : Relation between (Dr. M. H. F. Wilkins and Dr. G. F. J. Garlick), 565
Photocopies of French Scientific Periodicals, 429
Photodynamic Action of 3 : 4 Benzpyrene : Inhibition of the (G. Calcutt and J. P. Newhouse), 53
Photo-Elastic Investigation of Internal Stresses in Silver Chloride caused by Plastic Deformation (J. F. Nye), 367
Photo-Elasticity : Some Modern Applications of (R. B. Heywood), 329
Photo-Elasticity in Mechanical Engineering (Dr. E. K. Frankl), 329 ; (W. A. P. Fisher), 329
Photo-electric Colorimetry : Units and Useful Range in (Dr. Walter Koch and Dr. Deborah Kaplan), 247 ; (Dr. J. R. Edisbury, R. J. Taylor and N. T. Gridgeman), 247
Photo-electric Counting of Individual Microscopic Plant and Animal Cells (Carl Lagercrantz), 25
Photographic Emulsions : Electron Tracks in (R. W. Berriman), 432 ; (Dr. R. H. Herz), 928
Photographic Emulsions Exposed to Cosmic Rays—Double Stars : Anomalous Distribution of Nuclear Disintegration in (L. Leprince-Ringuet and J. Heidmann), 844 ; (T. T. Li and D. H. Perkins), 844
Photographic Method : Investigation of the Radioactivity of Rocks by the (Dr. J. H. J. Poole and J. W. Bremner), 884
Photographic and Visual Observations of the Perseid Meteor Shower of 1947 : Combined Radar, (Dr. Peter M. Millman, Dr. D. W. R. McKinley and Miriam S. Burland), 278 ; (Dr. A. C. B. Lovell), 280
Photographically Recorded Oscillograph Signals : Reproduction of (R. L. F. Boyd), 227
Photographing Spectra : A Simple Way of (Dr. R. A. Houstoun), 973
Photographs : Nuclear Physics in (Dr. C. F. Powell and Dr. G. P. S. Occhialini), *review* by Prof. P. I. Dee, 333
Photography on Selenium (Dr. P. Selényi), 522
Photometer : Pulse-Counting, 635
Photometric Measurement of Specific Surface (B. A. Scott), 358
Photons, Neutrons, Mesotrons and Cosmic Rays : Electrons (+ and —), Protons, (Robert Andrews Millikan), revised edition, *review* by Dr. L. G. H. Huxley, 789
Photostat Copies of German Scientific and Technical Papers, 90
Photosynthesis of Foliage Leaves : Threshold Value of Carbon Dioxide Concentration in (Dr. E. K. Gabrielsen), 138
Physical Background of Perception (Prof. E. D. Adrian), *review* by Dr. O. A. Trowell, 498
Physical Chemistry at the Mellon Institute of Industrial Research, 89
Physical Measurements : Blinking, its Role in (Dr. Robert W. Lawson), 154
Physical Patterns of Speech, *review* by Dr. W. G. Radley, 334
Physical Planning in the South-West of England, *review* by Prof. L. Dudley Stamp, 786
Physical Properties of Metals : Structure and (X-Ray Analysis Group of the Institute of Physics discussion on), 263
Physical Science : The Growth of (Sir James Jeans), *review* by Prof. J. A. Crowther, 260
Physics : College (Prof. John A. Eldridge), third edition, *review* by S. Weintroub, 954
    College Technical (Robert L. Weber, Marsh W. White and Kenneth V. Manning), *review* by S. Weintroub, 954
    Low-Temperature (Dr. K. Mendelssohn), 732
    Metal (Summer School in the Cavendish Laboratory), 637
Physics (Modern) : Electricity, Magnetism and (Dr. G. T. P. Tarrant), *review* by Prof. L. F. Bates, 829
    Introduction to (F. K. Richtmyer and E. H. Kennard), fourth edition, *review* by Prof. L. F. Bates, 912
Physics at the University of Bristol, 755
Physics of Metals : International Conference on the (Netherlands Physical Society), 389
Physics of Solids : Summer School in (University of Bristol in co-operation with the Institute of Physics), 233, 636
Physics and Music : The Borderline of Psychology, (Acoustics Group of the Physical Society symposium on), 589
Physiological Chemistry : Practical (Dr. Philip B. Hawk, Dr. Bernard L. Oser and Dr. William H. Summerson), twelfth edition, *review*, 830
Physiological and Psychological Factors in Sex Behaviour (New York Academy of Sciences conference on), 124
Physiology : Advances in, *review* by Dr. O. A. Trowell, 542
    Annual Review of (edited by Victor E. Hall, Jefferson M. Crismon and Arthur C. Giese), Vol. 9, *review* by Dr. O. A. Trowell, 542
    Elementary, *review* by Prof. W. C. Cullis, 828
    Introduction to (Prof. W. H. Newton), *review* by Prof. W. C. Cullis, 828
Physiology (Medical and Agricultural) : Co-operation between, *review*, 113
Physiology (Sex and Reproductive) : Recent Advances in (Dr. J. M. Robson), third edition, *review* by Dr. F. H. A. Marshall, 790
Physiology at St. Andrews, 922
Physiology of Man in the Desert (E. F. Adolph and associates), *review* by Dr. B. McArdle, 744
Physiology and Biochemistry of Fats and Lipoids (Le Centre National de la Recherche scientifique symposium on), 534
Physiology and Pathology of Animal Production and on Artificial Insemination : First International Congress on the, 197
Physiology of Resistance to Disease in Plants (Royal Society symposium on), 422
Physiques : Les mesures (Albert Pérard), *review* by S. Weintroub, 955
Picture : Trees in Prose and, *review* by Sir Edward Salisbury, 497
Pie was Opened" : "When the, *review* by Prof. E. H. Neville, 186
Piezo-Electric Constants of α- and β-Quartz : Calculation of the (Dr. Bishambhar Dayal Saksena), 283
Piezo-Electric Resonance of Barium Titanate Crystals : Dielectric Constant and (Bernd T. Matthias), 325
Piezo-Electricity : Equations of (Richard K. Cook), 524
Pigment-fillings held in Cellulose Acetate Moulds : Recording Crevices in Plane Surfaces by (Dr. A. T. J. Dollar), 358
Pigmentation and Colour Vision : Race, (Dr. R. W. Pickford), 687
Pigs : Stimulation of Growth in, by Iodinated Casein and Stilbœstrol (Dr. R. Braude), 856
Pinhole Radiography of Magnetrons (Dr. R. Dunsmuir, Dr. C. J. Milner and A. J. Spayne), 244
Pituitary of the Guinea Pig : Alkaline Phosphatase in various Cell Types of the Anterior (Prof. Leo Abolins), 556
Plague Grasshopper (Australian) : Measurement of 'Environmental Resistance' in the (Dr. H. G. Andrewartha and L. C. Birch), 447
Plan your own Industries (M. P. Fogarty), 183
Planck (Max) Memorial Ceremony at Göttingen (Prof. E. N. da C. Andrade), 751
Plane Surfaces : Recording Crevices in, by Pigment-fillings held in Cellulose Acetate Moulds (Dr. A. T. J. Dollar), 358
Planetary Properties : Parallelism between Atomic and, 780
Planets : Between the (Fletcher G. Watson), *review* by H. S. J., 460
Planktonic Copepoda : The Free-Swimming (Lieut.-Colonel R. B. Seymour Sewell), 822
Planning in Scientific Research : Limitations of, 35
Planning in the South-West of England : Physical, *review* by Prof. L. Dudley Stamp, 786
Plant (Living) : Botany of the (Prof. F. O. Bower), fourth edition, *review* by Prof. F. T. Brooks, 153
Plant en dier : Koper als onmisbaar element voor (W. J. Melchers en H. J. Gerritsen), *review*, 624
Plant in the Food Industry : Cleaning and Sterilizing of (Royal Sanitary Institute and the Food Group of the Society of Chemical Industry discussion on), 1025
Plant Analysis and Fertilizer Requirements, 406
Plant Cells : Quantitative Relation between Salt Accumulation and Salt Respiration in (Dr. R. N. Robertson and Marjorie Wilkins), 101
Plant Collecting in the Far East (Dr. George Taylor), 635
Plant Disease caused by a Spore-forming Bacterium under Natural Conditions (Z. Volcani and Dr. W. J. Dowson), 980
Plant Disease Charts (*Plant Protection, Ltd.*), 389
Plant Ecology : Introduction to (A. G. Tansley), 158
Plant Ecology and the School (A. G. Tansley and E. Price Evans), 158
Plant Geography, *review* by Sir Edward Salisbury, 704 ; (Prof. Ronald Good), 857
Plant Nutrition : Antagonism between Molybdenum and certain Heavy Metals in (C. R. Millikan), 528
Plant Pathology at the Rothamsted Experimental Station, 676
Plant Physiology : Trace Elements in (International Union of Biological Sciences symposium on), 364
Plant Species : Differential Effect of 2-Benzoylbenzoic Acid and its Derivatives upon (Dr. W. A. Sexton and Dr. W. G. Templeman), 974
Plant Tissues (Meristematic) : Chromatographical Study of (Dr. A. Allsopp), 833
Plant Virus Diseases, 945
Plant Virus Proteins and Antibody-Antigen Reactions (R. E. F. Matthews), 611
Plant Virus Research at Cambridge (Dr. Kenneth M. Smith), 776
Plant and Animal Cells : Photo-electric Counting of Individual Microscopic (Carl Lagercrantz), 25
Plant-growth Substances : Treatment of Apple Canker Lesions with (S. H. Crowdy), 320
Plantas : Las heladas y la necrosis fria de la (Plutarco Naranjo V), *review* by H. L. P., 706
Plants : British Bee (edited by A. F. Harwood), 470
    Chemical Promotion of Rooting in, *review* by Prof. M. Thomas, 993
    Relation of Manganese and some other Metals to the Iron Status of (Eric J. Hewitt), 489
    Physiology of Resistance to Disease in (Royal Society symposium on), 422
Plants (Flowering) : Critical British Groups of (J. E. Lousley), 733
    The Geography of the (Prof. Ronald Good), *review* by Sir Edward Salisbury, 704, 857
Plants as an Index of their Nutritional Status : Chemical Composition of (Dr. D. W. Goodall and Dr. F. G. Gregory), 406
Plasma (Ether-extracted) : Sodium Citrate Concentration in (Margaret E. Mackay and W. d'A. Maycock), 235
Plasma of Rats : Effect of Thyroid Deficiency on the Level of Pseudo-Cholinesterase in the (R. D. Hawkins, Prof. B. Mendel and M. Nishikawara), 639
Plasma Protease : Staphylokinase, an Activator of (Charles H. Lack), 559

Plasmodia by Acridines and Antimalarial Action : Absence of Correlation between Respiratory Inhibition of (Dr. Adrien Albert and P. B. Marshall), 1008
Plasteins : Structure of (Prof. Artturi I. Virtanen and Heikki K. Kerkkonen), 888
Plastetics, *review* by Dr. S. R. Carter, 581
Plastic Deformation : Photo-elastic Investigation of Internal Stresses in Silver Chloride caused by (J. F. Nye), 367
Plastics : Low-Pressure Laminating of (J. S. Hicks, assisted by R. J. Francis), *review* by J. M. J. Estevez, 788
Plastics Annual 1947 : The British International, *review* by Dr. S. R. Carter, 581
Platinum : Magnetic Susceptibility of Borax Glasses containing Crystallites of Alkali Metal Salts, Gold and (Prof. Subodh Kumar Majumdar), 684
Plato's Theory of Education (Prof. R. C. Lodge), *review*, 376
Playfair (Lyon) and Technical Education in Britain (W. H. G. Armytage), 752
Plerocercoid Fragments : Development of Cestodes *in vitro*—Production of Fertile Eggs ; Cultivation of (Dr. J. D. Smyth), 138
Plesianthropus : Size of the Brain in the Ape-Man, (Dr. R. Broom and J. T. Robinson), 438
Plumbaginaceæ : Relationships in the (Dr. H. G. Baker), 400
Plymouth : A Submerged Ancient Cliff near (Dr. L. H. N. Cooper), 280
Podocarpic Acid as a Source of an Œstrogenic Hormone (C. W. Brandt and D. J. Ross), 892
Poisoning : Food (Elliot B. Dewberry), second edition, *review*, 540
Poisons and Magnetic Susceptibility : Catalytic (M. H. Dilke, Dr. D. D. Eley and Dr. E. B. Maxted), 804
Polar from Non-Polar Molecules : Separation of (Prof. G. Karagounis), 855
Polar Groups (Rotating) : Dielectric Relaxation of Molecules containing (Prof. A. Budó), 133
Polarizability for some Halogen Compounds : Variation of the Force Constant with the Ionization Potential and the (P. Torkington), 724
Polarized Light : Phase-Contrast in (Prof. A. Kastler and R. Montarnal), 357
Polarographic Determination of the Gamma-Isomer of Benzene Hexachloride (G. B. Ingram and H. K. Southern), 437
Polished Glass Surfaces : Structure of Calcium Fluoride Films Evaporated on (J. Bannon and C. E. Curnow), 136
Political Behaviour : The Analysis of (Harold D. Lasswell), *review* by Prof. D. W. Brogan, 950
Political Testament of an Anthropologist, *review* by Dr. E. R. Leach, 457
Politics : Science and (Prof. D. W. Brogan), 6 ; (Prof. A. D. Ritchie), 6
Pollen Dimorphism in Late-Glacial *Armeria* : Significance of (Dr. H. G. Baker), 770
Polonium : Excitation Curves for the γ-Radiation from Light Elements Bombarded with α-Particles from (Prof. Hilding Slätis), 899
Polyglutamic Acid : Synthetic (W. E. Hanby, S. G. Waley and J. Watson), 132
Polymeric Systems : Cross-Linking in (Dr. G. F. Bloomfield), 298
Polymers : Branched-Chain High (Prof. H. W. Melville and G. W. Youngson), 803
Polymethylene *bis*-Quaternary Ammonium Salts : Curare-like Action of (Dr. R. B. Barlow and Dr. H. R. Ing), 718 ; (Dr. W. D. M. Paton and Dr. E. J. Zaimis), 718
Polyphase Supply : Bridge Networks discriminating between Positive and Negative Sequences in (N. F. Barber), 685
Polyploidogenic Agents : Hormone-Mimetic and other Responses of the Silkworm (*Bombyx mori* L.) to some (L. J. Havas and J. Kahan), 570
Polysaccharide from Hydatid Cyst Fluid (Gwen M. Macnab), 310
Polysaccharide-like Substances ('Mucin') in Saliva : Bacterial Hydrolysis and Utilization of (Dr. H. J. Rogers), 815
Polysaccharides : Reaction of Boric Acid with (Dr. H. Deuel, H. Neukom and F. Weber), 96
Polysaccharides (Bacterial) : Adsorption of, to Erythrocytes (Dr. E. V. Keogh, Dr. E. A. North and M. F. Warburton), 687
Polyvinyl Alcohol : Crystal Structure of (C. W. Bunn), 929
Pomelo : Botanical Nomenclature of the Shaddock or (Dr. D. Chatterjee), 770
Population of France : Scientific Research on Ageing in the (French National Union of Prevention of Depopulation and the French National Demographic Institute conference on), 163
Population and World Resources in relation to the Family : International Congress on (Family Planning Association of Great Britain), 882
Porometer in the Investigation of Stomatal Aperture : Studies in Stomatal Action—Adequacy of the (Dr. O. V. S. Heath and Dr. W. T. Williams), 178
Porous Materials : Interaction of Water and (Faraday Society General Discussion on), 307, 629
Portugal : Earthquake at Santarem on October 3, 306
Positive Electrons from β-Emitters : Apparent Emission of (C. B. A. McCusker), 564
Positive and Negative Sequences in Polyphase Supply : Bridge Networks discriminating between (N. F. Barber), 685
Post-Epileptic Automatism in *Peromyscus* : Aggression, a Component of (M. R. A. Chance), 101
Post-War World : The Intelligent Man's Guide to the (G. D. H. Cole), *review* by Maurice Bruce, 151
Potassium Nitrate : Formation of Oxime-Nitrogen in *Torula*-Yeast Fed with (Prof. Artturi I. Virtanen and Tihamér Z. Csáky), 814
Potato : Nitrogenous Constituents of the (Dr. E. B. Black), 211
Potato Blight and the Weather in Britain (A. Beaumont), 429
Potato Sets in Acid Soils : Effect of Calcium Deficiency on (Prof. T. Wallace and E. J. Hewitt), 28
Potency of Pancreatic Insulin in the Animal System : Relation of Intermediary Metabolites to the Lowering of the (Prof. M. C. Nath and H. D. Brahmachari), 18
Potential (Streaming) : Theory of the (G. A. H. Elton), 847
Potential Field Distributions : An Electrolytic Tank for Exploring (R. Makar, A. R. Boothroyd and E. C. Cherry), 845
Potential Theory of Aerofoils, *review* by Prof. W. J. Duncan, 703
Powder Metallurgy : International Conference on (Steirmark of the Association of Austrian Chemists), 307
Power : Peace or (Sir Harold Butler), 414
Power (Micro-Wave) : A Method of Feeding, into a Resonator having a Fine Mode Structure (G. R. Newbery and W. E. Willshaw), 519
Power and Personal Leadership, 654
Power and Personality : The Dynamics of (Prof. H. D. Lasswell), 654
Power Industries : The British Fuel and (Political and Economic Planning Report on), 669
Precipitation and Crystallization of Proteins : Use of Solubility Curves at Varying *p*H and Constant Ionic Strength for the (A. Distèche), 130
Precise Measurement for Engineers (Film on the work of the Metrology Division of the National Physical Laboratory), 717
Pre-erythrocytic Stage in Mammalian Malaria Parasites (Prof. H. E. Shortt and P. C. C. Garnham), 126 ; (Dr. Frank Hawking), 175
Pregnancy Test using the Male Toad (Dr. Octavio Rodrigues Lima and Dr. Oswaldo Gelli Pereira), 676
Pregnanediol : A Rapid Method for the Estimation of (J. Rabinovitch), 605
Pregnant Mare : Ovarian Activity in the (Prof. E. C. Amoroso, J. L. Hancock and Dr. I. W. Rowlands), 355
Prehistoric Industry : Earliest Known (T. T. Paterson), 278
Prehistory and the Missouri Development Program (W. R. Wedel), 636
Premortal Increase in the Output of Sodium and Chlorine in Fasting Rats (Dr. Peter Bálint and Dr. Helene Kabdebó), 57
Preparation of Heparin : A New Extraction Procedure for the (Olle Snellman, Robert Jensen and Dr. Bengt Sylvén), 639
Press : Science and the (Association of British Science Writers Forum Discussion on), 882
Prestwich Medal of the Geological Society awarded to the Abbé Henri Breuil, 122
Primary Calcification in Bone: The Theory of (Dr. Marcel J. Dallemagne), 115
Primary Cells : Air-depolarized (British Standard 1335 : 1946), 51
Primates discovered during 1947 : African Fossil (Prof. W. E. Le Gros Clark), 667
Probit Analysis (D. J. Finney), *review* by Prof. J. H. Gaddum, 417
Production of Mesons : The Artificial (Dr. G. P. S. Occhialini and Dr. C. F. Powell), 551
Professional Meteorologist : Meteorology for the, *review* by Prof. P. A. Sheppard, 625
Progress of Cancer Research (Dr. I. Hieger), 385
Progress of Industry : Science and the (Sir Edward Appleton), 368
Propagation of Large Barkhausen Discontinuities : Effect of Lattice Distortions on the Mean Rate of (Dr. L. J. Dijkstra and Dr. J. L. Snoek), 886
Prose and Picture : Trees in, *review* by Sir Edward Salisbury, 497
Protanopes : Darkening of Red in (Dr. R. W. Pickford), 27
Protease (Plasma) : Staphylokinase, an Activator of (Charles H. Lack), 559
Protein by X-Ray Microspectrography : Intracellular Determination of (Dr. A. Engström and M. A. Jakus), 168
Protein Complexes and the van den Bergh Reaction : Bilirubin-Serum (C. H. Gray and Dr. R. A. Kekwick), 274
Protein Deficiency : Dietetic Hepatic Lesions and (Dr. M. V. Radhakrishna Rao), 446
Protein and Bacteria from Normal and Infected Joints : Absorption of (Torbjörn Edlund), 102
Protein-Free Media : Animal Tissue Cells in (Aage Bohus Jensen), 273
Proteins : Action of Nitrogen Trichloride on—Production of Toxic Derivative (H. R. Bentley, Dr. R. G. Booth, E. N. Greer, J. G. Heathcote, Dr. J. B. Hutchinson and Dr. T. Moran), 127
    Reaction of Mustard Gas with (Dr. J. C. Boursnell), 225
    Reactions of Lachrymators with Enzymes and (Dr. M. Dixon), 226
    Use of Solubility Curves at Varying *p*H and Constant Ionic Strength for the Precipitation and Crystallization of (A. Distèche), 130
Proteins and Antibody-Antigen Reactions : Plant Virus (R. E. F. Matthews), 611
Prothrombin : Dicumarol Poisoning and Vitamin K Deficiency in relation to Quick's Concept of the Composition of (Prof. Henrik Dam), 1010
Prothrombin Activity : Regeneration of, by Carbon Dioxide (I. M. Chak and Dr. K. V. Giri), 354
Protons : Scattering of 100-MeV. Neutrons by (F. C. Barker), 726
Protons, Photons, Neutrons, Mesotrons, and Cosmic Rays : Electrons (+ and −), (Robert Andrews Millikan), revised edition, *review* by Dr. L. G. H. Huxley, 789
Protozoa : The Status of the (Dr. John R. Baker), 548, 587
Protozoan Fauna of Soil and Inland Waters : Ciliate (Ernest Gray), 854
Pseudo-Cholinesterase in the Plasma of Rats : Effect of Thyroid Deficiency on the Level of (R. D. Hawkins, Prof. B. Mendel and M. Nishikawara), 639
Psychological Factors in Sex Behaviour : Physiological and (New York Academy of Sciences conference on), 124
Psychology of Industry (Prof. James Drever), second edition, *review* by T. H. Hawkins, 955
Psychology, Physics and Music : The Borderline of (Acoustics Group of the Physical Society symposium on), 589
Pteridines : Reductone and the Synthesis of (Dr. H. S. Forrest and Dr. James Walker), 721
Public : Peace and the (Mass-Observation), 415
Public Administration : Study of (Dr. W. A. Robson), 879
Public Libraries in Germany (H. Schurer), 90
Public Welfare Medal for 1947 of the U.S. National Academy of Sciences awarded to Dr. Karl T. Compton, 50
Publication of Scientific Papers : Proposed Central (Sir George Thomson and Dr. John R. Baker), 771 ; (Prof. J. D. Bernal), 799 ; (Watson Davis), 896 ; (Mrs. Lucia Moholy), 922
Puffinosis, a Virus Epizootic of the Manx Shearwater (*Puffinus p. puffinus*), (J. A. R. Miles and M. G. P. Stoker), 1016
Pulmonary Artery Pressure : Effect of Renin on (E. G. Brewin, R. A. Kenney and D. H. Miller), 893
Pulse Counting Photometer, 635
Punjab : Geology of the Salt Range of the (Sir Edward Bailey), 265
Purification of Anti-pernicious Anæmia Factors from Liver (Dr. E. Lester Smith), 638, 676
Pyrenees : Earthquake on December 13, 306
Pyrimidine Nucleosides : Separation of, by Synthetic Resin Ion-Exchangers (D. T. Elmore), 931
Pyrimidine Nucleosides of Yeast Ribosenucleic Acid : Isolation and Separation of (Dr. R. J. C. Harris and J. F. Thomas), 931

QUAKES : When the Earth (Rev. James B. Macelwane), *review* by Ernest Tillotson, 459
Quality Control (British Standard 1313: 1947), 50

Quantitative Chromatographic Estimation of α-Amino-Acids (Dr. L. Naftalin), 763
Quantitative Paper Chromatography (R. B. Fisher, D. S. Parsons and G. A. Morrison), 764
Quantitative Relation between Salt Accumulation and Salt Respiration in Plant Cells (Dr. R. N. Robertson and Marjorie Wilkins), 101
α- and β-Quartz: Calculation of the Piezo-electric Constants of (Dr. Bishambhar Dayal Saksena), 283
Quartz Crystals (Oscillating): Application of Multiple-Beam Interferometry to the Study of (Prof. S. Tolansky and W. Bardsley), 925
Quaternary Ammonium Compounds for the Improvement of Electrical Insulation Resistance: Treatment of Glass and Steatite Ceramic with (J. S. Dryden and R. J. Meakins), 23
bis-Quaternary Ammonium Salts: Curare-like Action of Polymethylene (Dr. R. B. Barlow and Dr. H. R. Ing), 718; (Dr. W. D. M. Paton and Dr. E. J. Zaimis), 718
Quaternary History of the British Isles: Bottom Deposits of Lake Windermere in relation to the (Dr. H. G. Baker), 987
Quick's Concept of the Composition of Prothrombin: Dicumarol Poisoning and Vitamin K Deficiency in relation to (Prof. Henrik Dam), 1010
β-Quinol, an Example of the Firm Union of Molecules without the Formation of Chemical Bonds between Them (H. M. Powell and P. Riesz), 52

R.38 Memorial Prize of the Royal Aeronautical Society awarded to W. M. Widgery, 593
Rabbit Ova (Fertilized): Transplantation of—the Effect on Viability of Age, *in vitro* Storage Period, and Storage Temperature (Dr. Min-Chueh Chang), 978
Race for Oil: The, *review* by H. B. Milner, 186
Race, Pigmentation and Colour Vision (Dr. R. W. Pickford), 687
Race (Fisher and): Two Examples of Sera containing the Anti-*d* Agglutinin predicted by (Dr. Joseph M. Hill and Dr. Sol Haberman), 688
Radar: Development of, *review* by Sir Robert Watson-Watt, 867
Radar System Engineering (edited by Prof. Louis N. Ridenour), *review* by Sir Robert Watson-Watt, 867
Radar, Photographic and Visual Observations of the Perseid Meteor Shower of 1947: Combined (Dr. Peter M. Millman, Dr. D. W. R. McKinley and Miriam S. Burland), 278; (Dr. A. C. B. Lovell), 280
Radial Pressure: Delayed Fracture of Glass under Tension, Torsion and (C. Gurney), 729
Radiation (Bactericidal): Transmission of, through Glass (J. E. Stanworth), 856; *erratum*, 882
Radiation Damping and Velocity of Light (Prof. W. Heitler), 678
Radiations (Ionizing): Chemical Effects of (Gabriel Stein and Dr. Joseph Weiss), 650
Radio: Scientific (Radio Section of the Institution of Electrical Engineers and the British National Committee for Scientific Radio convention on), 233, 793
Radio Aids to Navigation (Dr. R. A. Smith), *review* by Dr. R. L. Smith-Rose, 334
Radio Conferences: International, 695
Radio Data Charts (Dr. R. T. Beatty), revised by J. McG. Sowerby, fourth edition, *review* by B. G. P., 871
Radio Engineering (Dr. E. K. Sandeman), Vol. I, *review* by Dr. L. E. C. Hughes, 706
Radio Field: British Research in the (Research Committee of the Institution of Electrical Engineers), 943
Radio-Frequency Radiation in the Constellation of Cygnus: Variable Source of (J. G. Bolton and G. J. Stanley), 312
Radio-Frequency Spectrum: International Aspects of the, 863
Radio Noise (Cosmic): Frequency Variation of the Intensity of (Jack W. Herbstreit and Joseph R. Johler), 515
Radio Noise over the Frequency Range 1–30 Mc./s.: Survey of Existing Information and Data on (Dr. H. A. Thomas and R. E. Burgess), 107
Radio Research in Britain (Prof. J. Greig), 943
Radio Research in Great Britain, 387
Radio Technique: Modern, *review* by Dr. R. L. Smith-Rose, 334
Radio Waves: Meteorology and the Propagation of (Dr. R. L. Smith-Rose), 145
Radio Waves from the Sun: Audio-Frequency (Dr. Donald H. Menzel and Winfield W. Salisbury), 91
Radio Waves from Trails during Formation: Velocity of Meteors Measured by Diffraction of (C. D. Ellyett and J. G. Davies), 596
Radio and Electrical Research in Canada, 513
Radio and Telecommunication Conferences at Atlantic City: International, 863
Radioactive Disintegration Products: Angular Distribution of (J. A. Spiers), 807
Radioactive Local Anæsthetic: A (Frank Howarth), 857
Radioactive Penicillin: Studies with (Dr. D. Rowley, J. Miller, S. Rowlands and Dr. E. Lester-Smith), 1009
Radioactive Phosphate Exchange by Yeasts: Riboflavin Enhancement of (Dr. Walter J. Nickerson and Dr. Lorin J. Mullins), 939
Radioactive Tracers in Biology (Prof. Martin D. Kamen), *review* by Prof. F. A. Paneth, 456
Radioactive and Stable Tracer Isotopes: The Determination of (Physical Methods Group of the Society of Public Analysts and other Analytical Chemists symposium on), 693
Radioactivity: Discovery of (Prof. Jean Becquerel), 609; (Prof. J. A. Crowther), 609
Radioactivity of Osmium: Reported (A. H. W. Aten, Jun.), 1019
Radioactivity of Rocks by the Photographic Method: Investigation of the (Dr. J. H. J. Poole and J. W. Bremner), 884
Radioelements as a Tool in Scientific Research, *review* by Prof. F. A. Paneth, 456
Radiography with Alpha Rays: Surface (C. Jech), 214
Radiography of Magnetrons: Pinhole (Dr. R. Dunsmuir, Dr. C. J. Milner and A. J. Spayne), 244
Radiophosphorus, $^{32}_{15}$P: Influence of Folliculin on Bone Metabolism, Studied by Means of (Dr. J. Govaerts and Prof. M. J. Dallemagne), 977
Radiophysiologie expérimentale, cancer et hormones, 6, Étude de la cancérisation par les substances chimiques exogènes (Antoine Lacassagne), *review* by Prof. E. Boyland, 621
Raman Spectra of some Synthetic Mixtures of α-Chloroacids (Dr. Marcel Renard), 354
Ramsay Memorial Fellowships for Chemical Research, 272
Rare-Earth Chlorides: Preparation of (F. R. Hartley and A. W. Wylie), 241
Rat Thymus: Weight of the (L. R. C. Agnew), 205
Rate of Wear in the Region of the Validity of Amontons' Law (Henry James Bezer and Dr. Robert Schnurmann), 728
Rats: Contribution to the Knowledge of the Influences of Gonadotrophic and Sex Hormones on the Gonads of (J. H. Gaarenstroom and S. E. de Jongh), *review* by Prof. S. Zuckerman, 221
  Effect of Feeding 2-Acetaminofluorene on the Adreno-Gonadal System of (Cornelia Hoch-Ligeti), 58
  Effect of Thyroid Deficiency on the Level of Pseudo-Cholinesterase in the Plasma of (R. D. Hawkins, Prof. B. Mendel and M. Nishikawara), 639
Rats (Alloxan Diabetic): Effect of Insulin on Intestinal Glucose Absorption in (Dr. A. Sols, S. Vidal and J. Larralde), 932
Rats (Fasting): Premortal Increase in the Output of Sodium and Chlorine in (Dr. Peter Bálint and Dr. Helene Kabdebó), 57
Rats' Eggs from the Fallopian Tubes: Improved Method of getting (S. A. Simpson and P. C. Williams), 237
Ray: English Naturalists from Neckam to (Dr. Charles E. Raven), *review* by Prof. F. J. Cole, 373
Rays Reflected from the F_2 Region: Triple Magneto Ionic Splitting of (Gordon Newstead), 312
Reaction: The Sommelet (Dr. S. J. Angyal and R. C. Rassack), 723
Reaction (van den Bergh): Bilirubin-Serum Protein Complexes and the (C. H. Gray and Dr. R. A. Kekwick), 274
Reaction of Boric Acid with Polysaccharides (Dr. H. Deuel, H. Neukom and F. Weber), 96
Reaction between Catalase and Hydrogen Peroxide (R. Lemberg and E. C. Foulkes), 131
Reaction between Manganous Ion and Manganese Dioxide (J. M. Cowley and Allan Walkley), 173
Reaction of Mustard Gas with Proteins (Dr. J. C. Boursnell), 225
Reaction of β-Naphthol with *l*-α- and *l*—β-Phellandrene (G. G. Acheson and Dr. T. F. West), 976
Reaction for Uronic Acids: The Tollens Naphthoresorcinol (A. H. Guerrera and Dr. R. Tecwyn Williams), 930
Reactions (Slow Neutron): Cloud Chamber Investigation of Straggling of Short-Range Particles produced by (Dr. J. K. Bøggild), 810
Reactions at Carbon-Carbon Double Bonds: Mechanisms of (Prof. Charles C. Price), *review* by Dr. J. Sheridan, 626
Reactions of Lachrymators with Enzymes and Proteins (Dr. M. Dixon), 226
Reactions of Mustard Gas in Aqueous Solution (Dr. A. G. Ogston), 225
Reactivity of Aromatic Double Bonds: Relative (Dr. G. M. Badger and Dr. R. I. Reed), 238
Reactivity and Structure of Molecules (Prof. F. A. Paneth), 901
Realism: Logical, *review* by Prof. A. D. Ritchie, 623
  The Revival of, Critical Studies in Contemporary Philosophy (James Feibleman), *review* by Prof. A. D. Ritchie, 623
Reason: Eclipse of (Max Horkheimer), *review* by A. D. R., 664
Reason in the Modern World, *review*, 664
Rebuilding Europe's Fat Supplies (G. Heyworth), 123
Reclamation Disease in Agriculture, *review*, 624
Recorded Sound: Proposed Institute of (Association of Special Libraries and Information Bureaux meeting to discuss the formation of a), 493
Recording of Related Oscillograph Traces: Simultaneous, 89
Recording Crevices in Plane Surfaces by Pigment-fillings held in Cellulose Acetate Moulds (Dr. A. T. J. Dollar), 358
Recovery: Design for (Design for Freedom Committee), 660
Red in Protanopes: Darkening of (Dr. R. W. Pickford), 27
Red Cell: Submicroscopic Structure of the (Dr. M. F. Perutz), 204
Red Cells (Human): Action of Heating on *Rh*-Positive (Dr. P. O. Hubinont), 642
  Enzymic Action of Viruses and Bacterial Products on (C. M. Chu), 606
Red Spider Mite: Toxicity of Azo-Compounds and other Substances to the Fruit Tree (Dr. J. K. Eaton and R. G. Davies), 644
Reduction of Cytochrome *c* by Cytochrome *b*: A Factor in Heart Muscle required for the (E. C. Slater), 405
Reduction of 1:4-Diketones (Dr. Neil Campbell and Nandoomal Khanna), 54
Reductone and the Synthesis of Pteridines (Dr. H. S. Forrest and Dr. James Walker), 721
Reference and Information: British Sources of (edited by Theodore Besterman), *review* by R. Brightman, 789
References in Scientific Literature (Prof. R. A. Peters), 731
Refining of Non-ferrous Metals (Institution of Mining and Metallurgy symposium on), 924
Reflecting Microscope: Applications of the, to the Nuclear Plates Technique (Dr. W. J. Bates and Dr. G. P. S. Occhialini), 473
Reflections: Incidents and (J. B. Atkin), 866
Refraction Effects in Electron Diffraction and in Electron Microscopy (Dr. H. Raether), 311
Refractive Index Gradients: A Short-Focus Modification of the Lamm Scale Method for Measuring (Harry Svensson), 234
Regeneration of Prothrombin Activity by Carbon Dioxide (I. M. Chak and Dr. K. V. Giri), 354
Regional Development Organisations in Britain, 183
Regional Government: Local and (G. D. H. Cole), 825
Rehabilitation of Europe, 659
Relation between the Action of Clover Juice on Isolated Muscle and 'Bloat' in Cattle: A Possible (W. S. Ferguson), 816
Relation of Intermediary Metabolites to the Lowering of the Potency of Pancreatic Insulin in the Animal System (Prof. M. C. Nath and H. D. Brahmachari), 18
Relation between Photoconduction and Luminescence in Zinc Sulphide (Dr. M. H. F. Wilkins and Dr. G. F. J. Garlick), 565
Relationships in the Plumbaginaceæ (Dr. H. G. Baker), 400
Relaxation of Molecules containing Rotating Polar Groups: Dielectric (Prof. A. Budó), 133
Relaxation Methods: Summer School in (Imperial College of Science and Technology), 717
Release of Information on Atomic Energy, 146
Removal of Neurosecretory Cells in the Brain of Adult *Calliphora erythrocephala* Meig.: Effect of (Dr. Ellen Thomsen), 439

Renal Circulation : Studies of the (Dr. Josep Trueta, Dr. Alfred E. Barclay, Dr. Kenneth F. Franklin, Peter M. Daniel, Marjorie M. L. Prichard), *review*, 663
Renal Tubules : Osmotic-Work performed by the (David F. Cole), 640
Renin on Pulmonary Artery Pressure : Effect of (E. G. Brewin, R. A. Kenney and D. H. Miller), 893
Renosine : Electron Microscope Observations of (A. G. Matoltsy), 353
Reproductive Physiology : Recent Advances in Sex and (Dr. J. M. Robson), third edition, *review* by Dr. F. H. A. Marshall, 790
Research : British Rocket Weapons (R. H. Macmillan), 329
  Colonial, 1946–47, 141
  Corrosion, in Canada, 553
  Electronics and their Application in Industry and (edited by Dr. Bernard Lovell), *review* by Dr. T. E. Allibone, 702
  Government, in Britain, 214
  Greenkeeping, 757
  Industrial, 1947 (edited by Dr. Percy Dunsheath), *review* by R. Brightman, 705
  Industrial, in East Africa, 122
  Medical, in South Africa, 162
  Medical, during War-time (Dr. G. Lapage), 998
  Operational (Sir Charles Goodeve), 377, 609 ; (Prof. C. H. Waddington), 404 ; (Dr. F. Yates), 609
  Operational, in the Research Associations (Committee of Directors of Research Associations conference on), 584
  Plant Virus, at Cambridge (Dr. Kenneth M. Smith), 776
  Radio, in Britain (Prof. J. Greig), 943
  Radio and Electrical, in Canada, 513
  Road, 231
  Scientific, in Belgium (Grants for), 634
  Scientific, in the British Zone of Germany (Prof. F. A. Paneth), 191
  Scientific, in India (National Institute of Sciences of India symposium on), 513
  Scientific, and Development in Northern Ireland, 162
  Scientific and Industrial, in Palestine, 800
  Scientific, and Industrial Development, 699
  Scientific, and Industry, 368
  Seismological, in Great Britain, 615
Research (Biophysical) : Amphibian Tissue Cultures for (M. M'E. Preston), 203
Research (Cancer) : Progress of (Dr. I. Hieger), 385
Research (Chemical) : Ramsay Memorial Fellowships for, 272
Research (Genetic) : Possible Significance of Free-living Nematodes in (Dr. Ellsworth C. Dougherty and Hermione Grant Calhoun), 29
Research (Hormone) : Recent Progress in (Proceedings of the Laurentian Hormone Conference, Vol. I, edited by Gregory Pincus), *review* by Prof. S. Zuckerman, 295
Research (Pasture) : Pastures and (C. M. Donald), second edition, *review* by Dr. John Grainger, 747
Research (Scientific) : Limitations of Planning in, 35
  Radioelements as a Tool in, *review* by Prof. F. A. Paneth, 456
Research in Central Africa, 230
Research at the University of Birmingham, 594
Research in Wales : Industry and (Industrial Research Committee of the Federation of British Industries and the Industrial Association of Wales and Monmouthshire joint regional conference on), 233
Research in World War II : German (Colonel Leslie E. Simon), *review*, 219
Research on the Biochemistry of Brain Tissue, 346
Research in Hydraulics : Model, *review* by Prof. J. Th. Thijsse, 219
Research in Industry—Working Party Reports, 448
Research on Management, *review* by E. F. L. Brech, 869
Research in Marine Biology : Recent (Dr. N. B. Eales), 737
Research on Nematology, 1006
Research in the Radio Field : British (Research Committee of the Institution of Electrical Engineers), 943
Research in Surveying at University College, London, 50
Research on the Trematoda, *review* by Dr. G. Lapage, 222
Research and Development in British Colonial Territories, 141
Research Associations : Operational Research in the (Committee of Directors of Research Associations conference on), 584
Research Fellowship : Dewar, 802
Research Fellowships : Nuffield (Penicillin), 16
Research Fellowships in the University of Cambridge (Imperial Chemical Industries, Ltd.), 90
Research Fellowships in Chemistry or Physics at the University of Glasgow and the Royal Technical College, Glasgow (J. and P. Coats, Ltd.), 164
Research Scholarship (Aluminium Development Association), 882
Residence : The Planning of University Halls of, 344
Resin Chemistry : Synthetic (Dr. S. R. W. Martin), *review* by Dr. P. D. Ritchie, 502
Resin Ion-Exchangers (Synthetic) : Separation of Pyrimidine Nucleosides by (D. T. Elmore), 931
Resistance to Disease in Plants : Physiology of (Royal Society symposium on), 422
Resistance to 'Inanition' in Grass Seedlings (H. G. Chippindale), 65 ; (J. P. Cooper), 894
Resistance of Metal Films at a Frequency of 24,000 Mc./s. : Surface (Dr. L. Speirs), 601
'Resistine' : An Adaptation Mechanism of the Organism to Damage—the Role of (Dr. S. Karády and Dr. A. Kovács), 688
Resolution Testing in Autoradiography (G. W. W. Stevens), 432
Resolving Power (10^{-8}–10^{-9} Sec.) : Coincidence Device of (Z. Bay and G. Papp), 59
Resonance Hypothesis : Phase Memory of the Ear, a Proof of the (Dr. R. J. Pumphrey and T. Gold), 640
Resonator having a Fine Mode Structure : A Method of Feeding Microwave Power into a (G. R. Newbery and W. E. Willshaw), 519
Resources : The Conservation and Utilization of (United Nations conference on), 617
Respiratory Inhibition of Plasmodia by Acridines and Antimalarial Action : Absence of Correlation between (Dr. Adrien Albert and E. B. Marshall), 1008
Respiratory Quotient of the Mammary Gland (Dr. S. J. Folley and T. H. French), 933
Responses of the Silkworm (*Bombyx mori* L.) to some Polyploidogenic Agents : Hormone-Mimetic and other (L. J. Havas and J. Kahan), 570
Responsibility in Nationalized Industries, 619
Responsibility (Social) : Individual Freedom and (Conference on), 843
Retained Austenite : Comparison of Metallographic and X-Ray Measurements of (William J. Harris, Jun.), 315
Reversal of Vernalization by High Temperature (Prof. F. G. Gregory and Dr. O. N. Purvis), 859
Reversion, a New Procedure in Absorptiometry (Dr. H. Irving, G. Andrew and E. J. Risdon), 805
Revival of Realism, Critical Studies in Contemporary Philosophy (James Feibleman), *review* by Prof. A. D. Ritchie, 623
Rh Genes Allelomorphic to *C* (Dr. R. R. Race, Dr. Ruth Sanger and Mrs. Sylvia D. Lawler), 316
Rh Nomenclature (Dr. A. E. Mourant), 492
Rh-Positive Human Red Cells : Action of Heating on (Dr. P. O. Hubinont), 642
Rheological Congress : International, 105, 636
Rheological Investigations for the British Armed Services : War-time (British Rheologists' Club meeting on), 252
Rheology : Some New Anisotropic Time Effects in (S. M. Freeman and K. Weissenberg), 324
  International Study of, 104
Rheology in the Textile Industries (British Rheologists' Club and others conference on), 307
Rhinarium (Rodent) : An Undescribed Structure in the (Dr. W. C. Osman Hill), 276
Rhodesia : The Romance of (Ardaser Sorabjee N. Wadia), *review*, 871
Riboflavin Enhancement of Radioactive Phosphate Exchange by Yeasts (Dr. Walter J. Nickerson and Dr. Lorin J. Mullins), 939
Ribonucleic Acid (Yeast) : Structure of (the late Prof. J. Masson Gulland and D. O. Jordan), 561
  Isolation and Separation of the Pyrimidine Nucleosides of (Dr. R. J. C. Harris and J. F. Thomas), 931
2-Deoxy *D*-Ribose and 3-Deoxy *D*-Xylose : Conversion of *D*-Arabinose into (Dr. P. W. Kent, Prof. M. Stacey and Dr. L. F. P. Wiggins), 21
Ribose Nucleic Acid in the *Drosophila* Egg (H. G. Callan), 440
Rice in Lower Burma : Results of the Continuous Use of an Ammonium Phosphate Fertilizer on (D. Rhind and U Tin), 105
Riddell Memorial Lectures : Nineteenth (Prof. A. D. Ritchie), 6
Right Way to Understand the Countryside (Stanley A. Manning), *review* by T. H. Hawkins, 995
C/D Ring Union in the Œstrogenic Hormones : Nature of the (Dr. C. W. Shoppee), 207
C/D Ring Union in Œstrone and Equilenin (Dr. W. Klyne), 434 ; *errata*, 514
River Never Sleeps : A (Roderick Haig-Brown), *review* by Seton Gordon, 951
Rivers : Our (J. W. Kempster), *review* by Dr. A. T. Doodson, 911
Road Research, 231
Rocket as a Weapon of War in the British Forces (Sir Alwyn Crow), 329
Rocket Flight : Mathematical Theory of (Prof. J. Barkley Rosser, Dr. Robert R. Newton and Dr. George L. Gross), *review* by Dr. R. A. Rankin, 3
Rocket Weapons Research : British (R. H. Macmillan), 329
Rockets : Exterior Ballistics of, *review* by Dr. R. A. Rankin, 3
Rocks : Investigation of the Radioactivity of, by the Photographic Method (Dr. J. H. J. Poole and J. W. Bremner), 884
Rocky Mountains : Handbook of the Trees of the Northern States and Canada East of the (Romeyn Beck Hough), *review* by Sir Edward Salisbury, 497
Rodent Rhinarium : An Undescribed Structure in the (Dr. W. C. Osman Hill), 276
Rodent Species : Pharmacological Activities in Different, of *d*-Tubocurarine Chloride and the Dimethyl Ether of *d*-Tubocurarine Iodide (Dr. H. O. J. Collier, Sheila K. Paris and Dr. L. I. Woolf), 817
Rodents (Laboratory) : Natural Amœbic Infections in (Dr. J. D. Fulton and J. P. Joyner), 66
Romance of Rhodesia : The (Ardaser Sorabjee N. Wadia), *review*, 871
Roofs Supported by Air Pressure (Herbert W. Stevens, Jun.), 613
Room Temperature : Luminescence Efficiency Changes in Zinc Sulphide Phosphors below (Dr. G. F. J. Garlick and A. Gibson), 359
Rooting in Plants : Chemical Promotion of, *review* by Prof. M. Thomas, 993
Rooting of Woody Cuttings : The Use of Auxins in the (Kenneth V. Thimann and Jane Behnke), *review* by Prof. M. Thomas, 993
Rotating Bodies : Blackett's Hypothesis of the Magnetic Field of (Dr. Niels Arley), 598 ; (Dr. J. Fuchs), 599
  Magnetic Field of Massive (Prof. H. T. H. Piaggio), 450
Rotating Polar Groups : Dielectric Relaxation of Molecules containing (Prof. A. Budó), 133
Royal Botanic Garden, Calcutta : Early History of the (Dr. D. Chatterjee), 362
Rubber Technology (Institution of the Rubber Industry conference on), 51
Rubber Tubing : Factors involved in the Deactivation of Penicillin Solutions by (Dr. L. J. Bellamy and C. H. Watt), 940
Rubber-proofed Clothing : Working Party Report on (Board of Trade), 448
Rumen : Microflora of the (C. A. McGaughey and K. C. Sellers), 1014
Rust-Affected Crop as Seed : Shrivelled Wheat Grain from (R. B. Ekbote and K. R. Sahasrabuddhe), 442

SALIVA : Bacterial Hydrolysis and Utilization of Polysaccharide-like Substances ('Mucin') in (Dr. H. J. Rogers), 815
Salmon (Thomas W.) Memorial Lectures (Prof. H. D. Lasswell), 654
Salmon and Animal Migration (Dr. A. G. Huntsman), 300
Salt Accumulation and Salt Respiration in Plant Cells : Quantitative Relation between (Dr. R. N. Robertson and Marjorie Wilkins), 101
Salt Range of the Punjab : Geology of the (Sir Edward Bailey), 265
Salt Respiration in Plant Cells : Quantitative Relation between Salt Accumulation and (Dr. R. N. Robertson and Marjorie Wilkins), 101
Salts : Inner-Complex, of Trivalent Thallium (Prof. Fr. Feigl), 436
Sampling Practice in the United States of America, *review* by Dr. F. Yates, 153
Sarcolemma : Electron Microscopy of the (W. M. Jones and Dr. Robert Barer), 1012
Sargent Diagram : A Revised (Prof. N. Feather), 431

Sarkar (Sir Jadunath) Gold Medal of the Royal Asiatic Society of Bengal awarded to Sir Panduranga S. S. Pissurlencar, 553
Scale of *Sciaena coitor* (Hamilton): An Atypical (Dr. Sivatosh Mookerjee), 64
Scale Models in Hydraulic Engineering (Prof. J. Allen), *review* by Prof. J. Th. Thijsse, 219
Scattering of Neutrons by Lead (R. Latham and J. M. Cassels), 282
Scattering of D—D Neutrons by Deuterium (J. F. Darby and J. B. Swan), 22
Scattering of 100-MeV. Neutrons by Protons (F. C. Barker), 726
Scholarship : John Gray Jubilee (Society of Chemical Industry), 595
  Research (Aluminium Development Association), 882
Scholarships : Agricultural and Veterinary (Ministry of Agriculture and Fisheries), 430
Scholarships for European Students : American Summer (Massachusetts Institute of Technology), 593 ; *erratum*, 637
Scholarships for 1948–49 at Foreign Universities (British Council), 347
Scholarships in Husbandry, Agricultural Economics, Statistics and Agricultural and Dairy Engineering : Postgraduate (Ministry of Agriculture and Fisheries and the Department of Agriculture for Scotland), 637
School : Plant Ecology and the (A. G. Tansley and E. Price Evans), 158
School Child : The Health of the (Dr. Robert Sutherland), 960
School Ecological Studies (Blundell's Scientific Publication), 271
Schools and the Land (British Social Hygiene Council Summer School on), 470
Schumann Region : Absorption Band Spectrum of S_2 in the (R. Maeder and Prof. E. Miescher), 393
Schumann-Runge System of the Oxygen Molecule : New Bands in the (Lalji Lal), 477
Sciaena coitor (Hamilton): An Atypical Scale of (Dr. Sivatosh Mookerjee), 64
Science : Ethics and (British Social Hygiene Council conference on), 197
  Grammar School, *review* by W. L. Sumner, 114
  A Short History of, *review* by Prof. J. A. Crowther, 260
  A Tribute of Industry to, 508
  On Understanding (Dr. J. B. Conant), 865
  World Co-operation in (Prof. J. D. Bernal), 840
  Written Expression in (Conference at Leicester on), 533
Science in Secondary Schools : The Teaching of (compiled by a Joint Committee of the Incorporated Association of Assistant Masters and the Science Masters' Association), *review* by W. L. Sumner, 114
Science in Social Affairs (Association of Scientific Workers conference on), 68
Science Advances (J. B. S. Haldane), *review* by R. Brightman, 747
Science and Freedom (Dr. Lyman Bryson), 577
Science and History, 865
Science and Politics (Prof. D. W. Brogan), 6 ; (Prof. A. D. Ritchie), 6
Science and the Press (Association of British Science Writers Forum Discussion on), 882
Science and the Progress of Industry (Sir Edward Appleton), 368
Science and Society in Ancient China (Dr. Joseph Needham), 305
Science and UNESCO, 159
Science at War (J. G. Crowther and R. Whiddington), *review* by S. Weintroub, 907
Scientific Aspects of the Work of the National Coal Board (John Crossland), 546
Scientific Centenaries in 1948 (Eng.-Capt. Edgar C. Smith), 11
Scientific Development of the West Indies : Social and, 181
Scientific Effort in Britain : The Deployment of, 1
Scientific Expedition to Arnhem Land (National Geographic Society, Smithsonian Institution and the Commonwealth of Australia), 195
Scientific Information Services (Royal Society conference on), 469
Scientific Instruments : Exhibition of (Physical Society), 732
Scientific Instruments : British (Dr. A. B. Wood), 732
  Export Organisation for, 345
Scientific Journalism : Awards for, 125
Scientific Literature : References in (Prof. R. A. Peters), 731
Scientific Management, *review* by J. Leigh, 910
Scientific and Natural History Books : Old, 305
Scientific Papers : Proposed Central Publication of (Sir George Thomson and Dr. John R. Baker), 771 ; (Prof. J. D. Bernal), 799 ; (Watson Davis), 896 ; (Mrs. Lucia Moholy), 922
  Use of Equivalent Metric Values in, 144
Scientific Periodicals : Photocopies of French, 429
Scientific Radio (Radio Section of the Institution of Electrical Engineers and the British National Committee for Scientific Radio convention on), 233, 793
Scientific Research : Limitations of Planning in, 35
  Radioelements as a Tool in, *review* by Prof. F. A. Paneth, 456
Scientific Research in Belgium : Grants for, 634
Scientific Research in the British Zone of Germany (Prof. F. A. Paneth), 191
Scientific Research in India (National Institute of Sciences of India symposium on), 513
Scientific Research and Development in Northern Ireland, 162
Scientific Research and Industrial Development, 699
Scientific Research and Industry, 368
Scientific and Industrial Research in Palestine, 800
Scientific and Technical Books : Imports of, 75
  Recent : Supp. ii, January 31 ; Supp. ii, February 28 ; Supp. ii, March 27 ; Supp. ii, April 24 ; Supp. ii, May 29 ; Supp. ii, June 26
Scientific War Effort : Britain's, *review* by S. Weintroub, 907
Scientific Workers (British) : American Awards to, 215, 390, 716, 800
Scientist in Industry (Sir Edward Appleton), 508, 537
Scotland and Ireland : Megalithic Tombs in (Prof. V. Gordon Childe), 841
Sea : They Live in the (Douglas P. Wilson), *review* by Dr. L. Harrison Matthews, 40
  This Great and Wide (R. E. Coker), *review*, 38
Sea and Inland Fisheries : Report on (Government of Northern Ireland), 451
Sea-urchin : Distribution of Alkaline Phosphatase in the Eggs of a (Elsa Wicklund), 556
Seasonal Variation in Chemical Constitution of some Common British Laminariales (Dr. W. A. P. Black), 174
Seaweed Survey : Sublittoral—Relationship of Algal Growth and Depth (F. T. Walker), 977
Secondary Schools : The Teaching of Science in (compiled by a Joint Committee of the Incorporated Association of Assistant Masters and the Science Masters' Association), *review* by W. L. Sumner, 114
Secondary Thickening in Excised Tomato Roots (Dr. K. J. Dormer and Dr. H. E. Street), 483
Secretion : Internal, *review* by Dr. F. H. A. Marshall, 953
Sedimentation : Influence of Solvent Movement on (Bertil Enoksson), 934
Seed : Shrivelled Wheat Grain from Rust-Affected Crop as (R. B. Ekbote and K. R. Sahasrabuddhe), 442
Seed of Sugar Beet : Transmission of a Disease Resembling Virus Yellows through the (Dr. Phyllis E. M. Clinch, J. B. Loughnane and R. McKay), 28
Seedlings (Grass) : Resistance to Inanition in (H. G. Chippindale), 65 ; (J. P. Cooper), 894
Seeing : Light, Vision and (Dr. Matthew Luckiesh), fourth printing, *review* by Dr. R. W. Pickford, 40
Séismes et volcans (Prof. J.-P. Rothé), *review* by Ernest Tillotson, 296
Seismological Observatories : British, 923
Seismological Research in Great Britain, 615
Seismological Summary : International, 923
Seismology : Pure and Applied, *review* by Ernest Tillotson, 459
Seismology of the Pacific Region : The Bikini Bomb and the (Prof. K. E. Bullen), 62
Selenium : Photography on (Dr. P. Selényi), 522
Semaphore Numerals (Prof. W. G. Bickley), 807
Semen : Citric Acid in (G. F. Humphrey and Dr. T. Mann), 352
Semiconductors and their Applications (Manchester and District Branch of the Institute of Physics conference on), 430
Sensory Processes : Minimum Perceptible Energy and Brownian Motion in (Dr. Hl. de Vries), 63
Separation of Particles of Different Sizes : Principle of a Counter-streaming Centrifuge for the (Per Eric Lindahl), 648
Separation and Identification of Methylated Sugars on the Paper Chromatogram (F. Brown, Prof. E. L. Hirst, L. Hough, Dr. J. K. N. Jones and H. Wadman), 720
Sequential Analysis (Prof. Abraham Wald), *review* by M. G. Kendall, 790
Sera containing the Anti-*d* Agglutinin Predicted by Fisher and Race : Two Examples of (Dr. Joseph M. Hill and Dr. Sol Haberman), 688
Sericultural Congress : Seventh International (French National Institute of Agronomic Research), 307
Serological Position of *Streptococcus bovis* (Dr. P. M. F. Shattock), 318
Serpulid Tubes : Formation and Breakdown of (Jean Hanson), 610
Sertoli Cell : The Nucleolus of the Apodan (B. R. Seshachar), 558
Serum : Effect of Under-Nutrition and Alterations in Diet on the Choline Esterase Activity of (Prof. R. A. McCance, E. M. Widdowson and A. O. Hutchinson), 56
  Histaminolytic Activity of a Copper Protein in (Dr. C. G. Holmberg and C.-B. Laurell), 236
Service Requirements in Britain : Land Use and, 149
Servomechanism Fundamentals (Henri Lauer, Robert Lesnick and Leslie E. Matson), *review*, 294
Servomechanisms : Theory of (edited by Prof. Hubert M. James, Nathaniel B. Nichols and Prof. Ralph S. Phillips), *review* by Prof. A. Porter, 994
Sesamum laciniatum Klein : Chromosome Number of (Dr. S. Ramanujam and A. B. Joshi), 99
Set (Permanent) : Chemical Mechanism of (A. J. Farnworth and Prof. J. B. Speakman), 890
Severn Tide (Brian Waters), *review* by A. T. D., 790
Sex Behaviour : Animal and Human, 124
  Physiological and Psychological Factors in (New York Academy of Sciences conference on), 124
Sex Forms of *Luffa acutangula* Roxb. ; Inheritance of (H. B. Singh, S. Ramanujam and B. P. Pal), 775
Sex Hormones on the Gonads of Rats : Contribution to the Knowledge of the Influences of Gonadotrophic and (J. H. Gaarenstroom and S. E. de Jongh), *review* by Prof. S. Zuckerman, 221
Sex Reversal in Copepods (J. G. Cattley), 937
Sex and Reproductive Physiology : Recent Advances in (Dr. J. M. Robson), third edition, *review* by Dr. F. H. A. Marshall, 790
SH Enzymes : Inhibition of, by Methyl Bromide (S. E. Lewis), 692
Shaddock or Pomelo: Botanical Nomenclature of the (Dr. D. Chatterjee), 770
Shallot : Bulb Formation in the (Dr. L. G. G. Warne), 935
Shark, *Necturus*, and the Cat : Guide to the Study of the Anatomy of the (Prof. Samuel Eddy, Prof. Clarence P. Oliver and Prof. John P. Turner), second edition, *review* by Dr. P. D. F. Murray, 955
Shearwater (*Puffinus p. puffinus*) : Puffinosis, a Virus Epizootic of the Manx (J. A. R. Miles and M. G. P. Stoker), 1016
Sheffield : Interchange of Technical Publications in, 305
Sherrington (Sir Charles) and Diphtheria Antitoxin (Dr. A. N. Drury), 266
Short-Focus Modification of the Lamm Scale Method for Measuring Refractive Index Gradients (Harry Svensson), 234
Short-Range Particles produced by Slow Neutron Reactions : Cloud Chamber Investigation of Straggling of (Dr. J. K. Bøggild), 810
Showers : Extensive Penetrating (B. Chaudhuri), 680
Showers of Penetrating Particles (Prof. G. Wataghin), 91
Shrinkage of Animal Cells due to Fixatives (Dr. Daya Krishna), 202
Shrivelled Wheat Grain from Rust-Affected Crop as Seed (R. B. Ekbote and K. R. Sahasrabuddhe), 442
Signalübermittlung im Nerven : Die (Prof. Alexander v. Muralt), *review* by Prof. J. Z. Young, 76
Significance of Free-living Nematodes in Genetic Research : Possible (Dr. Ellsworth C. Dougherty and Hermione Grant Calhoun), 29
Significance of Pollen Dimorphism in Late-Glacial *Armeria* (Dr. H. G. Baker), 770
Silicate Inclusions in Steel : Determination of (Prof. J. Kamecki and A. Kotlinski), 402
Silk : Bibliography of the Technical Literature on (Dr. F. O. Howitt), *review* by Prof. J. B. Speakman, 790
Silkworm (*Bombyx mori* L.) : Hormone-Mimetic and other Responses of the, to some Polyploidogenic Agents (L. J. Havas and J. Kahan), 570
Silver Chloride caused by Plastic Deformation : Photo-elastic Investigation of Internal Stresses in (J. F. Nye), 367
Silver Medal of the Royal Aeronautical Society awarded to I. I. Sikorsky, 593
Silver and Copper : Amalgamation of some Alloys of Gold, (Dr. Douglas Rennie Hudson), 288
Simms Gold Medal of the Royal Aeronautical Society awarded to Sir William T. Griffith, 593
Simms Gold Medal of the Society of Engineers awarded to J. G. Milton, 346
Simultaneous Recording of Related Oscillograph Traces, [illegible]89

TITLE INDEX

Siphons in Lamellibranchia : Formation of (Prof. C. M. Yonge), 198
Sizes (Different) : Principle of a Counter-streaming Centrifuge for the Separation of Particles of (Per Eric Lindahl), 648
Skagerak: Foraminifera in the Gullmar Fjord and the (Hans Högland), 513
Skating : Theory of (Dr. A. E. Bell), 391
Skill and Management (G. E. Milward), *review* by J. Leigh, 910
Skin (Cow) : Capillary Distribution in (Dr. J. D. Findlay and S. H. Yang), 1012
Skin Effect in Metals : Theory of the Anomalous (G. E. H. Reuter and E. H. Sondheimer), 394
Skokholm : Letters from (R. M. Lockley), *review* by Frances Pitt, 5
Sky : The Night, in January, 17 ; in February, 164 ; in April, 471 ; in May, 677 ; in June, 843
Sky (Night) and Auroras : Emission Spectra of the (Physical Society to arrange for separate publication of papers read before the International Conference on the), 514
Sleeping Sickness : International Conference on, 306
Sleeps: A River Never (Roderick Haig-Brown), *review* by Seton Gordon, 951
Slow Neutron Reactions : Cloud Chamber Investigation of Straggling of Short-Range Particles produced by (Dr. J. K. Bøggild), 810
Smithsonian Elliptic Functions Tables (G. W. and R. M. Spenceley), *review*, 747
Smoke (Arnold Marsh), *review* by F. I. G. Rawlins, 706
Smoothing Periodograms from Time-Series with Continuous Spectra (Prof. M. S. Bartlett), 686
Soap : Bactericidal Activity of Phenols in Aqueous Solutions of (Prof. H. Berry and H. S. Bean), 396
Social Affairs : Science in (Association of Scientific Workers conference on), 68
Social Biology : The International and Cultural Relations of (British Social Hygiene Council Summer School on), 842
Social Hymenoptera : Regulation of Oviposition in (M. V. Brian and A. D. Brian), 854
Social Responsibility : Individual Freedom and (Conference on), 843
Social Studies of the Elderly (Eleanor French), 253
Social Studies in Manchester, 15
Social Survey : The Government (Maurice Goldsmith), 573
Social and Scientific Development of the West Indies, 181
Society : Archæology and (Grahame Clark), second edition, *review* by Prof. C. F. C. Hawkes, 583
    The Engineer in (John Mills), *review* by R. Brightman, 374
    The Free (John Middleton Murry), 538
    Men of Science in Industry and, *review* by R. Brightman, 374
Society (Good) : Freedom in the, 577
Society in Ancient China : Science and (Dr. Joseph Needham), 305
Society and the Individual (British Social Hygiene Council Ethics and Science conference on), 197
Sociological Periodicals : Recent (Prof. P. Sargant Florence), 450
Sociology : Approaches to, *review* by Prof. D. W. Brogan, 950
    Essays in (from Max Weber), translated, edited and with an introduction by H. H. Gerth and C. Wright Mills, *review* by Prof. D. W. Brogan, 950
    A Handbook of (Prof. William F. Ogburn and Prof. Meyer F. Nimkoff), *review* by T. H. Hawkins, 188
Sociology of Mental Disease (National Association for Mental Health conference on), 407
Sodium and Chlorine in Fasting Rats : Premortal Increase in the Output of (Dr. Peter Bálint and Dr. Helene Kabdebó), 57
Sodium Citrate Concentration in Ether-extracted Plasma (Margaret E. Mackay and W. d'A. Maycock), 235
Soil : Chemicals, Humus and the (Donald P. Hopkins), *review*, 39
    Limitation of Bacteria by Micro-Predators in (Dr. F. J. Anscombe and Dr. B. N. Singh), 140
    Persistence of D.D.T. and Benzene Hexachloride in (Dr. M. S. Smith), 246
    Production of an Antibiotic Substance on Wheat Straw and other Organic Materials and in the (Erna Grossbard), 614
Soil Fertility, *review*, 39
Soil Indicators : Mosses as (H. Watson), 823
Soil Sterilization : Practical (Ministry of Agriculture, Bulletin 22), 196
Soil and Inland Waters : Ciliate Protozoan Fauna of (Ernest Gray), 854
Soils (Acid) : Effects of Calcium Deficiency on Potato Sets in (Prof. T. Wallace and E. J. Hewitt), 28
Soils and Water : Dielectric Properties of, at a Wave-length of 3·2 cm. (Prof. A. W. Straiton and C. W. Tolbert), 73
Solar Atmosphere : Spontaneous Waves in Discharge Tubes and in the (Prof. V. A. Bailey), 599
Solar Noise (E. C. Drewe and D. Maurice), 167
Solar Noise Outburst at 600 Mc./s. and 1200 Mc./s. (F. J. Lehany and D. E. Yabsley), 645
Solar Radiation (Enhanced Microwave) : Emission of (R. G. Giovanelli), 133
Solar Radio Emissions and Sunspots (I. L. Thomsen), 134 ; (M. Ryle), 136
Solar and Terrestrial Relationships, *review* by Dr. M. A. Ellison, 951
Solids : Physics of (University of Bristol in co-operation with the Institute of Physics Summer School in the), 233, 636
    Birth and Growth of the Explosion in, Initiated by Impact (Dr. F. P. Bowden and O. A. Gurton), 348
Solubility Curves at Varying *pH* and Constant Ionic Strength for the Precipitation and Crystallization of Proteins : Use of (A. Distèche), 130
Solution of the Fundamental Equation of the Statistical Atom Theory : An Asymptotic (Dr. J. I. Hórvath), 26
Solutions of Macromolecules : Normal Stress Coefficient in (R. S. Rivlin), 567
Solvation of Hydrogen Ion in Oxygen-containing Solvents (Dr. Ernest A. Braude and E. S. Stern), 169
Solvent Movement on Sedimentation : Influence of (Bertil Enoksson), 934
Solvents (Oxygen-containing) : Solvation of Hydrogen Ion in (Dr. Ernest A. Braude and E. S. Stern), 169
Somali Place Names (British) : A Gazetteer of, 195
Somaliland (British) : Report on the General Survey of (1945), 195
Somatic Tissues : Chromosome Multiplication and Reduction in (Prof. C. Leonard Huskins), 80
Sommelet Reaction (Dr. S. J. Angyal and R. C. Rassack), 723
Song of *Fringilla coelebs* Linn. : Chronometric Observations of the (D. R. Barber), [illegible]77
Sons of Cambridge, *review* by Prof. F. J. M. Stratton, 661
Sound (Recorded) : Proposed Institute of (Association of Special Libraries and Information Bureaux meeting to discuss the formation of a), 493
South Africa : Archæology in, 881
    Medical Research in, 162
South American Chemical Congress : The Fourth, 654
South Australia : Jellyfish from the Basal Cambrian in (Reg. C. Sprigg), 568
    Newly Discovered Submarine Canyons of New Guinea and (Reg. C. Sprigg), 246
South Georgia (near) : Earthquake on July 23, 657
Southwest Pacific : Birds of the (Ernst Mayr), *review* by Frances Pitt, 545
Soviet Economic Development since 1917 (Maurice Dobb), *review* by Maurice Bruce, 908
Spark Discharge : Development of the (Dr. T. E. Allibone), 970
Special Factor Influencing the Conditional Disposition to Infectious Diseases : Thyroid Gland as a (Dr. S. Zimanyi), 57
Special Librarianship : Study Group on (Association of Special Libraries and Information Bureaux), 430
Species : Origins of, and Migrations of Floras, *review* by Prof. I. Manton, 455
Specific and Non-specific Competition in Tubular Excretion (I. Sperber), 236
Specific Surface : Photometric Measurement of (B. A. Scott), 358
Spectra : A Simple Way of Photographing (Dr. R. A. Houstoun), 973
Spectra (Continuous) : Smoothing Periodograms from Time-Series with (Prof. M. S. Bartlett), 686
Spectra of Crystals : Infra-Red Absorption (Sir C. V. Raman), 165
Spectra of the Night Sky and Auroras : Emission (Physical Society to arrange for separate publication of papers read before the International Conference on the), 514
Spectral Response of Lead Selenide (T. S. Moss and R. P. Chasmar), 244
Spectral Sensitivity of Lead Telluride Layers (T. S. Moss), 766
Spectroscopy (Infra-Red) : Lead Telluride Cells for (O. Simpson, Dr. G. B. B. M. Sutherland and Dr. D. E. Blackwell), 281
Spectrum (Ammonia Inversion) : Collision Broadening of the, at High Pressures (Dr. B. Bleaney and J. H. N. Loubser), 522
Spectrum (Radio-Frequency) : International Aspects of the, 863
Spectrum of Active Nitrogen : Mechanism of the Emission (L. Herman and R. Herman), 1018
Spectrum of Aluminium Bromide : Band (Carl Gustav Jennergren), 315
Spectrum of ClO in Flames : Band (Dr. G. Pannetier and Dr. A. G. Gaydon), 242
Spectrum of S_2 in the Schumann Region : Absorption Band (R. Maeder and Prof. E. Miescher), 393
Spectrum of White Dwarfs (Dr. Evry Schatzman), 61
Speech : Man's Organs of (Prof. H. A. Harris), 628
    Physical Patterns of, *review* by Dr. W. G. Radley, 334
    Visible (Ralph K. Potter, George A. Kopp and Harriet C. Green), *review* by Dr. W. G. Radley, 334
Speech Therapy (College of Speech Therapists conference on), 125
Spermatogenesis of Oligospermic Men : Variations in (Prof. B. Zondek, Y. M. Bromberg and Z. Polishuk), 176
Spiders : A Book of (Dr. W. S. Bristowe), *review* by T. H. S., 706
Spin-Dependence of Magnetic Dipole Gamma Radiation and the Nuclear Level Scheme of Pb^{208} (Dr. H. O. W. Richardson), 516
Spinning Particle : The Meson Field and the Equation of Motion of a (R. C. Majumdar and Dr. S. Gupta), 410
Splitting of Ionospheric Rays : Triple (J. H. Meek), 597 ; (T. L. Eckersley), 597
Splitting of Rays Reflected from the F_2 Region : Triple Magneto Ionic (Gordon Newstead), 312
Spontaneous Waves in Discharge Tubes and in the Solar Atmosphere (Prof. V. A. Bailey), 599
Spore-forming Bacterium under Natural Conditions : A Plant Disease caused by a (Z. Volcani and Dr. W. J. Dowson), 980
Stability of Apple Juice : Effect of Ion-Exchange Treatment on the (Dr. S. W. Challinor, Margaret E. Kieser and Dr. A. Pollard), 1023
Stability of Metal Complexes : Order of (Dr. D. P. Mellor and L. Maley), 436
Staff of Life : Controlling the, *review* by A. L. Bacharach, 293
Stainless Steels : Ferromagnetic Structure of Cold-Worked Austenitic (P. T. Hobson and W. P. Osmond), 562
Standardization of Micro-film Technique (British Standard Specification 1371 : 1947), 346
Staphylococci before and after Treatment with Penicillin : Cytology of (Prof. R. Tulasne and Dr. R. Vendrely), 316
Staphylococcus aureus : Glutamine-synthesizing System of, its Inhibition by Crystal Violet and Methionine-sulphoxide (W. H. Elliott and Dr. E. F. Gale), 129
Staphylokinase, an Activator of Plasma Protease (Charles H. Lack), 559
Starch : Arsenolysis and Phosphorolysis of the Amylose and Amylopectin Fractions of (Dr. Joseph Katz, Dr. W. Z. Hassid and Dr. Michael Doudoroff), 96
    Photochemical Degradation of (Dr. S. Peat, Dr. E. J. Bourne and W. J. Whelan), 763
Starches of the Wrinkled and the Smooth Pea (Dr. S. Peat, Dr. E. J. Bourne and Mary J. Nicholls), 206
Stars (Variable) : The Story of (Leon Campbell and Luigi Jacchia), *review* by H. S. J., 460
State (Changing) : The Civil Service in the (H. R. G. Greaves), 496
Statistical Atom Theory : An Asymptotic Solution of the Fundamental Equation of the (Dr. J. I. Hórvath), 26
Statistics : Mathematics of (John F. Kenney), Part I, second edition, *review* by P. A. Moran, 544
Statistics and Agricultural and Dairy Engineering : Postgraduate Scholarships in Husbandry, Agricultural Economics, (Ministry of Agriculture and Fisheries and the Department of Agriculture for Scotland), 637
Status of the Protozoa (Dr. John R. Baker), 548, 587
Steatite Ceramic with Quaternary Ammonium Compounds for the Improvement of Electrical Insulation Resistance : Treatment of Glass and (J. S. Dryden and R. J. Meakins), 23
Steel : Determination of Silicate Inclusions in (Prof. J. Kamecki and A. Kotlinski), 402
Steels : Ferromagnetic Structure of Cold-Worked Austenitic Stainless (P. T. Hobson and W. P. Osmond), 562
Steepest Descents : Methods of—Improved Formula for X-Ray Analysis (Dr. V. Vand), 600

Stereochemistry of Trimeric Thioaldehydes (Prof. Alexander Schönberg and Mohamed Zaki Barakat), 722 ; (Dr. G. M. Bennett), 723
Sterilizing of Plant in the Food Industry : Cleaning and (Royal Sanitary Institute and the Food Group of the Society of Chemical Industry discussion on), 1025
Stilbœstrol : Stimulation of Growth in Pigs by Iodinated Casein and (Dr. R. Braude), 856
Stilbœstrol Monoglucuronide from Human Urine : Isolation of (K. S. Dodgson and Dr. R. Tecwyn Williams), 604
Stomatal Action : Studies in—Adequacy of the Porometer in the Investigation of Stomatal Aperture (Dr. O. V. S. Heath and Dr. W. T. Williams), 178 ; Control of Stomatal Movement by a Reduction in the Normal Carbon Dioxide Content of the Air (Dr. O. V. S. Heath), 179
Straggling of Short-Range Particles produced by Slow Neutron Reactions : Cloud Chamber Investigation of (Dr. J. K. Bøggild), 810
Streaming Potential : Theory of the (G. A. H. Elton), 847
Strength of Materials : Aircraft (Dr. H. D. Conway), *review*, 503
Streptococcus bovis : Serological Position of (Dr. P. M. F. Shattock), 318
Streptococcus faecalis in *E. histolytica* Infections (Dr. G. T. Stewart, W. R. Jones and M. A. T. Rogers), 936
Stress Coefficient in Solutions of Macromolecules: Normal (R. S. Rivlin), 567
Stress Corrosion (J. C. Chaston), 891
Stressed Aluminium (Prof. E. A. Owen, Y. H. Liu and D. P. Morris), 681
Stresses : Photo-elastic Investigation of Internal, in Silver Chloride caused by Plastic Deformation (J. F. Nye), 367
Stresses in Metals : Internal (W. A. Wood and N. Dewsnap), 682 ; (G. B. Greenough), 683
Stresses in Metals and Alloys : Internal (Institute of Metals, in association with the Faraday Society, the Institute of Physics, the Institution of Mechanical Engineers, the Iron and Steel Institute, the Physical Society and the Royal Aeronautical Society symposium on), 70
Structure of an Animal Virus (Dr. I. M. Dawson and Dr. A. S. McFarlane), 464
Structure of the Bacterial Cell, as shown by the Electron Microscope : Submicroscopical (Dr. Stuart Mudd), 302
Structure of Barium Sulphate : Electrokinetic Potential and Surface (A. S. Buchanan and Prof. E. Heymann), 691
Structure of Biological Tissues as revealed by X-Ray Diffraction Analysis and Electron Microscopy (Prof. W. T. Astbury), 514
Structure of Chemical Compounds : The Theory of Valency and the (Prof. P. Ray), *review*, 460
Structure of Clay Minerals : Theory of the—Tailed X-Ray Reflexions from Random Layer Lattices (Dr. A. J. C. Wilson), 773 ; Banded X-Ray Reflexions from Clay Minerals (Dr. G. W. Brindley and J. Méring), 774
Structure of Cyclo-octatetræne (H. S. Kaufman, Dr. I. Fankuchen and Prof. H. Mark), 165
Structure of Cyclopropane (Sir Robert Robinson), 176
Structure of Jute : X-Ray Investigation of the (M. K. Sen and H. J. Woods), 768
Structure of Molecules : Reactivity and (Prof. F. A. Paneth), 901
Structure of Plasteins (Prof. Artturi I. Virtanen and Heikki K. Kerkkonen), 888
Structure of the Red Cell : Submicroscopic (Dr. M. F. Perutz), 204
Structure in the Rodent Rhinarium : An Undescribed (Dr. W. C. Osman Hill), 276
Structure of Turnip Yellow Mosaic Virus Crystals in the Electron Microscope (Dr. V. E. Cosslett and Dr. Roy Markham), 250
Structure of Urea (Dr. J. O. Harris and A. H. Robson), 98
Structure of Yeast Ribonucleic Acid (the late Prof. J. Masson Gulland and D. O. Jordan), 561
Structure Testing Machine : A 150-ton Universal (Dr. C. F. Tipper), 656
Structure and Physical Properties of Metals (X-Ray Analysis Group of the Institute of Physics discussion on), 263
Strychnine and Brucine : Relation of Vomicine to (Dr. A. S. Bailey and Sir Robert Robinson), 433
Studentship in Aeronautics : Busk, 595
Studio Acoustics (H. L. Kirke), 732
Stylasteridæ (Hydrocorals) of the John Murray Expedition to the Indian Ocean (Dr. Hjalmar Broch), 822
Sublimation in the Atmosphere over the Oceans (Dr. B. Cwilong), 62
Sublittoral Seaweed Survey—Relationship of Algal Growth and Depth (F. T. Walker), 977
Submarine Canyons of New Guinea and South Australia : Newly Discovered (Reg. C. Sprigg), 246
Submarine Gravity Survey in the English Channel, 272
Submerged Ancient Cliff near Plymouth (Dr. L. H. N. Cooper), 280
Submicroscopic Structure of the Bacterial Cell, as shown by the Electron Microscope (Dr. Stuart Mudd), 302
Submicroscopic Structure of the Red Cell (Dr. M. F. Perutz), 204
Substances Inhibitory to Acid Phosphatase in Normal Human Urine : Presence of (Dr. Alice M. Robinson and Dr. F. L. Warren), 397
Substitution in the Naphthalene Nucleus : Mechanism of (Dr. N. M. Cullinane and S. J. Chard), 690
Subtilin C, an Antibiotic Concentrate from *Bacillus subtilis* (C. H. Hassall), 317
Sugar Beet : Transmission of a Disease Resembling Virus Yellows through the 'Seed' of (Dr. Phyllis E. M. Clinch, J. B. Loughnane and R. McKay), 28
Sugar Canes (*Saccharum officinarum* L.) : Origin of Noble (Dr. N. Parthasarathy), 608
Sugars : Acetylation of (S. D. Nicholas and Dr. F. Smith), 349 ; (Dr. P. H. Plesch), 637
  Colour Reagents for the Paper Chromatography of (Dr. W. G. C. Forsyth), 239
Sulpha Compound ('6257') and its Use in Human Cholera Infection : A New (Dr. S. S. Bhatnagar, F. Fernandes, J. de Sa and P. V. Divekar), 395
Sulphanilamide : Failure of, to Inhibit Calcification of Bone (Dr. Zelma Baker Miller, Dr. Jerome Waldman and Prof. Franklin C. McLean), 273
Sulphanilamides and Sulphonic Acids : Ammonium Salts of (S. K. Munshi, B. D. Tilak and Prof. K. Venkataraman), 55
Sulphhydryl Reagents : Inhibition of Hexosediphosphatase by, and by Ascorbic Acid (Dr. E. O'F. Walsh and Mrs. G. Walsh), 976
Sulphonic Acids : Ammonium Salts of Sulphanilamides and (S. K. Munshi, B. D. Tilak and Prof. K. Venkataraman), 55
S_2 in the Schumann Region : Absorption Band Spectrum of (R. Maeder and Prof. E. Miescher), 393
Sulphuryl Chloride on Wool : Action of (A. J. Farnworth and Prof. J. B. Speakman), 850
Summer Course in Food Science, 1007
Summer School in Chemistry at Dublin, 390
Summer School in Electron Microscopy at the Cavendish Laboratory, 758
Summer School in Health Education (Central Council for Health Education), 842
Summer School on the International and Cultural Relations of Social Biology (British Social Hygiene Council), 842
Summer School in Metal Physics (Cavendish Laboratory), 637
Summer School in Micro-Chemical Techniques (Queen's University, Belfast), 125
Summer School in the Physics of Solids (University of Bristol), 233, 636
Summer School in Relaxation Methods (Imperial College of Science and Technology), 717
Summer School on the Schools and the Land (British Social Hygiene Council), 470
Summer School in X-Ray Crystallography (College of Technology, Manchester), 555
Summer School for Youth Leaders (National Association of Girls' Clubs and Mixed Clubs), 924
Sun : Annular Eclipse on May 8–9, 196, 389, 879
  Audio-Frequency Radio Waves from the (Dr. Donald H. Menzel and Winfield W. Salisbury), 91
Sunspots : Solar Radio Emissions and (I. L. Thomsen), 134 ; (M. Ryle), 136
Sunspots in Action (Dr. Harlan True Stetson), *review* by Dr. M. A. Ellison, 951
Superconductivity, *review* by Dr. H. Fröhlich, 37
  Theory of (Prof. Max Born and Kai Chia Cheng), 968, 1017
'Supermalloy', a New Magnetic Alloy (O. L. Boothby and R. M. Bozorth), 554
Supraleitung : Theorie der (M. von Laue), *review* by Dr. H. Fröhlich, 37
Surface (Specific) : Photometric Measurement of (B. A. Scott), 358
Surface Phenomenon on Flowing Water : The Floating Thread, a (I. Kuščer), *erratum*, 51
Surface Pressure and Climatic Fluctuations and Vegetation Growth in Northern Finland : Northern Hemisphere (G. W. Brier), 730
Surface Radiography with Alpha Rays (C. Jech), 314
Surface Resistance of Metal Films at a Frequency of 24,000 Mc./s. (Dr. L. Speirs), 601
Surface Structure of Barium Sulphate : Electrokinetic Potential and (A. S. Buchanan and Dr. E. Heymann), 649
Surgery : Use of High-frequency Current in (A. W. Lay), 167
Surrey (Eric Parker), *review* by W. E. S., 912
Survey of Svalbard, 232
Surveying : Research in, at University College, London, 50
Surveying for Young Engineers (S. Wright Perrott), *review*, 79
Svalbard : Survey of, 232
Swimming of Dolphins (Alfred H. Woodcock), 602 ; (Dr. L. Harrison Matthews), 731
Switzerland : Fuel Economy in, 253
Sword : The Chrysanthemum and the (Ruth Benedict), *review* by Peter Lawrence, 77
Synchroton : 30-MeV. Electron (D. W. Fry, J. W. Gallop, F. K. Goward and J. Dain), 504
Synonymy of the Nudibranch Genera *Pellibranchus* and *Okadaia* (Patricia M. Ralph), 528
Synoptic Weather Maps for the Antarctic, 709
Synthesis of Adenosine Triphosphate (J. Baddiley, A. M. Michelson and Prof. A. R. Todd), 761
Synthesis of Dehydro-β-Ionone (Dr. H. B. Henbest), 481
Synthesis of 5 : 6-Dihydroxy-Indole : The Melanin Problem—a (Dr. R. J. S. Beer, K. Clarke, H. G. Khorana and Prof. A. Robertson), 525
Synthesis of 5 : 6-Dihydroxy-Indole and its Derivatives : The Melanin Problem—a (Prof. H. Burton and J. A. Duffield), 725
Synthesis of Fluoranthene Derivatives (Dr. E. Bergmann), 889
Synthesis of Ovalene (Dr. E. Clar), 238
Synthesis of Pteridines : Reductone and the (Dr. H. S. Forrest and Dr. James Walker), 721
Synthetic Medium : Animal Tissue Culture with a (Dr. F. Jacoby and S. J. Darke), 768
Synthetic Mixtures of α-Chloroacids : Raman Spectra of some (Dr. Marcel Renard), 354
Synthetic Œstrogens : Configuration of (H. P. Koch), 309
Synthetic Pentapeptides related to Gramicidin-*S* (J. I. Harris and T. S. Work), 804
Synthetic Polyglutamic Acid (W. E. Hanby, S. G. Waley and J. Watson), 132
Synthetic Resin Chemistry (Dr. S. R. W. Martin), *review* by Dr. P. D. Ritchie, 501
Synthetic Resin Ion-Exchangers : Separation of Pyrimidine Nucleosides by (D. T. Elmore), 931

TALLENSI : The Dynamics of Clanship among the (Dr. Meyer Fortes), *review* by Dr. A. I. Richards, 111
Tanning Materials of India : Vegetable, 255
Taste Buds and Nasal Mucosa : Alkaline Phosphatase in (Dr. Geoffrey H. Bourne), 445
Taylor (George) Gold Medal of the Royal Aeronautical Society awarded to Dr. J. W. Drinkwater and W. G. Glendinning, 593
Teaching of Science in Secondary Schools (Compiled by a Joint Committee of the Incorporated Association of Assistant Masters and the Science Masters' Association), *review* by W. L. Sumner, 114
Teaching Aids : Exhibition of War Office, 164
Technical Education in Britain : Lyon Playfair and (W. H. G. Armytage), 752
Technical Literature on Silk : Bibliography of the (Dr. F. O. Howitt), *review* by Prof. J. B. Speakman, 790
Technical Publications in Sheffield : Interchange of, 305
Technique for Mechanical Vibration Problems, *review* by Prof. W. G. Bickley, 954

Technological Education in Britain : Higher, 217
  University Grants Committee Sub-Committee on, 841
Telecommunication and Radio Conferences at Atlantic City : International, 863
Telescope : Making your own (Allyn J. Thompson), *review*, 502
Telescope Objectives : The Adjustment and Testing of (H. Dennis Taylor), fourth edition, *review*, 419
Temperature : Methods of Measuring (Dr. Ezer Griffiths), third edition, *review* by S. Weintroub, 624
  Critical, and Molecular Weight of *n*-Paraffins (L. Grunberg and Dr. A. H. Nissan), 170
Temperature (Body) : Acetylcholine and (Prof. J. H. Burn and N. K. Dutta), 18
Temperature (High) : Reversal of Vernalization by (Prof. F. G. Gregory and Dr. O. N. Purvis), 859
Temperature (Room) : Luminescence Efficiency Changes in Zinc Sulphide Phosphors below (Dr. G. F. J. Garlick and A. F. Gibson), 359
Temperature in Clays : Relationships of Vapour Pressure, Capillarity and (B. Vassiliou and Dr. J. White), 487
Temperature on the Urea Denaturation of β-Lactoglobulin : Influence of (C. F. Jacobsen and L. Korsgaard Christensen), 30
Temperature Measurement, *review* by S. Weintroub, 624
Temperatures (High) : Preparation of Œstrogens from Urine by Application of (Dr. Felix Sulman), 605
Temperatures (Low) : Insulating Materials and Methods for Use at (Low Temperature Group of the Physical Society discussion on), 323
Tension, Torsion and Radial Pressure : Delayed Fracture of Glass under (C. Gurney), 729
Termites : La lutte contre les (Ch. Noriot et H. Alliot), *review* by A. D. I., 544
Terrestrial Relationships : Solar and, *review* by Dr. M. A. Ellison, 951
Test for Gold : A New Dry (R. C. Mehrotra), 321
Testis : Vascular Patterns in the, with particular reference to *Macropus* (Dr. R. G. Harrison), 399
Tetraploidy : Mathematical Theory of (Prof. R. A. Fisher), 758
Textile Fibers (Matthews), fifth edition, edited by Herbert R. Mauersberger, *review* by Dr. C. S. Whewell, 581
Textile Industries : Rheology in the (British Rheologists' Club and others conference on), 307
Textile Industry : The Organisation of the (Textile Institute conference on), 842
Textile Laboratories at Leeds, 305
Thallium : Volumetric Estimation of (B. C. Mehrotra), 242
Thallium (Trivalent) : Inner-Complex Salts of (Prof. Fr. Feigl), 436
Theoretical Aerodynamics (Prof. L. M. Milne-Thomson), *review* by Prof. W. J. Duncan, 703
Theoretical Physics : Summer School in (University of Bristol in co-operation with the Institute of Physics), 233
Theoretical Physics at the University of Liverpool, 715
Théorie des champs macroscopiques (Prof. Jean Mariani), 450
Theorie der Supraleitung (M. von Laue), *review* by Dr. H. Fröhlich, 37
Theory of Aerofoils : Potential, *review* by Prof. W. J. Duncan, 703
Theory of the Anomalous Skin Effect in Metals (G. E. H. Reuter and E. H. Sondheimer), 394
Theory of Electricity and Magnetism : Elementary, *review* by Prof. L. F. Bates, 829
Theory of Primary Calcification in Bone (Dr. Marcel L. Dallemagne), 115
Theory of Servomechanisms (edited by Prof. Hubert M. James, Nathaniel B. Nichols and Prof. Ralph S. Phillips), *review* by Prof. A. Porter, 994
Theory of Skating (Dr. A. E. Bell), 391
Theory of the Streaming Potential (G. A. H. Elton), 847
Theory of the Structure of Clay Minerals—Tailed X-Ray Reflexions from Random Layer Lattices (Dr. A. J. C. Wilson), 773 ; Banded X-Ray Reflexions from Clay Minerals (Dr. G. W. Brindley and J. Méring), 774
Theory of Superconductivity (Prof. Max Born and Kai Chia Cheng), 968, 1017
Theory of Valency and the Structure of Chemical Compounds (Prof. P. Ray), *review*, 460
Thermal Conduction in Dense Gases and Liquids : Coefficients of Viscosity and (L. M. Yang), 523
Thermal Mutual Inductance (Dr. R. C. L. Bosworth), 166
Thermionic Cathode : The, *review* by D. A. Wright, 500
Thermionic Valves working under Amplifying Conditions : Low-Frequency Noise from (Dr. E. J. Harris and P. O. Bishop), 971
Thermo-electric Power of Electronic Semi-Conductors with Vapour Pressure : Variation of (C. A. Hogarth), 60
Thermometry in the Region of Millidegrees Absolute : Magnetic Observations and (D. de Klerk, M. J. Steenland and Prof. C. J. Gorter), 678
Thermophile Fungus : A *Chaetomium*-like (C. J. La Touche), 320
Thibaud's 'Particles': Electronic Waves and (W. E. Benham), 93
Thickening in Excised Tomato Roots : Secondary (Dr. K. J. Dormer and Dr. H. E. Street), 483
Thioaldehydes (Trimeric) : Stereochemistry of (Prof. Alexander Schönberg and Mohamed Zaki Barakat), 722 ; (Dr. G. M. Bennett), 723
Thompson (Silvanus) Memorial Lecture of the British Institute of Radiology (Prof. W. T. Astbury), 514
Thread : The Floating, a Surface Phenomenon on Flowing Water (I. Kuščer), *erratum*, 51
Threshold Value of Carbon Dioxide Concentration in Photosynthesis of Foliage Leaves (Dr. E. K. Gabrielsen), 138
Thuja plicata Don. : Antibiotic Substances from the Heart Wood of (Prof. Holger Erdtman and Dr. Jarl Gripenberg), 719
Thymus (Rat) : Weight of the (L. R. C. Agnew), 205
Thyroid Deficiency on the Level of Pseudo-Cholinesterase in the Plasma of Rats : Effect of (R. D. Hawkins, Prof. B. Mendel and M. Nishikawara), 639
Thyroid Gland as a Special Factor influencing the Conditional Disposition to Infectious Diseases (Dr. S. Zimanyi), 57
Thyroxine from Derivatives of Diiodotyrosine : Formation of Derivatives of (Rosalind Pitt Rivers), 308
Tibet and Burma (borders of) : Earthquake on July 29, 657
Tidal Biology : Problems of (Prof. C. M. Yonge), 796
Tide : Severn (Brian Waters), *review* by A. T. D., 790
Timbers : How to Identify, 881
Time-Series (Oscillatory) : Contributions to the Study of (Maurice G. Kendall), *review* by David G. Kendall, 187
Time-Series with Continuous Spectra : Smoothing Periodograms from (Prof. M. S. Bartlett), 686
Time Study and Common Sense (Abraham Cohen), *review* by J. Leigh, 910
Tirol : Earthquake on December 20, 306
Tissue Cells *in vitro* : Amino-Acid Metabolism of (Dr. Albert Fischer), 1008
Tissue Cultures for Biophysical Research : Amphibian (M. M'E. Preston), 203
Tissue Extracts : Inactivation of Flavine Adenine Dinucleotide by (R. S. Comline and F. R. Whatley), 350
Tissues : Effects of Mustard Gas on Enzymes and (Dr. D. M. Needham), 225
Tissues of Inbred Strains of Mice : Ultracentrifugation and Electron Microscope Studies of (Prof. R. D. Passey, Dr. L. Dmochowski, Prof. W. T. Astbury, Dr. R. Reed and Dr. P. Johnson), 759
Toad (Male) : Pregnancy Test using the (Dr. Octavio Rodrigues Lima and Dr. Oswaldo Gelli Pereira), 676
Tobacco Necrosis Virus Crystals : Molecular Arrangement in (Roy Markham, Dr. Kenneth M. Smith and Dr. Ralph W. G. Wyckoff), 760
Tobago : Forestry in Trinidad and, 147
Tollens Naphthoresorcinol Reaction for Uronic Acids (A. H. Guerrera and Dr. R. Tecwyn Williams), 930
Tomato Roots (Excised) : Secondary Thickening in (Dr. K. J. Dormer and Dr. H. E. Street), 483
Tombs in Scotland and Ireland : Megalithic (Prof. V. Gordon Childe), 841
Tonga Islands (west of the) : Earthquake on September 2, 657
Tool in Scientific Research : Radioelements as a, *review* by Prof. F. A. Paneth, 456
Torsion and Radial Pressure : Delayed Fracture of Glass under Tension, (C. Gurney), 729
Torula-Yeast Fed with Potassium Nitrate : Formation of Oxime-Nitrogen in (Prof. Artturi I. Virtanen and Tihamér Z. Csáky), 814
Town and Country : Trees for (Brenda Colvin and Jaqueline Tyrwhitt), *review* by Sir Edward Salisbury, 497
Toxicity of Arsenicals : An Improved Method for the Assay of (W. L. M. Perry), 975
Toxicity of Azo-Compounds and other Substances to the Fruit Tree Red Spider Mite (Dr. J. K. Eaton and R. G. Davies), 644
Trace Elements and Nitrification (Dr. Howard Lees and Jane Meiklejohn), 398
Trace Elements in Plant Physiology (International Union of Biological Sciences symposium on), 364
Tracer Isotopes : The Determination of Radioactive and Stable (Physical Methods Group of the Society of Public Analysts and other Analytical Chemists symposium on), 693
Tracheids and Wood Fibres : Organisation of the Cell Walls of (A. B. Wardrop and Dr. R. D. Preston), *erratum*, 90
Trail : The End of the (Willoughby P. Lowe), *review* by Frances Pitt, 222
Trail Award and Medal for 1942 of the Linnean Society of London awarded to Dr. Honor B. Fell, 51, 882
Trail Award and Medal for 1947 of the Linnean Society of London awarded to Dr. C. D. Darlington, 51, 882
Training for Chemists (Dr. E. J. Holmyard), 31
Transfer Rates in Liquid Helium Films (K. R. Atkins), 925
Transformations : Lorentz-like (P. T. Landsberg), 208 ; (Prof. Herbert Dingle), 209
Transit Circle for the Royal Observatory, Greenwich, 271
Transition from Glow to Arc Discharge (Dr. Chas. E. R. Bruce), 521
Transmission of the Atmosphere in the 1–5 Micron Region (A. Elliott and G. G. MacNeice), 516
Transmission of Bactericidal Radiation through Glass (J. E. Stanworth), 856
Transmission of a Disease Resembling Virus Yellows through the 'Seed' of Sugar Beet (Dr. Phyllis E. M. Clinch, J. B. Loughnane and R. McKay), 28
Transmission in Nerves, *review* by Prof. J. Z. Young, 76
Transplantation of Fertilized Rabbit Ova—the Effect on Viability of Age, *in vitro* Storage Period, and Storage Temperature (Dr. Min-Chueh Chang), 978
Transport System : London's (R. H. Macmillan), 942
Treatment of Glass and Steatite Ceramic with Quaternary Ammonium Compounds for the Improvement of Electrical Insulation Resistance (J. S. Dryden and R. J. Meakins), 23
Treatment of Tuberculosis : *p*-Aminosalicylic Acid in the (D. D. Martin, Prof. F. S. Spring, Dr. T. G. Dempsey, C. L. Goodacre and D. E. Seymour), 435
Trees (Lime) : Honeydew on (C. A. Mawson), 176
Trees of the Northern States and Canada East of the Rocky Mountains : Handbook of the (Romeyn Beck Hough), *review* by Sir Edward Salisbury, 497
Trees in Prose and Picture, *review* by Sir Edward Salisbury, 497
Trees for Town and Country (Brenda Colvin and Jaqueline Tyrwhitt), *review* by Sir Edward Salisbury, 497
Trematoda of British Fishes (Dr. Ben Dawes), *review* by Dr. G. Lapage, 222
Trematode : A Rare Cœlom-Dwelling (Dr. Ben Dawes), 642
Trend of National Intelligence (Prof. Godfrey Thomson, with a Symposium by Sir Alexander Carr-Saunders, Sir Cyril Burt, Prof. Lionel Penrose and Prof. Godfrey Thomson), *review* by Dr. Julian Blackburn, 37
2 : 4 : 5-Triamino-6-hydroxy-pyrimidine with Glucose and Fructose : Condensation of (H. S. Forrest and Dr. James Walker), 308
Tribute of Industry to Science, 508
Trimeric Thioaldehydes : Stereochemistry of (Prof. Alexander Schönberg and Mohamed Zaki Barakat), 722 ; (Dr. G. M. Bennett), 723
Trinidad : The Natural Vegetation of (Prof. C. W. Wardlaw), 31 ; (Dr. J. S. Beard), 31
Trinidad and Tobago : Forestry in, 147
Triodes : Klystrons and Microwave (Prof. Donald R. Hamilton, Prof. Julian K. Knipp and J. B. Horner Kuper), *review* by Prof. J. T. Randall, 952
Triolite : Occurrence of (Dr. J. J. Frankel), 63
Triple Magneto Ionic Splitting of Rays Reflected from the F_2 Region (Gordon Newstead), 312
Triple Splitting of Ionospheric Rays (J. H. Meek), 597 ; (T. L. Eckersley), 597
Trisodium Citrate Solutions stored under Customary Laboratory Conditions : *p*H of (J. Jordan and Dr. M. Bobtelsky), 240
Trivalent Thallium : Inner-Complex Salts of (Prof. Fr. Feigl), 436
Tropical Diseases : The Role of Chemistry in combating (Sir Ian Heilbron), 956

Tropical and Sub-Tropical Areas : Memoranda on Medical Diseases in (War Office), eighth edition, *review* by Dr. N. Hamilton Fairley, 499
Trypanosoma congolense Infections : Cinnoline Derivatives as Chemotherapeutic Agents for (J. R. Keneford, Dr. E. M. Lourie, J. S. Morley, J. C. E. Simpson, J. Williamson and P. H. Wright), 603, 758
Trypanosoma heptatretae sp. n., a Blood Parasite of the Hagfish (Marshall Laird), 440
Trypanosomiasis (Cattle) : Control of (R. N. T.-W.-Fiennes), 602
Tsetse Flies and the Development of Africa (Prof. P. A. Buxton), 802
Tuberculosis : *p*-Aminosalicylic Acid in the Treatment of (D. D. Martin, Prof. F. S. Spring, Dr. T. G. Dempsey, C. L. Goodacre and D. E. Seymour), 435
d-Tubocurarine Chloride and the Dimethyl Ether of *d*-Tubocurarine Iodide : Pharmacological Activities in Different Rodent Species of (Dr. H. O. J. Collier, Sheila K. Paris and Dr. L. I. Woolf), 817
d-Tubocurarine Iodide : Pharmacological Activities in Different Rodent Species of *d*-Tubocurarine Chloride and the Dimethyl Ether of (Dr. H. O. J. Collier, Sheila K. Paris and Dr. L. I. Woolf), 817
Tubular Excretion : Specific and Non-specific Competition in (I. Sperber), 236
Tubules (Renal) : Osmotic Work performed by the (David F. Cole), 640
Tumours by Chemical Compounds : Induction of, *review* by Prof. E. Boyland, 621
Turbines : Modern Gas (Arthur W. Judge), *review* by E. G. Sterland, 910
Turnip Yellow Mosaic Virus Crystals in the Electron Microscope : Structure of (Dr. V. E. Cosslett and Dr. Roy Markham), 250
Type Cultures of Fungi, 16

UFAW Handbook on the Care and Management of Laboratory Animals (edited by Prof. Alastair N. Worden), *review* by Frances Pitt, 664
Ultra High-Frequencies : Electrical Breakdown Strength of Air at (J. A. Pim), 683
Ultracentrifugation and Electron Microscope Studies of Tissues of Inbred Strains of Mice (Prof. R. D. Passey, Dr. L. Dmochowski, Prof. W. T. Astbury, Dr. R. Reed and Dr. P. Johnson), 759
Ultrasonic Dispersion in Organic Liquids (Dr. A. Schallamach), 476
Ultrasonic Waves : Diffraction of Light by Very High Frequency (Prof. S. Bhagavantam and B. Ramachandra Rao), 927
Ultra-Violet Fluorescence in Paper Chromatography : Use of (D. M. P. Phillips), 53
Ultra-Violet and Infra-Red Radiation : Biological Applications of, *review* by H. G. Jenkins, 542
Under-Nutrition in Man : Effect of, on Hepatic Structure and Function (Sheila Sherlock and Veryan Walshe), 604
Under-Nutrition and Alterations in Diet : Effect of, on the Choline Esterase Activity of Serum (Prof. R. A. McCance, E. M. Widdowson and A. O. Hutchinson), 56
Understand the Countryside : The Right Way to (Stanley A. Manning), *review* by T. H. Hawkins, 995
Union Catalogue of German Books and Periodicals (National Central Library), 1006
United States : Corn (*Zea Mays* L.) in the (Gordon Haskell), 42
    Earthquake in south-west Montana on November 23, 306
    Medical Group Practice in the (P.E.P. Broadsheet No. 274), 841
    Mineral Resources of the (Staffs of the Bureau of Mines and Geological Survey), *review* by Dr. K. C. Dunham, 991
    Sampling Practice in the, *review* by Dr. F. Yates, 153
United States Armed Forces : Audiovisual Aids in the, *review* by Lieut.-Colonel Eric Lowe, 745
Units and Useful Range in Photo-electric Colorimetry (Dr. Walter Koch and Dr. Deborah Kaplan), 247 ; (Dr. J. R. Edisbury, R. J. Taylor and N. T. Gridgeman), 247
Universal Structure Testing Machine : A 150-ton (Dr. C. F. Tipper), 656
Universities (Colonial) : Biology in (Dr. E. B. Edney), 506
Universities (Foreign) : Scholarships for 1948–49 at (British Council), 347
Universities of the British Empire : Congress of, 430
Universities of the Empire 1947 : The Yearbook of the (Universities Bureau of the British Empire), *review*, 583
University of North Carolina Graduate School Research and Publications (edited by Prof. Edgar W. Knight and Agatha Boyd Adams), *review*, 705
University of Prague Sexcentenary Celebrations (Dr. Gerald Druce), 670
University Halls of Residence : The Planning of, 344
University Representation in the House of Commons, 259 ; (O. Peake), 468 ; (Herbert Morrison), 468 ; (Chuter Ede), 468
Unsaturated Fatty Acids in Cotton Wool Plugs (Dr. M. R. Pollock), 853
Uovo : Le Forze creatricj dell' (Prof. Pasquale Pasquini), *review* by C. H. W., 831
U^{233} : Fission Products of (Dr. W. E. Grummitt and Dr. G. Wilkinson), 520
Uranus : New Satellite of, 637
Urea : Structure of (Dr. J. O. Harris and A. H. Robson), 98
Urea Denaturation of *β*-Lactoglobulin : Influence of Temperature on the (C. F. Jacobsen and L. Korsgaard Christensen), 30
Urine : Preparation of Œstrogens from, by Application of High Temperatures (Dr. Felix Sulman), 605
Urine (Human) : Isolation of Stilbœstrol Monoglucuronide from (K. S. Dodgson and Dr. R. Tecwyn Williams), 604
Urine (Normal Human) : Presence of Substances Inhibitory to Acid Phosphatase in (Dr. Alice M. Robinson and Dr. F. L. Warren), 397
Urine of a Patient with Adrenal Cancer : Isolation of a New Androstenol-3(α)-on-17 from the (Dr. Elizabeth Dingemanse, Leonora G. Huis in 't Veld and S. Lore Jartogh-Katz), 848
Uronic Acids : The Tollens Naphthoresclnol Reaction for (A. H. Guerrera and Dr. R. Tecwyn Williams), 930
Utilization of Polysaccharide-like Substances ('Mucin') in Saliva : Bacterial Hydrolysis and (Dr. H. J. Rogers), 815
Utilization of Resources : The Conservation and (United Nations conference on), 617

VACUUM Gauge : A New Hot-Wire (H. von Ubisch), 927
Vacuum Practice : A Manual of (Dr. L. H. Martin and R. D. Hill), *review*, 665
Valency and the Structure of Chemical Compounds : The Theory of (Prof. P. Ray), *review*, 460
Validity of Amontons' Law : Rate of Wear in the Region of the (Henry James Bezer and Dr. Robert Schnurmann), 728
van den Bergh Reaction : Bilirubin-Serum Protein Complexes and the (C. H. Gray and Dr. R. A. Kekwick), 274
Vapour Pressure : Variation of Thermoelectric Power of Electronic Semi-Conductors with (C. A. Hogarth), 60
Vapour Pressure, Capillarity and Temperature in Clays: Relationships of (B. Vassiliou and Dr. J. White), 487
Variable Stars : The Story of (Leon Campbell and Luigi Jacchia), *review* by H. S. J., 460
Variation : Seasonal, in Chemical Constitution of some Common British Laminariales (Dr. W. A. P. Black), 174
Variation of the Force Constant with the Ionization Potential and the Polarizability for some Halogen Compounds (P. Torkington), 724
Variation of Geomagnetic Intensity with Depth (Prof. Sydney Chapman), 52 ; (S. K. Runcorn), 52
Variation of the Horizontal Magnetic Forte at the Magnetic Equator : Daily (J. Egedal), 443
Vascular Patterns in the Testis, with particular reference to *Macropus* (Dr. R. G. Harrison), 399
Vasodilator, Adrenolytic Substance in Aglomerular Fish Kidney : A (Dr. Benjamin Jablons), 100
Vedha : Ancient Indian Mathematics and (Prof. L. V. Gurjar), *review* by Prof. E. H. Neville, 580
Vega Medal of the Geographic Society of Sweden awarded to Admiral Richard Byrd, 430
Vegetable Cultivation : Intensive, 196
Vegetable Tanning Materials of India, 255
Vegetation after Draining (V. S. Summerhayes and Dr. W. B. Turrill), 421
Vegetation of Trinidad : The Natural (Prof. C. W. Wardlaw), 31 ; (Dr. J. S. Beard), 31
Vegetation Growth in Northern Finland : Northern Hemisphere Surface Pressure and Climatic Fluctuations and (G. W. Brier), 730
Velocity of Light : Radiation Damping and (Prof. W. Heitler), 678
Velocity of Meteors Measured by Diffraction of Radio Waves from Trails during Formation (C. D. Ellyett and J. G. Davies), 596
Vernalization by High Temperature : Reversal of (Prof. F. G. Gregory and Dr. O. N. Purvis), 859
Vertebrate Ear : Oscillographic Analysis of the Non-Acoustic Functions of the (Dr. Otto Lowenstein), 652
Veterinary Education : Grants for, 163
Vibration Problems (Mechanical) : A Technique for, *review* by Prof. W. G. Bickley, 954
Vibrations : Mechanical (Prof. J. P. Den Hartog), third edition, *review* by A. L. P., 503
Vibrations (Molecular) : Interaction Terms in (D. F. Heath and Dr. J. W. Linnett), 243
Victoria Medal for 1948 of the Royal Geographical Society awarded to Prof. Frank Debenham, 553
Victory over Pain (Dr. Victor Robinson), *review* by Dr. G. Edwards, 458
Viewing-Distance or Field-Size : Dependence of Anomaloscope Matching on (R. G. Horner and E. T. Purslow), 484
Viking Fund Award given to Dr. R. E. G. Armattoe for a field trip to West Africa, 125
Village Life in the Eighteenth Century (G. E. Fussell), *review* by Sir John Russell, 701
Virus (Animal) : Structure of an (Dr. I. M. Dawson and Dr. A. S. McFarlane), 464
Virus Crystals (Tobacco Necrosis) : Molecular Arrangement in (Roy Markham, Dr. Kenneth M. Smith and Dr. Ralph W. G. Wyckoff), 760
Virus Diseases : Plant, 945
    Viruses and (British Museum (Natural History), Exhibition of), 966
Virus Epizootic of the Manx Shearwater (*Puffinus p. puffinus*) : Puffinosis, a (J. A. R. Miles and M. G. P. Stoker), 1016
Virus Multiplication : Association of Xanthine Oxidase with (Dr. D. J. Bauer), 852
Virus Research at Cambridge : Plant (Dr. Kenneth M. Smith), 776
Virus Yellows : Transmission of a Disease resembling, through the 'Seed' of Sugar Beet (Dr. Phyllis E. M. Clinch, J. B. Loughnane and R. McKay), 28
Viruses and Bacterial Products on Human Red Cells : Enzymic Action of (C. M. Chu), 606
Viruses and Virus Diseases : Exhibition of (British Museum (Natural History)), 966
Viscosity and Thermal Conduction in Dense Gases and Liquids : Coefficients of (L. M. Yang), 523
Viscous Extension : A Coefficient of (Dr. K. H. Swainger), 650
Visible Speech (Ralph K. Potter, George A. Kopp and Harriet C. Green), *review* by Dr. W. G. Radley, 334
Vision (Colour) : Race, Pigmentation and (Dr. R. W. Pickford), 687
Vision and Seeing : Light, (Dr. Matthew Luckiesh), fourth printing, *review* by Dr. R. W. Pickford, 40
Visual Aids, Notes on some Modern Apparatus (Wilfred J. Garnett), 124
Visual Education : Material for (Betty M. B. Harris), *review* by Colonel Eric Lowe, 40
Visual Observations of the Perseid Meteor Shower of 1947 : Combined Radar, Photographic and (Dr. Peter M. Millman, Dr. D. W. R. McKinley and Miriam S. Burland), 278 ; (Dr. A. C. B. Lovell), 280
Visual Processes : Chemistry of (S. Ball, F. D. Collins, Prof. R. A. Morton and Dr. A. L. Stubbs), 424 ; (Dr. M. H. Pirenne), 724
Vitamin A : Glycerol Dichlorhydrin and (D. D. Penketh), 893
Vitamin B_T, a new Vitamin of the B-Group and its relation to the Folic Acid Group, and other Anti-Anæmia Factors (Dr. G. Fraenkel, with the assistance of M. Blewett and M. Coles), 981
Vitamin K on *M. tuberculosis* : Effect of Antibacterial Analogues of (C. N. Iland), 1010
Vitamin K Deficiency in relation to Quick's Concept of the Composition of Prothrombin : Dicumarol Poisoning and (Prof. Henrik Dam), 1010
Vitamin P (Vitamin C_2) : Influence of, upon the Amount of Ascorbic Acid in the Organs of the Guinea Pig (H. Cotereau, M. Gabe, E. Géro and Prof. J.-L. Parrot), 557

Volcanic Bomb in the Agglomeratic Slates of Kashmir : Occurrence of (Dr. R. C. Misra), 895
Volcanoes : Earthquakes and, *review* by Ernest Tillotson, 296
Volcans : Séismes et (Prof. J.-P. Rothé), *review* by Ernest Tillotson, 296
Volitional Life : An Analysis of (C. Lambek), translated from the Danish by Agnete Kortsen, *review* by Dr. Clifford Allen, 789
Voltage Distribution of a High-Voltage Multi-Stage Electron Accelerator : Effect of the Electron Beam on the (F. W. Waterton), 563
Volts at War : Men and, the Story of General Electric in World War II (John Anderson Miller), *review* by Sir Arthur Fleming, 113
Volumetric Error : Microdiffusion Analysis and (Prof. Edward J. Conway), revised edition, *review*, 583
Volumetric Estimation of Thallium (B. C. Mehrotra), 242
Vomicine to Strychnine and Brucine : Relation of (Dr. A. S. Bailey and Sir Robert Robinson), 433

WALCOTT (Charles Doolittle) Bronze Medal and Award for 1947 of the U.S. National Academy of Sciences awarded to Dr. Alexander G. Vologdin, 861
Wales : Industry and Research in (Industrial Research Committee of the Federation of British Industries and the Industrial Association of Wales and Monmouthshire joint regional conference on), 233
War : Men and Volts at, the Story of General Electric in World War II (John Anderson Miller), *review* by Sir Arthur Fleming, 113
  The Rocket as a Weapon of, in the British Forces (Sir Alwyn Crow), 329
  Science at (J. G. Crowther and R. Whiddington), *review* by S. Weintroub), 907
War Effort : Britain's Scientific, *review* by S. Weintroub, 907
War Effort of a Great Engineering Organisation, *review* by Sir Arthur Fleming, 113
War Research : German, *review*, 219
War Years : Northern Ireland Fishing Industry Developments during the, 451
  Progress in the Oil Industry during the, *review* by H. B. Milner, 703
War-time : Medical Research during (Dr. G. Lapage), 998
War-time Explorations in Manipur (F. Kingdon Ward), 636
War-time Rheological Investigations for the British Armed Services (British Rheologists' Club meeting on), 252
War-time Work of the American Academies, 304
Water : Dielectric Properties of Soils and, at a Wave-length of 3·2 cm. (Prof. A. W. Straiton and C. W. Tolbert), 73
Water (Flowing) : The Floating Thread, a Surface Phenomenon on (I. Kuščer), *erratum*, 51
Water Movements and Earth Currents—Electrical and Magnetic Effects (N. Barber and M. S. Longuet-Higgins), 192
Water Pollution : Biological Aspects of (Association of Applied Biologists symposium on), 874
Water Requirements under Desert Conditions, *review* by Dr. B. McArdle, 744
Water and Porous Materials : Interaction of (Faraday Society General Discussion on), 307, 629
Waters (British) : Occurrence of *Elminius modestus* (Darwin) in (D. J. Crisp and P. N. J. Chipperfield), 64
Waters (Inland) : Ciliate Protozoan Fauna of Soil and (Ernest Gray), 854
Wave Guides : A Survey of the Principles and Practice of (Dr. L. G. H. Huxley), *review* by Dr. R. L. Smith-Rose, 334
Wave-length of 3·2 cm. : Dielectric Properties of Soils and Water at a (Prof. A. W. Straiton and C. W. Tolbert), 73
Wave-lengths (Centimetre) : Measurement of High Permittivity Values at (J. G. Powles), 25
Waves : Electronic, and Thibaud's 'Particles' (W. E. Benham), 93
  Internal, in certain Types of Density Distribution (Dr. P. Groen), 92
Waves in Discharge Tubes and in the Solar Atmosphere : Spontaneous (Prof. V. A. Bailey), 599
Waynflete Lectures (Prof. E. D. Adrian), 498
Weapon of War in the British Forces : The Rocket as a (Sir Alwyn Crow), 329
Wear in the Region of the Validity of Amontons' Law : Rate of (Henry James Bezer and Dr. Robert Schnurmann), 728
Weather in Britain : Potato Blight and the (A. Beaumont), 429
Weather Forecast : Here is the (E. G. Bilham), *review* by M. K. Miles, 540
Weather Maps for the Antarctic : Synoptic, 709
Weather Prediction : Organisation, Meteorology and, *review* by M. K. Miles, 540
Web of Government (Prof. R. M. MacIver), 579
Weight of the Rat Thymus (L. R. C. Agnew), 205
Welfare in the West Indies : Development and (Sir John Macpherson), 181
West Indies : Development and Welfare in the (Sir John Macpherson), 181
  Social and Scientific Development of the, 181
Westlake (Mr. E.) and the Geology of the Cantal Region, Central France (G. Maynard and Aubrey T. Westlake), 485
Whale : Bile Acids of the (Dr. G. A. D. Haslewood and Veryan Wootton), 356
  Aspects of the Locomotion of (R. W. L. Gawn), 44 ; (Prof. J. Gray), 199 ; (Dr. D. A. Parry), 200
Whales : Effect of Present-day Whaling on the Stock of (J. E. Hamilton), 913
What People Are, a Study of Normal Young Men (Clark W. Heath, in collaboration with Lucien Brouha, Lewise W. Gregory, Carl C. Seltzer, Frederic L. Wells and William L. Woods), *review*, 502
Wheat : The Nature and Prevention of Cereal Rusts as Exemplified in the Leaf Rust of (Dr. K. Starr Chester), *review* by P. H. Gregory, 220
Wheat Grain from Rust-Affected Crop as Seed : Shrivelled (R. B. Ekbote and K. R. Sahasrabuddhe), 442
Wheat Straw and other Organic Materials : Production of an Antibiotic Substance on, and in the Soil (Erna Grossbard), 614
Whistles : Meteor (H. V. Griffiths, S. E. Martingell and R. W. Bayliff), 478
White Dwarfs : Spectrum of (Dr. Evry Schatzman), 61
White-eyed Mutants of Diptera (Dr. P. Tate), 641
Wild Flowers of the Chalk (John Gilmour), *review*, 188
Williams Prize for 1947 of the Iron and Steel Institute awarded to R. Fowler, 512
Wind Power : Generation of Electricity from, 162
Wings : Wonder of (Nancy Price). *review* by Frances Pitt, 460
Wireless Direction Finding (R. Keen), fourth edition, *review* by Dr. R. L. Smith-Rose, 375
Wollaston Fund of the Geological Society awarded to Dr. J. G. C. Anderson, 122
Wollaston Medal of the Geological Society awarded to Sir Edward Bailey, 122
Wonder of Wings (Nancy Price), *review* by Frances Pitt, 460
Wood (Frances) Memorial Prize for 1948 offered by the Royal Statistical Society, 390
Wood Fibres : Organisation of the Cell Walls of Tracheids and (A. B. Wardrop and Dr. R. D. Preston), *erratum*, 90
Woody Cuttings : The Use of Auxins in the Rooting of (Kenneth V. Thimann and Jane Behnke), *review* by Prof. M. Thomas, 993
Wool : Action of Sulphuryl Chloride on (A. J. Farnworth and Prof. J. B. Speakman), 850
Work (Cold) : The Disordering of β-Brass by (R. W. K. Honeycombe and Dr. W. Boas), 612
Worker (Country) : Housing the (Michael F. Tilley), *review* by R. B., 665
Worker (Young) : Education of the (University of Oxford Department of Education conference on), 801
Working Party Report on the Cutlery Industry, 448
Working Party Report on Rubber-proofed Clothing, 448
Working Party Report on Hand-blown Domestic Glassware, 449
World (Modern) : Reason in the, *review*, 664
World (Post-War) : The Intelligent Man's Guide to the (G. D. H. Cole), *review* by Maurice Bruce, 151
World Co-operation in Science (Prof. J. D. Bernal), 840
World Forestry and Forest Products (Prof. E. P. Stebbing), 710
World Magnetic Data (Comdr. Elliott B. Roberts), 677
World Problem : Afforestation as a (Prof. F. G. Champion), 902
World Resources in relation to the Family : Population and (Family Planning Association of Great Britain International Congress on), 882
World Supplies of Oils and Fats, 123
World War II : German Research in (Colonel Leslie E. Simon), *review*, 219
  Men and Volts at War, the Story of General Electric in (John Anderson Miller), *review* by Sir Arthur Fleming, 113
Wounds of the Head (*British Journal of Surgery* War Surgery Supplement No. 1), 635
Written Expression in Science (Conference at Leicester on), 533

X-RADIATION from a 20-MeV. Betatron (W. Bosley, Dr. J. D. Craggs, W. F. Nash and R. M. Payne), 1022
X- and γ-Radiations : Fluorescence of Highly Insulating Dielectrics produced by (Dr. C. W. Wilson), 520
X-Ray Analysis : Method of Steepest Descents—Improved Formulæ for (Dr. V. Vand), 600
X-Ray Crystallography : Phase-Angle Determination in (Dr. Alexander R. Stokes), 679
  Summer School in (College of Technology, Manchester), 555
X-Ray Diffraction Analysis and Electron Microscopy : The Structure of Biological Tissues as revealed by (Prof. W. T. Astbury), 514
X-Ray Diffraction Rings from Deformed Solid Metal and Metal Powders (Dr. W. A. Wood and W. A. Rachinger), 93
X-Ray Investigation of the Structure of Jute (M. K. Sen and H. J. Woods), 768
X-Ray Measurements of Retained Austenite : Comparison of Metallographic and (William J. Harris, jun.), 315
X-Ray Microspectrography : Intracellular Determination of Protein by (Dr. A. Engström and M. A. Jakus), 168
X-Ray the City ! (Dr. Ernest Fooks), *review* by R. Brightman, 297
Xanthine Oxidase with Virus Multiplication : Association of (Dr. D. J. Bauer), 852
Xanthotoxin from the Fruits of *Ammi majus* L. (Prof. Alexander Schönberg and Aly Sina), 481
3-Deoxy *D*-Xylose : Conversion of *D*-Arabinose into 2-Deoxy *D*-Ribose and (Dr. P. W. Kent, Prof. M. Stacey and Dr. L. F. P. Wiggins), 21

YALE Collections : The (Wilmarth S. Lewis), *review* by Dr. L. Harrison Matthews, 79
Yearbook of the Universities of the Empire, 1947 (Universities Bureau of the British Empire), *review*, 583
Torula-Yeast Fed with Potassium Nitrate : Formation of Oxime-Nitrogen in (Prof. Artturi I. Virtanen and Tihamér Z. Csáky), 814
Yeast Ribonucleic Acid : Structure of (the late Prof. J. Masson Gulland and D. O. Jordan), 561
Yeast Ribosenucleic Acid : Isolation and Separation of the Pyrimidine Nucleosides of (Dr. R. J. C. Harris and J. F. Thomas), 931
Yeasts : Riboflavin Enhancement of Radioactive Phosphate Exchange by (Dr. Walter J. Nickerson and Dr. Lorin J. Mullins), 939
Yeasts and Actinomycetes : Molds, (the late Dr. A. T. Henrici), second edition by Dr. Charles E. Skinner, Dr. Chester W. Emmons and Dr. Henry M. Tsuchiya), *review*, 40
Young Worker : Education of the (University of Oxford Department of Education conference on), 801
Youth Leaders : Summer School for (National Association of Girls' Clubs and Mixed Clubs), 924

ZINC Sulphide : Relation between Photo-conduction and Luminescence in (Dr. M. H. F. Wilkins and Dr. G. F. J. Garlick), 565
Zinc Sulphide Phosphors below Room Temperature : Luminescence Efficiency Changes in (Dr. G. F. J. Garlick and A. F. Gibson), 359
Zoo : Nature's Own (C. M. Beadnell), *review* by Seton Gordon, 744
Zoology : Thirteenth International Congress of, 924

THE DEPLOYMENT OF SCIENTIFIC EFFORT IN BRITAIN

IN his presidential address to the Royal Society on December 1, Sir Robert Robinson referred to the establishment of the Defence Research Policy Committee and the Advisory Council on Scientific Policy as the most interesting development in the relationship of science and administration during the past year, and as the fruition of insistent demands for scientific consultation at the highest levels. The Select Committee on Estimates in its Third Report for the Session 1946–47 (London : H.M. Stationery Office, 1947), on expenditure on research and development, not only made it clear that it looked to this development to secure in the future a better balance in the distribution of the nation's expenditure on research, but also to improve departmental administrative defects in the utilization and direction of research. This development has, however, been accompanied by uneasiness with regard to possible infringement of freedom of research by some form of planning or control, and to detrimental effects on the informal relations and collaboration between the Government and the Royal Society and other bodies.

This informality has been an important factor in maintaining the elasticity which has been a valuable feature of the nation's organisation for research in the past. Sir Robert Robinson has no anxiety on either of these points, and expressed his confidence that whatever gain in efficiency and co-ordination might be secured under the new arrangements, they would not lead to over-organisation or jeopardize the essential conditions of creative scientific work. On the other hand, there is a section of opinion which looks to the new developments to provide the essential framework of general control which will ensure that no important field of research of national interest is neglected,' and that the broad distribution of the nation's resources of trained man-power, equipment, materials and finance for research is in reasonable balance so far as it is possible to judge.

What is in debate at the moment, however, is the limits to which such planning and control can extend. It is not seriously suggested that there is in Great Britain any real wish that the Government would interfere with the free development of fundamental research. There is every reason for believing that the Government as a whole recognizes the vital importance of such research, and that while seeking to ensure that research is adequately endowed, its great leaders will still be able to choose and pursue their own objectives and lines of work.

That being so, there remains a large field within which the general trend of the nation's research effort may be guided or planned, at least on broad lines ; and the economic crisis, which has intensified the need for the wisest use and fullest economy of all our resources, has brought to the fore a question which was already under discussion, namely, how far the methods of attack on urgent objectives adopted during the War, and generally known as 'operational research', can be applied in the present emergency, or even as a regular feature of our peace-time system.

It has been suggested, for example, that Cabinet planning bodies such as that presided over by Sir Guy Plowden, and the Advisory Council of Scientific Policy, may be regarded as operational research sections established at a strategic level in the economic field. As the situation develops, such different bodies may find a common meeting-ground for the exposition of the major economic, scientific and administrative problems which have to be taken into consideration in a peace-time strategy.

Such a conception consorts with that of operational research as scientific management; but Prof. J. D. Bernal's contribution to the discussion at the Dundee meeting of the British Association showed that he wishes the principle to be applied at the highest level of planning authority. He proposed that the technique should be used to determine scientifically the highest priority, in accordance with Prof. Blackett's general principle, and that our effort should be concentrated on those problems which combined the greatest need with the greatest possibility of rapid achievement. The most obvious priorities are coal, steel, building and agriculture; but others, such as transport, distribution and the utilization of chemical wastes, may prove equally important, and the technique of operational research should be used, in his opinion, to find out what has to be done, to verify the success of the operation and to modify its conduct.

These are all in the nature of economic planning, but physical research is required wherever materials and techniques have to be transferred from their present use to a new one. A redistribution of the nation's research effort of the order of that proposed by the Association of Scientific Workers must inevitably pose a large number of problems in research as well as in organisation. Already, however, the redistribution outlined in the White Paper on "Capital Investment in 1948" (Cmd. 7268. London: H.M. Stationery Office, 1947. 6*d*. net) involves some repercussions on the research effort in Great Britain, and in itself raises afresh the whole question of the limits within which economic planning and control are feasible or wise.

The limitations of what is often called 'physical' control are one of the most striking lessons of the last two years, and central detailed control of complex economic relationships is now recognized as much more difficult than was at first realized. This is not to say that the attempt at economic or political planning should be wholly abandoned, although Prof. D. H. Robertson, in his presidential address to Section F (Economics and Statistics) at the Dundee meeting of the British Association, went far towards indicating this. It was not suggested that the task of planning cannot be accomplished by methods of freedom and tolerance; but it was suggested that a real effort should be made to establish, experimentally if need be, as a matter of urgency, the limits of planning. If progressive direction and political democracy are to work together, the main method must be, first to secure the maximum possible dispersion of decisions, and then to influence such decisions by indirect, persuasive measures, such as taxation and credit control.

These doubts as to the value of planning in practice, despite general agreement with it in principle, are largely the outcome of experience, often personal, of the wastefulness of physical controls in man-power. Multiplicity of forms, interminable details and a lack of common sense have in many cases led to hopeless inefficiency, frustration and exasperation. To eliminate the maximum amount of friction rather than to engender it, and to secure the maximum amount of consent and support for proposed administrative action is a primary and urgent need; this is one of the outstanding characteristics of that technique we describe as operational research, and one reason for its striking success.

It was a main purpose of Sir Hubert Henderson's Rede Lecture last May on "The Uses and Abuses of Economic Planning" to direct attention to the danger that on the strength of the misleading analogy of our war-time experience, planning may be regarded as a magic talisman by which those difficulties can be charmed away. That warning is equally valid for operational research, which, like planning, needs much hard thinking before it can be applied effectively to meet the needs either of the economic crisis or of a normal peace-time economy. Sir Hubert Henderson did not combat the view that we must have more State intervention and direction in our economic life than we had before the War; nor did he dispute the need for quantitative programmes for such purposes as the regulation of imports. He insisted, indeed, on the importance of the Government computing as precisely as possible the calls which its programmes for housing, schools, generating stations, etc., will make on man-power, materials and productive capacity; and the White Paper on capital investment indicates that to some extent the Government has accepted the view that it is desirable in the interests of economic balance to restrain within moderate limits the amount of long-term investment work that is set on foot during the next few years. But Sir Hubert Henderson does not agree that there are equally good reasons for slowing down the work of renewing and modernizing industrial plant; and although on this point the White Paper is vague, it seems clear that the shortage of steel will considerably retard the re-equipment and development of industry during the next few years.

This is the feature of the White Paper that is most disturbing. Inevitable as restrictions may be, the repercussions on industrial efficiency and even on our export programme may be very serious. Considerations advanced by Sir Hubert Henderson show the practical impossibility of any detailed planning of the restrictions so as to avoid impeding the expansion of particular branches of industry which will contribute most rapidly to industrial recovery in Britain and restoration of the balance of trade. It may be doubted whether even the most brilliant application of the methods of operational research could do much here to elucidate the uncertainties which surround new industrial development arising from scientific research even in normal times, and one great risk inherent in the new restrictions is that potential new advances may be stifled at birth for lack of laboratory and small-scale plant facilities, so that the opportunity is missed and our competitors overseas are first in the field.

Sir Hubert Henderson believes that over the greater part of our economic system quantitative programmes cannot play the part of 'directives to action' for purposes of increasing prosperity; but he does not believe that large-scale readjustments will be made smoothly or satisfactorily if they are left to the forces of supply and demand, unaided and uncontrolled. Programmes must never be an excuse for evading the crucial questions of costs and prices and competitive efficiency. What was challenged by Prof. Robertson, however, was the practicability of maintaining the distinction made by Sir Hubert Henderson between the Government sector of economic life and the private sector, or that made by Sir Oliver Franks between the strategy functions of Government and the tactical functions to be performed by industry and by labour. He questioned the feasibility of even the minimum of planning and control suggested by Sir Oliver Franks, and whether there is any real distinction between democratic and totalitarian planning.

Prof. Robertson suggested frankly that we should work towards the restoration of the price system as the only way of directing labour in a free society, and incomparably the most effective in any society; and in urging this he is in line with a marked trend of opinion in favour of using indirect persuasive measures in place of the detailed control which in practice proves so dangerous and so irksome. It is true that the great risk here is to the method of agreement stressed by Sir Oliver Franks; but although the task of devising a system for central planning and control in time of peace which does not conflict with democratic ideas and habits may be difficult and dangerous, that is no reason for not making the attempt. Sir Hubert Henderson does not challenge the correctness of Sir Oliver Franks' view that the decisions of Government must be kept general in scope and limited in number, determining merely the broad pattern of the economy and the consequent programmes to be carried out by industry and commerce; but he emphasizes the disturbing influence of external conditions and world trade generally.

Now the scientific investigator entering a new field cannot attempt to isolate all the unknown factors in a problem at the start. He must proceed from stage to stage, as he enlarges the boundaries of his knowledge. To abandon the attempt to order what is within our control because we cannot deal with what is at present beyond it would be the death-knell of scientific advance. If the technique of planning is used in economic affairs in accordance with the scientific method, there can be little fear that it will be over-strained; but its use does demand a large measure of public understanding and an attempt to clear away the false impressions which extravagant claims have created in the past. Only so can we ensure that Government decisions are criticized honestly and constructively, and that the way is prepared for the public consent which is an essential element for their success in a free society.

To the extent to which the technique of operational research contributes to this process by extending the boundaries of public discussion and understanding, its adoption is to be welcomed, at the lower levels as well as at the highest. None the less, unless the points of application are wisely chosen, there is danger that false hopes will be raised and the new method discredited before it has been fairly tried. It may be, and probably is, true, as Prof. Bernal has suggested, that thousands of scientific workers and engineers are being used in a wasteful manner or for purposes of secondary importance both in industry and in the Service research departments; but 'operational research' will not necessarily determine the best distribution. Research in the true sense may be required to assess some of the targets and to decide on which the expenditure of man-power will be most worth while; this will be one of the tasks of Sir William Stanier's panel under the new Committee on Industrial Productivity. But decisions must ultimately be matters of human judgment, in which much besides technical and scientific factors has to be pondered.

EXTERIOR BALLISTICS OF ROCKETS

Mathematical Theory of Rocket Flight

By Prof. J. Barkley Rosser, Dr. Robert R. Newton and Dr. George L. Gross. Pp. viii+276. (New York and London: McGraw-Hill Book Co., Inc., 1947.) 22*s*. 6*d*.

THIS book is the official final report concerning the work done on the exterior ballistics of fin-stabilized rockets at the Allegany Ballistics Laboratory during 1944 and 1945. It is of importance as containing the only serious treatment of the mathematical theory of rocket flight so far published. Much of the material has been known to rocket ballisticians for a considerable time, but has, for security reasons, remained unpublished until now. The authors make generous acknowledgment of the work of their predecessors in Great Britain and the United States; but, because of official regulations, they cannot mention individual contributions. It therefore seems fair to record that in Great Britain the theory was well advanced, and in a form suitable for application, before the outbreak of war, the foundations having been laid as early as 1936 by W. R. Cook and other members of the Rocket Section of the Ballistics Department at Woolwich. Since 1939, work on rocket development has proceeded rapidly both in Great Britain and the United States, and information has been freely exchanged; to this development the authors have made important contributions.

The book contains five chapters and five appendixes. In Chapter 1 the equations of motion are formulated. As Nielsen and Synge have shown (*Quart. Rev. Appl. Maths.*, 4, 201; 1946), even in the simpler case of shell fired from guns, considerable care has to be taken if this is to be done consistently. For a rocket there are added difficulties due to the decrease in mass caused by the expulsion at high velocity of the burning gases from the nozzle. For these and other reasons the principles of the conservation of linear and angular momentum require careful enunciation, and over-simplified treatments of the problem can lead to erroneous results. The authors avoid such pitfalls by a careful examination of the equations governing the motion of systems of particles of changing mass. The equations of motion, as derived, hold for unrotated rockets only; the modifications necessary to cater for a slow axial spin are indicated briefly and are valid if the spin is sufficiently low to avoid all gyroscopic effects.

The chief objects of rocket ballistic theory are to give methods which can be used to calculate (1) the trajectory of a perfect round fired under ideal conditions, and (2) the deviations from this mean trajectory, due to various disturbing factors, of a group of rounds fired in similar circumstances. Of these two problems the second is the harder. The deviations which occur are due to asymmetries of design and functioning and, being generally of a random character, produce a dispersion about the mean trajectory which is larger than that of shell fired from guns. The greater part of this dispersion is usually attained before the propellant has ceased burning, so that deviations during the succeeding part of the trajectory are of lesser importance. In Chapter 3 the authors obtain solutions of the equations of motion which are valid during the burning period under certain simplified assumptions such as constant acceleration and absence of damping, and in Chapter 2 they examine the effects of the conditions existing at 'all-burnt', and of other factors, upon the motion throughout the remainder of the trajectory. These solutions can be used to estimate the dispersion when numerical values of the parameters describing the asymmetries are known. For the unrotated rocket the chief factor causing dispersion has generally been thought to be malalignment of the direction of the thrust. The dispersion observed in trials has usually, however, been much larger than that predicted by the theory when this malalignment is taken to be the same as that of the nozzle axis. The reasons which have been advanced to account for this discrepancy, and the other factors which contribute to the dispersion, are fully and completely discussed in an unbiased manner and are illustrated by numerical examples from actual trials. In this connexion, the reviewer has only the minor criticism to make that the term 'dispersion' is sometimes used to cover deviations which are systematic and not random.

In Chapter 4 the effect of 'tip-off' at launch from the launcher (projector) is considered, and in Chapter 5 the 'rocket functions', in terms of which the solutions of the equations are expressed, are described and fully tabulated. These functions are related to the Fresnel integrals but, being monotonic, are more suitable for interpolation. The two basic functions $\mathrm{rr}(x)$ and $\mathrm{rj}(x)$ are essentially the functions $(K \pm H)/\sqrt{\pi}$ introduced by Lash Miller and Gordon (*J. Phys. Chem.*, 35, 2785; 1931).

The book is written in a clear and lucid manner throughout, and is intended not only for the trained man of science and rocket ballistician—for whom it will be invaluable—but also "for the person with little scientific training who is interested in what makes a rocket go". The latter type of reader will no doubt wish to omit the more mathematical parts of the book, but the introductory remarks at the beginning of the sections and the many numerical examples will give him a clear picture of the principles and peculiarities of rocket flight.

ATOMIC ENERGY

Atomic Energy in Cosmic and Human Life

Fifty Years of Radioactivity. By Assoc. Prof. George Gamow. Pp. xi + 161 + 5 plates. (Cambridge: At the University Press, 1947.) 7*s*. 6*d*. net.

It is a bitter commentary on man's failure as a social being that any mention of atomic energy arouses feelings, not of pleasurable anticipation of a boon conferred, but of dread of an approaching and scarcely to be escaped evil; and that an artist, commissioned to design a book-jacket for a treatise on the subject, should have been inspired, as John Hookham has been by the book that lies before us, to produce an allegorical picture of the fine flower of civilization already half-eclipsed by an obviously deadly and hideous growth. There is a certain bitter irony in the fact that the release of at least a small fraction of the enormous energy lying dormant in the heart of matter, which from one point of view represents the highest peak achieved by the modern scientific age, should also present the greatest single threat to its continued existence.

In spite of the pictorial warning of the dust cover, however, the reader who opens this little volume will find little either to increase or allay his fears. Prof. Gamow, in spite of the title, is much more interested in the achievement than in its possible social consequences whether for good or for evil. That atomic energy can be released explosively, and that it may ultimately be used constructively, are facts which he notes among the many other interesting properties of the atom; he even goes so far as to make some half-humorous suggestions as to how the thing can be done. In the main, however, he is concerned to give an intelligible account of the development of atomic research during the fifty years which have elapsed since the spontaneous release of atomic energy fogged a packet of photographic material in the drawer of Becquerel's desk, and J. J. Thomson discovered the electron.

It is a story well worth the telling; and we may congratulate ourselves that Prof. Gamow has undertaken the task. Prof. Gamow, as many readers of *Nature* will know, has the enviable art of making abstruse matters appear not merely intelligible but even actually entertaining. This is due, in part, to his own very obvious delight in the ideas which he is trying to convey, and in part, no doubt, to a certain naïve and rather charming humour, which bubbles up in his text in the form of little asides, quaint anecdotes and crude little sketches, inserted for no reason more obvious than that it amused the author to draw them. In the main, however, his success is due to the fact that he lives on such familiar terms with his subject that he can afford to treat it with a certain friendly disrespect, and has no hesitation in dragging it down within the comprehension of his prospective readers. This is all very refreshing. There is no reason why a scientific book should be either portentous or dull. One caveat, however, might be taken. It is not amusing to christen 'one million electron-volts' a 'crocodile'. Nothing can be less funny to an outsider than a private family joke, even when, as in this case, its retailer takes the trouble to explain it at length. When, as in the case of the 'crocodile', it is repeated on page after page of the text, it is apt to become somewhat annoying.

Prof. Gamow has divided his book into three sections. In the first, under the title of "Modern

Alchemy", he sketches the development of nuclear physics, from the early discoveries of radioactivity to the latest available publications. In this chapter he, as it were, sets the scene for the final *dénouement* and introduces us to the leading characters. The sketch is, of course, far from complete as a history of fifty years of scientific effort; but Prof. Gamow has a good eye for the main points, and it is surprising how much exact information he has succeeded in compressing into these fifty-two pages. In the second section, "How the Stars use Atomic Energy", Prof. Gamow discusses in considerable detail the cosmic aspects of atomic energy, and the processes by which the energy of the universe, assumed to have been originally all in nuclear form, is being steadily transformed into the radiant light and heat from which all our sources of terrestrial energy are ultimately derived. Much work has recently been done on this subject, and the main outlines and some of the details are now becoming sufficiently clear and certain; and this summary of the present position is very welcome. Few writers on the cosmical aspects of physics can avoid speculations, such as those which we enjoyed so much in the works of Eddington and Jeans, about the birth, progress and possible end of the universe, and Prof. Gamow is certainly not of their number. One may say that his account of the matter seems quite as convincing, and just as fascinating, as those of his predecessors in the field.

In the final section, "How can Man use Atomic Energy?", the author gives an account of the physical principles underlying the purposive release of atomic energy, whether for destructive or for constructive purposes. Prof. Gamow's mastery of the subject is evident in every page of the text, though in fact he reveals nothing which was not implicit in Dr. Smyth's official report. In these times, when a scientific author must write with one eye on his readers and the other on the police, more could not be expected. However, the official report was so informative on the purely scientific aspects of the problem that Prof. Gamow has quite enough material available for his particular purpose. If there is one portion of the book where we might have hoped for rather more guidance from the author it is in the very brief concluding paragraphs on the peaceful uses of atomic power, on which a considerable amount of information has recently been released in the United States. Possibly Prof. Gamow considers that these economic and technical matters are outside the scope of his present book.

Although the book is entertainingly written, and entirely non-mathematical in character, it is a very serious attempt to present as complete a picture as possible of the atomic energy problem in its scientific aspects, and demands and deserves the close attention of the reader. Prof. Gamow has not shirked the undoubted difficulties of the subject, though he has taken great pains to alleviate them by numerous analogies, illustrations and graphs. What that somewhat hypothetical individual—the general reader—can make of it all must be left for him to discover. He is not likely to find a pleasanter or more competent guide to the subject. Any student about to begin a course on nuclear physics should certainly read the book in order to learn what it is all about; while any student who has just completed such a course might equally profitably read it in order to discover what it has all been about. Many physicists and other scientifically minded people, who realize that during these last few strenuous years they have been unable to keep abreast of this latest efflorescence of science, will thank Prof. Gamow for providing them with this opportunity of bringing their knowledge up to date. The more widely a knowledge of the potentialities for good or evil of this latest addition to our power resources is disseminated the better.

J. A. Crowther

DAY BY DAY ON SKOKHOLM ISLAND

Letters from Skokholm

By R. M. Lockley. Pp. x+244. (London: J. M. Dent and Sons, Ltd., 1947.) 15*s*. net.

The letter form of composition has many advantages, particularly in describing the day-by-day happenings of a rural, or in this case an island, life. Mr. Lockley has written before of islands, and in particular of his own island of Skokholm off the Pembrokeshire coast of Wales; but he has by no means exhausted the interest and fascination of the subject, and we are glad he has recast the letters originally addressed to his brother-in-law, John Buxton, when a prisoner-of-war, and made them into a book.

In the first letter the author discusses why he went to live on Skokholm and the joys of simple living. He continues with various subjects, such as the history of the island and its occupation by man, beasts and birds. It was early populated by rabbits. There are documents dating back to 1324 which show how numerous they must have been. In the winter of 1387–88, 3,120 carcases were brought from the islands of "Schalmey, Schokolm and Middleholm".

Since those days rabbits have continued to flourish on the islands and all attempts to exterminate them have failed. In 1936 Mr. Lockley, having tried trapping, ferreting, snares and nets without any really marked effect, resorted to a virus disease which it was hoped would be 100 per cent effective, but it was not. It had little or no effect.

The best results were achieved with 'Cyano-gas' and the rabbits were really reduced, enabling the author's farming operations to be conducted with much more success.

One of the most interesting letters is that which tells of an old cow grey seal coming ashore on an early October day to give birth to her calf. For four days she "did not stir from beside her child, which she fed at least three times a day, probably oftener. To watch the calf suck the retractable breasts, and to see Clementina"—as the mother had been dubbed—"paw and fondle her lovingly, very humanly, was a happy sight."

Mr. Lockley says that he has found grey seal calves dropped here any time between late July and late December, whereas on the north-west of Scotland calving seems to be confined to September, October and November.

The author's letters cover a wide field, including bird migration and trapping of the migrants for identification and ringing purposes; a visit to Grassholm and its gannets; the Manx shearwaters that throng in such numbers to Skokholm; and many other things. A brief review can but hint at his topics, but reference must be made to the admirable illustrations executed by Mr. Charles Tunnicliffe, which are illustrations in fact as well as in name.

F. Pitt

SCIENCE AND POLITICS

By D. W. BROGAN

Professor of Political Science, University of Cambridge

No one could complain that the nineteenth Riddell Memorial Lectures in the University of Durham are lacking in topicality*. The terrifying efficiency of science, the terrifying inefficiency of politics, make, in combination, probably the most difficult and almost certainly the most urgent problem on the world's agenda. For much of the pressure of contemporary events, much of the strain that the whole world feels and wilts under, comes from the knowledge that the human race has set itself a problem which it may quite possibly prove to be unable to solve. We are faced, in a far truer sense than we were in 1914, with the possibility of a "war that will end war".

This problem is present in Prof. Ritchie's mind and it gives an especial urgency to the general problem that he is discussing, but his theme is not just the "control of the atom bomb". It is the wider theme of the role of science (which, of course, means of men of science) in the modern world and their relationship with the modern State.

It is also the theme of the meaning of the word 'science' in political discussion. Prof. Ritchie is right in linking the two problems, for the discussion of the first is clouded and often made pointless by ambiguity about the second. Faced with the immense power for good and for mischief that modern science puts into the hands of the modern State, the man-in-the-street (including the man-in-the-street who spends his working days in a laboratory) is bewildered and indignant. If he is a scientist man-in-the-street, he is alarmed at his own moral responsibility and tempted to think that the evil comes from letting the control of the scientific resources of the world, or of his own country, fall into wrong, that is, unscientific hands. So he dallies with the dream of a political society in which power and responsibility are united in the same hands. Since the world can be destroyed by men of science, why should not the power to save the world be put into their hands? Sometimes, this hankering after a society 'scientifically' controlled is merely a revival of the old dreams of Platonic guardians or H. G. Wells' "Samurai". More commonly, to-day, it is based on a belief that immense possibilities for good are being thwarted and immense possibilities for evil being created by rulers who, neither by training, nor by interest, understand the world that science has so thoroughly upset.

As Prof. Ritchie suggests, this dream is often given a local habitation and a name in the U.S.S.R.; and, as Prof. Ritchie also suggests, this dream is only a dream. In the Soviet Union, men of science *are* privileged people—like ballet dancers. They are not rulers and, so far as we know anything of the distribution of power in Russia, there is no Russian equivalent of Sir Stafford Cripps, no political ruler who has had a first-class scientific education. It is perhaps worth noting that this dream of a land where science is taken seriously is not new, and the country to which British men of science looked enviously, a generation ago, was Germany; the proof of the superior regard of an enlightened State for science was the Kaiser Wilhelm Institute in Berlin. There is, that is to say, no necessary relationship between a 'right' political organisation and a low regard for science. The Prussian army was once described by an optimistic admirer as "science in a Pickelhaube". Nor is there any necessary connexion between the man of science and a given attitude to politics. If most British, French and, probably, American men of science are 'left', that is due to social and historical conditions in their countries, not to any inherent bias due to a scientific training. Political credulity is quite compatible with a very high degree of scientific accomplishment, as the case of Germany shows. When we say, to-day, that a world so largely remade by science calls for 'scientific government', and by that mean a government by scientists, we are begging a great many questions. We are assuming that there is a unified class of 'scientists' and that this class has an identifiable and uniformly admirable attitude to politics. These things are to be proved, not assumed.

Prof. Ritchie raises, too, the question of the fitness of the man of science as such for political life. It is a question that might be further developed with great profit. It is often confused with the question of the desirability of having a great number of people in politics who have had a scientific education. The concealed assumption in arguments on these topics is that the man of science of the first order has something especially valuable to contribute to politics, and that the way to contribute it is for him to become a politician. The first proposition is, I think, indisputable. But it does not mean more than that in the fields in which the man of science is an expert he should be able to make his opinion heard, that there should be no danger of only one group or individual being heard, that the highest level of relevant public opinion in the scientific field concerned should be given all facilities for influencing general public opinion (including the public opinion of politicians).

It is also desirable that projects calling for a high degree of scientific expertize be planned by people who know how science does, in fact, progress. Prof. Ritchie points out that there is no agreement on how science *does* progress, though he has no doubt that the real principle is that "the wind bloweth where it listeth". In the case of technology, Prof. Ritchie both accepts and welcomes far more general control of experiment, far more general imposition of ends than we have been accustomed to. He accepts these limitations less, one might guess, because he thinks that this is bound to promote technical progress, than because he sees the dangers of uncontrolled 'progress', of technical advances made without its being anybody's business to question or define the 'good' of such progress.

But Prof. Ritchie sees another danger in the credulous and indeed superstitious acceptance of the magical claims of science. That what the man-in-the-street often means by science is an unintelligible magical power is suggested by the way the popular Press treats any real or alleged scientific achievement, by the low standard of critical reporting in this field and by the fine, general confusion of very different kinds of scientific technique which is the attitude of millions who yet smile pityingly at the superstitions of their ancestors. What is admired or worshipped is not scientific methods but a mysterious power. "In short, to be scientific is to be powerful; to possess the 'mana' or power of the witch doctor so much admired and feared by primitive man." There is good reason to fear that a popular decision to put power into the hands of 'scientists' would be far from making for general progress or even safety. Scientific demagogues, scientific revivalists, are quite serious possibilities. Indeed, there is a danger that if real or fictitious scientific attainments were a way to political power, the last state of science (and politics) might be worse than the first. For both science and politics are very jealous taskmasters. It is almost certain that no man of science of the first order could keep his scientific rank and live a full political life at the same time. Indeed, all the pressures of both ways of life are against such a combination. It is not only that science changes rapidly, but that politics is more and more a full-time job. It is not a matter of a few interventions in debate, of a few deputations to ministers, of service on an occasional royal commission. With the great modern extension of the powers of the State, the duties of an active politician have more and more become incompatible with the successful pursuit of any other career. It is a problem that affects more people than men of science. It is, for example, doubtful if even a university constituency to-day would put up with a member doing so little direct political work as Edinburgh agreed to tolerate in the case of Macaulay. If it be said that this is only true of democratic countries (in the Western sense), it can be replied that it does not matter how a great man of science fritters away his time, whether in democratic or dictatorial politics; the price of power is the same—eternal vigilance and a consequent neglect of his primary claim to power, his scientific excellence.

---

* "Science and Politics", by Prof. A. D. Ritchie. (University of Durham, Riddell Memorial Lectures.) (London: Oxford University Press, 1947.) 2s. 6d. net.

It is quite another matter to suggest ways in which the highest scientific opinion should be given opportunities of access to an effective sounding board. Perhaps there should be more university Members of Parliament, more men of science promoted to the House of Lords, more weight given to the considered judgment of organised bodies like the Royal Society; but this is far from the rule of the State by men of science. It is a truth, possibly a sad truth, that the rulers of a State are always politicians, and if they have been men of science, the decision as to whether they have done well or ill by leaving science for politics depends on the degree to which their transfer of allegiance has been a loss to science or a gain to politics; and that in every case is an individual judgment.

Carefully and ingeniously distinguishing between various kinds of scientific technique, Prof. Ritchie takes up the claims of the so-called 'social sciences'. It is true that this ambiguous term is often used merely to placate contemporary taste, to give the impression that the economist or historian or anthropologist or statistician is doing *real* work comparable in importance and in method to work on the atom bomb or on bacteriological warfare or on new applications of nylon or penicillin. But this confidence trick does neither the physical nor the social sciences much good. It is, perhaps, in a natural reaction against this trick that Prof. Ritchie scales down the claims of the social sciences. "The rules already formulated are generally only assertions of what happens for the most part, not of what happens always; they resemble the looser rules of biology, not the stricter ones of physics." This is true, but the application to social problems even of "the looser rules of biology" is highly desirable. Prof. Ritchie thinks that "if there is to be social science which produces control of human beings, legitimate yet in some ways comparable to that control of physical objects which is the fruit of physical science, should it not be a science of persuasion ?". It should, but one drawback of a society largely governed by persuasion is that persuasion becomes an end in itself; winning over the jury, the House of Commons, the electorate is all that matters. Such a society overvalues the arts of persuasion, and the skilled persuader is often genuinely angered when exterior forces refuse to be persuaded as a mass meeting can be, or when a popular vote repealing arithmetic or abolishing rain on holidays proves ineffective. It is in breeding a habit of respect for established truths that a scientific education, or any rigorous education, is useful to the State and to the would-be statesman. 'Social science' is doubly useful in that it can or should breed respect for the awkward fact and that it brings to the notice of the ruler the existence of the awkward fact. Prof. Ritchie goes too far, surely, when he writes "there is one genuine improvement to be recorded of the last 150 years that can definitely count as scientific: i.e. the collection and use of social statistics". That the growth and improvement of statistical methods is one of the most valuable conquests of the social sciences is undoubted. But statistics as such may be mere information; a statistician may have no very helpful ideas about what questions to ask or any clear idea of what to do with his own answers. Social scientists must continually ask themselves, as Prof. Lynd recommends them to do, "knowledge for what ?". Statistical questions and answers are often about categories which must, so far as is humanly possible, be defined before the statistical question can be usefully put. Mere knowledge of numbers of Hindus and Moslems in India is barren unless we have some idea of what we mean by Hindus and Moslems. Surely another great gain of the past 150 years has been an extension of sympathetic curiosity about human society, so that we do not now think of China or India or even of savage societies exclusively in our own terms ? We do know a great deal more about the mechanisms of other societies and indeed about the mechanisms of our own society than was known 150 years ago—or much later. Anthropology and sociology have not been merely efforts in cataloguing (though many books in these fields have been that and nothing more).

Primitive as it is, social science is not as primitive as it was. In its methodology it is not like physics or even the biological sciences, and its results are less certain, less general, less permanent. But into the study of human affairs something of the spirit of the exact sciences has been imported, and one fairly well established result has been the understanding of the great differences which there must be between the exact sciences and the would-be sciences of social organisation and human behaviour. The acceptance of as much of the spirit of the exact sciences as human frailty and the character of the materials permits, the acceptance of the idea that an exact, infallible, quasi-mathematical science of society is impossible, these results are not everything, but they are something. If Prof. Ritchie's lectures devote more space to eradicating error and exposing false analogies than to laying down the lines of a scientific politics, his time and his readers' time has not been wasted, since the weeds tend to grow up again, and since the new Riddell Lectures with great skill bring home the nature of the problem, both to the reader who thinks that the creation of a social science is easy and to the reader who thinks that it is superfluous.

EDIBILITY OF THE EGGS OF BIRDS

By Dr. HUGH B. COTT
University Museum of Zoology, Cambridge

IN a previous communication[1], a preliminary account was given of observations and experiments on the relative edibility of the flesh of birds. Full details of this research have now been published elsewhere[2]. During the past two years, this work has been extended to an investigation of the relative edibility of birds' eggs. Final results of the inquiry, which is still in progress, will not be available for some time; but since, with the exception of a paper by C. F. M. Swynnerton published in 1916[3], the subject appears hitherto to have remained almost unexplored, it would now seem appropriate to summarize the new observations and to indicate certain conclusions to be drawn from them.

The bulk production and purchase of various foodstuffs (including eggs) during the War led to a widespread use of tasting panels (together with other methods for the assessment of quality) for the purposes of standardization and grading. At the Low Temperature Research Station, Cambridge, a tasting panel was already in existence in 1936[4]; and I take this opportunity of expressing my indebtedness to the three members of this panel—Dr. J. Brooks, Mr. H. P. Hale and Dr. J. R. Hawthorne—whose skill and experience have made possible the reliable assessments of palatability which form the basis of the present inquiry. Sincere thanks are also due to the Superintendent of the Station for allowing me storage and many other facilities in his Department.

The method of assessment was similar to that used in routine examination of fowls' eggs. Each sample was tested in the form of a scramble, prepared over steam, a numerical score being awarded on a scale ranging from 10·0 (excellent flavour) to 2·0 (inedible). In general, seven or eight species were tested at one session. Members of the panel were in all cases unaware of the identity of the samples to be examined (except in the case of a fowl's egg used as a control); and they recorded their results independently. The majority of species listed below were examined on two occasions by each taster, so that in general the mean edibility rating for a species is based upon six independent assessments. Eggs of eighty-one species, belonging to eleven orders and thirty-five families, have now been examined. In the following list these are arranged in order of palatability.

GROUP A (RELATIVELY PALATABLE)

Domestic fowl	8·8
Coot (*Fulica a. atra* Linn.)	8·3
Moorhen (*Gallinula c. chloropus* (Linn.))	8·3
Lesser black-backed gull (*Larus fuscus grællsii* Brehm)	8·3
Kittiwake (*Rissa t. tridactyla* (Linn.))	8·2
Herring-gull (*Larus a. argentatus* Pont.)	7·9
Common tern (*Sterna h. hirundo* Linn.)	7·8
Fulmar petrel (*Fulmarus g. glacialis* (Linn.))	7·7
Greater black-backed gull (*Larus marinus* Linn.)	7·7
Guinea-fowl (*Numida m. meleagris* (Linn.)	7·6
Razorbill (*Alca torda britannica* Ticehurst)	7·6
White-naped crane (*Grus vipio* Pall.)	7·5
Chaffinch (*Fringilla cœlebs gengleri* Kleinschmidt)	7·5
Hedge-sparrow (*Prunella modularis occidentalis* (Hart.))	7·5
Partridge (*Perdix p. perdix* Linn.)	7·3
Lapwing (*Vanellus vanellus* (Linn.))	7·3
Spur-winged plover (*Lobivanellus lobatus* Lath.)	7·3
Stock-dove (*Columba œnas* Linn.)	7·3
Jackdaw (*Corvus monedula spermologus* Vieill.)	7·3
Spotted flycatcher (*Muscicapa s. striata* (Pall.))	7·3
Domestic turkey	7·2
Red-legged partridge (*Alectoris r. rufa* (Linn.))	7·2
Bullfinch (*Pyrrhula p. nesa* Math. and Ired.)	7·2
Southern guillemot (*Uria aalge albionis* With.)	7·1
Great skua (*Stercorarius s. skua* (Brünn))	7·1
Rock-dove (*Columba l. livia* Gmel.)	7·1
House-sparrow (*Passer d. domesticus* (Linn.))	7·1
Common gull (*Larus c. canus* Linn.)	7·0
Dipper (*Cinclus c. gularis* (Lath.))	7·0

GROUP B (INTERMEDIATE)

Hobby (*Falco s. subbuteo* Linn.)	6·9
Cirl bunting (*Emberiza c. cirlus* Linn.)	6·9
Black-headed gull (*Larus r. ridibundus* Linn.)	6·8
Wood-pigeon (*Columba p. palumbus* Linn.)	6·8
Little owl (*Athene noctua vidalii* Brehm)	6·8
Kestrel (*Falco t. tinnunculus* Linn.)	6·7
White-fronted goose (*Anser a. albifrons* Scop.)	6·7
Carrion-crow (*Corvus c. corone* Linn.)	6·7
Magpie (*Pica p. pica* (Linn.))	6·7
Pheasant (*Phasianus colchicus* Linn.)	6·6
Domestic duck	6·6
Robin (*Erithacus rubecula melophilus* Hart.)	6·5
Rook (*Corvus f. frugilegus* Linn.)	6·3
Skylark (*Alauda a. arvensis* Linn.)	6·3
Catbird (*Dumetella carolinensis* (Linn.))	6·3
Sparrow-hawk (*Accipiter n. nisus* (Linn.))	6·2
Little tern (*Sterna a. albifrons* Pall.)	6·1
Eider (*Somateria n. mollissima* (Linn.))	6·0
Red-backed shrike (*Lanius c. collurio* Linn.)	6·0
Swallow (*Hirundo r. rustica* Linn.)	6·0
British jay (*Garrulus glandarius rufitergum* Hart.)	5·8
Long-tailed tit (*Aegithalos caudatus rosaceus* Mathews)	5·8
Blackbird (*Turdus m. merula* Linn.)	5·8
Greenfinch (*Chloris c. chloris* (Linn.))	5·7
Chiffchaff (*Phylloscopus c. collybita* (Vieill.))	5·7
Meadow-pipit (*Anthus pratensis* (Linn.))	5·7
Sand-martin (*Riparia r. riparia* (Linn.))	5·7
Capercaillie (*Tetrao u. urogallus* Linn.)	5·5
Song-thrush (*Turdus e. ericetorum* Turton)	5·5
Cowbird (*Molothrus a. ater* (Bodd.))	5·4
Tree-sparrow (*Passer m. montanus* (Linn.))	5·3
Yellow bunting (*Emberiza c. citrinella* Linn.)	5·3
Gannet (*Sula bassana* (Linn.))	5·3
Oyster-catcher (*Hæmatopus ostralegus occidentalis* Neum.)	5·2
Bar-headed goose (*Eulabeia indica* (Lath.))	5·2
Dabchick (*Podiceps r. ruficollis* (Pall.))	5·0
Turtle-dove (*Streptopelia t. turtur* (Linn.))	5·0

GROUP C (RELATIVELY UNPALATABLE)

Puffin (*Fratercula arctica grabæ* (Brehm))	4·8
Sedge-warbler (*Acrocephalus schœnobænus* (Linn.))	4·7
Blackcap (*Sylvia a. atricapilla* (Linn.))	4·7
Lesser whitethroat (*Sylvia c. curruca* (Linn.))	4·5
Shag (*Phalacrocorax a. aristotelis* (Linn.))	4·4
Sandwich tern (*Sterna s. sandvicensis* Lath.)	4·3
Little crake (*Porzana parva* (Scop.))	4·0
Linnet (*Carduelis c. cannabina* (Linn.))	3·9
Ringed plover (*Charadrius h. hiaticula* Linn.)	3·8
Whitethroat (*Sylvia c. communis* Lath.)	3·8
Great tit (*Parus major newtoni* Prazak)	3·5
Reed-warbler (*Acrocephalus s. scirpaceus* (Herm.))	3·4
Blue tit (*Parus cœruleus obscurus* Prazak)	3·3
Eastern house-wren (*Troglodytes a. ædon* (Vieill.))	3·2
Wren (*Troglodytes t. troglodytes* (Linn.))	2·0

An extensive series of experiments has also been carried out to test the preferences of small egg-eating mammals such as the ferret, rat and hedgehog. In each test, the experimental animal was offered a choice as between two egg-samples. On the basis of 454 experiments with rats, it has been possible to arrange the eggs of thirty-five species in their approximate order of palatability for these animals. With hedgehogs, 230 tests have provided a basis for assessing eighteen egg-species. Only 17 tests have as yet been made with a ferret, on eleven egg-species.

From this work it is clear that the eggs of various birds differ very widely in palatability to egg-eating mammals, as they do to man—all these animals showing unmistakable preferences or aversions for particular eggs. It appears also that the assessments by experimental animals are in fair agreement with the human palatability rating. This general agreement is very close for the ferret, and tolerably so for the hedgehog. Rats show wider differences, especially in their rating of various species considered as palatable or intermediate by man. For example, rats appear to class chaffinch, spotted flycatcher and hedge-sparrow as relatively unpalatable, while the bar-headed goose, magpie, dabchick and eider are given a high place in the series.

Similar *pairs* of egg-species offered to the various experimental animals afford a means of comparison, and show the following agreement or disagreement with the human edibility rating :

Experimental animal	Number of paired samples		
	Agreement	Doubtful	Disagreement
Rat	55	19	30
Hedgehog	23	7	10
Ferret	9	3	0

It is perhaps significant that agreement is closest for eggs of low-grade edibility. Thus, among eleven species below 4·9 (Grade C), no fewer than eight, namely, great tit, sedge-warbler, lesser whitethroat, linnet, eastern house-wren, blue tit, whitethroat and blackcap, appear (in the order given) at the bottom of the sequence for rats. Similarly, three of the four Grade C eggs offered to hedgehogs, namely, sedge-warbler, linnet and whitethroat, appear to be the least edible of eighteen species offered to these animals : puffin, on the other hand, is given a high place.

We may here note that Swynnerton's experiments[3], with a mongoose as taster, though not carried far enough to yield a graded sequence of egg-species, tend also to show some coincidence with the present ratings by man—where similar species are available for comparison. Thus, the eggs most acceptable to the mongoose included those of house-sparrow, bullfinch, greenfinch and moorhen ; and those most repugnant, lesser whitethroat, great tit and wren. The above evidence on the preferences of four mammals therefore suggests that the sequence of palatability in terms of human preference may afford a provisional basis for the consideration of ecological and other aspects of the subject.

Eggs belonging to the few orders in which a considerable number of species has been examined show a very wide range of palatability. For example, Charadriiformes grade from 8·3 (lesser black-backed gull) to 3·8 (ringed plover) ; Passeriformes, from 7·5 (chaffinch) to 2·0 (wren). This wide intra-ordinal range appears to indicate that edibility in eggs may be largely independent of systematic status. A comparison of the various orders in this respect should be based upon a more extensive series than has at present been examined. Nevertheless, the following figures may give some indication of relative edibility within various groups :

Order	No. of species	Edibility range	Mean edibility
Procellariiformes	1	—	7·7
Galliformes	7	8·3 — 5·5	7·2
Gruiformes	4	8·3 — 4·0	7·0
Strigiformes	1	—	6·8
Charadriiformes	17	8·3 — 3·8	6·7
Columbiformes	4	7·3 — 5·0	6·6
Falconiformes	3	6·9 — 6·2	6·6
Anseriformes	4	6·7 — 5·2	6·1
Passeriformes	37	7·5 — 2·0	5·6
Colymbiformes	1	—	5·0
Pelecaniformes	2	5·3 — 4·4	4·9

It might be expected, in the absence of contrary evidence, that the palatability of an egg would show some relation to that of the bird which laid it, and that an acceptable or repugnant flavour in the former might be a reflexion of palatable or distasteful properties of the parent. Indeed, it is true that some birds with high-grade flesh lay palatable eggs—as is notably the case with Galliformes, and with some Charadriiformes and Columbiformes. Similarly, in the oyster-catcher both eggs and flesh are unpalatable. Nevertheless, in general there is a wide discrepancy between the quality of the flesh and eggs of various species. Thus, the relatively distasteful common tern, jackdaw, and bullfinch lay palatable eggs. Conversely, many of the species the eggs of which are bitter and repugnant, including turtle-dove, little crake, ringed plover, yellow bunting, tree-sparrow, sedge-warbler and reed-warbler, are themselves good or excellent as food. Such divergences no doubt follow from the fact that while there is a general correlation between coloration and palatability, both for eggs (see below) and for birds[3], the coloration of the egg itself has no relation to that of the parent bird.

We have also to note that there is no close or obvious relationship between the food-habits of a bird and the flavour of its egg. For example, the eggs of many maritime or shore-feeding species such as kittiwake, common gull, herring-gull, lesser and greater black-backed gulls, common tern, great skua, razorbill, guillemot and fulmar petrel, are good in flavour and free from 'fishiness'. The same is true of others outside the series examined. Thus, as I am informed by Mr. G. A. Gibson-Hill and Dr. L. Harrison Matthews, the eggs of king (*Aptenodytes p. patagonica*), gentoo (*Pygoscelis p. papua*), jackass (*Spheniscus demersus*), macaroni (*Eudyptes chrysolophus*) and rockhopper penguins (*E. c. crestatus*) are quite palatable and without any unpleasant or fishy flavour. The last-named is described by Earle (in Murphy[5]) as "particularly fine and delicate in flavour". Similarly, Gibson-Hill and Matthews considered the eggs of black-browed (*Diomedia melanophrys*) and wandering albatross (*D. exulans*) very good eating and nearly as palatable as those of domestic fowl. Conversely, the eggs of some species (see below) which do not eat fish or feed along the shore yet have a more or less pronounced and unpleasant fishy flavour. This apparent lack of correlation between edibility status of the egg and feeding-habits of the parent is again illustrated by insectivorous species, which may have high-grade (spotted fly-catcher, dipper), intermediate (sand-martin), or low-grade eggs (sedge-warbler, reed-warbler, wren). Similarly, the eggs of mixed (seed and insect) feeders may vary widely : thus we have the palatable chaffinch and hedge-sparrow ; the intermediate greenfinch and yellow bunting ; and the unpalatable linnet and blue tit. It appears, therefore, that no simple explanation of distastefulness, in terms of food-derived deterrents, is admissible.

There appears to be a broad relationship between relative edibility and egg-size. The shell-length of the species so far examined ranges from 104·0 mm. (white-naped crane) to 14·0 mm. (eastern house-wren). The five most distasteful eggs, those of the wren, eastern house-wren, blue tit, great tit and reed-warbler, are all among the smallest tested, and range from 14·0 to 18·3 mm. Conversely, the twelve species heading the list as most palatable are mostly large eggs, ranging from 41·0 (common tern) to 104·0 mm.—seven of these species laying an egg larger than the domestic fowl's. This general correlation is apparent from the accompanying graph (Fig. 1), which shows the mean shell-length for species within various palatability-groups.

The relationship appears to hold even within the limits of several orders and families. Thus the gannet is rated at 5·3 as compared with the shag at 4·4 (the respective egg-lengths being 78·1 and 62·9 mm.) ; among Rallidæ, coot (8·3, 52·6 mm.) and moorhen (8·3, 44·4 mm.) are rated above the little crake (4·0, 30·4 mm.) ; among Ploceidæ, the house-sparrow (7·1, 22·5 mm.) is preferred to the tree-sparrow (5·4,

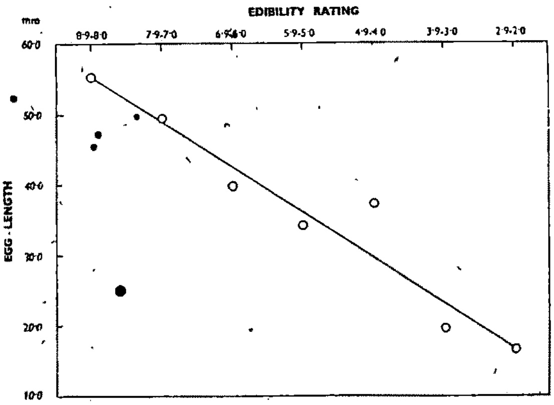

Fig. 1. MEAN SHELL-LENGTH WITHIN GRADED EDIBILITY GROUPS

19·3 mm.); among Hirundinidæ, the swallow (6·0, 19·9 mm.) to the sand-martin (5·7, 18·0 mm.). In several other cases, where the correlation throughout the group is less clear, it is found that the smallest egg is also the least palatable within its systematic group. For example, among three auks tested, guillemot (7·1, 81·5 mm.) and razorbill (7·6, 73·1 mm.) are more palatable than the puffin (4·8, 61·0 mm.); among three plovers, spur-winged plover (7·3, 50·0 mm.) and lapwing (7·3, 47·1 mm.) are both considerably larger and more palatable than the ringed plover (3·8, 35·7 mm.); among six species of gulls, the black-headed gull (6·8, 52·0 mm.) is both the smallest in size and lowest in edibility; among four Columbidæ, the turtle dove (5·0, 30·7 mm.) is again lowest for its group in both respects; while the same is true for six species of Corvidæ and six Fringillidæ, the jay (5·8, 31·7 mm.) in the former and linnet (3·9, 18·0 mm.) in the latter each showing the lowest figure for size and edibility within their respective families. In other groups, notably the terns and game birds, no such correlation is apparent; and on looking at the series as a whole, many outstanding exceptions are to be seen, both among the smaller and larger eggs. Thus, chaffinch, hedge-sparrow, spotted flycatcher, bullfinch and house-sparrow all lay small but palatable eggs graded between 7·5 and 7·1. Similarly, several relatively large eggs are outstanding as exceptions: the status of some of these, such as sandwich tern and bar-headed goose, is still subject to confirmation, since the freshness of the material available may have been in question. The remaining large unpalatable eggs are typically those of shore-living or maritime species such as puffin, shag, oyster-catcher and eider, in which the flavour of the egg is possibly tainted by the bird's diet.

There also appears to be a general correlation between the degree of conspicuousness of the egg and its palatability. Among nineteen species laying cryptic eggs in open situations, twelve occur in the palatable group (A) and five in the intermediate group (B), only two being recorded as unpalatable (C). Moreover, within Group A, cryptic eggs predominate at the head of the list, the first six species (omitting domestic fowl) all falling into this category. Twelve other species, in which non-cryptic eggs are covered by a cryptic parent on open nests, are also distributed (with one exception) in Groups A and B. Of the remaining fifty species, in which the eggs are more or less conspicuously coloured, and are not incubated by a cryptic parent, twelve are unpalatable, representing no less than 80 per cent of all species in Group C. The distribution of cryptic and non-cryptic eggs within graded palatability groups is shown in Fig. 2.

The various species rated as least palatable owe their distastefulness to a variety of unpleasant or foreign flavours: such terms as acid, rancid, soapy, sour, oily, salty, fishy, and bitter occurring in the reports of the panel. Eggs of the oyster-catcher (*Hæmatopus ostralegus occidentalis*) (5·2) are markedly different from those of all other eggs tested, being remarkable both for their strong aromatic odour and flavour, and for their wide individual variation: thus of three samples examined, the first was rated by the three observers at 4·0, 4·0, 5·0, each member of the panel recording a strong smell and taste of onions; the second, at 8·5, 7·5, 7·0, with normal or nutty flavour; the third, at 4·0, 4·0, 3·0, inedible, with a strong odour and flavour of hemp. Species rated as 'fishy' were numerous, those with a markedly rank and fishy smell and taste being shag (4·4), bar-headed goose (5·2), eider (6·0), sparrow-hawk (6·2), ringed plover (3·8), sandwich tern (4·3) and blue tit (3·3). It will be noted that some of these, such as the sparrow-hawk and blue tit, are not themselves fish-eaters.

But by far the most widespread and important distasteful quality is bitterness. This is a frequent attribute of eggs in the lowest palatability grades. In nineteen species this flavour was more or less pronounced (being noted in at least 50 per cent of tests on the species concerned). Fifteen of these bitter-tasting eggs were those of passerine birds: greenfinch, linnet, yellow bunting, tree-sparrow, meadow-pipit, long-tailed tit, red-backed shrike, sedge-warbler, reed-warbler, chiffchaff, common and lesser whitethroats, eastern house-wren, swallow and sand-martin. It will be noted that all these are small species, laying eggs between 23·0 and 14·0 mm. long. Moreover, the remaining four species recognized as markedly bitter, namely, ringed plover, little tern, little crake and turtle-dove, are in each case the smallest eggs examined within their respective orders or families. To this we may add that the two smallest eggs of Corvidæ (jay and magpie) were both recorded (in two observations out of six for each species) as bitter; the same being true of the puffin—the smallest of three auks examined.

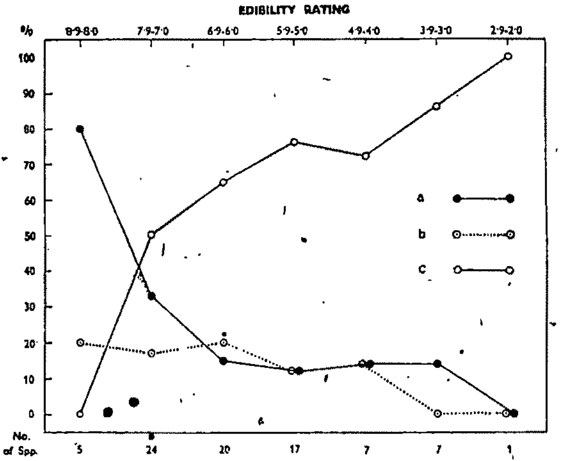

Fig. 2. PERCENTAGES, IN GRADED EDIBILITY GROUPS, OF SPECIES IN WHICH (*a*) THE EGGS ARE CRYPTIC, (*b*) NON-CRYPTIC EGGS ARE COVERED BY A CRYPTIC PARENT, (*c*) NEITHER EGGS NOR PARENTS ARE CRYPTIC

This incidence of bitterness among the smaller eggs laid by members of four different orders, Passeriformes, Charadriiformes, Gruiformes and Columbiformes, raises an interesting ecological question, and suggests that this quality may have been developed as a deterrent to attack by potential egg-eating predators. Obviously, the point requires further investigation, especially in the light of field observations, but the suggestion appears to be supported by three types of evidence.

In the first place, while distasteful properties of the egg appear to be neither directly related to the feeding-habits nor to the palatability of the parent bird, they are, on the other hand, often associated with small size and with conspicuousness. Size is an important factor in the vulnerability of a species in Nature. In the absence of compensating adaptations, smaller birds are liable to attack by a wider range of predators, and are less able to protect themselves and their eggs during the incubation period than larger species. Consequently any deterrent property such as relative distastefulness in the eggs of such birds is likely to be of selective value in the interspecific struggle for existence—especially if it is associated with conspicuous coloration easily recognized and remembered by potential predators.

Secondly, Rensch[6] has shown, in his work on the sensitivity of birds to various tastes, that the lower limit of (externally ascertainable) taste perception is not markedly different from that of man; and that while relative insensitivity to bitterness is characteristic of birds feeding on seeds or insects which often have a sharp or bitter flavour, other species, and in particular birds of prey, such as the goshawk (*Accipiter gentilis*) and tawny owl (*Strix aluco*), are especially sensitive to bitterness.

A third approach to the question is through feeding experiments with egg-eating predators. We have already noted that there is a fair agreement between the palatability ratings of man and the apparent preferences of the ferret, rat, hedgehog and mongoose, and that this agreement is closest for the eggs rated as least edible by man. The series of thirty-five egg-species used in the rat tests includes eleven species rated as bitter, and all these occur in the lower half of the palatability sequence. Among eighteen species used in the hedgehog experiments, the three which appear at the end of the list as least palatable to these animals are the only three markedly bitter eggs offered.

In conclusion, it may be noted that previous work on the relative edibility of the flesh of birds affords a series of facts parallel in many respects to those here considered. Thus cryptic coloration, whether of plumage or egg-shell, appears to be correlated with palatability; and conspicuousness, in otherwise vulnerable species, often to be associated with a distasteful or deterrent property. I hope to continue the present investigation next season, and should be glad to hear from anyone (*a*) who has tasted eggs of tropical or other species not usually eaten by man, or (*b*) who might be willing to submit newly laid eggs (of species not included in the above series) for examination.

SCIENTIFIC CENTENARIES IN 1948

By Eng.-Capt. EDGAR C. SMITH, O.B.E., R.N.

THE past year has seen the commemoration of the centenaries of many men and institutions, and thus homage has been paid, memories recalled, interest aroused and history enriched. Notable among commemorations in the realm of science and technology were those associated with the Chemical Society, the Institution of Mechanical Engineers, the Royal Netherlands Institution of Engineers, King's College Engineering Society, and with Edison, Graham Bell and Denis Papin. Papin's work (see *Nature*, Sept. 27, 1947, p. 422) belonged mainly to the seventeenth century, which saw the foundation of the Royal Society in 1660 and of the Paris Academy of Sciences in 1666. Both these bodies sprang from earlier meetings of men with scientific leanings, and the meetings in France are recalled by the tercentenary of the death of Marin Mersenne, who carried on a large correspondence with men of science and joined with Mydorge, Roberval, Pascal and others in friendly discussions. Born at Souitière (Sarthe) on September 8, 1588, he was educated at La Flèche, where for a time Descartes was his school-fellow, studied at the Sorbonne and entered the priesthood. He became the superior of a convent of his order in Paris, and he died there on September 1, 1648. An amiable and conciliatory man, he was given to experimenting, translated Galileo's mechanics, contributed to mathematics and was much devoted to music.

Turning back to the later part of the Renaissance, the year 1548 saw the birth of Simon Stevin, the Dutch mathematician, a friend of Prince Maurice of Orange, by whom he was made quartermaster-general of the Dutch Army. His best work was done in fortification and military engineering; but he is remembered for his invention of decimal fractions and as one of the first to revive the study of statics. Cajori wrote of him as "a man remarkable for attainments in science, independence of thought and extreme lack of respect for authority". His statue was erected at Bruges in 1847.

It was such men as Stevin and Mersenne, whose lives overlapped those of Kepler, Galileo and Newton, who helped to pave the way for the great discoveries and advances made in the eighteenth century, so rich in the names of famous men, of whom the first to be mentioned is John Bernoulli, who died at Basle on January 1, 1748. No fewer than eight members of the Bernoulli family achieved fame as mathematicians, John being the eldest. His equally distinguished brother James died in 1705 at the early age of fifty, but John lived to be eighty years of age, leaving two sons, Daniel and John, and a grandson, another John, to maintain the family traditions. Especially remembered for his work on the calculus, John the first had a temperament in marked contrast to that of the priestly Mersenne; but, said Ball, "he was, however, the most successful teacher of his age and had the faculty of inspiring his pupils with almost as passionate a zeal for mathematics as he felt himself". Born at Basle on August 7, 1667, from 1695 to 1705 he held a chair of mathematics at Groningen and then returned home to fill the chair left vacant by his brother's death. For twenty years he corresponded with Leibniz. He was a foreign associate for forty years of the Paris Academy of Sciences, and D'Alembert declared that whatever he knew of mathematics he owed to the works of this great mathematician.

Bernoulli's fame was earned by work steadily pursued over half a century; the name of his contemporary, the German physicist and ecclesiastic, Ewald Georg von Kleist (1700–48), is remembered for a single electrical experiment made in 1745 with a phial, a nail and an electrical machine. Much the same experiment was made a year later by Musschenbroek at Leyden, giving rise to the so-called Leyden jar, a piece of apparatus which became popular with itinerant showmen. Kleist, who was dean of the cathedral at Cammin, in Pomerania, made his experiment in his house, and a tablet thereon, erected in 1898, recalls the episode.

If John Bernoulli be regarded as the outstanding man of science who died in 1748, the most eminent born that year was undoubtedly the French chemist Claude-Louis, Comte Berthollet, one of that distinguished group who made Paris the scientific centre of the world in the days of Napoleon. Though born at Talloires near Annecy, in the Savoy, then an Italian possession, and educated partly at Turin, Berthollet passed the greater part of his life in the French capital, near which he died in 1822. As the discoverer of the composition of ammonia, the supporter of the views of Lavoisier, the director of the Government dye-works, a reorganiser of the Academies and the companion of Napoleon, he enjoyed a great reputation. Sir David Brewster, who was in Paris in 1814, related how he was taken by Laplace, Biot and Poisson to see Berthollet at his house at Arceuil, and how Berthollet and his wife met them: "A more homely pair you never saw, and though very rich, they were dressed little better than a decent Scotch farmer and his wife". It was at Berthollet's house that the English chemist and experimentalist Sir Charles Blagden (1748–1820) died suddenly. An army surgeon, Blagden was a legatee of Cavendish, a friend of Sir Joseph Banks, and during 1784–97 was secretary of the Royal Society. Before his election, there had been dissensions among the fellows of the Society, but on his assumption of office, records Weld, "The ordinary meetings resumed their former scientific appearances, and if harmony was not entirely restored, at least there was no longer any violent attempts to interrupt the regular business of the Society".

Two other distinguished French men of science were born in the same year as Berthollet, one being the botanist Antoine-Laurent Jussieu (1748–1836), long connected with the Jardin des Plantes, the other Jacques-Dominique Comte de Cassini (1748–1845), the last of the four Cassinis who directed the Paris Observatory. The Bernoullis, the Jussieus, and the Cassinis are all examples of science appealing to several members of the same family, and another such family is recalled by Johann Friedrich Gmelin (1748–1804), who held chairs at Tübingen and Göttingen. He and his relations were known as physicians, chemists and botanists. The year 1748 also saw the birth of Scipione Breislak (died 1826), an Italian geologist and a friend of Cuvier, of Pierre Louis Guinaud (died 1824), the watchmaker of Les Brenets near Le Locle in the Swiss Jura, who made important advances in the manufacture of optical glass, and of John Playfair (died 1819) of Edinburgh. It is perhaps difficult now to realize the great admiration and esteem felt in Scotland for Playfair. One of the most cultivated men of his time, he started his career as a minister, successively held the chairs of mathematics and natural philosophy in the University of Edinburgh, was a founder of the Royal Society of Edinburgh, and the centre of an interesting circle of literary and scientific men. Among his greatest friends was James Hutton. Five years after Hutton's death in 1797, Playfair published the classic "Illustrations of the Huttonian Theory of the Earth", a book Geikie advised every young student of geology to read (see *Nature*, Nov. 22, 1947, p. 694). "How different," wrote Geikie in 1897, "would geological literature be to-day if men had tried to think and write like Playfair." Finally, mention must be made of the tragic figure, Phillippe-Frédéric, Baron de Dietrich (1748–93), who like Lavoisier, Bailly and Bochart de Saron fell beneath the guillotine. A mineralogist of note, a member of the Academy of Sciences, a royal commissioner of mines and a magistrate of Strasbourg, during the Revolution he fled to Switzerland, but returning to France voluntarily he was tried once and acquitted, only to be condemned by the revolutionary tribunal. He was executed on December 28, 1793. By one account, it was at Dietrich's house at Strasbourg that Rouget de Lisle composed the "Marseillaise".

Moving forward another hundred years to the middle of last century, as might be expected inventors and engineers take their places besides the devotees of science, and no one will question the greatness of George Stephenson, universally honoured as the 'father of railways', who died at his home, Tapton House, near Chesterfield, on August 12, 1848, at the age of sixty-seven. Of scarcely less stature was Jons Jakob, Baron Berzelius, the Swedish chemist, who passed away at Stockholm five days earlier, at the age of sixty-eight. In the gardens at Stockholm "not far from the statues of kings, amidst trees, with a fountain playing before it, is the bronze figure of Berzelius, the great chemist. He is enveloped in a thick heavy mantel, the stoic fur of the philosopher, and the face and the whole pose indicate the union of perseverance and intelligence which belong to such conquerors in the field of science." Sir William Ramsay once said of Berzelius that "he believed that since the time of Boyle none had done more for the advancement of chemistry". To the same period belong the labours of the German engineer Johann Albert Eytelwein (1764–1848), and the French engineer Baptiste-Alexis Legrand (1791–1848), for sixteen years head of the Corps des Ponts et Chausseés, and also the Alsatian mechanician Joshua Heilmann (1796–1848), who secured for himself a place among the improvers of textile machinery. On January 8, 1848, Caroline Herschel, long the assistant of her brother Sir William Herschel, died in Hanover when nearly ninety-eight. Twenty years before, the Royal Astronomical Society had awarded her its Gold Medal, and seven years before her death had placed her name among its honorary members, the first woman to be so honoured. Another astronomer who worked in the early part of the nineteenth century was the Jesuit father, Francesco de Vico (1805–48), who six times won the gold medal offered by the King of Denmark for the discovery of telescopic comets. De Vico's work was done in Rome; but the political disturbances of 1848 led him to join Georgetown College in the United States. Travelling to England on business, he contracted typhus and died in London on November 15, 1848. To these names may be added those of Sir George Steuart Mackenzie (1780–1848), who discovered the identity of diamonds and carbon; Wilhelm Albrecht (1786–

1848), who introduced scientific methods into agriculture in western Germany and directed the Normal Agricultural Institute at Geisberg; George Augustus Goldfuss (1782–1848), professor of zoology and mineralogy at Bonn; Josiah Christopher Gamble (1776–1848), one of the founders of the British chemical industry, and Sir John Barrow (1764–1848), who from being a timekeeper in a Liverpool iron foundry rose to be the Secretary of the Admiralty and became the virtual founder of the Royal Geographical Society. The cottage at Ulverston in which Barrow was born now bears a memorial tablet, while on the summit on the hill behind is the tower erected in his memory.

In an age which has seen the spread of education, the founding of many colleges, universities, laboratories and scientific societies, a remarkable increase in inventions and the harnessing of science to industry, the centenaries of men of science born a century ago, who as investigators, teachers, writers or administrators have left their mark, fall fast and thick. Each year, indeed, brings a longer and longer list. Taken in chronological order, the year 1848 saw the birth in February of Josiah Richard Perrett (died 1918), who from a dockyard apprentice rose to be the chief naval architect at Elswick, where he built many fine warships. In March occurred the birth of Shelford Bidwell (died 1909), known for his work in electricity and magnetism, who served as president of the Physical Society during 1897–99; of the Austrian scientist Josef Maria Pernter (died 1908), for many years a leader of meteorology in his country; of the German pioneer of flight, Otto Lilienthal, who was accidentally killed while gliding in 1896, and whose monument is to be seen at East Lichterfelde, Berlin; and of Henry Marion Howe (died 1922), the leading American metallurgist of his day.

The Rev. Frederick John Jervis-Smith (died 1911), of Trinity College, Oxford, who represented his University at the tercentenary of Torricelli at Faenza in 1908, was born in April 1848; and Vero Charles Driffield (died 1915), the eminent manufacturing chemist and collaborator with Hurter, was also born in the same month. In July of that year the physicist Baron Roland von Eötvös (died 1919) was born at Budapest. A pupil of Helmholtz, Kirchhoff and Bunsen, he founded the Hungarian Mathematical and Physical Society and for many years was president of the Hungarian Academy of Science. In the following month Paul Henri (died 1905), brother of Matthieu-Prosper Henri (1849–1903), was born at Nancy. Their outstanding work at the Paris Observatory gained for them both the associateship of the Royal Astronomical Society. Seldom, if ever, have two brothers been such close collaborators. The famous German chemist, Victor Meyer (died 1897), was born in Berlin on September 8, 1848, and became Bunsen's successor at Heidelberg, where Sir Edward Thorpe first knew him. Thirty years later, Thorpe delivered the memorial lecture on Meyer to the Chemical Society, giving a fascinating picture of one whom he first remembered as a "bright-eyed youth, quick of movement and action, ready and fluent of speech and full of zeal". In many of his characteristics, Meyer, said Thorpe, was not unlike Davy.

The list of physicists born in 1848 includes also Sir Arthur Rücker (died 1915), Henry Augustus Rowland (died 1901), and Sigmund von Wroblewski (died 1888). Rücker was born on October 23 and Rowland on November 27. A Royal Medallist and secretary of the Royal Society, Rücker was professor of physics for fifteen years at the Royal College of Science, London, and then principal of the University of London. Rowland held the chair of physics in the Johns Hopkins University, Baltimore, from its foundation in 1876, a post for which he was recommended by Maxwell. Wroblewski, like many of his compatriots, suffered for taking part in the Polish insurrection in 1863, and spent six years in exile in Siberia. Afterwards he was able to work under Helmholtz; in 1874 he went from Berlin to Strasbourg, and in 1882 became professor of experimental physics in the University of Cracow; where, working with Karl Olszewski, he liquefied in considerable quantities the three gases oxygen, nitrogen and hydrogen. He met his death on April 16, 1888, at the early age of forty, through the accidental overturning of a lamp.

Finally, it may be recalled that on May 12, 1748, Thomas Lowndes died at the age of fifty-five, leaving his property in Cheshire to found a chair of astronomy at Cambridge, the first occupant of which was Dr. Roger Long (1680–1770), vice-chancellor of the University from 1733 until 1769. The reason for Lowndes' bequest is obscure, for his activities had been concerned with the colonization of South Carolina, the manufacture of potash, the decay of England's wool industry and the supply of salt to the Navy.

OBITUARIES

Prof. Max Planck, For.Mem.R.S.

PROF. MAX PLANCK died on October 4 in Göttingen at the age of eighty-nine. The burial service was held in the crowded church of St. Alban, where addresses of appreciation were given by the officiating minister and by Profs. O. Hahn and M. von Laue. It is hoped to hold a larger memorial service in the spring of next year, probably on the ninetieth anniversary of Planck's birthday.

Planck was born in Kiel on April 23, 1858. His father was professor of constitutional law in the University of Kiel and later in Göttingen. He took the degree of doctor of philosophy at Munich at the age of twenty-two, the subject of his thesis being the second law of the mechanical theory of heat. In 1885 he was appointed professor *extraordinarius* in Kiel. His association with the University of Berlin began in 1889 and lasted for fifty years: he was appointed professor *ordinarius* in 1892. In 1920 he was awarded the Nobel Prize for Physics and in 1926 was elected a foreign member of the Royal Society. He was granted the title of professor emeritus in 1926; but this was not to usher him to a period of retirement, for shortly afterwards he became president of the Kaiser Wilhelm Institute for the Promotion of Science, an appointment which he held until 1937. Planck's original and critical writings extended from about 1879 until shortly before his death. He was, indeed, engaged in writing down some of his latest views during his visit to Great Britain last year.

In his early twenties, Planck attended lectures given by Kirchhoff in Berlin. He had a great admiration for Kirchhoff's work, and it may be supposed that this was one of the influences which directed him to the study of thermodynamics and the theory of radiant heat.

A very early paper, written at the age of twenty-two, was on the theory of the law of saturation. The statement of this law he expresses in the form: in the case of each isothermal the straight line, parallel to the axis of abscissæ, which represents the pressure of the saturated vapour, lies so that the areas between it and the isothermal are equal. This work appeared almost simultaneously with a paper by Clausius, who reached the same conclusion.

There is a feature of this early paper which is characteristic of his outlook. He was always ready to apply himself to concrete examples and to put his conclusions to the test of experiment. In this case he calculated the pressure of saturated carbon dioxide and made a comparison with the results of Andrews' experiments.

During the following decade, he published a number of papers on thermo-electricity and on the theory of dilute solutions. Between 1890 and 1900 he appears to have concentrated particularly upon thermodynamics and the process of radiation. The first edition of his treatise on thermodynamics appeared in 1897, and this work alone places him in the front rank as a clear and critical thinker. It is perhaps the greatest work on this subject, and it is certainly a classic. At the same time he was writing upon the processes of radiation. He showed that these were to be considered as electromagnetic, the phenomena being confined to the oscillation of certain entities analogous to Hertzian oscillators connected in some way with the atoms of matter. The phenomenon of absorption of radiant heat was not to be regarded as a consequence of ohmic resistance or friction of any kind, but simply as a phenomenon of resonance; the oscillators were regarded not merely as emitters of waves, but also as capable of excitation by incident waves.

These studies of thermodynamics and of electromagnetic vibrations brought Planck naturally to the problem of the distribution of energy in the spectrum of full radiation. His famous formula was first given in the latter half of the year 1900. He had come to the conclusion that the law of energy distribution could be completely solved if the entropy of an irradiated monochromatic resonator could be expressed as a function of its energy U. The essential part of his work was the discovery of this expression. In an earlier attempt he had deduced Wien's law and expected it to have general validity. This law fails as a general law on experimental grounds, so Planck found it necessary to consider more closely the concept of entropy.

By applying Boltzmann's equation from the theory of gases, relating entropy and probability, to a set of resonators the energy of which must necessarily occur in discrete multiples of an amount ε, he was able to show that the entropy was a function of U/ε. At the same time, by means of Wien's displacement law, he realized that, ν being the frequency of the radiation emitted, the entropy was a function of U/ν. He was thus led to his famous relation between the elements of energy and the frequency and to the introduction of the constant h, named universally after him.

This was the climax of Planck's work. It was also a climax in the history of physics, for there had been nothing of greater importance since the time of Newton. But in 1900 there was no suggestion of a climax. Planck's work continued and his contemporaries were unconvinced or sceptical. In the same volume in the *Annalen der Physik* as that in which Planck's work was published appears a paper by Rubens and Kurlbaum on the experimental proof of the law of radiation, in which it is stated that the two formulæ best fitted to express the law are those suggested by Lummer and Pringsheim and by Planck, though Planck's has the advantage of its greater simplicity.

It is also of interest to recall that Jeans' contributions to this question were made between 1900 and 1910, and in this latter year Planck, in a summary of the situation, describes this work of Jeans as faultless and as the most satisfactory from the point of view of the accepted theories of physics, but as a failure from the point of view of experiment. It may be that the unwillingness to accept Planck's theory at this time was partly due to his clear statement of the assumptions made. These may have caused his contemporaries to hope that they might ultimately be set aside, leaving the old doctrines sufficient.

When asked many years later what he had felt in this period, he replied: "I knew I could wait", and on another occasion: "I am glad I led no one astray". The gradual accumulation of data from the domain of atomic physics, from Einstein's theory of the photo-electric effect and from the work of Rutherford and Bohr, are familiar to all students of physics. But it took a quarter of a century of theoretical and experimental work to build up a self-contained quantum theory. This is the measure of the quality of Planck's insight and inspiration.

But he appears always to have hoped for the establishment of a theory harmonizing the classical and quantum points of view. This was evident in his interest, even his delight, in Schroedinger's theory of wave mechanics which, by the title of his first paper, "Quantization as a Problem of Characteristic Values", raised hopes which have not been realized.

On wave mechanics Planck published papers in 1940 and 1941. He does not appear to have followed modern developments beyond this stage.

Planck remained mentally clear and active to the end; but during the last two years he was physically weak and easily became tired during conversation and in his efforts at writing.

There is no doubt about Planck's place in science. His name will be remembered with those of Newton and Einstein for generations. For the shorter period of the lives of those who knew him, he will be remembered, with a rare affection. Among his colleagues and, indeed, among his countrymen, he inspired a deep respect akin to reverence. This was due not merely to the importance and originality of his scientific discoveries, but also to his great personal qualities, to his sympathy, modesty and patience.

His friends and students will delight to recall his piano accompaniments with Einstein playing the violin. Even in Great Britain there are some who have enjoyed his gift as a pianist. He has said that at one time he considered music as a career.

He was twice married and suffered heavy blows in the loss of two sons and twin daughters. These sorrows saddened but did not embitter him, and he was always ready to give sympathy in matters which, compared to his own sufferings, must have seemed trivialities. His second wife and one son survive him. The end of the War had involved him in disaster. His house in Berlin was destroyed and his source of income vanished. In the last days of the War he was homeless and took shelter in a wood until he was recognized by members of the American Army. He ultimately found shelter in very limited quarters in the house of his grand-niece in Göttingen.

Planck was unpopular with the former German Government on account of his refusal to be associated with the movement for 'German physics' and on account of his admiration for the work of Einstein. Moreover, he appealed personally at the highest level for a relaxation of the persecution of Jewish men of science. A very gifted son, a Secretary of State to an earlier German Government, was executed for alleged complicity in the plot to overthrow the Nazi regime in the last stage of the War.

These experiences had greatly enfeebled Planck, when he was invited by the Royal Society to take part in the Newton celebrations last year. In spite of the anxiety of his relatives he insisted on undertaking the journey in order, as he said, to reopen the bridge which united the physicists of both countries. His old friends were pained to see his enfeeblement, but they will all be glad to know that he returned home refreshed in mind and body by the renewal of old friendships and by the hospitality so readily offered. Of the latter aspect of his visit his own words were: "Ich lebe wie im Schlaraffenland".

One of the last letters he wrote was to friends in Britain on the anniversary of his visit, recalling happy memories of it. Before the letter could be posted he had a bad fall and sustained bruises and a slight fracture from which he did not recover.

H. T. Flint

We regret to announce the following deaths:

Prof. J. N. Brönsted, professor of chemistry in the University of Copenhagen, on December 17.

Prof. A. N. Whitehead, O.M., F.R.S., professor of philosophy in Harvard University during 1924–37, on December 30, aged eighty-six.

Erratum.—In *Nature* of December 13, p. 821, the death was announced of Mr. S. A. Courtauld. This was incorrect; the reference should have been to Mr. S. Courtauld, a trustee of the National Gallery, who died on December 1 at the age of seventy-one.

NEWS and VIEWS

Social Studies in Manchester: Appointment of Prof. M. Polanyi, F.R.S.

Prof. Michael Polanyi has been appointed professor of social studies in the University of Manchester in lieu of his present position as professor of physical chemistry. The change of duties will become effective after Easter of this year. Prof. Polanyi graduated in medicine in the University of Budapest. Later he was appointed professor of chemistry in the Technical High School, Berlin, and taught in the Kaiser Wilhelm Institute, publishing much original work. In 1933 he accepted an invitation to become professor of physical chemistry in the University of Manchester, where he has conducted distinguished teaching and research, and has directed a stream of research workers in that subject. Prof. Polanyi's wide experience and range of interests have brought him closely into contact with investigators and teachers in social studies and in economics, and in recent years he has produced a number of papers on aspects of those subjects. These include volumes entitled "The Contempt of Freedom" and "Full Employment and Free Trade", together with a substantial number of essays in this field published in economic and other journals. In 1946 he accepted an invitation to deliver the Riddell Lectures in the University of Durham, his subject being "Science, Faith and Society". He has recently accepted an invitation to give the Gifford Lectures for 1949–50 in the University of Aberdeen.

University College, Exeter, and the Norman Lockyer Observatory

Arrangements have now been completed by which the astronomical observatory on Salcombe Hill, Devon, will become "The Norman Lockyer Observatory of the University College of the South West of England, Exeter". The Observatory occupies a commanding site of about 44 acres above Sidmouth, at an altitude of 565 ft.; and since its foundation in 1912 it has been maintained through funds provided by a few generous donors as a non-profit making corporation with articles of association approved by the Board of Trade. By the will of Lady Lockyer, who died in September 1943, some additional land, with her house and also her residuary estate, were bequeathed to the Corporation. These gifts brought the capital funds of the Observatory up to about £33,000 in March 1947, with an income therefrom of nearly £1,400 a year. The whole property is now being incorporated in the University College of the South West, with the buildings, telescopes and other equipment for astronomical research, under a scheme adopted by the Councils of the College and of the Observatory Corporation. The director (Mr. D. L. Edwards) and chief assistant will thus become attached to the staff of the College, and the registrar of the College will become secretary of the Observatory Corporation. Under the revised articles of association, the future Council of the Observatory Corporation will consist of not more than twenty persons nominated by the Council of the College and not more than five nominated by the Corporation. By this provision, leading British astronomers will still be able to ensure the promotion of the educational and research sides of astronomy, in which, because of lack of financial support, Great Britain has lagged behind other countries in many of the new developments.

The work of the Norman Lockyer Observatory hitherto has mainly dealt with stellar spectroscopy; but the erection of the Mond astrographic instrument has enabled a somewhat wider field of astrophysical research to be included. In all, sixty-one papers from the Observatory have been accepted by the Royal Astronomical Society, in addition to a number of contributions published elsewhere. At present the principal routine programmes of work deal with colour temperatures of stars, bright-line stars, spectrum variables and galactic clusters. Work on the last is at the moment in abeyance, owing to shortage of staff, and progress in the other programmes is retarded for the same reason. Minor programmes are also kept in reserve for use when conditions are not suitable for the main routine work.

Jubilee of the Discovery of the Electron

IN *Nature* of December 6, p. 776, an account was given of celebrations in London arranged by the Institute of Physics, the Physical Society, and the Institution of Electrical Engineers to mark the jubilee of the discovery of the electron by Sir J. J. Thomson in 1897. It is of interest to learn that the event was also remembered on the Continent. The Bernische Naturforschende Gesellschaft held a commemorative meeting in June 1947, with Dr. A. Kurz in the chair. An address was delivered by Prof. André Mercier; as a professor of theoretical physics, he insisted especially on the great influence that the discovery of the electron has had since 1897 on physical theories, particularly under the impulse given by H. A. Lorentz, W. Pauli and P. A. M. Dirac.

Institute of Metals: Elections

THE Council of the Institute of Metals has made the following elections: *Fellows* (members who have rendered eminent service to the Institute), Dr. C. H. Desch, formerly superintendent of the Metallurgy Division, National Physical Laboratory; Sir John Greenly, chairman of the British Non-Ferrous Metals Research Association and a past-president of the Institute of Metals. *Honorary Members* (in recognition of their distinguished services to the science or practice of non-ferrous metallurgy), Prof. P. A. J. Chevenard, member of the Institut de France, known for his work on special steels; Sir Geoffrey Taylor, Yarrow research professor of the Royal Society; Dr. J. F. Thompson, executive vice-president of the International Nickel Company of Canada, Ltd., known for his studies of the science and practice of non-ferrous metallurgy.

Ministries of Food and Health: Lasker Group Award

A LASKER GROUP AWARD for 1947 has been presented by the American Public Health Association to the British Ministries of Food and Health "for the unprecedented programme of food distribution in Great Britain" during the War, "with resulting improvement in the health of the people". The Lasker Award, which takes the form of a statuette of the "Winged Victory of Samothrace", was provided through the generosity of the Albert and Mary Lasker Foundation, and is made either to individuals for their achievement in the field of medical research and public health administration or to groups for outstanding work or research. This is the first occasion on which the award has been given outside the United States.

Nuffield (Penicillin) Research Fellowships

LORD NUFFIELD has given £50,000 to Lincoln College, Oxford, of which Sir Howard Florey is a fellow, to establish three research fellowships in science and allied medicine. The gift is to commemorate the discovery, in the Sir William Dunn School of Pathology, of which Sir Howard Florey is head, of the chemotherapeutic properties of penicillin. The fellowships are to be known as Nuffield (Penicillin) Research Fellowships.

University of Glasgow

THE following appointments in the University of Glasgow have been announced: Prof. Thomas Alty, Cargill professor of natural philosophy, deputy principal; Dr. Basil C. King, lecturer in geology; Messrs. Daniel Martin and Walter Brown, lecturers in mathematics; Messrs. John B. Birks (formerly an I.C.I. Fellow) and G. M. Lewis (from University College, Hull), lecturers in natural philosophy; and (from April 1, 1948) Dr. William C. Hutchison, lecturer in physiology in the University of Edinburgh, and Mr. George Leaf (from the National Institute for Medical Research), lecturers in physiological chemistry.

For the 1947–48 session, 350 students have been admitted to the various first-year classes covered by the Faculty of Science—280 in pure science and 70 in applied. These numbers represent a slight reduction compared with the 1946–47 session. Of the 250 fresh admissions, about 45 per cent are ex-Servicemen. Of the graduate research students who have been registered, or re-registered, about sixty are at the University and forty at the Royal Technical College, Glasgow.

University of Leeds: Appointments

THE following appointments in the University of Leeds have been announced: Dr. W. Bradley (at present research director at the British Drug Houses, Ltd.), professor of colour chemistry and dyeing, in succession to the late Prof. F. M. Rowe; Mr. A. H. Hanson, lecturer in the Departments of Social Studies and Extra-Mural Studies; Mr. H. D. Ursell, lecturer in mathematics, to succeed Mr. R. M. Gabriel as reader in mathematical analysis.

University of Sheffield: Appointments

THE following appointments in the University of Sheffield have been announced: Dr. S. R. Elsden, senior lecturer in microbiology in the Department of Bacteriology; R. O'Rahilly, lecturer in anatomy; T. F. Bamber (at present research assistant), assistant lecturer in the Department of Mining; Dr. J. L. Emery, honorary lecturer in pathology.

Agricultural Research Council: Postgraduate Scholarships

THE Agricultural Research Council announces the following awards of postgraduate scholarships in agricultural science and in animal health, to be held at the university or college mentioned from the beginning of the academic year 1947: P. Aitkenhead (Durham), a two-year research scholarship in entomology; N. Bateman (London), a three-year research scholarship in animal genetics; J. R. Butler (Cambridge), a three-year research scholarship in soil mineralogy; J. W. B. King (Cambridge), a three-year research scholarship in animal genetics; D. Lewis (Wales), a three-year scholarship in biochemistry; A. M. McCallum (Glasgow Veterinary College), a one-year research scholarship in animal health; I. A. Nicholson (Durham), a three-year research scholarship in plant breeding; H. Platt (Liverpool), a one-year research scholarship in animal pathology; Miss P. E. Stokes (London), a three-year research scholarship in plant physiology; K. F. Thompson (Cambridge), a three-year research scholarship in plant genetics; G. M. Urquhart (Glasgow Veterinary College), a one-year research scholarship in animal parasitology; D. P. Webley (Durham), a one-year research scholarship in entomology; Miss J. N. Winfield (Leeds), research scholarship in plant pathology renewed for one further year from October 1, 1947.

Type Cultures of Fungi

FROM January 1, the National Collection of Type Cultures preserved by the Lister Institute has ceased to maintain and distribute cultures of fungi and yeasts; it is now confining its activities to bacteria and viruses. Most of the fungi, except yeasts and fungi of medical interest, from the National Collection of Type Cultures, have been transferred to the Imperial Mycological Institute, which proposes to maintain cultures of phytopathogenic, taxonomic and economic interest, provided expected financial support is forthcoming. Applications for cultures should be addressed to the Director of the Institute at Ferry Lane, Kew, Surrey. Timber-rotting fungi can be obtained, as before, from the Director, Forest Products Research Laboratory, Princes Risborough, Bucks.

Conference on Films in Agriculture

The Scientific Film Association is organising a one-day conference to be held on January 17 at the Caxton Hall, London, at which the present state and the future development of the use of films in agriculture and their place in the drive for increasing production will be discussed. The chair will be taken by Prof. J. A. Scott Watson, chief scientific and agricultural adviser to the Ministry of Agriculture and Fisheries. Mr. G. Goodman (Ministry of Agriculture) will speak on the scope, and Mr. A. Vesselo (Central Film Library) on the sources and distribution of agricultural films. Dr. W. K. Slater (senior education and advisory officer of the Ministry of Agriculture) will discuss the use of the instructional film in agriculture; Mr. R. Kenney, lecturer in agriculture, University of Reading, will deal with its use in university training and research; and Mr. E. Anstey (Film Centre) with the making of agricultural teaching films. In the evening a show of selected British and foreign agricultural films will be given. Further information and tickets (£1 1*s*. each, including buffet lunch and tea) can be obtained from the Conference Secretary, Scientific Film Association, 34 Soho Square, London, W.1.

Geographical Distribution of Deaths from Cancer

The General Register Office has initiated a series of occasional publications under the title of "Studies on Medical and Population Subjects". The purpose of the series is to present a more detailed treatment of certain important subjects than is possible in the Registrar General's Annual Statistical Review. The first publication is by Dr. Percy Stocks, and studies geographical variations in mortality from cancer of various sites (Regional and Local Differences in Cancer Death Rates. London: H.M. Stationery Office. 1*s*. net). One of the underlying difficulties in such a study is the uncertainty as to the accuracy of the certified cause of death, particularly in relation to inaccessible sites. It is, however, impossible to dismiss all the local differences demonstrated by Dr. Stocks as due to such variations in certification practice, and this study investigates other possible explanations. Correlations with social indices show a marked relationship with stomach cancer, but none with lung cancer. However, lung cancer mortality is closely associated with annual hours of sunshine in twenty large towns, and this suggests that a beneficial effect of sunshine or a deleterious effect of smoke may operate. A grouping of London boroughs according to their water supply is reminiscent of Farr and cholera, but is not so revealing. Dr. Stocks has brought together a great deal of information and has put forward many suggestions for more intensive research.

Comet 1947*n*

This comet was discovered in the southern hemisphere on December 8, and was described as diffuse with stellar condensation and a tail longer than 1°. Its magnitude was − 5, and it was moving northward. Dr. Cunningham computed an orbit from observations supplied; but as these may not have been very accurate, the orbit must be regarded as merely provisional. The elements of the orbit and an ephemeris are given below:

$$\begin{array}{ll} T & 1947 \text{ December } 2{\cdot}710 \text{ U.T.} \\ \Omega & 341^\circ\ 05' \\ \omega & 197\ \ 00 \\ i & 133\ \ 54 \\ q & 0{\cdot}0999 \end{array} \left.\begin{array}{l} \\ \\ \\ \\ \\ \end{array}\right\} 1947{\cdot}0$$

The Night Sky in January

New moon occurs on Jan. 11d. 07h. 44m., U.T., and full moon on Jan. 26d. 07h. 11m. The following conjunctions with the moon take place: Jan. 8d. 14h., Jupiter 3° N.; Jan. 14d. 04h., Venus 4° N.; Jan. 27d. 05h., Saturn 4° S.; Jan. 28d. 06h., Mars 0·6° S. Mercury, in superior conjunction on Jan. 3, becomes an evening star later and sets at 16h. 52m., and 18h. 15m., at the middle and end of the month, respectively, but the planet lies too low for good visibility. Venus, an evening star of stellar magnitude −3·4, sets at 18h. 23m., 19h. 08m. and 20h., at the beginning, middle and end of the month, respectively, and is a conspicuous object, about 80 per cent of the illuminated disk being visible. Mars, in the constellation of Leo, is visible throughout the greater portion of the night, rising at 21h., 20h. 04m. and 18h. 41m., on Jan. 1, 15 and 31, respectively. Jupiter is not visible until the late morning hours, its time of rising on Jan. 1 being 6h. 20m., and 4h. 50m. on Jan. 31. As the planet does not attain an altitude of 17° in the latitude of Greenwich, it is not very suitably placed for observation. Saturn, in the constellation of Leo, is visible throughout most of the night, rising at 19h. 46m. and 17h. 30m., at the beginning and end of the month, respectively. Occultations of stars brighter than magnitude 6 are as follows: Jan 3d. 05h. 35·1m., γ Virg. m. (*D*); Jan. 3d. 06h. 48·5m., γ Virg. (*R*); Jan. 17d. 19h. 45·7m., 14 Ceti (*D*); Jan. 23d. 20h. 51·9m., 139 Taur. (*D*). *D* and *R* refer to disappearance and reappearance, respectively, and the latitude and longitude of Greenwich are assumed. In addition to these occultations of stars, Mars is occulted on Jan. 28d. 06h. 09·9m., reappearing at 6h. 26·3m. The earth is in perihelion on Jan. 2.

Announcements

Viscount Falmouth has been elected by the governors of the Imperial College of Science and Technology to be their chairman in succession to Lord Rayleigh, whose period of office terminated on May 31, 1947.

The Council of the British Welding Research Association has accepted an offer from Messrs. British Oxygen Company, Ltd., to provide a prize fund of £100 a year for three years. A single prize of £100 is offered in 1948 for the best paper on a research into welding or its application. Papers must be submitted on or before September 30, 1948.

Acetylcholine and Body Temperature

Glaubach and Pick[1] were the first to find that procaine causes a fall of body temperature. The fall has recently been shown by Peczenik[2] to be greatly increased after adrenalectomy. The work of Dawes[3] in this laboratory on quinidine substitutes led him to point out that quinine, quinidine and procaine antagonize the effect of acetylcholine on many types of tissue. They reduce its effect on the heart and on the intestine, and they reduce its effect on skeletal muscle also (Harvey[4]). Thus procaine, in addition to being a local anæsthetic, reduces the action of acetylcholine in all forms of muscle. Recently, de Elio[5] has shown in this laboratory that procaine shares these properties, not only with quinidine, but also with atropine and with the analgesic 'Pethidine' (demerol), while Dews and Graham[6] have shown that the antihistamine substance 'Neoantergan' shares them too.

We have now tested atropine, benadryl, 'Pethidine' and quinidine to see if they affect the body temperature of mice as does procaine. We have discovered that they do, and that the fall they produce is augmented by adrenalectomy. Since the common property of these substances is that they depress the action of acetylcholine, it becomes probable that the maintenance of body temperature depends on a mechanism in which acetylcholine plays a part, and that the adrenal glands support such a mechanism against the depressant action of substances like procaine.

Cholinesterase Activity in Cerebro-Spinal Fluid

The published finding of Stedman and Stedman[1], that cholinesterase cannot be detected in cerebrospinal fluid, appears to be generally accepted, for recent literature contains no account of further investigations in cholinesterase activity.

We have found that the cholinesterase activity of the cerebro-spinal fluid of forty-two human subjects was in each case considerably above the range of the spontaneous hydrolysis of the cholinesters.

The cholinesterase activity was determined manometrically by Warburg's method at 37·5° C., and the result expressed in cubic millimetres of carbon dioxide produced by 1 ml. cerebro-spinal fluid in a period of thirty minutes. 1·6–2 ml. cerebro-spinal fluid, with 0·2 ml. 2 per cent bicarbonate, were put in the main vessel of the ordinary conical containers, and in the side arm 0·2 ml. of the substrate solutions, which consisted of 0·3 *M* acetylcholine, or 0·3 *M* acetylmethylcholine ('Mecholyl'), or 0·06 *M* benzoylcholine, respectively. This procedure was adopted in the light of the recent investigations of Mendel and Rudney and Mendel and Mundell[2].

The cerebro-spinal fluid was obtained from psychotic patients suffering from organic (general paralysis of the insane) and non-organic (mania, schizophrenia) psychoses. The cholinesterase activity of individual specimens varied considerably: substrate acetylcholine, between 6·6 and 28·4; substrate acetylmethylcholine, between 5·4 and 23·6; substrate benzoylcholine, between 2·3 and 6·2.

The relation between cholinesterase activity of cerebro-spinal fluid and blood serum was: with acetylcholine as substrate, 1/90–1/150; with 'Mecholyl' as substrate, 1/8–1/40; with benzoylcholine as substrate, 1/125–1/300.

Specimens of cerebro-spinal fluid from a number of patients were mixed; the cholinesterase activity, using the different substrates, is shown in the accompanying table.

For preparatory reasons, we tried to absorb the cholinesterase by different absorbents: 'Permutit' ('Decalso'), kieselguhr and alumina. The result was negative; no activity was lost by treatment with any of the substances (see table).

	Hydrolysis (mm.^{3} CO_2 evolved by 1 ml. cerebro-spinal fluid in 30 min.) of			Nitrogen content (mgm./ml.)
	Acetylcholine 0·03 *M*	Acetylmethylcholine 0·03 *M*	Benzoylcholine 0·006 *M*	
Cerebro-spinal fluid mixture (16 patients)	23·6	12·4	4·6	1·18
After treatment with kieselguhr	25·1	11·8	5·2	1·19
After treatment with alumina	22·8	10·3	4·9	1·13
Cerebro-spinal fluid mixture (29 patients)	21·4	10·4	4·3	
After filtering through 'Decalso' column	21·5	9·6	4·6	
After boiling for four minutes	13·7	6·7	2·5	

It seems reasonable to suppose that the so-called true cholinesterase of Mendel and Rudney is the predominant enzyme system present in cerebro-spinal fluid.

We are now investigating possible relationships between the level of cerebro-spinal fluid cholinesterase and various disturbances of brain and mental function.

Relation of Intermediary Metabolites to the Lowering of the Potency of Pancreatic Insulin in the Animal System

It has long been felt by several workers that adiposity is connected with the onset of diabetes mellitus. It has previously been reported by us[1] that the intermediary fat metabolites such as β-hydroxy butyric acid, aceto-acetic acid and pyruvic acid, when injected into normal rabbits in the form of their sodium salts, give rise to the condition of hyperglycæmia characterized by decreased sugar tolerance in those animals. It has also been observed by us[2] that these substances can reduce the potency of external insulin while allowed to combine with them both *in vitro* as well as *in vivo*.

In order to obtain confirmatory evidence on this point, these metabolites were injected into normal guinea pigs beginning with 100 mgm. each animal per day, which was increased by 15 mgm. per animal per week.

The animals were depancreatized at intervals (15–30 days), and the insulin content of their pancreases was assayed on rabbits according to the usual method of Marks[3].

During the first stage of the experiments (that is, up to 15–25 days) there was observed much higher potency of the pancreatic insulin isolated from the animals injected with those metabolites ; the activity being about 50 per cent higher than that of normal animals. But this stage of hyperactivity was soon followed by the gradual reduction of potency as measured by the percentage reduction of blood sugar in normal rabbits ; this was found to be as low as 50 per cent of the normal values after seventy days.

These observations show that accumulation of intermediary fat metabolites is responsible for either lowering insulin secretion, or for decreasing the insulin potency in the system, and that these keto-bodies can be held responsible for the onset in the long run of diabetes mellitus.

Though hyperglycæmia thus caused may not be directly associated with the pancreatic damage, still it may be considered that the strain on the insulin-producing mechanism resulting from early hypertrophy and increased insulin production might ultimately lead to atrophy of the pancreatic islet cells, with consequent decrease in the insulin production.

Further investigations in this connexion as well as on the histological picture of the pancreas of the experimental animals are in progress.

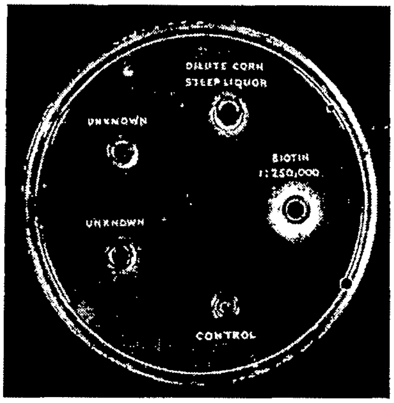
A Modified Microbiological Assay Procedure

Mr. A. L. Bacharach's letter[1] on the use of the plate-and-cylinder method in reverse for assaying certain growth-factors suggests that it may be of interest to record some very similar experiments which I carried out during 1944–45.

There was at that time a need for a simple and rapid method of approximately determining the biotin content of certain solutions. As the plate-and-cylinder method was then in daily use in the laboratory in connexion with research on antibiotics, the possibility of applying the method for assaying substances which promoted instead of inhibited growth was investigated.

Sterile agar containing glucose and mineral salts was poured into Petri dishes and the surface was seeded with the test organism, a strain of *Saccharomyces cerevisiæ*. The method of seeding was the same as that used for seeding plates with *S. aureus* for the assay of penicillin[2]. Cylinders for containing the liquids to be assayed were placed on the surface of the agar in the usual way.



The cylinders were filled with the solutions to be tested, using a 1 : 250,000 solution of pure biotin as a standard and saline as a control, and the plates were incubated at 37° C. Although growth proceeded slowly over the whole surface of the agar, it was very much more prolific around the cylinders containing the standard solution of biotin or other liquids in which biotin was known to be present. This effect is clearly shown in the accompanying photograph.

It was found that results were fairly reproducible and that it was possible to plot a graph relating ring-size to biotin concentration which gave consistent results over a considerable range when used to determine the strength of other solutions. Alternatively, solutions could be assayed by comparing them on the same plate with known dilutions of a standard biotin solution.

There seems to be no reason why this method of assay should not be generally applied and give results comparable with those obtained in the assay of antibacterial substances by the normal plate-and-cylinder method. Experience suggests that the main difficulties which may be encountered are as follows :

(1) Unless the micro-organism chosen is one the response of which to the various known growth-factors has been closely studied, there may be doubt as to whether the observed promotion of growth is, in fact, specifically due to the growth-factor under investigation. Certain derivatives of biotin, for example, possess the same kind of physiological activity as biotin itself. This danger is, of course, most serious when highly complex substances of largely unknown composition are being assayed.

(2) The edges of the 'rings of exhibition' are not always sharply defined. Among the factors which, by experience and by analogy with the assay of antibacterial substances, would be expected to influence this are the nature of the test organism, the thickness with which the agar is seeded, and the concentration of the substance being assayed.

(3) It may sometimes be difficult to prepare a culture medium which requires only the addition of a single growth-promoting substance to determine whether growth is negligible or prolific.

This work was done while I was a Nuffield Research Student at the Sir William Dunn School of Pathology, Oxford.

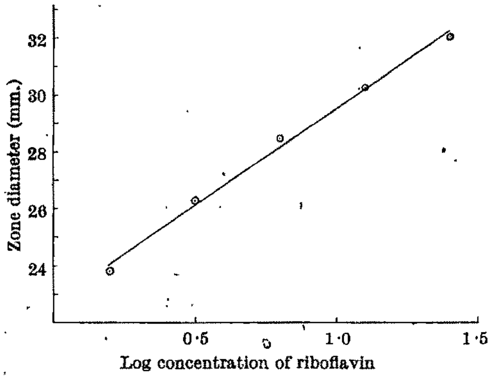
[1] Bacharach, A. L., *Nature*, 160, 640 (1947).

[2] Chain, E., Florey, H. W., Gardner, A. D., Heatley, N. G., Jennings, M. A., Orr-Ewing, J., and Sanders, A. G., *Lancet*, ii, 226 (1940).

THE Petri dish technique for the microbiological assay of vitamins described by Mr. Bacharach[1] has been used in these laboratories for demonstration purposes since September 1946, and the disadvantage to which he refers, namely, the lack of sensitivity, can be fully confirmed.

The general technique we have employed follows closely that used for the cup-plate assay of penicillin. The suspension for inoculum is prepared exactly as for a riboflavin assay by the usual method, except that the cells are suspended in the original volume of saline and used without further dilution. To 12·5 ml. of the melted medium at 45° C., 1 ml. of this strong suspension is added, and the flasks are held at 45° C. for 10 min. before pouring the plates. If a weaker inoculum is used, or the heating at 45° C. is omitted, the zones are less sharp and, in consequence, more difficult to read. Five cups are cut in each plate, and previously sterilized solutions of riboflavin containing 25, 12·5, 6·25, 3·125 and 1·56 μgm./ml. are distributed into the cups in approximately 0·05 ml. amounts. We can confirm Mr. Bacharach's observation that the zone diameter is proportional to the logarithm of the dose, as exemplified on the accompanying graph.



If further research makes it possible so to increase the sensitivity that the technique is suitable for the routine assay of riboflavin in foodstuffs, it will be interesting to examine the influence, on the sizes of the zones, of non-specific growth stimulants which are a source of difficulty with the assay of riboflavin as at present carried out. Since, in the Petri dish assay, the *diffusion* of the vitamin is a factor determining the magnitude of the response, it may be that stimulants of higher molecular weights than the vitamin under test will be without effect on an assay of this type.

Nevertheless the method is even now not without practical applications, as, for example, in demonstrating the qualitative and to some extent the quantitative differences between organisms with regard to their abilities to synthesize a given growth-factor. Instead of cutting cups in the bulk-inoculated, solidified riboflavin-free medium, the surface may be seeded in three or four places with suspensions of bacteria or mould-spores. Those organisms capable of synthesizing the vitamin may then be readily detected by the appearance of circular 'zones of exhibition', the diameter of the latter serving as an index of the amount synthesized. It is suggested that this might be an expeditious way of conducting a survey of organisms in order to differentiate them in this respect.

An obvious point of difficulty is the possibility of widely different requirements of the 'indicating' bacterium and the organisms under test, not only nutritionally but also with regard to pH and temperature. We have so far used only the usual basal media developed for microbiological assay (solidified with 1·5 per cent agar) and *Lactobacillus helveticus* and *Lactobacillus arabinosus* for the detection of riboflavin and nicotinic acid respectively. Such media permit growth of, and vitamin synthesis by, many moulds at 37° C., although they are scarcely likely to be optimal for this purpose. The ideal to be aimed at would be a medium and conditions of growth as nearly as possible optimal for both the indicating and the test organisms.

Pontecorvo[2] has described a technique, in some respects similar, for the identification of the nutritional requirements of a mutant, based on the addition of crystals of nutrilites to plates of 'minimal' medium inoculated with the mutant strain. The procedure outlined above, however, serves a different purpose, namely, the investigation of the synthesizing abilities of a range of organisms with respect to a given nutrilite.

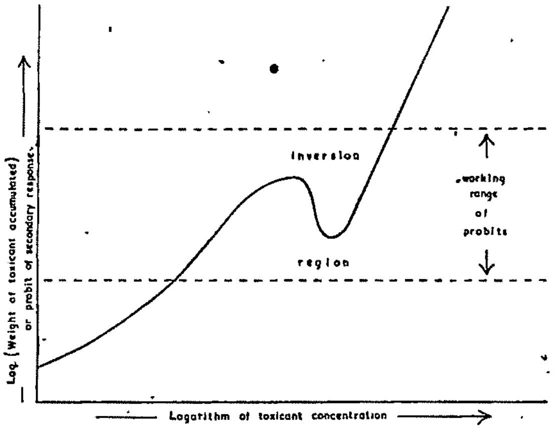
Primary and Secondary Responses in Biological Assay

IT has already been shown that the irritant and paralysing effects of the pyrethrins are of material influence in determining the dose of insecticides accumulated by flying insects in pyrethrum-bearing sprays[1].

The influence of such primary responses on the dose of toxicant accumulated, and thus on the resulting secondary response (usually estimated as proportionate mortality), is now widely accepted as of importance in this system, and the purpose of this communication is to suggest that similar factors may be of more common occurrence in biological assay systems than is generally appreciated, and in particular to indicate their probable influence in fungicidal assay.

Dimond *et al.*[2] reported that tetramethyl thiuram disulphide tested as a fungicide against *Macrosporium sarcinæforme* yields a dosage-response curve exhibiting a maximum and a minimum. They offered an explanation, based on the spontaneous dissociation of the fungicide, which Finney[3] has shown could not account for the observed action without the additional hypothesis of drug antagonism between the two states of the molecule. Montgomery and Shaw[4] also criticized the dissociation hypothesis on physico-chemical grounds, and found similar effects, which they termed 'inversion', in the dosage-response curves for five thiuram and five dithiocarbamate derivatives tested against *Venturia inæqualis.* Parker-Rhodes[5], applying the theory of variability to both types of fungicide, demonstrated that absorption is necessarily preceded by reaction with the spore secretion.

The spray pick-up/toxicant concentration curves, previously published for the flying insect system[1] may be converted into log (toxicant pick-up)/log (toxicant concentration) curves of the type shown



THEORETICAL FORM OF DOSAGE RESPONSE CURVE IN SYSTEMS WHERE PRIMARY RESPONSES INFLUENCE THE DOSE ACCUMULATED BY THE RESPONDING POPULATION

in the diagram. It has been pointed out to me by A. Stringer that such curves are quite general in that they can be derived empirically for systems where the toxicant pick-up, and hence the probit secondary response, is not a monotonic function of the applied dosage because of the influence of primary responses.

The probit response and log (toxicant pick-up) are interchangeable as ordinates, using an arbitrary scale ratio, when the probit of an observed response is proportional to the log (effective dose) expected to produce that response.

Since the working range of secondary response probits covers the region of the probit response/applied dosage curve most influenced by the primary responses, the relevant portion of the curve shown here is analogous to that obtained by Dimond *et al.*, whose data are fitted as well by a curve of this form as by that of the authors.

Wain and Wilkinson[6] observed that suspensions of spores dissolve about twice as much copper from Bordeaux mixture as filtrates from the same number of spores, and that the free secretion present in the former does not increase materially on standing in the absence of the fungicide. These facts indicate that further secretion takes place as a primary response to the fungicide, and the application of this general hypothesis to the observations of Parker-Rhodes completes the analogy outlined above.

While this interpretation does not necessarily conflict with the general construction for this system by Finney[3], it does suggest that the postulate of linearity for the regression lines outside the inversion region, made on statistical grounds, may be misleading. No reasonable transformation will consistently reduce the lower dosage end to linearity, and the high-dosage end is linear because the rate of inactivation of the test organism tends to become independent of the applied toxicant concentration. Interpretation of the curve in terms of tolerance distribution is therefore meaningless.

The statistical treatment of data from such systems is being developed; but it may be noted here that probit analysis assumes the linearity of the transformed response with respect to some monotonic function of the toxicant concentration. Such methods, applied to the systems under discussion, will give rise to estimates of relative potency and heterogeneity which are invalid and will frequently be misleading.

I am indebted to Dr. A. B. P. Page for his interest in and discussion of this note.

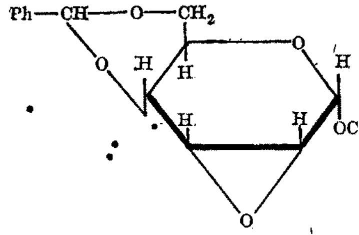
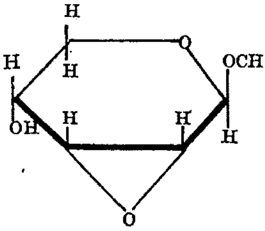
Conversion of *D*-Arabinose into 2-Deoxy *D*-Ribose and 3-Deoxy *D*-Xylose

2-DEOXY *D*-ribose is of considerable importance since it is the carbohydrate constituent of the deoxyribonucleic acid of cell nucleal material, and we have been interested in its preparation for structural and synthetic studies. Although we have made some improvements in the standard method of its synthesis from *D*-arabinal, we are exploring alternative routes. A possible method resulted from the work of Newth, Overend and Wiggins[1] on the ring scission of 2 : 3-anhydro 4 : 6-benzylidene α-methyl alloside (I) with halogen acids, because hydrobromic acid in aqueous acetone solution effected scission of the anhydro ring in this substance to give 2-bromo α-methyl altroside (one part) and 3-bromo α-methyl glucoside (4 parts). On this finding it was clear that a similar ring scission of 2 : 3-anhydro β-methyl *D*-riboside (II) would give rise to 2-bromo β-methyl *D*-arabinoside (III) and 3-bromo β-methyl *D*-xyloside (IV), although it is our experience[2] that, as yet, it would be inexpedient to predict the relative proportions of the isomers that could be produced in this reaction. The halogen sugars (III) and (IV) on reductive dehalogenation would afford 2-deoxy β-methyl *D*-riboside (arabinoside) and 3-deoxy β-methyl *D*-riboside (xyloside). Thus if 2-bromo β-methyl *D*-arabinoside (III) was the main product of the ring-opening of 2 : 3-anhydro β-methyl *D*-riboside, this procedure would furnish a new method of preparation of 2-deoxy β-methyl *D*-riboside and of 2-deoxy *D*-ribose itself. We have found, however, that (III) was only the minor constituent of the ring-scission products, 3-bromo β-methyl *D*-xyloside being the main product. We have, however, obtained 2-deoxy β-methyl *D*-riboside and 2-deoxy *D*-ribose by this procedure, although the method clearly has no preparative value.

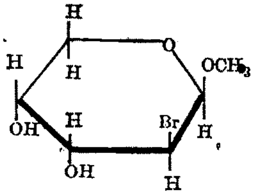
2-Tosyl 3 : 4-monoacetone β-methyl *D*-arabinoside (since described by Honeyman[3]) was converted into 2-tosyl β-methyl *D*-arabinoside, which gave on mild alkaline hydrolysis crystalline 2 : 3 anhydro β-methyl *D*-riboside (II), m.p. 45° $[\alpha]_D^{22} - 35{\cdot}8$ in chloroform (*c.* 0·6) (cf. ref. 3). Treatment of the anhydro derivative (II) with hydrobromic acid in aqueous acetone gave two halogenated sugar derivatives ; a crystalline substance, 3-bromo β-methyl *D*-xyloside (nine parts) (IV), m.p. 95° $[\alpha]_D^{18} - 16{\cdot}4$ in methyl alcohol (*c.* 0·36) and a liquid which was mainly 2-bromo β-methyl *D*-arabinoside (III) (one part). The latter substance on hydrogenation in the presence of Raney nickel and calcium hydroxide was converted into 2-deoxy β-methyl *D*-riboside, which gave a strongly positive Dische diphenylamine test[4] for 2-deoxy ribose. The glycoside, on hydrolysis with *N*/100 acetic acid, was



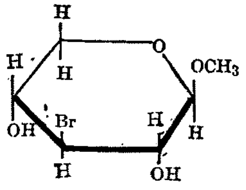
I



II



III



IV

converted into the free sugar 2-deoxy *D*-ribose, which was isolated in the form of the crystalline anilide. This was identical with a specimen obtained from authentic 2-deoxy *D*-ribose[5].

The designation of (IV) as 3-bromo β-methyl *D*-xyloside rests only on theoretical considerations. Some additional evidence comes, however, from the fact that on hydrogenation IV gave a deoxy β-methyl pentoside (3-deoxy β-methyl *D*-xyloside), b.p. 100/0·2 mm. (characterized as the crystalline bis 3 : 5-dinitrobenzoate, m.p. 157°), which gives a completely negative Dische test, a test which on the basis of the work of Deriaz, Stacey, Teece and Wiggins[5] is given only by 2-deoxy pentoses or readily hydrolysable derivatives thereof.

This work and further structural studies will be published in detail elsewhere.

Note. After the completion of this investigation it came to our notice that the synthesis of 3-deoxy *L*-xylose from 2 : 3 anhydro β-methyl *L*-riboside has been achieved in Prof. A. R. Todd's laboratory by different methods[6].

Scattering of D—D Neutrons by Deuterium

Massey and Buckingham[1,5] have pointed out that a study of the collisions of neutrons with deuterons can be expected to throw light on the nature of the nucleon forces even when the neutron energy is comparatively low. In a recent survey[1] of experimental data, they conclude that the evidence is in favour of exchange forces. It seems worth while, therefore, to report some experiments which give support to ordinary, rather than exchange, forces.

The tracks of 1,500 recoils from D—D neutrons of 2·53 MeV. energy have been photographed in a cloud chamber filled with heavy methane to an (expanded) pressure of 1·1 atmosphere, and those tracks were measured which started from points from which no track could pass out of the illuminated region.

Selection of tracks for a statistical count of number *vs.* angle was made by the method of Dee and Gilbert[2], in which only those tracks are counted the length and angle of projection of which are close to satisfying the theoretical range – angle relation. In this work the allowed spread in range was greater, because neutrons could enter the chamber during, as well as after, the expansion, though the observed results indicate that most entered after.

The numbers of tracks in equal intervals of cos 2φ, where φ is the angle of projection of the deuteron in room co-ordinates, were counted and plotted against the corresponding values of $(180 - 2\varphi) = \theta$ to give the number of neutrons scattered per unit solid angle in the direction θ, measured in centre-of-gravity co-ordinates (see table). A few long tracks attributed to recoil protons were observed and a correction was made at the larger recoil angles where allowed bands for protons and deuterons would overlap. The mean number of long tracks in the first three intervals was taken as the number to be expected in each interval, and the correction was obtained by multiplying this number, 10, by the ratio of the overlap area to the allowed deuteron area in each interval. A random track correction, for tracks produced by neutrons not coming directly from the source but yet lying within the allowed length – angle band, was made by subtracting a number proportional to the number of tracks observed just outside that band. The results are shown in the accompanying table.

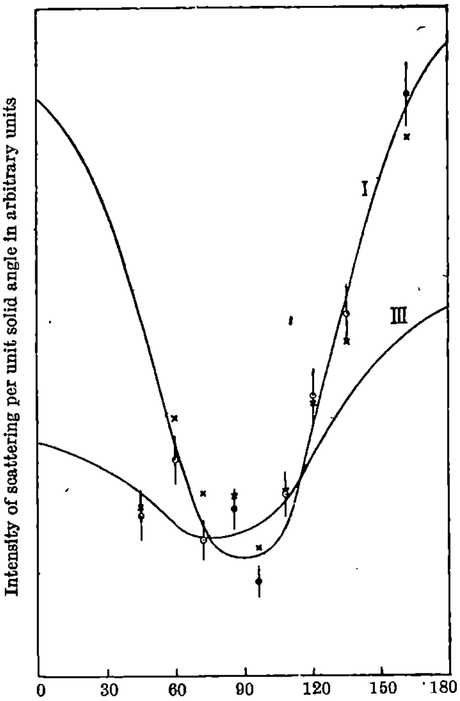
Interval	Cos 2φ	No. of tracks	Proton correction	Random correction	Corrected number	'Standard deviation'
1	1 –0·8	217	0	26	191	11·7
2	0·8–0·6	134	0	15	119	10·0
3	0·6–0·4	109	0	17	92	9·0
4	0·4–0·2	74	1	13	60	7·4
5	0·2–0·0	51	2	18	31	5·5
6	0·0– −0·2	72	3	14	55	7·1
7	−0·2– −0·4	74	5	24	45	6·5
8	−0·4– −0·6	103	5	27	71	8
9	−0·6– −0·8	68	6	9	53	7

The 'standard deviation' of the corrected numbers given in the table was calculated from the formula $\sigma = Npq$, where N is the total number of tracks, p is the probability that a track will lie in a particular angle interval and q is $1 - p$, for a uniform binomial distribution. In this case p is different for each interval, and the best estimate of p was taken to be the ratio of the number of tracks observed in an interval to the total number, so that the formula became

$$\sigma_i = n^{1/2}\left(1 - \frac{n_i}{N}\right)^{1/2} \qquad i = 1, 2 \ldots 9.$$

The random track correction is rather large and makes so great a difference to the distribution obtained—ratio of interval 1 to interval 5 is about 4 : 1 before correction and about 6 : 1 after—that the precision of the determination must be considered to be low. The track-lengths in interval 9 were less than 5 mm. and some could have been missed. The value given may be taken as a lower limit.

The distribution found shows qualitative agreement with that found by Kruger, Shoupp, Watson and Stallmann[3] and Coon and Barschall[4], but indicates a greater change between $\theta = 180°$ and $\theta = 90°$ than either, and a less sharp maximum in the forward direction than found by Coon and Barschall.



THEORETICAL DISTRIBUTION CURVES I (ORDINARY FORCES) AND III (EXCHANGE FORCES) CALCULATED BY BUCKINGHAM AND MASSEY

—×—, observed uncorrected points, adjusted to agree with curve I near 120°.

—⊙—, observed points after corrections have been applied, adjusted to agree with curve I near 120°, and showing twice 'standard deviation'.

The distributions to be expected on the assumptions of ordinary and exchange forces have been calculated by Buckingham and Massey[5] and are reproduced in the accompanying graph. Our data—ignoring point 9—fit the curve for ordinary forces very closely. Experiments are being continued with lower gas pressures in the attempt to study the distribution at small angles with greater precision.

We wish to thank Prof. L. H. Martin for continual advice and encouragement. The work was made possible by a grant from the Council for Scientific and Industrial Research.

Treatment of Glass and Steatite Ceramic with Quaternary Ammonium Compounds for the Improvement of Electrical Insulation Resistance

THE adsorption and condensation of water on the surface of insulators was responsible for the failure of much electrical equipment under service conditions in the tropics. From the literature of flotation[1], it was known that the adsorption of a unimolecular film of an amphipathic (polar – non-polar) compound gives to solid surfaces a paraffin-like character, rendering them less readily wetted by water. Some typical flotation reagents were therefore applied to glass and steatite ceramic surfaces in an endeavour to improve their electrical insulation resistances under moist conditions. As might be anticipated from the work of Wark[2], the quaternary ammonium compounds were effective. The accompanying table shows the results obtained with various substituent radicals for glass microscope slides and steatite terminal bushings. These were cleaned with chromic acid, immersed for about one second in an aqueous solution of the quaternary ammonium salt, and then washed thoroughly in distilled water.

Quaternary ammonium salt (10^{-4} *M* solutions used for treatment except where otherwise indicated)	Insulation resistance (megohms) measured *in situ* after 2 days at 98–100 per cent relative humidity and 30° C.		Contact angle with water for the treated glass
	Glass microscope slides (double contacts 1 in. in length, 1 in. apart)	Steatite terminal bushings (min. leakage path, 0·3 in.)	
Control samples (cleaned with chromic acid)	5×10^2	7×10^2	0°
Decyl-trimethylammonium bromide	4×10^2	4×10^3	0°
Dodecyl- ,, ,,	4×10^2	1×10^4	0°
Tetradecyl- ,, ,,	7×10^2	3×10^4	40°
Cetyl- ,, ,,	5×10^4	7×10^4	55°
Octadecyl- ,, ,,	2×10^5	1×10^5	54°
Ceryl- ,, ,,	1×10^5	4×10^4	55°
Cholestanyl- ,, ,, (10^{-5} *M*)	4×10^5	4×10^5	60°

The surface of glass in contact with an aqueous medium is negatively charged[3] and therefore attracts cations present in the medium. If amphipathic cations are present, they become oriented so that the polar groups are turned towards the glass surface[4,5]. Whereas hydrogen ions and metal ions at the surface are continuously exchanged with cations in the bulk of the solution, the diffusion of amphipathic cations from the surface back into the solution is hindered as a result of the cohesion of the non-polar groups. If this cohesion is sufficiently great, it leads to the formation of a stable monolayer of quaternary ammonium ions in which the outward orientation of the non-polar groups reduces the attraction of the surface for water. The results given in the table indicate that, for the treatment of glass with alkyl-trimethylammonium bromides under the conditions described, alkyl substituents of chain-lengths greater than fourteen carbon atoms give sufficient cohesion for the formation of stable adsorbed layers.

The replacement of the alkyl substituent by a cholestanyl group gives slightly better results, probably because the minimum area subtended by the latter at a glass surface is more nearly equal to that of the trimethylammonium head-group.

A more complete report on these experiments will be given elsewhere.

We are indebted to Dr. I. W. Wark, chief of the Division of Industrial Chemistry, and to Mr. K. L. Sutherland, Division of Industrial Chemistry, for the original suggestion regarding the use of cationic surface-active substances for the treatment of glass and steatite, and for subsequent helpful suggestions. Thanks are also due to Dr. D. M. Myers, chief of the Division of Electrotechnology, for his continued interest in, and encouragement of, this work.

Abnormalities in the *F*-Region of the Ionosphere at Calcutta

IONOSPHERIC observations carried out for more than two decades have clearly established the existence of correlation between the variation of electron contents of the different ionospheric layers and solar activity. It has been found that there is a general increase in the ionization density during the period of maximum sunspot numbers. This general increase, as expected, has also been noticed during the present phase of maximum solar activity in the routine ionospheric observations made at the Wireless Laboratory of the University College of Science, Calcutta. Besides this general increase, however, certain peculiar features of the diurnal variation of the ionization density have also been observed.

Figs. 1–3 depict the monthly mean diurnal variation of Region *F* ionization for the months of January 1946 and January 1947 for Madras (lat. 13° N., long. 80° 13′ E.), Calcutta (lat. 22° 33′ N., long. 88° 21′ E.), and Delhi (lat. 28° 35′ N., long. 77° 5′ E.) respectively. (For Calcutta the curve for 1945 is also given. The curves for Delhi and Madras are drawn from data kindly supplied by All India Radio.) It is at once noticed that there is a general increase of ionization at all the stations. The stations Calcutta and Madras, however, show another peculiar feature which is not noticeable at Delhi or at Slough (Fig. 4). A comparison of Figs. 3 and 4 shows that the general trend of diurnal variation for January 1947 at the two stations is the same, and is similar to that for the previous year at Delhi. The trend of variation for the same month for Calcutta and Madras is, however, markedly different. The ionization begins to rise sharply at daybreak and attains nearly the maximum value at about 11 a.m. In the case of normal solar activity, this value is maintained during the whole day and the decrease in ionization begins nearly at sunset. But for the month under consideration (January 1947, phase of maximum solar activity) the peak value is maintained more or less constant not only during the whole day but even up to the evening hours, 9–10 p.m. It is remarkable that there should be such marked difference in the character of ionization variation for two stations, Calcutta and Delhi, situated at not very different geographic latitudes. The difference in the magnetic dip values at the two stations is, however, comparatively larger, and one is tempted to associate the characteristic difference in ionization variation of the two stations as due to some geomagnetic control of the ionosphere[1], to the existence of which attention was first directed by Appleton[2].

Measurement of High Permittivity Values at Centimetre Wave-lengths

CERAMIC materials with permittivity values up to several thousand are now available. The measurement of permittivities of this order provides little difficulty at normal radio frequencies, but measurements have not been made, so far as I am aware, at frequencies of the order of 10^{10} c./s. ($\lambda = 3$ cm.)[1], in which frequency region the materials are likely to find increasing application. For this purpose the experimental technique illustrated in Fig. 1 has been developed. A specimen of the material is placed in a coaxial line or wave-guide (completely filling the dielectric space) and is followed by a non-reflecting termination. The energy transmitted through the specimen is measured at *A*, for constant incident energy, as the wave-length of the energy source is varied.

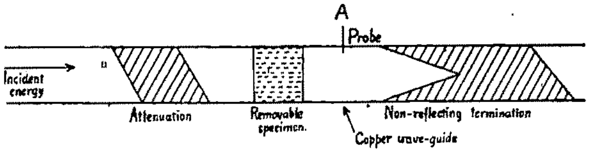

Fig. 1

Two sets of experimental results obtained in an H_{01} wave-guide system over the frequency range $8\cdot1 \times 10^9 - 10^{10}$ c./s. ($\lambda = 3\cdot7 - 3\cdot0$ cm.) are shown by the points in Fig. 2. The results marked ● and O relate to specimens of permittivity, as measured at $1\cdot5 \times 10^6$ c./s. of 25·8 (zinc orthotitanate) and 91·2 (rutile), and of thicknesses 1·810 and 2·140 cm., respectively. The curves (*a*) and (*b*) show the variations of transmitted energy determined theoretically for assumed permittivity values of 26·0 and 91·0. It will be seen that the peaks become sharper and move closer together, for a given length of specimen, as the permittivity increases, and that in both cases they are sufficiently sharp to afford an accurate permittivity evaluation from the experimental results. The peaks, in fact, disappear in the limiting case of infinite permittivity, since it may be shown that

$$\frac{\text{width of peak}}{\text{peak separation}} \sim \frac{1}{\sqrt{\varepsilon}} \quad \text{for large } \varepsilon.$$

The occurrence of peaks necessitates great accuracy in the preparation of the faces of the specimens, and causes considerable experimental difficulty in the usual methods of permittivity measurement.

Dielectric loss in the specimen causes a reduction in height of the peaks, but this effect is apparently not significant in the results shown.

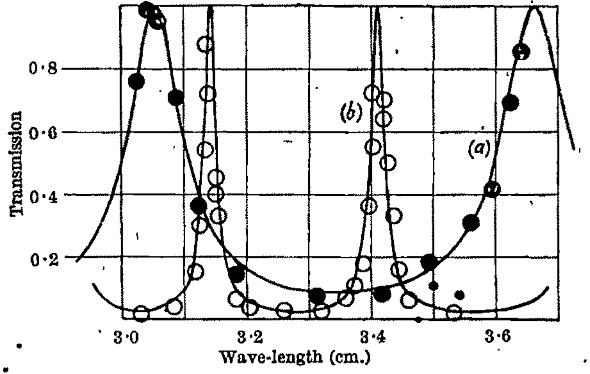

Fig. 2. EFFECT OF PERMITTIVITY ON SHARPNESS OF PEAKS
Curve *a*: $\varepsilon = 26\cdot0$; $b = 1\cdot81$. Curve *b*: $\varepsilon = 91\cdot0$; $b = 2\cdot14$

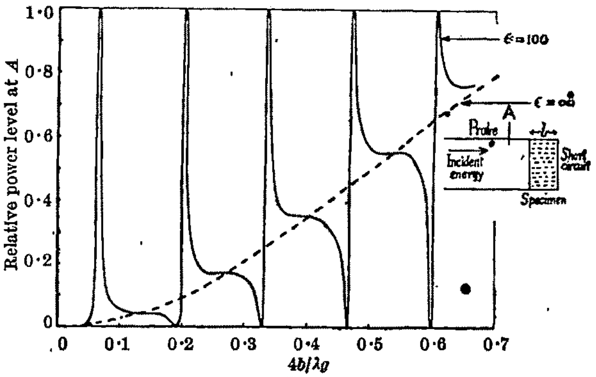

Fig. 3

The behaviour approaches that of a perfect metal as ε increases. This is demonstrated more clearly in the variation of the power-level at a fixed point in front of a specimen, when backed by a short circuit, as the length of the specimen, *b*, or the wave-length of the incident energy is varied. The calculated effect with this arrangement and a specimen of permittivity 100 is shown in Fig. 3 as a function of $4b/\lambda_g$, where λ_g is the wave-length in the air-filled guide. The dotted curve shows the behaviour for a metal specimen (that is, the limiting case as $\varepsilon \to \infty$).

The curves of Fig. 2 are reminiscent of the Fabry-Perot interference fringes, and, in fact, both are due to the presence of a pair of parallel, highly reflecting surfaces. The analogy between the effect with light and that described here with centimetre waves is very close.

The arrangement could be used as a highly selective filter, the response being of normal *Q* curve form with the '*Q* value' proportional to the permittivity.

Experiments are in progress on materials with much higher permittivities than those referred to in Fig. 2, and the work will be reported fully when these are completed.

I am indebted to Dr. D. F. Rushman, of the Mullard Radio Valve Co., for providing suitable ceramic materials.

Photo-electric Counting of Individual Microscopic Plant and Animal Cells

A PHOTO-ELECTRIC apparatus for counting individual microscopic cells in fluid suspension has been constructed in this laboratory. A sufficiently large signal-to-noise ratio from a single cell or a part of it has been obtained by the use of a specially designed dark-field system and an *RCA 931-A* multiplier phototube. The phototube is followed by an amplifier which operates a mechanical counter. As it was not possible to arrange the cells in one line in a capillary space, a scanning method using an ordinary counting chamber was evolved.

The optical arrangements are shown in Fig. 1. A circular aperture, *A*, is projected by a reversed microscope objective, O_D, in such a way that the diminished image, which has about the same size as a cell, is

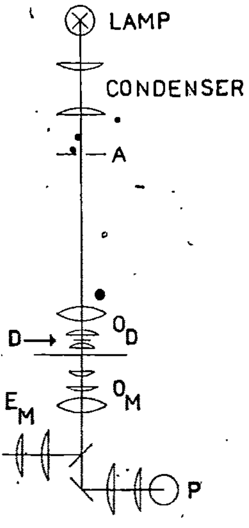

Fig. 1

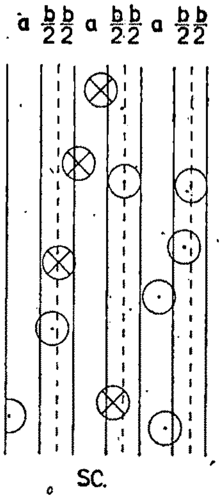

Fig. 2

focused on the plane where the cells are situated. By means of an opaque circular diaphragm, *D*, placed behind the front lens and covering the central part of the lens surface, the objective, O_D, also acts as a dark-field condenser. By these means the projected image of the circular aperture, *A*, is invisible and latent so long as the field is optically homogeneous. When a cell or part of it is inside the effective area of the latent spot, the light is reflected and refracted so that light from the latent spot reaches the objective of the microscope, O . The light emerging from this objective is divided by means of a double ocular into two parts, one part falling into the phototube, *P*, and the other falling into the ocular, E_M, through which the object plane may be observed.

When the counting chamber with the cells is moved, the latent spot meets successively cells or parts of them which now become luminous and are recorded by the phototube-amplifier-counter system. The width of the scanning area, which must be known in order to calculate the scanned volume, is derived in the following manner. Fig. 2 shows schematically the cells of an arbitrary field in the counting chamber. *a* is the effective diameter of the latent spot and *b* the median value of the cell diameter. The area of the counting chamber is divided by lines parallel to the scanning direction, so that the distance between two adjacent dotted lines is $\frac{1}{2}b + a + \frac{1}{2}b$. This distance is the scanning width. Those cells are counted (crossed in Fig. 2) the centres of which are inside the scanning width (actual scanning track marked *SC*). When the centre of a cell is situated just inside the scanning width, this cell is not counted if the diameter is so much smaller than the median value of the cell diameter which determines the position of the dotted line that the edge of the cell does not reach the effective area of the latent spot. In the same way, a cell which is situated just outside the scanning width is counted if the diameter is so much larger than the median value of the cell diameter that the edge of the cell reaches the effective area of the latent spot. However, the effects of these two groups of cells cancel each other if a large number of cells are counted, because there are as many cells of a diameter greater than the median value as there are cells of a diameter smaller than that value, according to the definition of the median value.

In order to get correct results, it is necessary to have the cells uniformly distributed and the cell suspension free from contamination with foreign particles that can be recorded by the electronic system. These two conditions will decide whether a certain kind of cell can be satisfactorily counted or not by the method described. The method has been applied to the counting of human erythrocytes and yeast cells. The results have been compared with those of the ordinary counting chamber method, and the two methods have been found to agree rather well.

A full account of this work will be published in *Upsala Läkareförenings Förhandlingar*.

An Asymptotic Solution of the Fundamental Equation of the Statistical Atom Theory

THE problem of atoms and ions with spherical symmetry as well as the problem of metals and ionic crystals seems to be dealt with quite satisfactorily by the Thomas–Fermi's statistical method[1], with its modifications due to Dirac[2], Jensen[3] and Gombás[4] respectively. But the fundamental equation of the modified theory having no solution in closed form, that is, in terms of elementary functions, one must apply for its solution, in each particular case, rather lengthy numerical methods. To avoid these difficulties, we propose an asymptotic method of solution which may be applied successfully in many cases.

The fundamental equation may be written in the following form[4]:

$$y'' = x\{(y/x)^{1/2} + \beta\}^3, \tag{1}$$

and is to be solved under the conditions

$$y(0) = 1 \text{ and } y(x_0) - x_0.y(x_0) = (Z-N)/Z, \tag{2}$$

where Z, N and x_0 denote respectively the atomic number, the number of the electrons and the atomic radius; β depends also on Z.

In the particular case $\beta = 0$, (1) reduces to the original equation of Fermi, which has been solved by Fermi[1], Sommerfeld[5] and Miranda[6].

In a previous paper we have attempted to solve (1) by the method of perturbations. By considering β as a perturbation parameter, we have sought the solution in the form of a power series

$$y = y_0 + \beta y_1 + \beta_0 y_2 + \ldots,$$

where y_0 is the solution of the Fermi equation. For $y_1, y_2, \ldots$ we have obtained a recursive system of linear differential equation, which may be solved quite easily. The only difficulty which arises is that the resulting series does not converge very rapidly, and one has to calculate, therefore, several terms.

We can avoid this difficulty by making use of the following method. In case $\beta = 0$, (1) has the particular solution

$$y = 144/x^3. \tag{3}$$

In case $\beta \neq 0$ we may seek, therefore, the solution in the form

$$y = 144/x^3.v(x). \tag{4}$$

For $v(x)$ we obtain the equation

$$\frac{1}{12}\,x^2v'' - \frac{1}{2}\,xv' + v = \left\{v^{1/2} + \frac{\beta}{12}\,x^2\right\}^3.$$

For $v(x) = w(x^2) = w(t)$ we have then

$$\frac{1}{3}\,t^2w'' - \frac{5}{6}\,tw' + w = \left\{w^{1/3} + \frac{\beta}{12}\,t\right\}^3. \tag{5}$$

Putting $w(t) = 1 + c_1t + c_2t^2 + \ldots$ we obtain, by comparing coefficients :

$$c_1 = -\frac{3}{16}\beta,\ c_2 = \frac{79}{9216}\beta^2,\ c_3 = \frac{1584}{63700992}\beta^3,\ \ldots$$

Thus we have the solution

$$y = \frac{144}{x}\,(1 + c_1x^2 + c_2x^4 + c_3x^6 + \ldots), \tag{6}$$

and the series converges rapidly, for it is majorized by the geometrical series with the quotient 10^{-3}. We may stop, for example, at the third term.

The shape of our curve is the same as that calculated by Jensen's numerical method. Our solution does not satisfy the condition $y(0) = 1$. We can avoid the difficulty by using an idea of Sommerfeld[5], namely, we put

$$y \sim \frac{144}{\{1 + (x/a)^2\}^{3/2}\,a^3}\,\{1 + c_1a^2\,\{1 + (x/a)^2\} + \ldots + c_3a^6\,\{1 + (x/a)^2\}^3\}. \tag{7}$$

This function is asymptotically equal to (6), and the parameter a may be chosen such that the condition $y(0) = 1$ be satisfied.

This asymptotic solution, as well as Sommerfeld's, yields a very good approximation, especially in the exterior parts of the atoms.

Brightness of the New Moon

I HAVE been unable to find in the literature any data for the brightness of the new moon. This can be calculated in two independent ways.

(1) The earth receives from the sun at noon about 10^5 lux[1]. The albedo value of the earth is about 45 per cent[2]. The brightness of the earth, as seen from a great distance, is therefore $4 \cdot 5 \times 10^4$ apostilb (equivalent metre candles) or $1 \cdot 43 \times 10^4$ c./m.^{2}. The cross-section of the earth is $1 \cdot 27 \times 10^8$ km.^{2}, or $1 \cdot 27 \times 10^{14}$ m.^{2}. The candle-power of 'full earth' is therefore $1 \cdot 82 \times 10^{18}$ c. The distance earth to moon being $3 \cdot 84 \times 10^8$ m., the latter receives from the earth 12·3 lux. The illumination on the earth at full moon being only 0·2 lux[1], the illumination-level on the moon at 'full earth' is consequently about sixty times better.

The albedo value of the moon is about 7·3 per cent[3] ; therefore, the brightness of the new moon is 0·86 apostilb or $2 \cdot 7 \times 10^{-5}$ stilb (candle per sq. cm.).

(2) The earth receives at full moon 0·2 lux. The surface of the earth is 15·1 times that of the moon. The earth reflects 6·2 times as well as the moon. Because the sun sheds the same number of lux on the earth as on the surface of the moon, the moon receives at full earth $15 \cdot 1 \times 6 \cdot 2 \times 0 \cdot 2$ lux or 18·7 lux. The moon reflects 7·3 per cent. The brightness of the new moon is thus 1·37 apostilb or $3 \cdot 6 \times 10^{-5}$ stilb.

Both methods lead thus to a value of about 3×10^{-5} stilb or about 1 apostilb. The brightness of full moon is about 0·3 stilb or 10,000 times higher.

With the aid of a formula given by P. J. Bouma[3] the brightness of the new moon can be converted into magnitudes and is equal to − 2·4, whereas for the full moon the magnitude is − 12·5.

Darkening of Red in Protanopes

THE degree of darkening of the Ilford Spectrum Red colour-filter was measured for twelve protanopes and compared with its brightness for eighteen deuteranopes and several hundred normal subjects. The light transmitted by the red filter from a daylight source was mixed with light transmitted by the Ilford Spectrum Green filter and matched for brightness against light transmitted by the Ilford Spectrum Yellow filter by varying the intensity of the yellow. The mean brightness-level for the eighteen deuteranopes was the same as for normal subjects for all red-green mixtures. For the twelve protanopes the red light was only 15·5 per cent as bright on the average as for normal subjects; but the brightness-level steadily increased as green was added, until it reached the normal level at the pure green end.

At the extreme red end of the scale, the scatter of brightness measurements for the twelve protanopes did not overlap the scatter for the eighteen deuteranopes. No calculations are necessary to show that we are dealing with two groups of subjects which are statistically distinct.

This experiment confirmed the view put forward previously[1] that the Ishihara Test for colour blindness fails to distinguish clearly between protanopes and deuteranopes. Of the eighteen deuteranopes who did the present experiment, fourteen also did the Ishihara Test, which failed to distinguish five of them clearly from protanopes. Similarly, nine of the twelve protanopes also did the Ishihara Test, and it failed to distinguish eight of them unequivocally from deuteranopes, although the evidence for this distinction based on actual measurements of the darkening of the red is very clear indeed. It is interesting that Geddes[2], assuming the validity of the Ishihara Test, makes a separate class ('incompletely red-green blind') for those subjects not decisively placed as protanopes or deuteranopes (that is, scoterythrous or photerythrous) by that test.

Effects of Calcium Deficiency on Potato Sets in Acid Soils

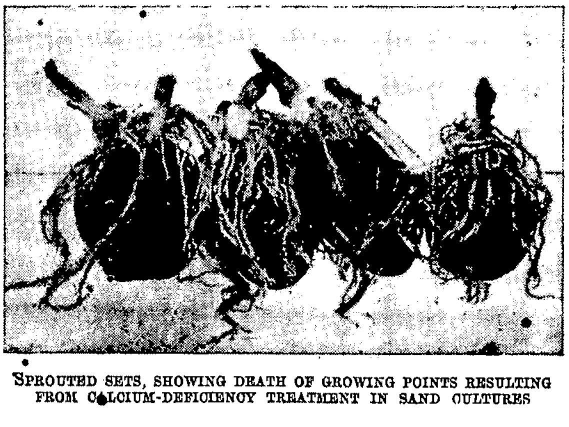
DURING the War, when many poor upland areas and commons in Britain were ploughed up for crop production, potatoes were commonly planted as a first crop in view of their tolerance to acid soil conditions. Many failures, however, were experienced where the soils were very strongly acid, with *p*H values of the order of 4·0, and it was shown that liming was necessary to correct the unfavourable conditions. Plants which survived on these acid soils usually showed pronounced symptoms of calcium deficiency in the haulms, and it was clear that the supply of this element was an important factor in determining success or failure of the crops.

A second point which was noted where the shoots failed to emerge, and which has so far remained unexplained, was that the planted tubers remained firm and apparently failed to make any shoot growth. This phenomenon appeared unusual, since tubers will sprout and soften normally in the absence of any soil, and seemed to suggest an inhibiting effect on shoot-growth, such as might result from toxic substances in the soil, as, for example, excess of hydrogen ions, manganese, aluminium or ammonium.

In the course of sand-culture experiments carried out at Long Ashton, in which the effects of possible soil-acidity factors have been examined on a number of crop plants[1,2], observations have been made on potatoes which indicate that the effect is a direct result of calcium deficiency and is not due to the toxic action of elements present in excess.

Sprouted potato sets, variety Majestic, were grown in sand, with and without calcium, both pots and sand being specially treated to ensure very acute conditions of calcium deficiency where the element was omitted from the nutrient solutions. Differential nitrogen treatments, including nitrate, ammonia and urea, were given, and some cultures also received concentrations of manganese and aluminium sufficiently high to produce severe toxic effects. Two series of parallel nutrient solutions, with *p*H values of 3·5 and 5·5, were used.

In the cultures from which calcium was omitted, the plants failed completely and the shoots did not emerge above the level of the sand. On examining the tubers of these plants, it was found that the sprouts had broken down immediately behind the growing points, after which they died off. The roots, in contrast, appeared fairly normal and the tubers remained as firm as when they were planted (see accompanying illustration).



SPROUTED SETS, SHOWING DEATH OF GROWING POINTS RESULTING FROM CALCIUM-DEFICIENCY TREATMENT IN SAND CULTURES

The affected tubers were afterwards thoroughly washed; then they again sprouted normally in boxes without sand or soil.

In all cultures to which calcium was given the shoots emerged normally, and it was not until a later stage of growth that signs of the other unfavourable treatments were developed.

It thus seems that the hard-tuber condition which occurs in failure-plants on acid soils results from the dying back of the young shoots prior to emergence above the soil, and that this is caused by deficiency of calcium and is not due to the effects of toxic concentrations of elements such as manganese and aluminium.

Transmission of a Disease Resembling Virus Yellows through the 'Seed' of Sugar Beet

IN the course of breeding experiments, Mr. B. Cronbie of the Irish Sugar Co. observed in 1946 that three separate field crops of a new family of sugar beet showed in each case approximately 25 per cent of 'yellowed' plants two to three weeks after singling. He stated that the disease resembled typical virus yellows but did not appear to spread to neighbouring beet crops. The parent plants of the family (No. 41) had been selected from good commercial beet crops in a relatively virus-free district, but no information was available as to their freedom or otherwise from yellows. The cross had been made in 1945 in a pollen-proof cage.

On September 7, 1946, the Sugar Co. transmitted to this laboratory field-plants of family 41 showing yellows, together with a small quantity of the residual 'seed' of this family. (The term 'seed' is used in the popular sense and refers to the fruit clusters.) A portion of the latter was sown in 1946, and the remainder in March 1947, in an insect-proof glasshouse, the seedlings being transplanted to 7-in. pots when of appropriate size. No abnormality was noted until the plants were about 10 in. in height, with ten to twelve foliage leaves, when the tips of the two basal leaves of certain plants became tough, then changed from the normal colour to light green and, gradually, through yellow to orange. As a general rule, the yellowing afterwards spread downwards through the leaves, only the areas around the veins remaining green. Similar symptoms meanwhile developed in the next leaves above, the advance of the disease being thus acropetal. No vein-clearing or other abnormality was detected in the young developing foliage. In some of the affected leaves the yellowing remained confined to the tips with, occasionally, an island of affected tissue midway on the lamina; in others it spread irregularly down one side. Frequently a yellow area was clearly demarcated from a green one by a main vein, this being more noticeable as the plants became older. Eventually the chlorotic areas withered and turned brown and the margins of the leaves curled upwards. Of the 143 plants which were raised from seed, 47·5 per cent showed the foregoing symptoms, which, in general, resemble those of virus yellows as described by Watson[1].

In view of repeated statements that beet yellows virus is not transmissible through the seed, and having regard to the proportion of plants affected in the 1946 field crops of family 41, it had been tentatively assumed that the yellowing might be due to a genetical abnormality rather than to virus infection. However, it has now been established that the disease is transmissible from family 41 to healthy plants of sugar beet and spinach (*Spinacia oleracea* L.) by means of the aphis *Myzus persicæ* (Sulz.). Confining the expression of results to those obtained with plants of family 41 raised from seed in the glasshouse, and thus protected from accidental infection, transmission has now been secured in three separate experiments involving sixty-eight sugar beet and thirty-four spinach seedlings as experimental hosts. Of these, 85 per cent and 76 per cent, respectively, developed yellows, the initial symptoms appearing in the lower leaves three to four weeks after inoculation by the insect vector. In parallel experiments, using as sources of infection field plants of commercial beet and mangold varieties showing typical yellows, a disease was obtained which appeared identical with that occurring in family 41. It is reasonable to assume, therefore, that an ordinary yellows virus was present in at least one of the parent plants of family 41, and that it penetrated the seed resulting from the cross. This new family is possibly unique in being thus susceptible to seed infection; but it is important to know that such a type can arise from the crossing of popular commercial sorts.

Incidentally, there appear to be two types of yellows disease occurring in commercial beet crops, for certain plants selected from the latter yielded a virus (or virus mixture) which invariably produced in the experimental hosts a clearing or superficial necrosis of the veins of the young leaves, this initial symptom being followed by acropetal yellowing as already described.

Possible Significance of Free-living Nematodes in Genetic Research

THE free-living nematodes of the sub-order Rhabditina are widespread in the soil[1] and relatively easily cultivable[2-4] on nutrient agar in the presence of bacteria and have short life-cycles (3–7 days from hatching to sexual maturity), with adult sizes up to 3 mm. in length. They offer, in our estimation, certain very interesting possibilities for the study of basic genetic phenomena—morphological, cytogenetic and physiological.

The particular morphological significance of these forms is related to the phenomenon of cellular constancy, or eutely, which the phylum Nematoda (along with the other aschelminth phyla) exhibits for some or all somatic cells. Therefore, the free-living nematodes, containing at most a few hundred somatic nuclei in cells and syncytia, offer material in which mutations affecting structural components may well be interpretable in terms of cellular morphology, rather than only in terms of organ morphology and gross structure.

The cytology of the sex cells of various species of the genus *Rhabditis* Dujardin (1844) has been studied by a few workers[5-11], and has revealed some very interesting sex-patterns. Diploid numbers of 10–24 chromosomes are known for the females and hermaphrodites of different species; the males, where known, are the heterogametic sex with an *XO* sex-chromosome pattern. Some species are diœcious, usually with approximately equal numbers of males and females; others are composed of hermaphrodites of female form and much rarer males, or no males at all; and a few consist only of thelytokous females. Certain diœcious and many hermaphroditic species use their sperm only to initiate development; the sperm confers its centrosome, but not its nucleus, on the ovum[5,7,8]. In some of these species pairing and reduction of chromosomes nevertheless occurs in meiosis; the diploid number is reconstituted with the failure of a second meiotic division to occur. Sex-determination is apparently effected by an unusual regulation of *X*-chromosome behaviour in meiosis. With simple chromosome numbers these forms should be good cytogenetic material; and with their unusual sex-patterns a considerable versatility in the detection and manipulation of mutations should be possible.

Another important consideration is the possibility of studying physiological mutants. As a result of the work of Kidder and Dewey[12] it is now possible to grow at least one organism of animal nutrition (the ciliate *Tetrahymena geleii*) on an almost completely chemically defined medium (consisting of inorganic salts, glucose, vitamins, amino-acids, purines and pyrimidines, and one unknown growth factor). It seems certain that the near future will see a completely known synthetic medium for this form. Through the use of a chemically defined medium the possibility arises that the new concepts of physiological genetics developed by Beadle[13] may be tested on a differentiating organism. Kidder and Dewey's work suggests a valuable lead for the development of a chemically defined medium for species of *Rhabditis*.

We feel that, with eutely, good cytological features, and convenient sex patterns, together with promising cultural and nutritional aspects, the soil-dwelling nematodes offer attractive possibilities for a correlation and precise interpretation of the morphological and physiological genetics of a simple, differentiating organism. Such a simultaneous approach is being attempted in this laboratory. We are presenting the foregoing discussion in the hope of stimulating others to work on the same problem.

INFLUENCE OF TEMPERATURE ON THE UREA DENATURATION OF β-LACTOGLOBULIN

By C. F. JACOBSEN
AND
L. KORSGAARD CHRISTENSEN
Carlsberg Laboratory, Copenhagen

THE kinetics of urea denaturation of globular proteins has been little investigated. This is surprising in view of the interesting results obtained by Hopkins[1], who showed that the temperature coefficient of urea denaturation of egg-albumin (60 per cent urea) is negative.

Since unusual features of a chemical process often help in the elucidation of the reaction mechanism, it was thought that a closer investigation of the urea denaturation might be valuable. Unfortunately, a negative temperature coefficient of the egg-albumin denaturation by urea is only found at very high urea concentrations (Clark[2]), which means that the reacting system must be built up from egg-albumin solution and solid urea. Because of the very high initial rate of the reaction, the numerically large temperature coefficient and the large heat consumption due to the dissolution of the urea, an accurate investigation of the denaturation of egg-albumin in high urea concentration seems to be difficult. It was, however, found that the β-lactoglobulin denaturation by urea has a negative temperature coefficient at an appreciably lower urea concentration, namely, 38 per cent. Some results of experiments with this protein are given in the following.

Solutions of iso-electric β-lactoglobulin in 0·1 *N* sodium chloride (*p*H 5·15) and freshly dissolved urea (*p*H 6·95) were mixed in such proportions that the reaction mixture contained 38 per cent urea and 2 per cent β-lactoglobulin. The *p*H of the reaction mixture was 5·17 (hydrogen electrode): The aliquots withdrawn were mixed with 10 volumes of a solution containing 0·8 mol. acetic acid, 0·4 mol. sodium acetate and 0·5 mol. magnesium sulphate. Extensive comparative experiments by Mr. G. Johansen in this Laboratory have shown that of all buffer-salt mixtures tried, this solution gives the highest yield of precipitated (denatured) protein, without precipitating undenatured protein. The precipitate was filtered and washed ten times with the salt-buffer mixture and analysed for nitrogen.

The accompanying curves are based on independent double determinations.

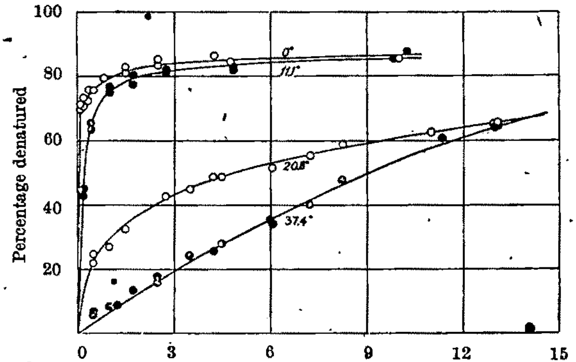

Fig. 1

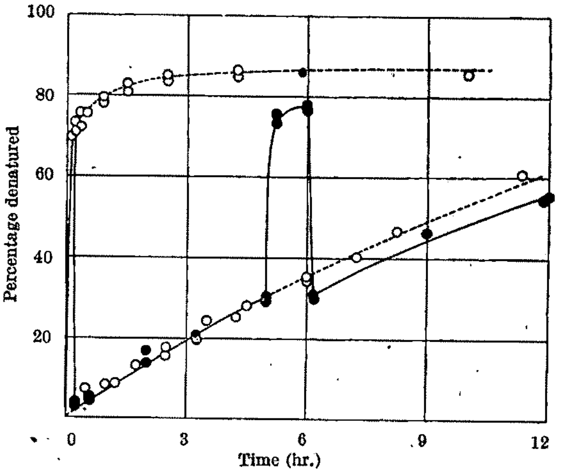

Fig. 2

The temperature dependence of β-lactoglobulin denaturation by urea is shown by Fig. 1, which shows the very large negative temperature coefficient for the initial stages of the denaturation. For the later part of the denaturation process the temperature coefficient is positive.

The denaturation at 0° C. is rapidly and nearly completely reversed if the temperature is increased. Fig. 2 shows the denaturation time-curves for experiments in which the temperature is changed. The dotted curves show the denaturation process at constant temperature, while the full-line curve shows the denaturation process in the following circumstances. The urea and protein solutions were mixed at 0° C.; after 6 min. the mixture was heated to 37·4° C. and was kept at this temperature for five hours, whereupon it was cooled to 0° C., kept at this temperature for one hour and again heated to 37·4° C.

The high denaturation-rate at 0° C. is already known from Fig. 1; the reversion of the denaturation upon heating is amazingly rapid. In this connexion it is interesting to note that heat denaturation of β-lactoglobulin can be reversed by cooling[3].

The shape of the curves of Fig. 1 seems to indicate that the denaturation process is composed of simultaneous or consecutive reactions, while Fig. 2 shows that at least one of the denaturing reactions goes to a temperature-dependent equilibrium between denatured and native protein. In these circumstances the mutual positions of the curves may be accounted for by assuming positive temperature coefficients for the partial reactions. The choice between the several possibilities for the paths of reactions must, however, wait until more experimental material is at hand.

The reversion of denaturation seems to be complete, since the reverted protein is crystallizable. This was shown in the following manner. The denaturation was allowed to proceed for 6 min. at 0° C. (70 per cent denatured), whereupon the solution was heated to 37·4° C. and kept at this temperature for 10 min. After addition of one volume of water, about 3 per cent of the protein was insoluble in the buffer-salt mixture. Slow addition of saturated ammonium sulphate solution to two-thirds saturation caused crystallization of practically all the protein (addition of trichloroacetic acid to the filtrate caused only a slight opalescence). The crystals were indistinguishable from those produced by the method of Sørensen and Sørensen[4].

It seems likely that the crystallized protein is identical with the starting material; a final identification cannot, however, be established without careful examination of other properties than the crystalline habit.

THE NATURAL VEGETATION OF TRINIDAD

IN a work bearing this title*, Dr. J. S. Beard has given a comprehensive and interesting account of the vegetation of the untouched forest regions of the island of Trinidad, B.W.I. In general, this work follows the earlier survey of R. C. Marshall and brings to the notice of the reader literature which has contributed to a knowledge of the ecology of this region. The underlying practical reason for this study, namely, the correct utilization and conservation of the remaining areas of unalienated Crown land, follows a long period of *laisser-faire* during which there was no effective official policy and, when, as in many other tropical regions, the harmful utilization of virgin areas was all too common.

The present survey is both thorough and readable. It gives a clear account of the uniquely interesting position of Trinidad—an outlier of the South American continent, rather than the southernmost member of the Antilles—and of the factors which enter into the ecological situation. It might almost be said that if what you want is an adequate introduction to the vegetation of tropical America, you should begin with Trinidad. The advantages are numerous. The island, roughly about the size of an English county, has a rich flora (upwards of 2,200 angiosperms), many being representative of the mainland. On the whole this flora is now sufficiently well known, and herbaria are available for consultation. The data of considerable soil surveys are also available: no less than twenty-three types have been enumerated, which for ecological purposes can be classed into three groups in terms of drainage—a conception of which much use has been made in Beard's studies. Other relevant data, topographical, geological and meteorological, are also at hand and are summarized in the present work.

The total of endemic species in the entire flora is estimated at 7 per cent—a low figure for an island flora. The evident close affinity of the Trinidad flora is with the rich adjacent South American region; affinities of a more remote kind with the flora of West Africa can also be traced.

The present work is chiefly concerned with the tree flora. Although a considerable part of the original forested area has been cleared for cultivation, much still remains in its native state, the influence of man being entirely local in nature. A check list of trees is followed by a classification of the plant communities. The six formations which are recognized, seasonal, dry evergreen, montane, intermediate, swamp and marsh formations, are based on climatic and edaphic factors. Each is treated in detail and illustrated by diagrams and some good photographs. Space does not permit of any account being given of this considerable section of the memoir: the overall result is, however, excellent, and the reader, and still more the visiting botanist, will be able, in a short space of time, to gain a real insight into the components of this rich and varied region.

In the concluding section the author analyses and discusses the relationships observed and the ecological conceptions which emerge. In particular, he is concerned with the correct application of certain terms—the names of the several floristic groups—and with concepts such as the nature of the climax. Of the climatic climax he writes as follows:

"In the tropics, studies have shown repeatedly that it is the moisture-supplying ability of the soil which is the most important consideration and this is not necessarily at all closely concerned with climate. The writer's classification of the formations into six series is based entirely on moisture relations which result from the interplay of the three factors of climate, topography, and soil. The ecosystem, in fact, is one and indivisible. Climate, however, is the only component factor of the ecosystem which for any given area is constant (or presumably more or less constant). Land-form and soil, and with them the vegetation, pass through young, mature, and senile stages of development. Within any climatic region or zone, therefore, at some point in the cycle of development a formation will appear which can be interpreted as the highest type of vegetation which can develop under the given climate, other environmental factors (land-form, soil) having at the same time developed the most favourable moisture conditions possible to them in the cycle. The writer believes this to be a more workable definition of the climatic climax.

"As so defined, the climatic climax will not necessarily be the highest type which can exist in the given climate, for such a type would only appear in the presence of ideally favourable conditions of soil and topography. This definition permits of the existence of more than one equivalent climatic climax within a given climate, according to differences in the land-form/soil complex."

A final section is devoted to a reconstruction of the palæo-ecology of the island. The author is to be congratulated on a valuable piece of work in which the reader's interest is sustained throughout.

C. W. WARDLAW

TRAINING FOR CHEMISTS

THE Education Committee of the British Association of Chemists has recently published its suggestions on the education of chemists*, and though the report does not contain any strikingly novel proposals, it is full of sound sense and should be carefully studied in both academic and industrial chemical circles. The Committee points out that practically the whole of the industry of Britain is dependent on scientific control: a platitude, no doubt, to men of science, but a fact that still has to be emphasized, and emphasized repeatedly, for a general public to whom science is even yet an arcanum. To implement this control a steady and increasing flow of scientific men, and particularly chemists, is essential, and the Committee considers

* Education in Chemistry: the Teaching of Chemistry in Schools and the Training of Chemists and Chemical Technicians for Industry. (London: British Association of Chemists.) 2*s*. net.

the education of chemists under the headings of chemistry in schools, chemistry at the university and the technical college, the training of chemists and chemical technicians engaged in industry, and the recruitment and training of teachers of chemistry.

The report has little to say about the inherent value of science as part of a liberal education, confining itself to the bare assertion that the study of science is of direct cultural importance. This aspect could usefully have been treated more fully, for even to-day it remains true that in a great many schools science is regarded as on a lower educative plane than the so-called humanities. A strong lead from the British Association of Chemists would have found wide support from science masters and mistresses, and since the fundamental education of chemists is given in the schools, the tone should have been pitched high from the start. The report does, however, make many valuable observations on school science, especially the remark that there is sometimes too much insistence on 'the spirit of science' and too little on providing in an assimilable form an essential basis of facts and their relationship. This is a fully justified charge : the pendulum has, indeed, swung to the opposite extreme from the old South Kensington days, and university chemistry teachers have good reason to complain of the lack of factual knowledge shown by freshmen. Though the report does not specifically refer to it, one contributory cause of this situation, so far as chemistry is concerned, is the neglect of qualitative analysis in the schools : analysis admittedly requires a great deal of time, but it does make the student familiar with the materials of his craft.

On types of school, the report refers to the suggestion in the White Paper on Education that at eleven, and at thirteen, pupils should be allocated to one of the three kinds of secondary school—grammar, modern or technical. This suggestion is regarded as unsound, because no preference is shown by most pupils at these ages ; instead, the Committee recommends that the three proposed types of school should be divisions of one multilateral institution under the general control of the same board of governors and arranged if possible on the house system. The chief advantage claimed for this system is a social one; it would help to prevent the development of superiority or inferiority complexes surrounding the type of child in a particular grade of school. The Committee agrees that there is a case for grouping pupils at about the age of thirteen into classes of differing intellectual abilities, but makes the very sound point that this grouping should be such as to allow those who learn quickly to make more rapid progress in a common curriculum than to divide children into classes taking widely different courses.

On the question of external school examinations, the Committee feels that some such test at School Certificate age should be maintained, since industry and society require some datum line on which they can base an initial estimate of educational attainment, and an internal standard must inevitably vary from school to school. The test should, however, be conducted in such a way as to yield an estimate of general intelligence rather than of an ability to reproduce set problems and books. After the school minimum leaving age, the Committee recommends for all pupils the continuation of a general course in certain compulsory subjects, including science, with a choice of others, such as languages, handicrafts, and so on. The basic subjects common to all would be English, science, mathematics, a modern language, history and geography, with the addition of Latin for potential science specialists if it has not been studied previously.

As to the Higher Certificate, the Committee feels, like so many of us, that the whole basis of the examination should be broadened, and that the certificate should not exempt the student from the first-year course at a university. Similarly, scholarship examinations should not be tests to discover how far candidates have already progressed towards their degree, but should be a means by which those most capable of profiting by further education on more specialized lines may be selected.

At the university and technical college, the report continues, the science student must have time to make contact with students in other faculties and sufficient leisure to follow some cultural interests. This would probably involve an increase from three years to four years in the normal pass degree course, and is particularly necessary in chemistry if the proper background to the subject is to be imparted.

Further suggestions by the Committee include closer co-operation between the universities and the chemical industry, a modification in the conditions of military service for undergraduates, the formation of training centres for technical grades, better prospects for junior employees, an improved financial standard of remuneration for chemists and the encouragement of well-qualified teachers. The report ends with an appeal to all the organisations now representing the craft of chemistry to make a common approach to the whole subject.

E. J. HOLMYARD

ECHINODERM FAUNA OF AUSTRALIA

DR. HUBERT LYMAN CLARK'S large work, "Echinoderms from Australia", was reviewed in *Nature* of September 24, 1938. That review and the obituary notice of Dr. Clark in *Nature* of September 20, 1947, show how many and how important were his contributions to the knowledge of Australian echinoderms. He had made them his peculiar province ; it is fitting that they should be the subject of his *chef-d'œuvre*, "The Echinoderm Fauna of Australia : its Composition and its Origin"*, which was published in 1946 and has now reached Great Britain. For it he received on his deathbed the award of the Australian Clarke Medal.

Part 1, which is by far the greater part of the volume, is an account of all the echinoderms, living or extinct, which are known from Australia. There are keys to all orders, families, genera and species ; and, under each species—and there are nearly nine hundred of them—notes on synonymy, range, occurrence, habitat, habits, colour, variation and food so far as they are known. There are no illustrations, since nearly all the species have been figured elsewhere, and references to those figures are given.

Part 2 is a discussion of the composition and origin of the Australian echinoderm fauna. Its most characteristic feature is the predominance of East Indian forms and influences, so that there can be no doubt it is derived from there. It appears to have come along two paths, one on either side of the land-bridge which once spanned what is now the Torres Strait; for the faunas of the north coast and of east Queensland bear each a different facies, having not yet completely commingled. The farther away one goes from Torres Strait, whether south by Queensland and west along the Bight, or north by Darwin and so around to Perth, the more characteristic the fauna becomes, until in the south-western corner it is nine-tenths endemic.

---

* Carnegie Institution of Washington, Publication No. 566. The Echinoderm Fauna of Australia; its Composition and its Origin. By Hubert Lyman Clark. Pp. iv+567. (Washington, D.C.: Carnegie Institution, 1946.) 4 dollars.

The conclusion that the Australian echinoderm fauna is East Indian in origin is preceded by successive and detailed comparisons with the echinoderm faunas of all surrounding lands—of Antarctica, Kerguelen, Mauritius, South Africa and so on north-about to New Zealand. Dr. Clark believed that because of their "relatively sedentary habits, their aversion to fresh or even brackish water, the brevity or complete absence of a free-living larval life, and the usually small bathymetric range, echinoderms are remarkably suitable material for studying changes in shore line or the relation of land masses to each other". Where in distant faunas he finds similarities to that of Australia he attributes them, for the most part, to a common source in the East Indian fauna. A number of perplexing forms, like, for example, the sea-urchin *Dermechinus*, which occurs off the southern tips of America, Africa and Australia, cannot be so explained; but Dr. Clark concludes "that only a desperate desire to validate the Wegener hypothesis can find in the echinoderm fauna of Australia any evidence that it is at all closely related to that of South Africa or even of New Zealand". D. Dilwyn John

TOWARDS AN INTERNATIONAL PHARMACOPŒIA

The first meeting was held at Geneva during October 13–17 of the Expert Committee on the Unification of Pharmacopœias of the World Health Organisation. There were present Prof. H. Baggesgaard Rasmussen (Denmark), Prof. E. Fullerton Cook (United States), Prof. I. R. Fahmy (Egypt), and Dr. C. H. Hampshire (Great Britain); Prof. R. Hazard (France) was prevented by illness from attending. The members were welcomed, in the name of the Executive Secretary, by Dr. R. Gautier, who said that the duties of the Committee would be to continue the work on the unification of pharmacopœias which had been begun by the Technical Commission of Pharmacopœial Experts of the League of Nations. Dr. C. H. Hampshire was elected chairman.

The Committee accepted the general principles expressed in the Interim Report of the previous Commission published in 1945, and approved the monographs contained therein, subject to consideration of any comments which might be received later. The intention that the recommendations of the Committee should take the form of an International Pharmacopœia was approved, the scope to be limited in the first place to drugs considered to be essential in medical practice. It was understood that such an International Pharmacopœia could have no authority in any country until it had been adopted by that country.

A list of 534 drugs was considered and 244 were selected for immediate attention. It was decided that monographs on the drugs for which the Committee on Biological Standardization had provided standards should be included. Thirty draft monographs were completed, making with those in the interim report a total of seventy-two.

The preparation of drafts of monographs, general notices and appendixes, and of reports on special subjects was allocated among the members present, who also undertook the necessary experimental work. Arrangements were made for special reports on such subjects as alkaloidal assays, boiling points and melting points, fineness of powders, and the sterilization of injectable materials.

In view of the fact that the place of galenicals in medicine had been largely taken by the new synthetics, alkaloids and injectable materials, the Committee decided not to re-establish the Reference Sub-Committee on Galenical Pharmacy, appointed by the previous Commission. The possibility of establishing an international procedure for naming new drugs at an early stage of their introduction into medicine, and the standardization of surgical ligatures, sutures and dressings, were also discussed and reserved for future consideration.

In view of the volume of work to be undertaken and of the necessity for widening the international basis of the work, the Committee recommended that at least three additional members should be appointed and that a unified secretariat with specialized staff should be formed.

FORTHCOMING EVENTS

Monday, January 5

Society of Chemical Industry (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 6.30 p.m.—Mr. H. J. Bunker: "Some Scientific Aspects of Beer".

Tuesday, January 6

Institution of Civil Engineers (at Great George Street, London, S.W.1), at 5.30 p.m.—Mr. Clifford Heyes and Mr. J. Brierley: "Airfield Lighting".

Institution of Mechanical Engineers, Automobile Division (at Storey's Gate, St. James's Park, London, S.W.1), at 6 p.m.—Capt. G. T. Smith-Clarke: Chairman's Address.

Institute of Welding, Manchester and District Branch (in the Reynolds Hall, College of Technology, Manchester), at 7 p.m.—Mr. S. W. Carpenter: "Automatic Welding".

Wednesday, January 7

Illuminating Engineering Society, Manchester Centre (joint meeting with the Association of Public Lighting Engineers, in the Reynolds Hall, College of Technology, Manchester), at 6 p.m.—Mr. E. J. Stewart: "The Lighting of Housing Estates".

Thursday, January 8

Physical Society, Acoustics Group (at the National Hospital, Queen Square, London, W.C.1), at 4.30 p.m.—Prof. H. Hartridge, F.R.S.: "The Use of Supersonic Sound by Animals"; Dr. C. S. Hallpike and Miss M. R. Dix: "Pure-Tone Audiometry in Young Children, a New Technique" (Film and Demonstration); Dr. Dennis Fry: "Tone Deafness".

Chemical Society, Manchester Section (joint meeting with the Local Sections of the Society of Chemical Industry and the Royal Institute of Chemistry, in the Chemistry Lecture Theatre, The University, Manchester), at 6.30 p.m.—Dr. M. P. Applebey: "Crystallisation of Fertilisers".

Institution of Civil Engineers, North-Western Association (at the Engineers' Club, Albert Square, Manchester), at 6.30 p.m.—Mr. W. J. O. Scott: "Roads and their Riding Qualities".

Chemical Society (at Burlington House, Piccadilly, London, W.1), at 7.30 p.m.—Prof. T. P. Hilditch, F.R.S.: "Structural Relationships in the Natural Unsaturated Higher Fatty Acids".

Friday, January 9

Textile Institute (at 16 St. Mary's Parsonage, Manchester), at 1 p.m.—Dr. A. Roberts: "Education for Management in the Textile Industry".

Oil and Colour Chemists' Association, Manchester Section (at the Engineers' Club, Albert Square, Manchester), at 2 p.m.—Mr. F. Armitage and Mr. J. J. Sleightholme: "Further Developments in Styrene Co-Polymers".

Royal Astronomical Society (at Burlington House, Piccadilly, London, W.1), at 4.30 p.m.—Scientific Papers.

Physical Society (in the Physics Department, Imperial College of Science, Imperial Institute Road, London, S.W.7), at 5 p.m.—Mr. D. R. Davies: "Shock Waves in Air at Very High Pressures"; Mr. D. C. Pack, Mr. W. M. Evans and Mr. H. J. James: "The Propagation of Shock Waves in Steel and Lead".

Institution of Mechanical Engineers, Applied Mechanics Group (at Storey's Gate, St. James's Park, London, S.W.1), at 5.30 p.m.—Prof. E. Schmidt: "Design of Contra-Flow Heat Exchangers".

Plastics Institute (at the Engineers' Club, Albert Square, Manchester), at 6.45 p.m.—Mr. J. M. J. Estevez: "Contact Resins".

Sheffield Metallurgical Association, Methods of Analysis Group (at 198 West Street, Sheffield), at 7 p.m.—Mr. E. J. Vaughan: "The Spekker—What it Is and How it Works", Part 1.

Institution of the Rubber Industry, Leicester Section (at the Bell Hotel, Humberstone Gate, Leicester), at 7.30 p.m.—Mr. G. A. Shires: "Libraries and the Handling of Technical Information in the Rubber Industry".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Resident Instructor and Lecturer in Agriculture at the Training Centre for Ex-Service men, Pulborough—The Secretary, West Sussex War Agricultural Executive Committee, County Hall, Chichester (January 10).

Senior Scientific Officer or Scientific Officer (Ref. No. A.337/47) to be responsible for radiation survey work and health radiation measurements, and a Senior Experimental Officer or Experimental Officer (Ref. No. F.773/47) to be concerned with problems of transportation and handling of chemicals, at the Atomic Energy Research Establishment, Harwell, Didcot, Berks—The Ministry of Labour and National Service, Technical and Scientific Register, Room 669, York House, Kingsway, London, W.C.2, quoting the appropriate Ref. No. (January 10).

Junior Physicist—The House Governor, King's College Hospital, Denmark Hill, London, S.E.5 (January 16).

Lecturer in Physics—The Clerk to the Governors, Woolwich Polytechnic, Woolwich, London, S.E.18 (January 17).

Analytical Chemists (male or female) for works in N.E. Scottish town—The Ministry of Labour and National Service, Room 669, York House, Kingsway, London, W.C.2, quoting F.515/47A (January 20).

Lecturer in Chemistry—The Secretary, Northampton Polytechnic, St. John Street, London, E.C.1 (January 24).

Lecturer or Assistant Lecturer in the Department of Civil Engineering—The Registrar, The University, Sheffield (January 31).

Watson-Watt Chair of Electrical Engineering in University College, Dundee—The Secretary, The University, St. Andrews (January 31).

Director of the Sugar Milling Research Institute (Natal University College)—The Secretary, Universities Bureau of the British Empire, 8 Park Street, London, W.1 (February 14).

Lecturer or Assistant Lecturer in Zoology—The Registrar, University College, Southampton (February 15).

University Demonstrator in Agriculture—The Secretary, School of Agriculture, Cambridge (February 21).

Chair of Applied Mathematics at King's College, Newcastle-upon-Tyne—The Registrar, University Office, 46 North Bailey, Durham (February 28).

Assistant Professor and an Associate Professor of Psychology—The Bursar, McGill University, Montreal, Canada (March 1).

Senior Lecturer in Theoretical Physics—The Secretary of Faculties, University Registry, Oxford (March 15).

Principal Scientific Officer, Empire Potato Collection, Cambridge—The Secretary, Commonwealth Agricultural Bureaux, 2 Queen Anne's Gate Buildings, London, S.W.1 (April 1).

I.C.I. Research Fellowships in Chemistry or Physics, or some allied subject such as Biochemistry, Colloid Science, Chemotherapy, Pharmacology, Metallurgy or Engineering—The Registrar, The University, Liverpool (April 30).

Expert in Soap Manufacture, Department of Commerce and Industries, Government of Ceylon—The Crown Agents for the Colonies, 4 Millbank, London, S.W.1, quoting M.N.17602.

Forestry Surveyor for Directorate-General of Agriculture, Government of Iraq—The Crown Agents for the Colonies, 4 Millbank, London, S.W.1, quoting M.N.18180.

Lecturer or Assistant Lecturer (man) in Colonial Social Science—The Secretary, London School of Economics and Political Science, Houghton Street, Aldwych, London, W.C.2.

Fisheries Officers (2) in Uganda—The Director of Recruitment (Colonial Service), Colonial Office, 15 Victoria Street, London, S.W.1.

Microanalyst—Sir Norman Haworth, F.R.S., Chemistry Department, The University, Birmingham 15.

Physical Chemist—The Secretary, British Hat and Allied Feltmakers Research Association, 12 St. Peter's Square, Stockport, Cheshire.

Lecturer in the Mathematics Department—The Principal, Northampton Polytechnic, St. John Street, London, E.C.1.

Laboratory Assistant in the Department of Biochemistry—The Secretary, University College London, Gower Street, London, W.C.1, quoting Biochemistry/1.

Design Engineers, Design Engineers (Instruments), Planning and Progress Engineers, Estimating Engineers, Buying Engineers, Electrical Engineers, Power Engineers, Standards Engineers, Civil Engineers, and Technical Engineers—The Staff Section, Ministry of Supply, Department of Atomic Energy, Risley, Warrington, Lancs.

Lecturer in Geography—The Registrar, University College, Exeter.

Soil Laboratory Assistant for Public Works Department, Government of Northern Rhodesia—The Crown Agents for the Colonies, 4 Millbank, London, S.W.1, quoting M.N.18396.

Assistant Inspector of Scientific Supplies by the India Store Department—The Office of the High Commissioner for India, India House, Aldwych, London, W.C.2, quoting S.965/46.

LIMITATIONS OF PLANNING IN SCIENTIFIC RESEARCH

THE best form for the central organisation of scientific effort in Great Britain is so complex a problem that it may be wise not to determine it finally with undue haste. We should have regard to the orderly evolution that marks the advance of science, and be on guard against rash generalizations and unsound analogies just as much as against the tendency to excessive planning at the centre. In this connexion, a review by Dr. F. B. Jewett of the future of scientific research in the post-war world (*Amer. Sci.*, 34, 439 ; July, 1946) should be studied. Dr. Jewett does much more than sound a note of caution as to whether there is not a limit to the speed at which society can wisely assimilate radically new scientific developments *en masse* into the social structure. He is concerned both with the effect on the balance of society, and, what is much more commonly overlooked, with its bearing on the attitude of the man of science himself towards his work as well as towards the society of which he is a part. Sir Henry Dale, in his presidential address at the Dundee meeting of the British Association, was obviously concerned with this latter aspect, though unlike Dr. Jewett he made no reference to the importance of further stimulating research into other fields of knowledge than the physical or biological sciences. In this connexion the forthcoming report of the National Committee on the Social Sciences set up by the Association of Scientific Workers (see p. 68) will be of interest.

The broad picture of the present conditions for scientific research drawn by Dr. Jewett is generally similar to that outlined by Sir Henry Dale, but he has filled in more of the detail. He reminds us that in fundamental and applied science the corps of highly trained research men is substantially the same numerically as at the beginning of the War ; but its average age is higher by four or five years and its creative potentiality has probably decreased. The next lower age-group of fully trained men is almost entirely lacking, and although partially trained men from the Services or war-work may ultimately fill the gap after completing their training or on the basis of experience, many will not be productive for some time. There is also a dearth of those who would normally be candidates for post-graduate training.

The contour and extent of fundamental knowledge do not differ greatly from those of four or five years ago ; but in the field of applied science, large extensions have been made in some sectors and none at all in others. A major problem of industrial research is to secure a better balance of technology in relation to social needs. The range, diversity and often the power of research tools have been greatly increased, and in some sectors tools, methods and materials previously rare, expensive or difficult to obtain, have been made comparatively easily available. The interdependence of different sectors of science for their mutual advancement has also been strikingly demonstrated during the War, just as have the value of new methods of planning and organising research, of team-work and the whole technique we know as operational research.

Only time can rectify the shortage of scientific man-power which Dr. Jewett and his colleagues in the United States emphasize, just as much as is done in Great Britain; but wise planning and the right priorities can speed up the process. As to the subjects of research, Dr. Jewett expects that if science is afforded the freedom it needs, it will for the next few years be mainly concerned with developing the fields on which interest is at present focused. He anticipates, however, a much wider use of, and greater demand for, the mathematician; and that there will be increasing co-operation between mathematicians and physical scientists; and in the field of applied science he anticipates a considerable expansion in the size and number of co-operative laboratories of the type of the Mellon and Battelle Institutes.

Dr. Jewett is concerned, however, that there should be no deterioration in the quality of research; and it should be remembered that this is one of the factors to be considered at every level in production. As Mr. A. C. Bossom observed in the concluding lecture on economic reconstruction delivered at the Royal Society of Arts last May, austerity production does not equip men to make better, or craftsmen's, articles. The manufacturing fame of Britain rests largely on the craftsmanship responsible for the high quality of our goods, and there is no more important aspect of industrial efficiency than this. It is one to which joint production committees and any other means we adopt for securing better industrial co-operation must give close and continuous attention.

It is in ways like this that the collaboration of the social scientist with the worker in the physical or the biological sciences can prove so fruitful; indeed, it should be remembered that the development of scientific management and the improvement of methods of administration do to some extent involve further research into problems of social science, though primarily they involve the wise and thorough application of existing knowledge and of the scientific approach.

It cannot in truth be seriously maintained that the question of the best deployment of the resources of scientific man-power in Great Britain is a matter to be resolved entirely by the technique described as 'operational research'. No doubt both the Advisory Council on Scientific Policy, the Defence Research Policy Committee and the Committee on Industrial Productivity between them can do something to indicate the most profitable distribution, and even enlist the co-operation of industry in the attack on research problems. But it is difficult to visualize them as instigating or directing a redistribution of scientific effort on the scale suggested by the Association of Scientific Workers, or to believe that the change-over could be effected rapidly without serious loss of efficiency or waste of man-power and resources. Prof. D. H. Robertson has suggested that the direction or mobility of labour will be most satisfactorily secured for all concerned by the operation of the old price system in a free economy. The reception of the Control of Engagement Order indicates that he may be right, and this may be as true at the scientific as at any other level.

The technique of operational research may be used, however, to help in determining the most profitable targets, and in organising the co-operative attack on the selected objectives. It could also foster the conception of the effectiveness and non-effectiveness of industrial research according to the opportunity and help we gave it to fructify which Sir Clifford Paterson commended for the consideration of the Royal Society as a means of ensuring economy in scientific man-power. Presumably the Committee of the Fabian Society had such ideas in mind when, in its recent report on the Civil Service, it suggested that the Civil departments, and particularly the Board of Trade, might use such a technique. 'Operational research' has undoubtedly assisted the administrator and the numerous types of expert to combine in the attack on a single problem, and there are few problems in our industrial and economic, not to mention our political, life which do not involve such co-operation. It may well be that some such technique could make an outstanding contribution in the field of industrial psychology, or industrial anthropology, which has such a vital bearing on industrial efficiency and morale to-day. The investigation of such matters and into problems of industrial administration which Prof. P. Sargant Florence suggested in a thoughtful article, "Incentives and Government Policy", in the *Political Quarterly* is one field in which the technique should be indispensable.

The importance of this needs no further emphasis than Field Marshal Montgomery and General Slim have recently given it, for morale in industry means as much to success as in military operations, and can be studied as scientifically as was the morale of the fighting man in time of war. Nor are the other conditions of success so dissimilar in the two spheres: simplification of the problem, the choice of subordinates and reliance upon them, courage and determination to achieve a clearly visualized objective —these have just as much to do with the attainment of scientific or industrial objectives, and no mere system of organisation can be a substitute for the wisdom and moral qualities they imply.

We already possess in Britain in large measure the administrative organisation that is required. What has to be done is to ensure that it is used effectively and wisely, that it is staffed with men competent to take the right decisions and to select the right targets, and to keep a proper balance between long-term and short-term objectives. We need to encourage the wider use of the techniques and methods which progressive firms found fruitful in technical or scientific service to industries using their products long before the term 'operational research' was introduced, while avoiding the fostering of extravagant hopes. We have to secure the co-operation of every scientific worker, in the fields of work in which he is immediately engaged, through his professional associations making representation as to what is required, and no less on the regional research councils, production committees and other bodies through which scientific and technical opinion can be clearly and effectively expressed on the problems confronting the nation, industry and commerce, and the means by which they can be attacked. There are limits to human judgment and to human powers of organisation; but within those limits it is possible to plan the use of the scientific and material resources of Britain with some approach to relative, if not to absolute, efficiency, and to avert the encroachment of political tyranny on scientific or any other form of human competence. But we must recognize the limits of planning, and keep to a minimum the burden of those central decisions which at present so often tend to clog the machine and to stifle rather than to encourage initiative, enterprise and judgment.

SUPERCONDUCTIVITY

Theorie der Supraleitung

Von M. von Laue. Pp. iii + 124. (Berlin und Göttingen: Springer-Verlag, 1947.) 12 R.marks.

THERE are few theoretical physicists who at one time or another have not tried to develop a theory of superconductivity; but all attempts so far have been unsuccessful. It might have been expected that it would be possible to explain such a spectacular phenomenon in a simple way in terms of the properties of electrons in metals. The conclusion has to be drawn, therefore, that we have not yet learned to derive in a satisfactory way the features of an assembly of electrons from their individual properties. Similar failures in other branches of physics (for example, liquid helium II, or the mechanical properties of solids) indicate that these difficulties are not restricted to electrons but concern many-body problems in general.

In discussions on this subject it is often suggested that a more successful treatment of the many-body problem requires an improvement of the mathematical technique rather than new physical ideas. Yet even an attempt to derive the properties of ideal gases would find the atomic physicist (if assumed to have no knowledge of macro-physics) at a loss without the introduction of new physical concepts. He would probably start with a discussion of the motion of two and then of three weakly interacting particles, and afterwards be led to the conclusion that consideration of more particles is very complicated and unlikely to lead to any simple results. It is only after the introduction of new physical concepts which do not exist in atomic physics—such as pressure and entropy—that other simple laws of physics (the gas laws) can be found. It may well be that further concepts of this kind will be discovered and that they will be essential in solving problems like superconductivity. An important step in this direction is the formulation of an adequate phenomenological theory.

In the case of superconductivity, this step was taken about twelve years ago by the brothers F. and H. London, and M. von Laue has now written an excellent monograph on this theory. He starts with a short discussion of the two basic electromagnetic properties of superconductors, the existence of permanent currents and the magnetic properties, and then proceeds to formulate the fundamental equations of the Maxwell–London theory. Maxwell's equations, as is well known, require a number of supplementary equations specifying the properties of the substances in the electromagnetic behaviour of which one is interested (for example, Ohm's law in the case of non-superconducting metals). London's equations for superconductors consist of a differential correlation between the electromagnetic field vectors and the current density. In conjunction with the Maxwell equations, they give rise to interesting developments which are very thoroughly treated in von Laue's book. The book continues with a discussion of space charges in superconductors and of conservation of energy. There follows a detailed treatment of a number of specific cases such as cylinders and spheres in magnetic fields, the properties of permanent currents (requiring theorems on multiple connected spaces), electric waves and high-frequency resistance, and others. After an outline of the thermodynamics of the transition from the normal to the superconducting state, the book finishes with two sections on the properties of thin layers and of the intermediate state.

One might find the section dealing with the thermodynamics of superconductors comparatively short, but then as von Laue points out in the introduction, his book aims at giving an account of the London theory only. Unfortunately, he does not quote the two original papers by F. and H. London (*Proc. Roy. Soc.*, A, **149**, 71 (1935); *Physica*, **4**, 341 (1935)), but only a later review by F. London, and he attributes the whole theory to the latter author only. The responsibility for the contributions was, in fact, equally shared by the two authors. It is therefore to be hoped that a suitable correction will be made in future editions to eliminate a misleading impression.

The book is written in a very thorough manner; all theoretical results are derived in detail and difficulties are indicated and discussed. Some of these results will no doubt stimulate new experiments. The book will be read with profit by all interested in the theory of superconductivity. H. FRÖHLICH

NATIONAL INTELLIGENCE

The Trend of National Intelligence

By Prof. Godfrey Thomson, with a Symposium by Sir Alexander Carr-Saunders, Sir Cyril Burt, Prof. Lionel Penrose and Prof. Godfrey Thomson. Pp. 35. (London: The Eugenics Society and Hamish Hamilton.) 2*s*. net.

IN the Galton Lecture for 1946, Prof. Godfrey Thomson marshalls the evidence that leads him to the conclusion that there is at the present time in Britain, and has been for at least twenty-five years, a correlation of approximately −0·25 between the intelligence score of a child of about eleven years and the size of the family of which he (or she) is a member. The facts are no longer in dispute: yet it makes a profound difference to the points of policy on which emphasis might be laid, if any attempt were made to reverse the present tendency, whether the interpretation of the facts is that the average level of innate intelligence in the country is declining, or that the facts merely indicate a differential environmental influence on intelligence test scores. To obtain an accurate interpretation would involve, as Carr-Saunders and Burt point out in their contributions to the symposium in 1947 which followed Thomson's Galton Lecture, a team of research geneticists, psychologists, statisticians and sociologists, backed by a heavy endowment. Thomson's interpretation, on the basis of his own and other people's carefully prepared investigations, is that hereditary factors are causing a decline in the national intelligence of at least one point in *I.Q.* per generation, and probably more.

Thomson would be the first to admit that his conclusion marks the opening of a new, rather than the closing of an old, chapter of investigation. For if it be true that the average level of national intelligence is declining as a result of hereditary factors, then a number of questions affecting future policy at once spring to one's mind. Is the decline to be attributed to an increase in the absolute number of those with less intelligence than the average, or to a decrease in the absolute number of those with more, or to both ? And which of these is the more important or disastrous socially ? Is the change one that is affecting all intelligence-levels or only those individuals at either or both extremes of the range ? To what extent does a decline in innate intelligence imply a decline also in other desirable characteristics (since many mental qualities are positively correlated) ? Is the true position merely that the more intelligent people are having fewer children, or are we justified in making the further deduction that the differential birth-rate is adversely affecting innate intelligence ?

Again, one needs to know whether the decline is one that has been continuing for a number of generations or whether it is a modern, and perhaps temporary, phenomenon. In this connexion one would need to know how long differential fertility had been a significant problem. Thomson is rightly concerned by the fact that the educational system of Britain sieves the more intelligent, gives them a longer education and prepares them for a profession in which they will marry later and have fewer children than the less intelligent. Yet if the differential birth-rate should happen to have been a significant factor in the decline of intelligence over the past centuries, then are there any influences to mitigate these effects and to counteract our decline into a nation of defectives ? That there may be some factor to be discovered is suggested by Penrose's investigation into the height of Toronto children. A very small but significant inverse correlation between height and sibship provided the basis for the expectation that the mean height would decline at the rate of about a quarter of an inch a generation. Measurements in 1923 and 1939, however, indicated that during this half generation the average height had actually increased by between 1 and 2 in. It may be, as Thomson suggests, that better nutrition or other environmental conditions have temporarily masked a genetic decrease, and that improved educational nutrition might similarly, though only temporarily, mask a decline in inborn intelligence.

If this should be so, it would be arguable that social policy might profitably be directed along these positive lines until the genetic factors underlying the decline can be more clearly formulated. For if it be true that nutrition can affect to such a startling degree something with so considerable a hereditary basis as height, then how much more might it not be worth while to investigate the effect of educational nutrition on intelligence test scores ?

It is now time to remind ourselves that all the predictions about the future trend of innate intelligence are based on intelligence test 'scores', and that a great many more investigations need to be undertaken into the extent to which such scores are affected by environmental handicaps or advantages. To what extent is the fact that the lower *I.Q.*s are found in the larger families associated with the fact that the larger families are also to be found among those with fewer social advantages ? Thomson's important investigation into a socially very homogeneous group was an attempt to answer this question ; yet even here the negative correlation between intelligence score and family-size might be reasonably interpreted in terms of the more extreme poverty of those with the larger families in a group that was altogether very poor (coal miners in 1926).

The fact, too, that different average *I.Q.*s are often obtained from different groups, for example, rural and urban, northern and southern, etc., raises questions about the relative fairness of the items included in a single test given to both groups : it also raises questions about the original standardization of the test, for example, whether the population on whom the test was originally standardized corresponds fairly with the population that has been selected for the purpose of a special investigation. Again, further investigation needs to be made into the extent to which individuals with very different types of mind can obtain the same score on an intelligence test ; and of the effect on their relative scores of different methods of grading the marks on a test. As a corollary to this question, more needs to be known about the extent to which individuals with the same type of mind obtain different intelligence scores. Even identical twins rarely obtain identical scores ; what, then, is the reason for, and what the significance of, their differences ? Are they an indication of the influence of pre-natal or post-natal environmental differences, or that the measuring rod itself, the test, is unreliable ? If the latter, is this unreliability constant for all groups of whatever social class, or does it vary from one class to another ?

I have been able to do little more than touch on some of the implications of Thomson's Galton Lecture. How far any answer to these questions may be obtained must depend on the support that is forthcoming for future investigations.

JULIAN BLACKBURN

THE SEA

This Great and Wide Sea

By R. E. Coker. Pp. xvii+325+91 plates. (Chapel Hill, N.C.: University of North Carolina Press; London: Oxford University Press, 1947.) 27*s.* 6*d.* net.

THIS book covers the range of physical, biological and geological oceanography, from the point of view of a biologist. It gives a number of comprehensive, but not technical, presentations of the basic phenomena of the ocean as a place of life for plants and animals. It is well written and well illustrated by a large number of good photographs, well chosen.

Part 1 consists of five chapters on history and geography, one of which is on oceanography in

America. There are short interesting accounts of the work of Maury, Wyville Thomson, Murray, Hensen, Chun, the Prince of Monaco, A. Agassiz and many others.

Part 2 consists of seven chapters on chemistry and physics, one being on deposits at the bottom of the sea and three on sea water in motion. The leading idea in these chapters is that "the seas, all together, constitute a great dynamical system with an intricate and world-wide mechanism for mixing everything soluble that comes into it". Of course, physical and dynamical processes are not considered in any detail. Many results are quoted from the recent writings of H. U. Sverdrup, and the whole appears to be up to date and accurate. These chapters have many biological references and prepare the way for dealing with conditions under which marine plants and animals live.

Part 3 consists of seven chapters on life in the sea which are packed with information. There are numerous references in footnotes which pay a handsome tribute to Murray and Hjort's "The Depths of the Ocean", now unfortunately out of print. The author states that "life in the sea cannot be treated adequately in a few chapters : volumes are required", and the truth of this is constantly in the mind of the reader ; but the tension is eased by the inclusion of a useful summary at the end of each chapter. The author depends, to some extent, upon a historical approach to unfold the theme of each chapter. He takes the reader back to the benthos and nekton of Haeckel, and is obviously impressed throughout with similar classifications of marine animals according to their mode of life. One chapter deals briefly with algæ, diatoms and dinoflagellates as pasturage of the sea, with a passing reference to the growing importance attached to the study of marine bacteria. There are two chapters on plankton. This is described by reviewing members according to the groups or phyla to which they belong. Then follow chapters on the benthos and nekton, the latter concentrating upon fishes with a special paragraph headed "Useful Fishes". There are also interesting references to the methods of capturing fish which fall in line with the equally useful descriptions in earlier chapters of gear used for obtaining plankton and bottom fauna. To complete the survey, turtles, seafowl, sea otters, sea lions, sea cows and whales are included. Altogether, a full programme which may leave the reader a little breathless, but which ought to stimulate his interest in "This Great and Wide Sea".

SOIL FERTILITY

Chemicals, Humus and the Soil

A Simple Presentation of Contemporary Knowledge and Opinions about Fertilizers, Manures and Soil Fertility. By Donald P. Hopkins. Pp. 278 + 5 plates. (London : Faber and Faber, Ltd., 1945.) 12*s.* 6*d.* net.

A FEATURE of the present-day attitude to agriculture is the increasing concern about soil fertility. Formerly this was confined to a limited number of specialists; but the impact of two world wars and the resulting shortages made all of us think about food, and awakened an interest about soil problems in the more reflective. There is an increasing literature about these matters both from the scientific and economic points of view, and Mr. Hopkins' very readable book deals with a section of this field which has perhaps received wider publicity than any other. The late Sir Albert Howard and his followers have for many years advocated certain methods of soil management in which humus maintenance by means of composts plays the chief part, and chemical fertilizers are entirely excluded. It is claimed that crops grown on compost are healthier and of better feeding value than those grown with chemicals and, further, the continued use of inorganic salts damages the soil population. The full thesis of the compost school has never been accepted by soil scientists ; but the case has been put forward with such energy and conviction that there have been many converts, while others are left wondering if there may not be another side to the story. It is here that Mr. Hopkins' book fills a real need. Its purpose is to set out for non-specialist readers the evidence for and against fertilizers as fairly as possible. The author is a chemist engaged in the manufacture of fertilizers, so complete detachment can scarcely be expected; nevertheless his case is presented with a skill and moderation not always found in the rival school.

The book is in two parts. The first deals with the broad facts of plant nutrition, and shows that, unaided, most soils are unable to supply sufficient readily available nutrients for high production. Innumerable field trials have proved that fertilizers rightly used can supply this nutrient deficiency. A discussion of the various means of enriching the soil in organic matter follows, and estimates are given to show that all the organic wastes in sight are insufficient to meet the nitrogen requirements of an intensive arable agriculture. The rational procedure, which has the backing of almost all scientific opinion, is to use as much organic material as possible for its humic value and supplement its nutritional content with chemical fertilizers. In the second part of the book the author examines the charges that fertilizers inhibit mycorrhizal development, and exterminate earthworms and bacteria. He concludes that these charges are not proved ; although gross misuse of fertilizers, such as the rendering of soil excessively acid by continued heavy doses of ammonium salts, may upset the soil populations. Passing on to the argument that fertilizers cause plant disease, the author points out that there were devastating outbreaks of disease before artificials were in general use. Once again wrong use of fertilizers, unbalanced nitrogen applications, may increase susceptibility to certain diseases. It is on the grounds of the alleged improved food value of produce grown with humic fertilizers that the compost school have gained many adherents. Even here the evidence from official research stations appears to be negative. Experiments that gave positive indications have, strangely enough, not been extensively repeated ; while evidence based on the state of health of widely separated communities consuming different diets is not convincing.

Several topics not directly in the line of argument are included ; for example, a concise and well-informed chapter on the fertilizers themselves.

Mr. Hopkins' book is written in a much less formal style than the scientific text-book, and he goes to some trouble to dissect faulty arguments. Apart from the public to whom it is addressed, many students who have mastered the elements of their subject might read this book with considerable profit.

Material for Visual Education

By Betty M. B. Harris. Edited by G. Patrick Meredith. (Published for the Film Council.) Pp. 96. (London: *Daily Mail* School-Aid Department, 1947.) 2*s.* 6*d.*

A VISUAL aid may fail through some inherent defect; or the right aid may be used in the wrong place, in which case the fault lies with the teacher. Yet not wholly so, for in the absence of any comprehensive survey of sources of visual material the teacher has too often been obliged to rest content with what he knew was available.

The book under review can fairly claim not only to map out the main areas of visual provision but also, by an ingenious and practical system of indexes, to make everyman his own explorer. Thus the inquirer for, say, a filmstrip on Chinese art is led through successive summaries, each of which narrows his field of search, until he arrives at the address of the organisation most likely to meet his need.

This book will be much thumbed and deserves a more substantial binding. Regarded from the point of view of a work of reference, the appendix, which deals more generally with the theme of visual education and with the work at University College, Exeter, might well have awaited the separate and more detailed account which is promised in the text.

It is to be hoped that there will be future editions which will expand the work where necessary and keep it up to date. In which case, again for ease of reference, pages of advertisements should not be interspersed with the text. The pertinent reminder, in the Films Section, that "inclusion in a catalogue is no guarantee of merit", might well be transposed to the preface. Eric Lowe

They Live in the Sea

By Douglas P. Wilson. Pp. 128 (90 plates). (London and Glasgow: Wm. Collins, Sons and Co., Ltd., 1947.) 12*s.* 6*d.* net.

THIS book of most beautiful photographs cannot fail to delight. To the biologist it is fascinating, and to those with only a superficial interest in natural history, or little appreciation of natural beauty, it is a revelation. From such a collection it is difficult to select individual pictures for special mention. The most dramatic are the series showing a Portuguese man-of-war capturing and feeding upon a wrasse, and that showing a cuttle-fish securing a prawn after a first attempt successfully dodged by the prospective victim. But the author is not content with the dramatic only, and follows up the studies of *Physalia* with an excellent photomicrograph of nematocysts, discharged and undischarged, and an enlarged view of the gastrozooids digesting the fish. No less striking are the studies of the strobilation and release of medusæ by the scyphistoma of *Aurelia*. Some of the most beautiful pictures are those of semi-transparent animals, where the author has been highly successful in showing the translucency of sea-anemones, alcyonarians, prawns, ascidians and larval forms. The text, avoiding technicalities and Latin names, gives a clear and accurate account of the animals portrayed in the plates. A short chapter deals with dredging and trawling; and any biologist who has worked at Plymouth during the last half-century will recognize with pleasure the characteristic portrait in Plate 25. From this author we expect outstanding pictures, and we are not disappointed. L. Harrison Matthews

Light, Vision and Seeing

A Simplified Presentation of their Relationships and their Importance in Human Efficiency and Welfare. By Dr. Matthew Luckiesh. Fourth printing. Pp. xiv+323+16 plates. (New York: D. Van Nostrand Co., Inc.; London: Macmillan and Co., Ltd., 1946.) 25*s.* net.

IN this book will be found a popular and readable account of numerous problems relating to lighting and vision. A large number of important psychological and physiological experiments carried out under the author's direction are reported in simple terms, with very clear diagrams illustrating the meaning of the results in a practical form. After reviewing the difficulties presented to the human eye by the needs of reading and innumerable everyday activities, the author proceeds to consider eye-defects, and the practical problems and history of artificial lighting. Then he studies the influence of various factors in making objects visible: intensity of illumination, relative size, brightness contrast, eye movements and the time required for seeing, visual acuity and its measurement by test charts. Later he considers the physiological effects of seeing, practical problems of lighting, various common illuminants, colour discrimination, glare and other important matters, including the relation of safety and efficiency to the ease of seeing. At the end of the book he includes answers to one hundred common questions about vision, light and colour.

The industrial psychologist and lighting engineer will find this book a mine of valuable information and practical help about problems of applied science as far as vision is concerned. R. W. Pickford

Molds, Yeasts and Actinomycetes

A Handbook for Students of Bacteriology. By the late Dr. A. T. Henrici. Second edition, by Dr. Charles E. Skinner, Dr. Chester W. Emmons and Dr. Henry M. Tsuchiya. Pp. xiv+409. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1947.) 5 dollars.

AS a short and readable handbook for the many different categories of student and research worker concerned with mycological problems, whether industrial or medical, this new edition of Henrici's well-known book should prove of real value. It is up to date—in so far as this is possible at a time when the whole subject is in a state of rapid advance, with the concomitant production of a vast new literature. Indeed, a more or less complete re-writing of the earlier edition has been necessary in order to do justice to the many exciting discoveries of the past decade. The aim, like that of the earlier edition, has been to provide bacteriologists with some of the knowledge which they ought to possess concerning other groups of parasitic and saprophytic micro-organisms, that is, yeasts, moulds, and actinomycetes.

The result is a book which, within its set limits, should prove useful to many. The stress, of course, is on the medical and industrial applications of mycology. In fourteen chapters, a wide range of topics is discussed and admirably illustrated. These include general dissertations on the structure, classification and methods of study of moulds, yeasts, etc., and particular accounts of fungi causing diseases of man and animals, and of use in industrial fermentations, etc. Yeasts and actinomycetes are accorded a fairly full treatment, and a final chapter is devoted to antibiotic substances.

THE NEW ERUPTION FROM HEKLA

By Dr. G. W. TYRRELL
University of Glasgow

AFTER a hundred and two years of quiescence, Hekla broke out in violent eruption at about 6.50 a.m. on March 29, 1947. Three days later, Dr. Jòh. Àskelsson, of the High School of Reykjavik (University of Iceland), sent me a fragment of the new lava, which I described in a 'letter' in *Nature* (May 10, 1947). The lava proved to be identical with previous Hekla lavas and, indeed, with the general run of Recent lavas in southern Iceland. I got into touch with Dr. Trausti Einarsson, also of the University of Iceland, who, as well as Dr. Àskelsson, had been a research student in the Geological Department of the University of Glasgow. Dr. Einarsson sent me numerous newspaper cuttings (in Icelandic), two long letters descriptive of the eruption, and a new book, "Hekla", by Gudhb. Kjartansson (167 pp., with numerous illustrations and a map), which was published as a Yearbook of the Icelandic Touring Association, 1945. What follows is mainly derived from Dr. Einarsson's letters.

Numerous observers have been following the eruption, and relays of workers have made it possible to record its phenomena hour by hour. In addition to J. Àskelsson and T. Einarsson, G. Kjartansson (author of the above-mentioned book), S. Thorarinsson, P. Hannesson, T. Tryggvasson and S. Sigurdsson among Icelandic geologists, N. Nielsen and A. Noe-Nygaard from Denmark, A. Gavelin from Sweden, and L. Hawkes of Bedford College, London, have visited Hekla and have worked on various aspects of the eruption. Samples of rocks and gases are being analysed in the State Research Laboratory, and some geophysical work is being done. Kjartansson and Tryggvasson will collaborate in a petrological and chemical study of all Hekla lavas.

According to Einarsson (letter of May 26), the main events of the eruption were as follows. It began a little before 6.50 a.m. on March 29, apparently without any preliminary symptoms. A considerable earthquake shock was felt as far away as Reykjavik; but, curiously enough, few noticed it in the region immediately surrounding the volcano, and people in farms only 9 km. distant were not even awakened. No serious damage was done by this shock. The sky was clear and, immediately after the shock, an enormous column (of steam and ash ?), more than 20 km. in height, was seen from Reykjavik. A north wind was blowing which carried the erupted material southward. The inhabited regions of Fljòtshlidh and Eyjafjöll were enveloped in complete darkness and soon covered by a layer of pumice and ash three inches thick. A continuous wall of black 'smoke' 10 km. high extended far out to sea.

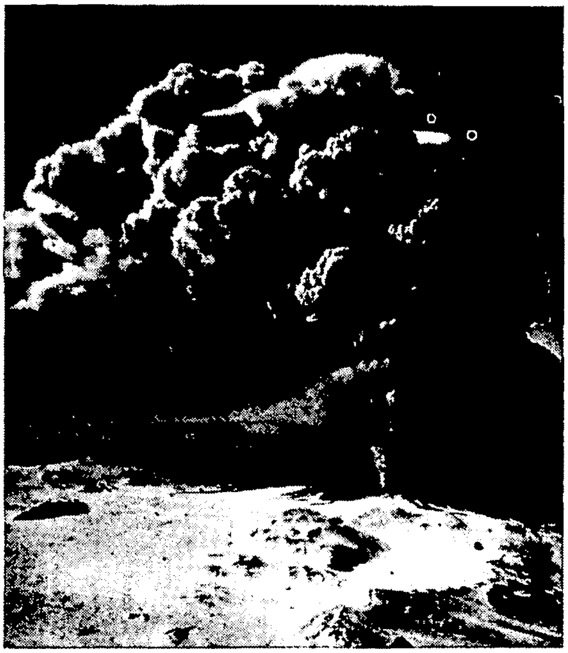

Fig. 2. HEKLA, MORNING OF MARCH 29, 1947, LOOKING SOUTH-SOUTH-WEST. PHOTO BY V. SIGURGEIRSSON, REYKJAVIK

At 10 a.m. Einarsson and others took aeroplane to the scene and found black clouds of ash being whirled out with tremendous force from a number of craters along the whole length of the volcano. (Hekla is an elongated ridge rather than a cone; see map, Fig. 1.) The mountain itself seemed a trifle in comparison with the enormous columns of ash (see Fig. 2). Lava had even then reached the plateau surface to the north and east of Hekla, and it was ascertained later that the lava was actually issuing from the whole length of the ridge. Streams of black mud were also being generated, no doubt by the mixture of thawed glacier ice and snow with ash; and on the first morning of the eruption an enormous rush of water from the north-west slope of the volcano caused a flood in the River Ytri-Rangà—a common feature of previous eruptions (see map).

Einarsson measured the temperature (950° C.) of a lava flow from a low-level crater on the south-western flank near Nafrholt. The lava here is welling out quietly as a fountain, and is very viscous. "With good asbestos insulation", says Einarsson, "it would be a simple matter to walk on it in the crater

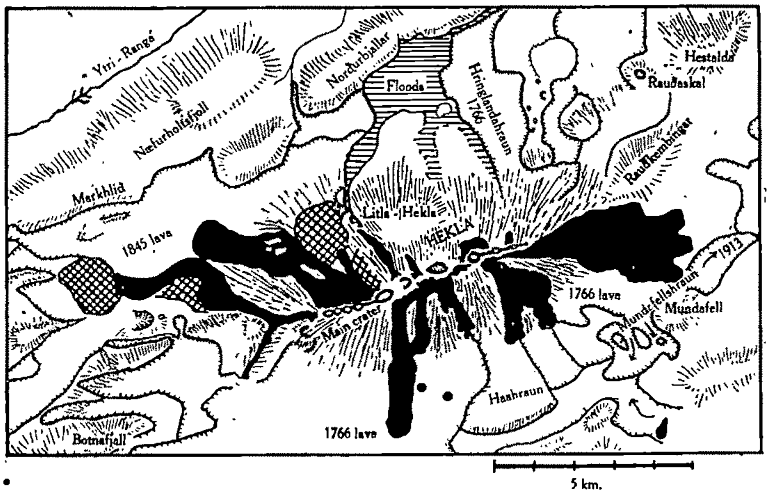

Fig. 1

itself. You can stand on the rim in the crater and reach the lava with a stick."

At the same time furious explosions were taking place in the higher craters. In a few days, however, the activity greatly diminished, especially at the northern end of the ridge. Lava ceased to flow from the crest, but flowed continuously, and still flows, from the low south-western craters. The extent of the new lavas on April 8 is shown on the map (in solid black).

While all activity ceased in the north-east and lava ceased to flow from the crest, violent explosions continued at the summit crater and the high-level craters of the south-western flank. In many of the explosions large blocks were thrown to a height of 500–600 m., and the detonations were so loud that it was difficult to sleep in Thórsádalur, 20 km. distant from the volcano. Again, at shorter distances, the same explosions did not seem to be so loud owing to some acoustical trick.

Flashing arcs of light were a common sight. Ash was only occasionally blown out in quantity and was harmless at first. Nevertheless, if it continued into the haymaking period serious effects would follow. The pumice fall in Fljótshlidh and Eyjafjöll, however, caused the evacuation of some farms.

With the exception of the initial shock, notable earthquakes have not occurred in the vicinity of the volcano; but in the district of Ölfus very heavy shocks occurred on May 19. Hot-spring activity was greatly augmented, and every quiescent pool in a long, narrow strip of country became a violent geyser of dirty water.

In a further letter (July 17), Dr. Einarsson states that the eruption goes on. Lava still flows uninterruptedly (presumably from the south-west craters) without any noticeable decrease of volume. The eruption of ash, however, has diminished to insignificant proportions, and is doing no harm. A curious result is that "during one period of heavy ash fall and dry weather the sheep got the usual 'eruption disease', which is caused by fluorine, but when a rainy period set in they somewhat recovered. The disease is, so far, not very serious."

With regard to the magnitude of the eruption, Dr. Einarsson is of opinion that the present eruption is at least as great as that of 1845, and will probably prove ultimately to be greater.

I visited Copenhagen on a lecture tour during October, and gained a few further details from Prof. A. Noe-Nygaard, and saw his very fine film of the eruption. The new crater on the summit is 300–400 m. in diameter, and has reached a height of 100 m. The orifice which continues to emit lava at the south-western end of the ridge is a fissure with six or seven small craters, very clearly seen in the film. The line along which the new eruption has taken place is situated some distance to the west of the still visible rent from which the eruption of 1845 was emitted. The film shows the minute details of the over-rolling and incorporation of solid lava-blocks by the liquid lava, and of auto-intrusion.

The accompanying map is re-drawn from a map published in the newspaper *Morgunbladid* (April 15, 1947) by Kjartansson, Hannesson and Thorarinsson. It shows the extent of the new flows (solid black) with additions (hatched) up to May 20. The very fine photograph of the eruption was taken by V. Sigurgeirsson of Reykjavik on the morning of March 29, the first day of the eruption, looking south-south-west.

Addendum. In a recent letter (November 9), Dr. Einarsson states that lava is still flowing in undiminished quantity from the crater on the south-west. Explosive activity ceased at the end of June. The lava is becoming very rich in gases and is more fluid than before, while the temperature remains constant.

CORN (*ZEA MAYS* L.) GENETICS IN THE UNITED STATES

By GORDON HASKELL

Connecticut Agricultural Experiment Station, New Haven, Connecticut

MAIZE (*Zea Mays* L.), or 'corn' as it is known throughout North America and so called throughout this article, is by far the largest crop grown in the United States, having many different uses ranging from animal food, a basis for the manufacture of nylon, to its use as table sweet corn. It is therefore not surprising that much time and money are spent investigating the corn plant. In addition to its economic importance, corn possesses a number of properties making it useful experimental material for cytologists, geneticists, plant breeders, and for evolutionists interested in the origins of cultivated plants. Some aspects of the genetic and breeding problems now attracting attention and an indication of lines of approach for solving them will give a brief indication of current work with this plant in the United States.

The problem drawing very wide attention at the moment is how to estimate combining ability of inbreds used in the production of hybrid seed corn. Modern strains of corn used commercially throughout the United States are known as 'double crosses' derived from crossing four inbred pure lines thus: $(A \times B) \times (B \times C)$. It is therefore highly important to know what open-pollinated varieties still in existence are more likely on inbreeding to give rise to inbreds which have the ability to produce the largest amount of hybrid vigour when crossed with other inbred lines. Jones, Singleton, Nelson and Hayes believe that it is best first to obtain the inbreds themselves possessing good plant characters before determining their potency in various combinations with other inbred lines, their principal argument being that it is no use having excellent hybrids if the inbreds which go into them are difficult to keep going from year to year. This is very important for the seedsmen. On the other hand, Jenkins, G. F. Sprague and colleagues at Iowa State College advocate early testing, that is, to determine the potency of different lines before inbreeding. General combining ability defined as the average performance of a line in hybrid combinations, and specific combining ability with a standard tester line, may both be used as pre-testers before commencing the inbreeding programme. Early elimination of varieties which pre-testing indicates will not produce inbreds possessing good combining powers, and selecting only the upper range, saves much labour inbreeding potentially unproductive material. The disadvantages of this method are, however, that testing requires a large amount of land and that open pollinated lines of corn are so heterozygous that often inbreeding has a drastic effect. There is no stability of the numerous genes segregating until after several generations of inbreeding, so that the combining ability of the derived inbreds has still to be estimated later, and this will vary *intra se*.

There has been some attempt to predict the value of inbred lines, using a cytological method. It now seems probable that the dent corn of the Mid-West was originally derived from hybridization between southern prolific dents and northern flint corns. Inbreeding mid-western dents releases variability, which manifests itself in plant habit and ear characters. The problem is to determine what two inbreds give the greatest heterotic effects and to determine whether this is predictable on the basis of the characters of the derived inbreds. It has been known that the greatest jumps can be expected from inbreds derived from open-pollinated varieties which differed widely in plant type and source of origin, for example, the northern corn belt hybrids which are dent corn crossed with flint corn, and the sweet dent silage hybrids. Inbreds derived from mid-west dents range from flinty types to extreme dent kinds. Longley had previously studied the positions of corn chromosome knobs, and Brown is now applying this method to inbreds derived from mid-west dents; those inbreds having knob numbers of approximately two are most like the northern flints, while those with higher numbers are more like southern dent corn. One would therefore expect that hybrids between inbreds of high and low knob number would be better than those between high knob numbers or between low knob numbers. Therefore a combination of seed characters and knob number of inbred lines may assist in reducing their number for testing and may indicate what inbred combinations are likely to prove most profitable.

The present basis for the hybrid corn industry has depended upon inbreeding different strains of open pollinated varieties to obtain the inbred lines, and then to make two sets of F_1 hybrids and cross these together to obtain the double-cross commercial hybrid. To obtain satisfactory homozygosity the lines may require not less than four or five years of selfing, and even then the amount of inbreeding depends upon how far the eye can judge the purity of such lines. Thus any method that could (*a*) short-cut the inbreeding programme and (*b*) give a more dependable amount of homozygosity would be valuable. Such attempts have been made. For example, a number of workers have investigated the effect of using pollen, sufficiently damaged by X-ray treatment as to be incapable of effecting fertilization, yet still viable and capable of growing down the style. By so doing it was hoped to stimulate haploid development of the egg cell without fertilization. So far results have been negative, and now Lindstrom is making a new attack on the problem, first by the application of numerous chemical substances to the silks to induce parthenocarpy, and also by exploring the possibility of using a method already successfully applied to *Linum*, namely, the selection of polyembryonic seeds in the hope that some of the embryos will be haploid. The haploid set of chromosomes can then be doubled with colchicine, immediately giving rise to autodiploid plants. Such plants would have much value in future investigations. It would seem, however, that these short-cuts must at the moment be considered more in the light of academic interest than of economic value.

Another problem of corn breeders is that even though they may establish inbred lines which carry with them the required amount of homozygosity to allow their use in hybrid combinations producing hybrid plants uniform for such quantitative characters as maturity, height and ear length, major mutations constantly occur. Jones first thought that degenerative changes were associated with the change in combining ability of the inbred lines; but now it seems likely that invisible mutations controlling combining ability continually occur in them, and are not readily detected until the inbreds are hybridized, either to inbreds from different sources or back to the original inbred lines. Hence the major degenerative changes only acted as stimulants for testing and so disclosing the cryptic mutations, but were not themselves responsible for such changes.

There are quite a number of general selection experiments with various types of corn for characters under multifactorial, or polygenic, control. One group of experiments refers to the selection of certain chemical constituents of the corn kernel. For example, at Iowa State College work directed towards the production of inbreds and hybrids of waxy corn is comparable with methods used for the production of field corns. The waxy gene corn was successfully utilized during the war years as a substitute for tapioca. Similarly, the oil content of kernels has been increased by the selection of strains with large embryos, hence increasing the value of corn feed. Many straight selection experiments with corn are being practised at the northern edge of the corn belt to obtain hardy lines which are also adjusted to the altered day-length of this area. Thus Minnesota, Wisconsin and Maine Agricultural Experiment Stations have developed crosses between flint and dent corn to give flint/dent hybrids with good plant and ear characters yet sufficiently hardy for the northerly areas. At the same time the Central Experimental Farm is selecting good flint lines for Ontario. So the corn-growing area is gradually moving farther north.

Another problem attracting much attention is the study of principles underlying the ability of some lines of corn to germinate after remaining under cold soil conditions while other lines are severely damaged. These investigations are being carried out at the Minnesota, Iowa and Connecticut Agricultural Experiment Stations and elsewhere. Hayes and his colleagues have now investigated the genetical basis for such phenomena, having established that different lines have different resistance to cold treatments. Haskell has determined the hardiness of some of the Connecticut inbred sweet corn lines and found, contrary to expectation, that they are not always worse than the behaviour of the starchy control under the conditions of the experiment. In general, although the usual experience of breeders is that sweet corn seed over a wide range of conditions germinates more poorly than that of other types of corn, this may not be due directly to the *Su*/*su* relationship, but to closely linked genetical factors and also to easier damage of the wrinkled sweet kernels during drying and threshing in the seed factories, which later allows pathogenic soil organisms to penetrate more easily. Commercial seed companies now use cold-room tests for determining the value of their corn strains. This is important, as the effects of the continental climate of the United States, with extreme hot and cold rapid changes in the soil at germination time, require strains to be adapted to such conditions. In general, it has been found that conditions of 50° F. for 8–10 days are most expedient for test purposes, and probably also as a selection criterion for a breeding programme.

Since the production of the first Golden Cross sweet corn by Glen Smith, hybrid sweet corn production has greatly progressed, with the adaptation of special inbreds and their hybrids for particular areas of the States. In view of the fact that sweet corn is primarily a canners' crop, great stress has been laid on uniformly maturing hybrids, and sweet corn breeders have established a complete series of early, medium and late inbreds and *single cross* ($A \times B$) hybrids, so that growers can use mechanical pickers and sweet corn canneries can work over a spread of time. Compared with field corn, sweet corn breeding has been to some extent simplified because single crosses may be used, the prices of seed being higher than for field corn. With the maturity range established, attention is now largely focused on quality testing. This is an elusive item to estimate, and although the sugar content of kernels is of some value, still the only satisfactory method is by tasting, usually in the raw state, rather than by any laboratory tests, such as estimating translucency, or puncture testing for pericarp tenderness. By experience, sweet corn breeders generally agree upon what good-quality sweet corn should taste like. Attention is also paid to the behaviour of the different sweet corn hybrids under freezing methods, since more ears are sent to market on ice each year.

Many of the northerly experiment stations in the United States and also in Canada are selecting early, hardy sweet corn lines. Owing to the sudden killing frosts towards the end of the season, these strains must be so adapted that seed is sufficiently matured for safe picking and for artificially drying before being otherwise killed on the ear. There have been various determinations of the optimum drying conditions. In general a temperature of 100° F. for three days is often sufficient to bring down the moisture content of the seed in the hard dough stage to a level permitting safe storage. Besides pushing sweet corn production northwards there is also an active attempt to spread sweet corn for canning and direct eating into the Southern States, where white dent corn is now grown for roasting. The resistance to the use of yellow sweet corn seems largely to be based on ignorance of the southern farmers and to the fact that no hybrid strains have been adapted to their climatic conditions, many northern hybrids being unable to meet the severe attacks of the corn ear worm in this region. These particular problems are now being overcome.

For a long time much attention has been paid to the history of the corn plant, concerning the origin of present forms and how it spread through the North American continent with the movements of the early American Indians. In addition, corn is one of the few cultivated plants the prototype of which has so far not been discovered growing wild in Nature, and its ear, so different from the female inflorescence of other members of the Gramineæ, offers interesting material for investigation. There is a division of opinions as to the source of corn. Mangelsdorf, Reeves and Merrill believe corn is a specialized product of selection by early American Indians of a grass that grew wild on the American continent. The present site of this prototype is still to be located, but evidence points to South America as the primary centre of origin. Teosinte (*Euchlæna*) is a hybrid between maize and *Tripsacum*, and is not a progenitor of maize, although where teosinte grows as a weed in Mexican corn fields there is a high incidence of hybridization. On the other hand, Edgar Anderson suggests that besides genetical indications, there are several pieces of ethnological evidence which suggest Burma as a possible source for the origin of corn. He has enumerated several pieces of circumstantial evidence showing similarities between Asiatic and Pre-Conquest civilizations. In addition, it is known that other members of the Tribe Maydeæ, to which maize belongs, occur in tropical Asia.[2]

Similarly, views on the origin of sweet corn are at variance, Mangelsdorf believing that the *su* mutation for sugary kernels has occurred spontaneously in different areas throughout America, and has been adopted by local farmers in those areas for specialized use, such as making fermented liquors; while Edgar Anderson conceives that the sugary mutation has gradually spread northwards across the American continent from a more southerly point of origin. At the present time, although much light has been shed on these problems, the origin of corn still awaits a final solution.

Acknowledgments are made to the Agricultural Research Council of Great Britain for funds allowing the writer to visit the corn belt of the Mid-Western States.

ASPECTS OF THE LOCOMOTION OF WHALES

By R. W. L. GAWN, O.B.E.
Superintendent, Admiralty Experiment Works, Haslar

REPORTS of the 1946–47 British Scientific Expedition to the Antarctic Whaling Ground have revived interest in the locomotion of whales and other marine mammals and fish. Some interesting studies and information on this subject already exist, but many of the reports of speed recorded in the past have proved rather conflicting in character. Care appears to have been taken on the recent Expedition to obtain reliable observations, and it now appears to be substantially confirmed that a blue whale can attain a speed of 20 knots for a short burst of about ten minutes duration, and maintain a speed of 14½ knots for two hours and probably longer. A killer whale may obtain slightly higher speeds.

The shape of fish and marine mammals has naturally been an inspiration for the forms of underwater bodies for a great many years, and investigations have been carried out accordingly. It is pertinent to examine whether any lessons can be learnt from the whale and other marine creatures that can contribute to faster speeds of submarines and other underwater locomotive bodies.

Particulars of the shape of fish and marine mammals were given so long ago as 1919[1]. The form is not unlike that of a good streamline body. A blue whale of normal proportions may be about 90 ft. long and as much as 120 tons weight. The shape is illustrated in Fig. 1.

In order to propel a smooth rigid body of this size and shape at 20 knots, it is estimated that 520 horsepower would have to be developed by the whale. The estimate for other speeds is shown in the curve in Fig. 4. This curve is deduced from measurement of the resistance of models of smooth rigid bodies towed in water.[2] These bodies form eddies which account for a fair proportion of the total power. It may be argued that the whale may succeed in avoiding eddy resistance by the natural flexure of the tail and

FIGURE 1

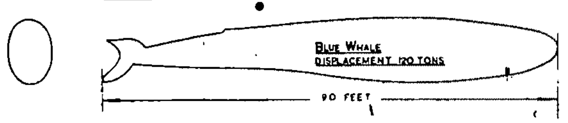

FIGURE 2

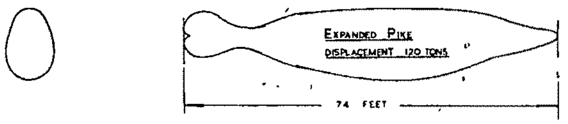

FIGURE 3

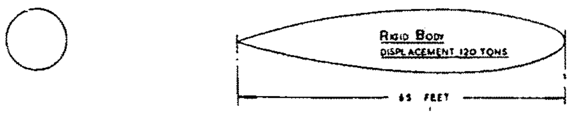

FIGURE 4

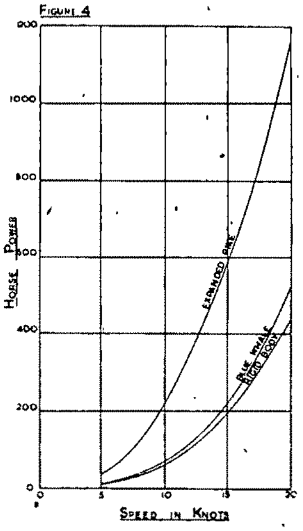

after-body generally. On the other hand, the unevenness caused by the fins and the fluting of the body will result in some increase of the horse-power required as compared with a smooth rigid body. It is also assumed that the propulsive efficiency of the tail of the mammal is equal to that of the best marine propeller, namely, 75 per cent. Here again it may be argued that a higher efficiency should be assigned because the tail of the whale is a comparatively large surface and moves at a slow rate. It may therefore be assumed that the rate of change of momentum to propel the whale is achieved by discharging a large quantity of water astern at a comparatively low speed. As a result the kinetic energy wasted in the race will be reduced. The energy so lost may be only about 10 per cent of the total, which indicates a possible 90 per cent for the efficiency. In assessing an efficiency of 75 per cent, I have, however, been guided by the results of a few experiments on flapping fins that have been carried out abroad.

It is of interest that the horse-power curve so obtained is very similar to that previously recorded in *Nature* by Prof. A. Krogh[2], although the method of estimate is different. In particular, the previous estimate assumed an efficiency of 100 per cent for the 'propeller', which is clearly inadmissible because of the loss due to kinetic energy in the water discharged sternwards.

If the curve in Fig. 4 truly represents the performance of the live whale, the developed horse-power per ton is 4·35 at 20 knots and 1·75 at 15 knots. This expenditure of power in relation to the weight is comparatively large and implies that the whale attains its remarkable speed by exertion of large power rather than by any special virtue in shape of body or smoothness of skin. There is no known measurement of the power which a whale can develop. Some approach to the problem can, however, be obtained from physiological researches. This question has been discussed by Gray[3] and Barcroft[4]. It appears that 0·01 horse-power per lb. of muscle is developed by athletes and dogs. There seems no reason for believing that whale muscle is more efficient as a machine than the muscle of other mammals. It also seems established that about 40 per cent of the weight of a whale consists of muscle. On these assumptions it would appear that the whale can develop 9 horse-power per ton of total weight. Thus the estimate of horse-power given in the curve is not inconsistent with the power obtainable from the muscles of the mammal.

It may be suggested that the surface friction resistance of the whale is less than that for turbulent flow past a rigid body. Taking a favourable view, the flow may be laminar. The horse-power would then be much less than that given in Fig. 4. While there is no definite evidence to prove or disprove this, such an explanation of the speed of the whale is unnecessary, since the horse-power mentioned above is not beyond that to be expected from a creature of 120 tons weight. There is also independent evidence[1] that great power is, in fact, developed by the whale; for example, a Sei whale is reported to have towed a vessel at 12 miles per hour, and a blue whale to have towed a steamer at 7 miles per hour, although the engines were working full speed astern.

A point which must not be overlooked and on which further information would be valuable is the means by which the whale avoids excessive rise of temperature when developing this large power. Assuming 22 per cent efficiency for the muscular engine, then the rise of temperature of the whale for a 10-minute burst of speed at 20 knots may be about 3° F., unless arrangements are made for dissipating the heat.

It should be added that the estimate of horse-power in Fig. 4 assumes that the whale is so deeply submerged that surface waves are not produced. It is understood that a whale normally proceeds at about three fathoms submersion and frequently on the surface. If the whale is proceeding on the surface at low buoyancy, it is estimated that the horse-power at the top speed would be treble that in the figure. If at three fathoms depth, the increase would be about 50 per cent. These estimates are deduced from experiments that have been made in water on models of shapes analogous to the whale.

A fish for which there is reliable information is the pike[5]. Experiments were carried out in the Hamburg Ship Model Experiment Tank. An anæsthetized pike was towed in the experiment tank, and the resistance measured at various speeds. The resistance was much greater than for a smooth solid body of similar shape. The oil exuded by the fish mollified the unevenness of the skin due to the scales to some extent, but the reduction in skin friction was inconsiderable. Observations of the speed of pike gave maxima of 6–8 knots, the mean speed being 5 knots. The effective horse-power per ton is considerable and varies from 26 at 8 knots for a large pike to 53 at 6·8 knots for a small pike. The tests established that the speed and form of individual fishes of the same type vary considerably. So far as they go, the experiments do not support the theory that fish have abnormally low surface friction.

Possibly anglers whose equipment has suffered in the struggle with a lively victim might hold the view that the pike tested in the Hamburg Tank were rather unenterprising. I am not an angler, but I have observed fish and have been impressed with their capacity for developing high acceleration over short periods. This led me to take the opportunity when in Hamburg before the War to discuss the experiments on pike with Prof. G. Kempf, director of the Hamburg Experiment Tank. I feel assured that the investigations on the pike were most carefully conducted, and that the results should be accepted as an accurate record of the performance of the species tested. Very complete particulars were taken of the shape of the pike. Fig. 3 indicates a pike of weight 9·05 lb. expanded to 120 tons to compare with the blue whale shown in Fig. 2. The horse-power for the pike as measured in the Hamburg Tank has also been expanded by the usual method adopted in ship-model experiments to compare with a whale. It has again been assumed that the propeller efficiency is 75 per cent. The horse-power curve for the expanded pike is shown in Fig. 4. The horse-power considerably exceeds that for the whale. This naturally casts a doubt on the estimate for the whale, but it may also reflect the wide difference between a small freshwater fish and a large deep-sea mammal. It is of interest to compare the performance with that of a rigid body of good design. Such a body is shown in Fig. 3. A model of this body has been tested both in water at the Admiralty Experiment Works, Haslar, and also in a wind tunnel. The horse-power curve deduced from the results is also shown in Fig. 4. The results compare favourably with the expanded pike and the whale.

Porpoises have been credited with a speed of 25 knots. This is a very high speed for a small creature to maintain for any length of time. Proceeding in the same way as for the whale, it is estimated that 14 horse-power would be required at this speed for a porpoise of 0·16 ton weight. This represents the high figure of 87 horse-power per ton. If, however, the speed is 20 knots, the horse-power per ton is reduced to 43, which is comparable with the pike.

It would be of great interest to ship designers and more particularly those associated with the design of submarines and other underwater bodies to obtain some reliable information concerning the whale. The day may be far distant when the towing power developed by the muscles of the whale can be accurately measured, but it would be of considerable interest to have the views of physiologists as to the muscular power. It should not prove a difficult matter to obtain a reasonably accurate measurement of the towing resistance of whales at various speeds. This is recommended for consideration by those responsible for organising future whaling expeditions. The whale differs from other marine creatures in that the tail is horizontal and moves vertically. Some information on the size of the tail and fins, and the method by which the whale dives and surfaces and maintains stability for course and depth, would also be of interest. If the particulars of the fin surfaces could be obtained, there is scope for wind tunnel investigations on the whale similar to the interesting tests on fish stability carried out by Harris[6].

I wish to express my appreciation of the help generously given by Dr. R. A. M. Case, of the Royal Naval Physiological Laboratory. Dr. Case was the leader of the 1946–47 British Scientific Expedition to the Antarctic Whaling Grounds, and he has provided particulars of the size and speed of the blue whale and has very kindly given references to the physiological work quoted in this article.

OBITUARIES

Dr. C. C. Hurst

CHARLES CHAMBERLAIN HURST, whose death occurred on December 17, was born in 1870 and educated at Wesley College, Sheffield. As a member of the family firm at Burbage, near Leicester, he was early brought into contact with horticultural practice and problems, and at the same time afforded opportunity for embarking on the investigations with which his name is connected.

Hurst was working at cross-fertilization in orchids when Bateson's papers in the *Journal of the Royal Horticultural Society* in 1900 brought the news of Mendel's discovery to the English-speaking world. Hurst at once got into touch with Bateson and started experiments with rabbits and poultry with the view of testing Mendel's conclusions. With rabbits he was able to confirm the results of Cuénot on coat colour in mice, and his extensive series of crosses among poultry, an account of which appeared in the Reports to the Evolution Committee of the Royal Society in 1904, added considerably to our knowledge of the genetics of the fowl. Better known was his demonstration of the recessive nature of chestnut in horses, which provoked much discussion when read before the Royal Society.

Perhaps the piece of work for which Hurst is most likely to be remembered is his paper on the "Inheritance of Eye-colour in Man". Through the careful and laborious collection of data from his native village of Burbage, where he was well known and trusted, he was able to determine the recessive nature of blue to non-blue eyes, and must thereby receive the credit for being the first to demonstrate the Mendelian inheritance of a 'normal' character in man.

Although he had, as it were, strayed for a time in the animal kingdom, he had by no means given up his horticultural interests. His attraction to the genus *Rosa* led him to form an outstanding collection of wild forms from all over the world, and his hybridization work contributed much to the understanding of this remarkable case of polyploidy.

As to many another scientific worker, the outbreak of war in 1914 came as a sad misfortune. In his capacity of a Territorial officer he joined the Army, and at the conclusion of hostilities he found himself unable to carry on at Burbage. Thereupon he entered Trinity College, Cambridge, as a fellow-commoner, and eventually his research work led to the award of the Sc.D. degree by the University. Fortunately he had been able to shift much of his collection of rose species to the Botanic Garden at Cambridge and was able to carry on his study of the genus, cytologically as well as in the field. Meanwhile he wrote his book on "Creative Evolution", an attractively illustrated exposition of the state of genetics at the time.

Hurst was gifted with fine powers of observation. He had, too, enthusiasm for an idea and a capacity for sustained and pertinacious work, both of which he devoted whole-heartedly to the furtherance of genetical science. That he was somewhat lacking in critical faculty may have been due to the fact that he had not been through the academic 'mill'. He was fortunate, however, in that his collaboration with William Bateson brought him into close touch with a critical mind of the highest order. Without that influence he might have become more the gifted amateur than the solid contributor to the science that claimed his interest.

R. C. PUNNETT

Dr. Stephen Miall

THE death of Stephen Miall on October 12, 1947, in his seventy-fifth year, inflicted on chemists an irreparable loss. Yet, paradoxically—and he enjoyed a paradox as much as any man—Miall was not a chemist at all. Of Yorkshire stock, with an inherited leaning towards science or, at any rate, towards natural philosophy, he was articled to his uncle, partner in a London firm of solicitors, when nineteen years old. He took prizes and the degree of LL.D., but right up to his end many hundreds of industrial chemists in Great Britain and elsewhere must have been entirely unaware that 'Doctor' Miall—that kindly, erudite, sociable, eclectic personality emerging almost as clearly from his editorials in *Chemistry and Industry* as from his twinkling eyes and grave smile, when one met him—was, in fact, a doctor of law and not of science at all.

Nevertheless, his contact with the chemical industry dates back to the beginning of the century, when he became very much concerned with the manufacture of white lead and, as a result, with the humanitarian aspect of that technology; that is, with lead poisoning as an industrial hazard, in connexion with which he more than once attended an International Labour Conference or discussions at the International Labour Office. Some time after qualifying in law, he also took a London B.Sc.

Miall's editorship of *Chemistry and Industry* began in 1922, and he remained at this post until two and a third years before his death. During his retiral, his health was not what his many friends and admirers had hoped for him; but he often found time and ability to join them at his favourite local haunt or in the Savage Club, where his wisdom, knowledge and slightly mordant wit, almost always mitigated by a cheerful grin, made him a most popular as well as a distinguished and unmistakable figure. He had great erudition, though it was wide rather than deep. He used it to illuminate both his attractively and, indeed, uniquely written editorials and his very deliberate but equally unique conversation, an art the apparent passing of which he always deplored. Homer and Horace as often furnished his reading—and his quotations—as did the English classics: he knew them all intimately.

Among his activities, besides his editorial work, have been the compiling of a light-verse anthology, "Poets at Play", active participation in the Society of Yorkshiremen in London and 'The Catalysts' Club', and the writing and editing, jointly or alone, of books designed to strengthen the links between chemists, especially industrial chemists, and the non-scientific world, particularly that part of it concerned with the arts. It is not surprising that his death will be mourned by a large and varied collection of individuals, some of whom may never have met him and will therefore not experience the strong sense of personal loss that is common to all those who had.

A. L. B.
P. J. V.

Prof. G. C. MacCurdy

NEWS has been received of the death in a road accident, at the age of eighty-four, of Dr. G. G. MacCurdy, the well-known prehistorian and professor emeritus of Yale University.

George Grant MacCurdy came from the southern branch of a well-known New England family, which had retained a close contact with Great Britain. He was a graduate of Harvard and of Yale, and from 1894 until 1898 he followed postgraduate courses in anthropology at the Universities of Paris, Berlin and Vienna. During 1900–31 he was successively lecturer in anthropology, assistant professor of prehistoric archæology, and research associate with the rank of professor at Yale University, and during the whole of this time he was also curator of anthropological collections. In 1921 he took a leading part in the foundation of the American School of Prehistoric Research, and was its first director, a post he held until last year, and in which he was supported by the collaboration of his wife, Janet Glenn Bartlett, whom he had married in 1919. His tenure of the directorship was marked by the organisation of many successful vacation tours in Europe, and by participation with various British funds and institutions in prehistoric excavations in Iraq, Palestine and Bulgaria.

This work was very close to Dr. MacCurdy's heart, and he was justly proud of the leading part played by a member of his own school, Theodore D. McCown, in the discovery of the new human fossil, Mount Carmel man, during 1931–32. His disinterested courage and vision in thus committing his school to a participation in field-work in which he himself was not free to take an active part has been of incalculable value to the advancement of prehistoric studies in the last twenty years, and will be his lasting monument.

His friends and pupils will cherish an affectionate memory of a distinguished scholar with a singularly kindly, gentle and modest personality.

D. A. E. GARROD

Prof. Max Planck, For Mem.R.S.

PROF. J. R. PARTINGTON writes: I knew Planck as professor of theoretical physics in the University of Berlin. His course was spread over more than one year, and I began with the last and most difficult part, comprising thermodynamics, the theory of heat, relativity, and quantum theory, next year taking the first part, which dealt with general mechanics and the theory of deformable bodies. The lectures began at 9 a.m. in the University building in Unter den Linden; they were very well attended, and there were always many standing around the room. As the lecture-room was well heated and rather close, some of the listeners would from time to time drop to the floor, but this did not disturb the lecture. The windows were all closed, partly because of the intense cold and partly because of the noise of the changing of the guard outside. There was also an exercise class, conducted by Planck himself, which nominally began at 8 a.m., but usually about 8.15. The medical lectures began at 6 a.m., so the University building was well aired by that time.

Planck lived some distance away, in the Grünewald, and travelled into Berlin by the Stadtbahn. His train often ran parallel to the one I was in from Charlottenberg for a short distance, and Planck could be seen, in a compartment filled with clerks and shop-girls, conning his notes in preparation for the lecture. In the lecture itself he used no notes. He began by writing down a simple equation, but would soon be in the middle of a Fourier series, or, as in the theory of elasticity, a complicated equation which seemed to develop itself. He never made a mistake and never faltered. Very rarely he would take his notes out, look at the board, say "Ja", and put them back again. He spoke in a quiet, audible and pleasant voice, and was the best lecturer I ever heard. He had no mannerisms except one: he had two sticks of chalk before him in parallel arrangement, which he changed about in place from time to time when he was not writing; he had a small reading desk and did not walk about. The mathematics on the board was extremely neat and legible, even when German vector symbols were used, and was set out in systematic order.

Planck's method was to develop the subject logically from general principles, and even when short cuts were possible, he liked to bring each topic into its logical sequence in a general scheme. This made some of it hard going for such as myself. He disliked vector methods, and although he usually wrote the final result in vector form when desirable, the deduction was in terms of Cartesian or polar co-ordinates. He had two favourite sentences. One was "Wir können noch einen Schritt weitergehen", and the other "Jetzt ist die Sache vollständig genügend erledigt".

His lectures on sound included some theory of music, and he gave an extra demonstration with a special harmonium of the natural scale and its necessary modification, "während die praktische Musik, besonders seit der Einführung der Instrumente mit festen Tönen, mit einer endlichen, nicht zu zahlreichen Menge von Tönen auskommen muss".

Planck was just then developing the 'second' quantum theory of continuous absorption and discontinuous emission (which brought in the half quantum of zero-point energy). He was conservative, and a little shocked by Einstein's bold development of the photon. He was keenly interested in the impact of the quantum theory on general philosophical ideas, and shrank from the extreme view that its later phases removed the validity of the law of causality. To the rather pessimistic outlook which came over what was once regarded as the solid foundation of science he was unsympathetic. Theoretical physics had progressed, it is true, but to him it still had a meaning.

PROF. E. N. DA C. ANDRADE writes: "In the last paragraph of my obituary notice on Prof. P. Lenard (*Nature*, December 27, p. 895), I venture to refer to him as 'a dark genius'. Going through some old papers I have just found a letter, dated 1936, from a well-known German physicist whose name I refrain from quoting because of the difficulty, at the present time, of obtaining his permission. It contains the following passage which I have translated except for the actual quotation.

"I have found the following lines in Hebbel which refer there to the Lord God, but apply very well to Lenard in our Heidelberg time:

" 'Und aus seinen Finsternissen tritt der Herr, *soweit er kann*'."

WE regret to announce the following deaths:

Prof. E. C. C. Baly, C.B.E., F.R.S., Grant professor of inorganic chemistry in the University of Liverpool during 1910–37, on January 3, aged seventy-six.

Prof. P. A. C. Dangeard, member of the Botanical Section of the Paris Academy of Sciences, on November 10.

Dr. C. A. Mitchell, formerly editor of *The Analyst*, on January 5, aged eighty.

Mr. W. H. Pick, of the Meteorological Office, on December 26, aged fifty-seven.

Prof. H. A. Prichard, White's professor of moral philosophy in the University of Oxford during 1928–37, aged seventy-six.

NEWS and VIEWS

New Year Honours

THE New Year Honours list includes the names of the following men of science and others associated with scientific and university work:

G.C.I.E.: Sir Maurice Gwyer, vice-chancellor of the University of Delhi.

G.B.E.: Sir Edward Mellanby, secretary of the Medical Research Council.

K.B.E.: Sir James Irvine, principal and vice-chancellor of the University of St. Andrews.

Knights: Prof. F. C. Bartlett, professor of experimental psychology, University of Cambridge; Mr. H. Claughton, recently principal of the University of London; Dr. J. D. Cockcroft, director of the Atomic Energy Research Establishment, Ministry of Supply; V. Z. de Ferranti, chairman and managing director of Ferranti, Ltd.; Dr. W. Ivor Jennings, vice-chancellor of the University of Ceylon; The Hon. C. J. Lowe, chancellor of the University of Melbourne; H. R. Ricardo, chairman and technical director, Ricardo and Co., Ltd.; Dr. R. V. Southwell, rector of the Imperial College of Science and Technology, London.

C.B.: Dr. G. M. Bennett, Government chemist.

C.S.I.: W. T. Hall, chief conservator of forests, United Provinces, India.

C.M.G.: A. P. Mitchell, director of land surveys, Palestine; W. A. Robertson, forestry adviser to the Colonial Office.

C.I.E.: J. Petty, chief conservator of forests, Sind; W. D. West, director of the Geological Survey of India; Dr. R. E. Mortimer Wheeler, director-general of archæology, India.

C.B.E.: H. W. Bennetts, principal of the Animal Health and Nutrition Laboratory, Western Australia; G. L. T. Brough, deputy director of electrical engineering, Admiralty; J. C. Bugher, director of the Yellow Fever Research Institute, Yaba, Lagos, Nigeria; B. G. Crewe, assistant comptroller, Patent Office; W. J. Dawson, late metallurgical director of Messrs. Hadfields, Ltd.; W. S. Gordon, director of the Agricultural Research Council Field Station, Compton; J. Henderson, formerly director of the New Zealand Geological Survey; Mrs. S. Sutherland Isaacs, psychologist; London Clinic of Psycho-Analysis; Dr. L. A. Jordan, director of the Research Association of British Paint, Colour and Varnish Manufacturers; Prof. W. Kerr, Royal Technical College, Glasgow; F. Lambert, president of the Museums Association, director of the Walker Art Gallery, Liverpool; W. L. S. Mackintosh, director of Veterinary Services, Uganda; R. O'F. Oakley, assistant secretary, Department of Scientific and Industrial Research; Prof. G. W. Robinson, professor of agricultural chemistry, University College of North Wales, Bangor; Prof. C. Y. Shephard, professor of economics, Imperial College of Tropical Agriculture, Trinidad; G. F. Stebbing, honorary secretary of the Radium Commission; Miss M. V. Taylor, for services to archæology; J. S. Teasdale, for services to agriculture in Western Australia.

Prof. Hamilton Hartridge, F.R.S.

PROF. HAMILTON HARTRIDGE has recently retired from the University chair of physiology at St. Bartholomew's Hospital Medical College, London, in order to take up the post of director of the Medical Research Council's newly constituted research unit on the physiology of vision. The appointment shows the importance which the Medical Research Council attaches to this subject, and is a recognition of Prof. Hartridge's pre-eminent position and his contributions in this field. Educated at Harrow and King's College, Cambridge, Prof. Hartridge has had a distinguished academic and scientific career. A former fellow of King's College, he was lecturer on the organs of special sense and senior demonstrator in physiology at Cambridge at the time when Prof. Langley had surrounded himself with the brilliant team of investigators which included Keith Lucas, A. V. Hill and E. D. Adrian. Although Prof. Hartridge has published many important papers and articles on the physiology of the special senses, his research work has not been entirely confined to this field; the brilliant work which he carried out with Prof. F. J. W. Roughton on the rates of gaseous exchanges of the constituents of the blood is one of many examples of a wide interest in the problems of physiology. An account of Prof. Hartridge's activities would not be complete without reference being made to his great powers of exposition. He has delivered popular lectures at meetings of the British Association, given a course of Christmas Lectures at the Royal Institution and is Gresham professor of physic at Gresham's College in the City of London. After occupying a university chair for twenty years (1927–47), Prof. Hartridge carries with him the good wishes of a wide circle of friends for a continuation of his outstanding experimental work.

British Welding Research Association: Dr. H. G. Taylor

THE Council of the British Welding Research Association announces the appointment of Dr. H. G. Taylor as director in succession to Mr. A. Ramsey-Moon, who has been with the Association from its earliest stages and whose resignation has been announced. Dr. Taylor joined Messrs. Vickers, Ltd., at Barrow-in-Furness in 1921, and three years later obtained the firm's scholarship, with which he entered the University of London, graduating with first class honours in electrical engineering. He was awarded a Royal Scholarship and conducted research at the City and Guilds of London Institute, receiving the degree of M.Sc. (Eng.) for a thesis on the collection of current from commutators and slip rings. Joining Messrs. Metropolitan-Vickers Electrical Co., Ltd., as a college apprentice, he was later posted to the Research Department. In 1929 he joined the staff of the Electrical Research Association to start investigations on earthing, and many reports have since been published on this subject. With these Dr. Taylor was associated, and for them he received the degree of doctor of science in engineering of the University of London. In 1937, he was appointed electrical engineer to the Copper Development Association, and it was here that he commenced his connexion with the welding industry. This has been continued in his appointments as technical adviser to Philips Industrial Co., Ltd., and as manager of the Industrial Development Department of Philips Lamps, Ltd., in which posts he has been closely connected with the latest developments in arc and resistance welding.

Biochemistry in the University of California: Prof. W. M. Stanley

DR. WENDELL M. STANLEY, of the Rockefeller Institute for Medical Research, has been appointed professor of biochemistry in the University of California at Berkeley and director of a new Virus Laboratory which will undertake a programme of research on viruses affecting plants, animals and man. The new virus research centre is regarded as a major effort on the part of the University of California. Prof. Stanley, who is forty-three years old, was awarded a share of the Nobel Prize for Chemistry in 1946, for his work on the isolation, in pure form for the first time, of a virus, the tobacco mosaic virus (see *Nature*, 158, 826; 1946).

Since this early work, which began in 1935, Prof. Stanley has remained in the forefront of research in his field. The isolation of viruses and the consequent determination of their physical properties opened the possibility of systematically producing chemical modifications of the disease agents for use as antigens in immunization. Prof. Stanley has already altered the chemical structure of the tobacco mosaic virus by means of known chemical reactions. He has also shown that mutation in viruses is accompanied by certain definite changes in chemical structure. During the War, Prof. Stanley and his colleagues developed an efficient method of producing a centrifuge-type influenza virus vaccine which was used in the Armed Services and is now available for civilian use.

U.S. National Academy of Sciences: Medal Awards

THE Daniel Giraud Elliot Medal for 1945 of the U.S. National Academy of Sciences has been presented to Prof. Sewall Wright, Ernest D. Burton distinguished service professor, University of Chicago, for his fundamental work dealing with the genetics of evolutionary processes, a programme based on work over a long period, including his paper "The Differential Equation of the Distribution of Gene Frequencies" (*Proc. Nat. Acad. Sci.*, 31, No. 12; 1945). In making the presentation, Prof. Th. Dobzhansky said that in a series of papers published during the last twenty-five years, and particularly since 1931, Prof. Wright has developed the modern mathematical theory of biological evolution. In the past, different authors attributed the principal role in evolution to different factors; there existed partisans of natural selection, of mutation, of hybridization, etc. Wright has shown that what is most important is the quantitative interrelations of all the factors. He has also discovered a new evolutionary agent, now known as the genetic drift or the Sewall Wright phenomenon. This hitherto almost unsuspected phenomenon is probably very effective, in connexion with the other previously known agents, in bringing about the theoretically most important and interesting form of evolutionary change, known as progressive evolution. The brilliant synthesis reached by Prof. Wright makes him the outstanding living evolutionist and the father of the modern neo-Darwinism.

The Public Welfare Medal for 1947 of the U.S. National Academy of Sciences has been presented to Karl Taylor Compton, president of the Massachusetts Institute of Technology, for his notable contributions of an original character to the science of physics, for his long and valuable career in the field of education and of university administration, and in recognition of his eminent service in the war-time research effort of the American nation, and in the reinforcing of collaboration and understanding between civilian scientific workers and military men. In his presentation address, Dr. A. R. Dochez pointed out that the Marcellus Hartley Fund was established and placed at the disposal of the National Academy of Sciences for the purpose of giving conspicuous recognition to eminence in the application of science to the public welfare. From the inception of the National Defense Research Committee, when the hazard of possible war emergency demanded a major effort by the United States, through the years of the emergency, to the final successful conclusion of hostilities, both as a physicist and as an administrator, Dr. Compton made outstanding contributions. As chief of the Office of Field Service of the Office of Scientific Research and Development, he headed a unique and eminently effective effort at partnership between military and civilian experts in bringing to bear the full strength of science and technology in the defence of the American way of life.

Research in Surveying at University College, London

The institution in 1946 in the Department of Civil Engineering at University College, London, of the first chair in surveying and photogrammetry in the United Kingdom, to which Dr. C. A. Hart was appointed, has excited considerable interest in the Commonwealth and overseas. This has been particularly so because of recent advances in air survey and of the increasing employment of radar techniques both for air survey and geodetic surveying. At University College funds have been made available for the provision of first-class teaching and research equipment in surveying, with particular reference to photogrammetry. Emphasis on surveying in the Civil Engineering and Geography Schools has long been a feature at the College, and it is now proposed to institute a one-year special course of a postgraduate character in surveying, commencing in October 1948. This course will be arranged so as to provide a training-ground for those who wish to enter the Colonial Survey Service or take up other careers of a similar character.

Colonial Geological Survey Service

An important part of a comprehensive plan for the economic development of the British Colonies is a thorough investigation of their mineral resources. This involves a considerable expansion of the Colonial geological surveys and the completion of maps on reconnaissance and more detailed scales with the view to discovery of mineral deposits and the determination of their economic significance. Such a programme of investigation offers geologists a wide range of interest—scientific and economic—with the added attraction of pursuing field-work under varied geographical and climatic conditions. There is place, too, for those who wish to specialize in petrology, mineralogy, economic geology, geophysics, etc. Most Colonial geological surveys offer opportunities for research, and men are encouraged to do new work and prepare for research degrees. Wherever possible they are given facilities also to study special subjects related to their work. A considerable number of geologists will be required during the next four years and a slightly lesser number in succeeding years to carry out such a programme. The vacancies in view are announced so far as possible in advance so that men who desire an active life of field-work may be encouraged to pursue geological studies with reasonable prospect of securing an appointment in the Colonial Geological Survey Service. The vacancies anticipated during the next few years are as follows: 1948–52, an average of 25 a year; 1953–56, an average of 15 a year. The Colonies in which these vacancies will occur include the following: Kenya, Uganda, Tanganyika Territory, Northern Rhodesia, Nyasaland, Bechuanaland, Swaziland, Nigeria, Gold Coast, Sierra Leone, British Guiana, British Honduras, Malaya, North Borneo, Sarawak, and certain other smaller Colonies. The posts offered are, in general, permanent and pensionable in themselves, or such as to lead to permanent and pensionable posts; temporary service would ordinarily count for pension where there has been no break in service. The qualification required is a good honours degree in geology, preferably supplemented by a research degree or research experience. Forms of application for appointment to the Colonial Geological Survey Service are obtainable on request from the Director of Recruitment (Colonial Service), Colonial Office, 15 Victoria Street, London, S.W.1.

A Standard for Quality Control

An increasing number of British Standards refer to quality control in acceptance clauses, and B.S. 1313: 1947 has been prepared to meet the need for a publication which would describe the simplest method of quality control, by the examination of the fraction defective in samples. It sets out accepted methods which are easy to use and which may safely and profitably replace 100 per cent routine examinations. They are widely applicable, and the publication, without dealing with the statistical principles underlying the methods, attempts to show how to use them. Simple instructions are given for the construction and use of a quality control chart in the first section. The second section deals with the methods in more detail, describing the basis of fraction-defective charts, with detailed recommendations for sample size and interval, and normal control limits. Refinements in the general method are indicated in the third section, such as the uses of average level of defectives, two-way control charts and compressed-limit control charts. The necessary tables with instruction sheets containing fully worked out examples are given in a further section, and a bibliography is appended.

Air-depolarized Primary Cells

BRITISH STANDARD SPECIFICATION No. 1335; 1946 (Publications Sales Department, British Standards Institution, 28 Victoria Street, London, S.W.1. 2*s.* post paid) prescribes the minimum rating of air-depolarized-type primary cells on continuous discharge and gives the methods of test on which the rating is based. An air-depolarized cell is defined as a primary cell with two electrodes, one mainly of carbon and the other of zinc, in an electrolyte of ammonium chloride, or other salts, or caustic soda, and in which the depolarization is mainly effected by air, to which free access must be given. A nomenclature is prescribed for the designation of the cells, a letter representing the type, and a number the size of cell. The letter code to be used consists of: *A*, *D*, *W*, *R*, *S*, and *C*, for air-depolarized, dry, wet, round, square and caustic soda, cells respectively. The quality of the materials to be used, the dimensions of the electrodes, containers, connecting wires and terminals of the cells are also specified in detail.

Rubber Technology Conference

IN 1938 the Institution of the Rubber Industry organised an International Rubber Technology Conference in London. It was the intention of the Institution to organise another conference within the following two or three years; but it has been necessary to wait ten years. A conference will accordingly be held at the Central Hall, Westminster, London, S.W.1, during June 23–25. The Conference will cover the following subjects: natural and synthetic rubber lattices; chemistry of rubber; physics of rubber; testing and analysis; synthetic rubbers; compounding ingredients; fibres and textiles; developments in factory processes and products since 1938. Invitations to attend the Conference have been sent to well-known technologists all over the world, many of whom have already promised papers. All the papers and full details of the Conference will be published in a volume entitled "The Proceedings of the Rubber Technology Conference, London, 1948", a copy of which will be issued free to all those enrolling for the Conference; extra copies will be available for sale generally at £2 2*s.* each. Application forms and details can be obtained from the Conference Secretary, Institution of the Rubber Industry, 12 Whitehall, London, S.W.1, who is prepared to assist in obtaining hotel accommodation.

University of London: Appointments

THE following appointments in the University of London have been announced:

Mr. G. E. H. Foxon, lecturer in zoology and comparative anatomy at University College, Cardiff, to the University readership in biology tenable at Guy's Hospital Medical School as from April 1.

The following titles have been conferred: professor of bacteriology in the University on Lord Stamp, in respect of the post held by him at the Postgraduate Medical School of London; professor of biology in the University on Dr. J. H. Woodger, in respect of the post held by him at Middlesex Hospital Medical School; reader in surveying in the University on Mr. Alfred Stephenson, in respect of the post held by him at the Imperial College of Science and Technology.

The degree of doctor of science has been conferred on Mr. F. W. Andrews (Birkbeck College).

Colonial Service: Appointments

THE following appointments have been made in the Colonial Service: P. A. Greig, agricultural development officer, Nigeria; W. G. Brookbank, agricultural officer, Tanganyika; D. H. Drennan, agricultural officer, Tanganyika; N. B. Flockhart, agricultural officer, North Borneo; R. Henderson, agricultural officer, Malaya; W. J. C. Little, agricultural officer, Nigeria; R. R. Mason, agricultural officer, Fiji; D. G. Thomas, botanist, Uganda; I. H. Warren, agricultural chemist, Tanganyika; J. R. Williams, entomologist, Mauritius; D. W. Winter, agricultural officer, Zanzibar; R. S. Ayliffe, assistant conservator of forests, Trinidad; J. A. D. Jackson, assistant conservator of forests, Nigeria; J. A. Laurenson, assistant conservator of forests, Sierra Leone/Gambia; F. J. S. Phillips, assistant conservator of forests, Nigeria; A. W. M. Watt, assistant conservator of forests, Uganda; D. A. J. Wood, assistant conservator of forests, Gold Coast; J. R. Harpum, geologist, Tanganyika; H. R. Threlfall, surveyor, Tanganyika; D. L. Johns, research officer (entomologist), Tanganyika; A. F. MacKenzie (agricultural officer, Sierra Leone), senior agricultural officer, Sierra Leone; J. F. Ward (agricultural officer, Kenya), senior agricultural officer, Nigeria; F. A. Cassidy (inspector of mines, Sierra Leone), senior inspector of mines, Nigeria.

Announcements

THE Council of the Linnean Society of London has nominated the following as recipients of the Trail Award and Medal: for 1942, Dr. Honor B. Fell, of the Strangeways Laboratory, Cambridge; for 1947, Dr. C. D. Darlington, director of John Innes Horticultural Institution. The Trail Award and Medal was established by a donation by the late Prof. J. W. H. Trail "to encourage study that throws light on the substance known as Protoplasm, or the physical basis of life" and is awarded by the Council at intervals of not less than five years. The presentations of the Award and Medal will be made at the Society's anniversary meeting on May 24.

H. B. HENBEST has been elected to a Beit Fellowship for Scientific Research of the value of £400 a year, tenable at the Imperial College of Science and Technology, London, for research in organic chemistry under the direction of Sir Ian Heilbron.

THE late Dr. Collinge's collection of terrestrial Isopoda has been presented to the Yorkshire Museum, to which institution all future inquiries with regard to the collection should be addressed. The collection is important since it contains a large number of Collinge's described species and varieties. A list will be supplied on loan to any interested worker on application to the Keeper, Yorkshire Museum, York.

ERRATUM.—Referring to the communication on the 'floating thread' in *Nature* of November 15, 1947, p. 673, I. Kuščer writes: "The formula at the bottom of the left-hand column should be $d = \pi(\sigma_0 - \sigma_1)^2 \div 4\mu\rho v_0^3$. In both expressions for y (right-hand column) substitute 1 for λ. The unit 'cm.' against the value for the derivative $(dy/dx)_0$, which is obviously dimensionless, should be omitted."

LETTERS TO THE EDITORS

The Editors do not hold themselves responsible for opinions expressed by their correspondents. No notice is taken of anonymous communications

Variation of Geomagnetic Intensity with Depth

In a recent letter[1], A. L. Hales and D. I. Gough compared their measurements of H_d, the horizontal magnetic intensity (H) at depth d, made in the Witwatersrand at $d = 4{,}800$ ft., with the formula

$$H_d/H_0 = 1 - 2\,(5\rho_1/\rho + 1)\,d/a \qquad (1)$$

obtained by S. K. Runcorn from Blackett's theory[2]. In (1), H_0 denotes the value of H at the overlying point on the surface ($d = 0$), a denotes the earth's radius, ρ_1 the mean density of the rocks down to depth d, and ρ the overall mean density of the earth. The observations were compared also with the formula

$$H_d/H_0 = a^3/(a-d)^3 = 1+3d/a \text{ (approximately)}, \qquad (2)$$

corresponding to any 'core' theory which places the source of the field wholly below the depth d.

It is clear that (1) cannot be correct, because it should agree with (2) if $\rho_1 = 0$, whereas in fact it gives $H_d/H_0 = 1 - 2d/a$ in that case. The correct formula, which can be derived from a vector potential or otherwise, is

$$H_d/H_0 \doteq 1 - 3(5\rho_1/k\rho - 1)d/a, \qquad (3)$$

where k denotes I/I_0, and I signifies the moment of inertia of the earth and I_0 that of a uniformly dense sphere of the same size and mass. The proof of this and allied and more general formulæ will be communicated to the Physical Society.

Taking $\rho = 5{\cdot}5$, $\rho_1 = 2{\cdot}8$, $k = 0{\cdot}88$, the factor of d/a in (1) is $-\ 7{\cdot}1$, and in (3) is $-\ 5{\cdot}7$. Hence $\Delta H \equiv (H_d - H_0)$, which for comparison with the Witwatersrand observations was calculated[1] as $-\ 26\,\gamma$ from (1), should be $-\ 21\,\gamma$ according to (3), whereas (2) gives $+\ 11\,\gamma$. The mean observed value, after making various alternative possible corrections for the effects of local magnetic matter, was given as lying between $-\ 10 \pm 4$ and $-\ 20 \pm 4\,\gamma$. These are not in accord with (2); but to what extent ΔH agrees with (3) must remain uncertain until a more unambiguous determination is obtained.

SYDNEY CHAPMAN

Queen's College,
Oxford.

[2] Blackett, P. M. S., *Nature*, **159**, 658 (1947).

The formula giving the variation of the earth's horizontal field with depth quoted in the letter of Hales and Gough involves an approximation concerning densities which is only applicable to spheres the density distribution of which is only slightly different from a uniform one, such as is roughly true for the earth. Thus it is not to be expected that the formula should give the dipole variation law when $\rho_1 = 0$, but I am grateful to Prof. Chapman for pointing out a more general formula. It should be noted, however, that in the present state of the theory of Blackett's formula, $P = \beta \dfrac{G^{1/2}}{2c} U$, the treatment of densities must remain ambiguous, various assumptions leading to slightly different values of the predicted variation with depth. This point will be dealt with in detail elsewhere.

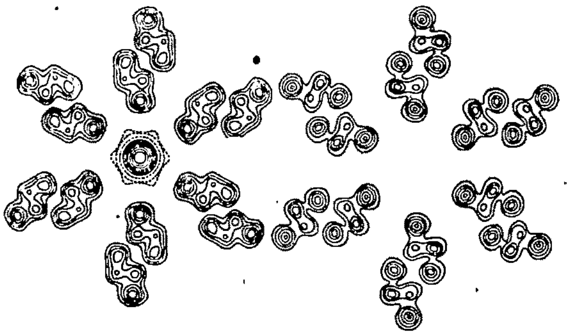
Beta-quinol: an Example of the Firm Union of Molecules Without the Formation of Chemical Bonds Between Them

The substance formerly called 'β-quinol' and obtained by crystallization of quinol from methanol has been shown[1] to be a compound of three molecules of quinol with one molecule of methanol. It is one of a series of solid compounds of very similar crystalline structure[2], which consists of two interpenetrating giant molecules of hydrogen-bonded quinol units together enclosing small molecules, such as that of methanol, in cavities that are left when these two giant molecules are fitted together as closely as possible. Compounds of this general type in which one component imprisons the other without necessarily having any strong attractive interaction with it have been named clathrate compounds[3]. When crystallized, for example, from ethanol in conditions such that molecules of suitable size are not available for enclosure in this way, quinol forms a more densely packed structure, α-quinol, by a different arrangement of quinol units which has not yet been completely determined.

In the clathrate compounds of quinol the presence of the enclosed molecules exerts a stabilizing effect on the double cagework quinol structure which, although it represents a simple way of satisfying the directional requirements of the hydrogen bonds linking the quinol units, is clearly of a very open character since it provides space for the second component. However, since some of the compounds are found to exist with a large proportion of the cavities unoccupied[4], it seemed possible that the completely empty structure might be capable of existence. Single crystals of quinol have now been obtained in this form. This crystalline form is given the name 'β-quinol', which should no longer be used for the methanol compound. It differs in unit-cell dimensions, refractive indices and density from α-quinol, and a preliminary Fourier electron-density synthesis shows that the structure is very similar to those already determined for the clathrate compounds '3 quinol.M', where M is SO_2, MeOH or a variety of other small molecules, with the essential difference that the spaces occupied in the compounds by molecules of the second component are here vacant. This may be seen in a comparison of the accompanying electron density maps for (*a*) 3 quinol.SO_2, (*b*) the empty β-quinol structure. Both show the projected electron density on the (0001) face of the crystal. Whereas the compound shows in the centre a high circular peak, corresponding to the (rotating) sulphur dioxide molecule, and the six surrounding quinol molecules which form its cage, the β-quinol projection shows similar quinol molecules with an empty space at the centre. In both projections the benzene rings are considerably out of the plane of the projection and consequently they appear distorted from their true regular hexagonal shape.

It may be shown from the unit-cell dimensions and from the number and dimensions of the cavities contained within it that in β-quinol about 7½ per cent of the total volume is empty space that could be



occupied by other molecules, and is so occupied in the clathrate compounds. In any structure regarded as composed of spherical atoms of fixed radius, a part of the total space is represented by the unoccupied small cavities between spheres in contact, and even in a closest packed arrangement of equal spheres this is a considerable proportion. The 7½ per cent mentioned above is in addition to the space of this sort.

β-Quinol is the first example of a special type of molecular compound. It is composed of two giant molecules which, although not linked by bonds of any sort, are held together in a manner much firmer than corresponds to van der Waals' interaction. Furthermore, the two molecules cannot be separated without the breaking of bonds, for example, hydrogen bonds, although these bonds do not connect the two molecules.

The state of the molecules may be described as follows. Let the skeleton of a steel-frame building represent a portion of the indefinitely extended three-dimensional giant molecule. Let a second identical framework be constructed displaced relative to the first so that each junction of girders in one framework is at the space centre of a compartment of the other framework. There is no join between the two systems of girders, and there is therefore some freedom of independent movement of the two; but they cannot be separated since each makes a multiple enclosure of the other and thus imprisons it. If the girders are regarded as quinol molecules and the junctions between them are taken to be hydrogen bonds, the description applies in all essentials, to β-quinol.

The imprisonment of one molecule by the other means that β-quinol is to be regarded as a special type of clathrate compound. Although a similar arrangement of molecules occurs in the compounds mentioned above, the complete absence of any enclosed molecules removes all possibility that they might play any part in the union of the two giant molecules. It is thus demonstrated that two molecules, which in this case happen to be identical in composition and structure, may be united as firmly as though there were hydrogen bonds between them, although, in fact, no such bonds exist.

Details of the crystal structure of β-quinol will be published elsewhere.

Use of Ultra-Violet Fluorescence in Paper Chromatography

It has been shown[1] that, by the action of chymotrypsin, insulin is broken down into a number of peptide fragments of comparatively small molecular weight, and a more massive residue. The higher molecular weight material can be precipitated by means of trichloro-acetic acid. Attempts have been made to separate the lighter peptide mixture, and the most effective method so far found has been paper partition chromatography[2].

With phenol as the mobile phase, the mixture is resolved into four broad bands each of which can be further resolved by the use of collidine. It has been found during these experiments that the α-amino-acids and peptides can be detected on the filter paper sheets by drying off the solvent and examining the sheet under illumination from a 'Hanovia' lamp in a darkroom, using a ⅜ in. thick Wood's glass filter.

De Ment has noted[3] the fluorescence of the common α-amino-acids and a few dipeptides in the solid state when illuminated with light of 3650 A. wave-length. On paper chromatograms this fluorescence can be seen even though drying has only been done at 37° C., but the intensity increases markedly when higher drying temperatures are used. The quality of the fluorescent light is visually about the same for all the acids and peptides, a whitish-violet colour standing out against the dark violet of the filter paper. Using this method, it is possible to mark out the positions of the substances and cut out the spots or bands for elution, without sacrificing material for ninhydrin testing. Sheets marked in this way and afterwards tested with ninhydrin have shown the coincidence of the markings and the colours; but the ninhydrin test is the more sensitive one, since 20 μgm. of an amino-acid per square inch of paper is about the least visible under the ultra-violet light used. The chief drawback of the method is that extraneous fluorescent substances can be obtained from the paper and solvents used. These impurities may not produce a chromatograph pattern until they have been eluted from a sheet and run with a different solvent on a fresh chromatogram.

Inhibition of the Photodynamic Action of 3 : 4 Benzpyrene

It has gradually become apparent that the carcinogenic activity of 3 : 4 benzpyrene is linked with sulphur metabolism[1]. Some experiments have, therefore, been carried out to attempt to determine whether another biological property of 3 : 4 benzpyrene, namely, its photodynamic action, is involved with sulphur. These were done by measuring the photodynamic activity of the benzpyrene in the presence of sulphur containing compounds.

For this purpose thick cultures of Paramecia were used as a biological indicator. Irradiation was from a mercury-vapour lamp screened with a glass filter, opaque to radiations of less than 3,300 A. Exposures were made using large well-slides to contain Paramecia and the media. The benzpyrene was used in the form of a colloid in tap water.

Preliminary experiments were carried out to determine the toxicity and any photodynamic action of the compounds under test. Toxic concentrations were taken as those which would cause cytolysis within 30 min.; tolerance concentrations as those which had no apparent effect after two hours exposure. The results of these trials are given in Table 1.

TABLE 1

Compound	Toxic conc.	Tolerance conc.	Photodynamic action at tolerance conc.
Cysteine hydrochloride	1/1250	1/1500	Nil
Glutathione	1/1250	1/2000	Nil
Methionine	1/225	1/250	Nil

Using concentrations which were non-toxic, these substances were tested again in the presence of various concentrations of 3 : 4 benzpyrene. Controls, in which the test substance was replaced by an equivalent volume of tap water, were irradiated side by side with the experimental cultures. In all cases the test substance and the benzpyrene colloid were added to the Paramecia cultures immediately before commencement of irradiation.

Of the compounds mentioned in Table 1, the only one causing any variation in the time required for cytolysis of 90 per cent of the Paramecia as compared with the time required for controls was cysteine hydrochloride. The results obtained using 0·03 per cent cysteine hydrochloride and varying concentrations of benzpyrene are shown in Fig. 1.

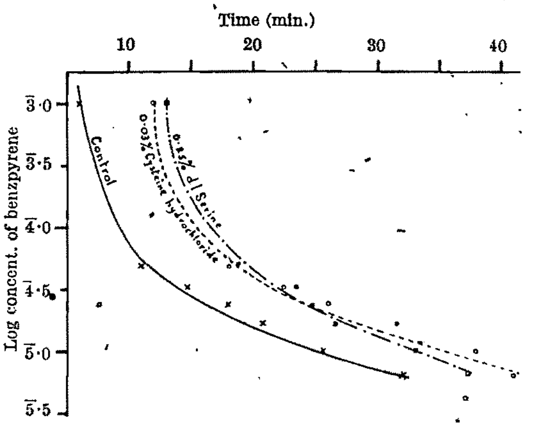

Fig. 1. INHIBITION OF PHOTODYNAMIC ACTION OF BENZPYRENE IN THE PRESENCE OF CYSTEINE HYDROCHLORIDE AND SERINE

Further tests were carried out with a series of amino-acids to determine whether any similar inhibition of photodynamic action could be obtained. The manner and conditions of testing were the same as used previously. The toxic concentrations, tolerance concentrations and photodynamic effects are shown in Table 2.

TABLE 2

Compound	Toxic conc.	Tolerance conc.	Photodynamic action at tolerance conc.
Glycine	1/225	1/250	Very slight
Histidine	1/250	1/300	Nil
Phenylalanine	1/200	1/250	Nil
d-l-Serine	1/200	1/250	Nil
Threonine	1/250	1/300	Very slight
d-l-Valine	1/200	1/250	Nil

Of this group of compounds, the only one having any effect on the photodynamic action of the benzpyrene was *d-l*-serine. The effect of using a 0·25 per cent solution is an inhibition very similar to that given by the cysteine hydrochloride (see Fig. 1).

Further results were obtained using a fixed concentration (0·001 per cent) of the benzpyrene and varying strengths of the cysteine hydrochloride and *d-l*-serine. The results are shown in Fig. 2.

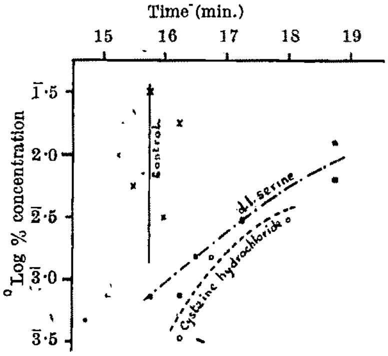

Fig. 2. VARIATION IN DEGREE OF INHIBITION WITH VARIATION IN CONCENTRATION OF INHIBITORS

The significance of these inhibitory actions and the manner in which they are exercised are still unknown, though it is interesting to recall the close chemical relationship between cysteine and serine. Further experiments are in hand to try to determine details of these actions.

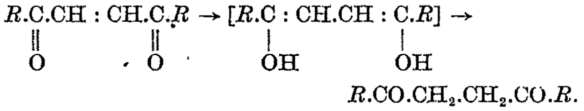
Reduction of 1 : 4-Diketones

THE dibenzoylethylenes on reduction with metal combinations or catalytic hydrogenation under certain conditions yield the corresponding diphenacyls[1], and there is evidence that the reaction occurs through 1 : 6-addition of hydrogen followed by rapid ketonization of the intermediate dienols[1]. Lutz and Reveley[2] showed the presence of one such dienol, without, however, isolating it:



$$\underset{\substack{\| \\ O}}{R.C}.CH : CH.\underset{\substack{\| \\ O}}{C}.R \rightarrow [R.\underset{\substack{| \\ OH}}{C} : CH.CH : \underset{\substack{| \\ OH}}{C}.R] \rightarrow R.CO.CH_2.CH_2.CO.R.$$

Confirmation of this mechanism is desirable, especially since 1 : 6-addition is comparatively uncommon[3]. We have done this by reducing several substituted dibenzoylethylenes with aluminium isopropoxide in *iso*propyl alcohol, a reagent known to attack carbonyl groups while leaving olefinic linkages intact. The reduction products were invariably the corresponding diphenacyls, identified (after chromatographic adsorption) by mixed melting points with authentic samples. Since direct hydrogenation of the carbon–carbon double bonds is ruled out, the reduction must have taken the course outlined above.

	Reduction product and yield	per cent
trans-Dibenzoylethylene	Diphenacyl	70
cis-Dibenzoylethylene	Diphenacyl	60
trans-Di-*p*-toluylethylene	4 : 4′-Dimethyldiphenacyl	75
cis-Di-*p*-toluylethylene	4 : 4′-Dimethyldiphenacyl	95
trans-Di(*p*-chlorobenzoyl)-ethylene	4 : 4′-Dichlorodiphenacyl	80
cis-Di(*p*-chlorobenzoyl)-ethylene	4 : 4′-Dichlorodiphenacyl	90
trans-Di(*p*-bromobenzoyl)-ethylene	4 : 4′-Dibromodiphenacyl	75
cis-Di(*p*-bromobenzoyl)-ethylene	4 : 4′-Dibromodiphenacyl	90

It is noteworthy that the *cis*-compounds react more rapidly with this reducing agent. With the *trans*-isomers some unchanged substance was always found in the product.

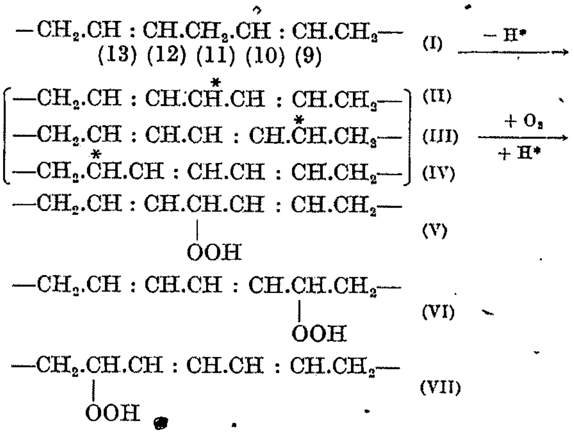
Total Conjugation of Linoleic Acid in Oxidation with Lipoxidase

Bolland and Koch[1] postulated the mechanism of autoxidation of linoleate to be:



$$\begin{array}{ll}
\underset{(13)\ (12)\ (11)\ (10)\ (9)}{-CH_2.CH : CH.CH_2.CH : CH.CH_2-} & (I) \xrightarrow{-H^*} \\
\left[\begin{array}{l} -CH_2.CH : CH.\overset{*}{C}H.CH : CH.CH_2- \\ -CH_2.CH : CH.CH : CH.\overset{*}{C}H.CH_2- \\ -CH_2.\overset{*}{C}H.CH : CH.CH : CH.CH_2- \end{array}\right] & \begin{array}{l}(II)\\(III)\\(IV)\end{array} \xrightarrow[+H^*]{+O_2} \\
-CH_2.CH : CH.\underset{\displaystyle OOH}{\underset{|}{C}H}.CH : CH.CH_2- & (V) \\
-CH_2.CH : CH.CH : CH.\underset{\displaystyle OOH}{\underset{|}{C}H}.CH_2- & (VI) \\
-CH_2.\underset{\displaystyle OOH}{\underset{|}{C}H}.CH : CH.CH : CH.CH_2- & (VII)
\end{array}$$

From the ultra-violet absorption due to the conjugation of the double bonds and from the active hydrogen content of the resulting mixture of peroxidic products, they concluded that it consisted of approximately equal parts of the hydroperoxides V, VI and VII, indicating that the free radical structures II, III and IV contribute equally to the free radical resonance hybrid.

Other workers' results are in agreement with the general outlines of the mechanism[2,3]. In the hydrogenated products, Bergström[2] identified comparable amounts of 9- and 13-hydroxystearate, but was unable to detect the 11-isomer.

The oxidation of linoleates in aqueous solution with crude soya-bean lipoxidase seems to follow the same general course as the autoxidation[2,3]. It was observed that the extinction at 234 mμ per absorbed oxygen increased when the enzyme was purified[4].

When crystalline lipoxidase[5] became available, the problem was reinvestigated under conditions least likely to promote side reactions or decompositions. The oxidations were carried out in Warburg vessels under air, using sodium linoleate substrate[4]. The reactions were stopped by addition of alcohol, and light absorption was measured using the Beckman spectrophotometer.

Apparent molar extinction coefficients of the primary oxidation product at 234 mμ were found to be 23,000 at 37°, 27,800 at 8° and 31,400 at 0°, indicating that reaction temperature affects the formation or decomposition of conjugated diene to a marked degree. Reduction of the extinction by elevated temperature is accompanied by increased absorption at 270 mμ. The extinction coefficient at 234 mμ remains near 30,000 up to 30 per cent oxidation at 0°, whereas at 37° it has decreased to 20,000 at 10 per cent oxidation.

Thus in the rapid enzymatic oxidation of linoleate at low temperature, one pair of conjugated double-bonds is formed for every oxygen absorbed. This indicates that III and IV are the main contributing structures to the free radical resonance hybrid, resulting in oxygen addition at the ends of the resonating system, giving only the conjugated hydroperoxides VI and VII. Variable amounts of products, other than conjugated hydroperoxides, formed at higher temperatures, with longer reaction times, or with impure enzyme, appear to be attributable to decompositions or secondary oxidations of conjugated peroxides.

Our evidence suggests that a similar mechanism may account for the low extinction coefficients observed in the autoxidation of linoleates.

A full report will appear in due course (*Arch. Biochem.*).

Ammonium Salts of Sulphanilamides and Sulphonic Acids

SULPHANILAMIDE salts of a few sulphonic and carboxylic acids have been described[1,2,3], but they have not been isolated in pure form and characterized. In the course of our work on surface-active compounds, and with the object of examining their activity as intestinal bacteriostatic agents, we have prepared sulphanilamide salts of di*iso*propyl naphthalene sodium sulphonate (m.p. 220–22°), sodium dioctylsulphosuccinate, and lauryl-*p*-toluidide-2-sodium sulphonate. Suitable experimental conditions were first determined by the preparation of (*a*) salts of naphthalene-β-sulphonic acid and sulphanilamide (m.p. 263–64°), sulphathiazole (214–15°), sulphapyridine (152–53°), sulphadiazine (188°), sulphamerazine (118–120°), sulphaguanidine (225–26°), N^1-acetylsulphanilamide (254–55°), and *p*-aminobenzoic acid (decomp. above 260°); and (*b*) sulphanilamide salt of phenol-*p*-sulphonic acid (241–42° decomp.). The last salt, described earlier[1] as giving m.p. 216–220° (decomp.), was apparently a mixture containing sulphanilamide hydrochloride.

The bacteriostatic activity (mgm. per cent) of salts of sulphanilamides and naphthalene-β-sulphonic acid is given in the table:

Sulpha drug	Sulpha drug in salt (%)	*St. aureus* Salt	*St. aureus* Parent drug	*Escherichia coli* Salt	*Escherichia coli* Parent drug
Sulphanilamide	45·0	500	500	500	500
N^1-Acetylsulphanilamide	50·7	150	200	150	225
Sulphapyridine	54·4	12	22	14	22
Sulphathiazole	55·1	8	12	8	10
Sulphadiazine	54·3	8	20	10	22
Sulphamerazine	56·1	20	40	30	30
Sulphaguanidine	50·7	250–300	250	250	300

The results indicate that the ammonium salts were more active than the parent sulphanilamides in spite of the lower content of the active sulpha component. The increased potency of our salts could not be due to increased solubility[2], as they were not more soluble than the sulpha components. The potentiation of the sulphanilamides by ammonium salt formation could be due to ionization, resulting in the sulpha component acquiring the highly active zwitterion form  $\overset{+}{}\left[H_3N-\bigcirc-SO_2NR\right]^{-}$, stabilized by the complementary inductive effects of the positively charged ammonium and the negatively charged sulphonamide groups. Inactivation of the sulpha drugs *in vivo* during metabolism by N^4-acetylation might perhaps be prevented or minimized by the use of sulphanilamide salts instead of the parent sulpha component.

Further, we have found that replacement of sulphanilamide in its salts with naphthalene-β-sulphonic acid by *p*-aminobenzoic acid took place to a small extent even at room temperature (26–29°), when an aqueous solution of *p*-aminobenzoic acid and the sulphanilamide salt was kept for ten days. The sulphonic anion might, therefore, make a small contribution to the bacteriostasis by removing part of the essential metabolite, *p*-aminobenzoic acid, by salt formation, as also by complex formation with the positively charged part of the enzyme molecule.

Effect of Under-nutrition and Alterations in Diet on the Choline Esterase Activity of Serum

THE activity or 'concentration' of choline esterase in serum has been considered as a test of liver function[1], and an interest in this enzyme has been stimulated in recent years by the developments which took place in chemical warfare during the period of hostilities. So far, diet has not been implicated as one of the agents regulating the activity of either the 'total' or the 'true' choline esterase of serum; but within the last eighteen months we have made numerous observations which show that the general level of nutrition and also certain changes of diet may exert a considerable influence. All the determinations of activity were made by measuring the carbon dioxide evolved by the enzyme in a Barcroft apparatus. The enzyme activity of a serum such that 1 c.c. liberates 1 c.mm. of carbon dioxide in 1 min. from the reaction mixture has been taken as unity. The 'total' choline esterase in serum was measured in the presence of 2·5 per cent of acetyl choline chloride. This concentration of substrate is well above the optimum for true choline esterase, and the activity determined by this method is due mainly to 'pseudo' choline esterase. The 'true' choline esterase in the serum was determined by the method of Mendel, Mundell and Rudney[2].

An average of 80·2 units of 'total' choline esterase (*S.D.* 15·5) was found in the sera of thirty-nine healthy British men who were living on British civilian or army rations. The mean concentration in a group of eighty-two German factory workers living on German civilian rations in 1946 was found to be 56·7 (*S.D.* 14·5), and forty-five German civilians, who were attending a hospital in Wuppertal-Barmen on account of nutritional œdema, gave an average of 48·5 (*S.D.* 16·2). An average of 42 units was obtained from twelve German civil internees who had œdema, and the very low average of 29·0 units from a group of nine civilian prisoners in a gaol at Kiel. Although severe under-nutrition and œdema may be accompanied by low serum proteins, there is good evidence that the changes in choline esterase were not due to this.

EFFECT OF AN IMPROVED DIET ON THE CHOLINE ESTERASE ACTIVITY OF SERUM

	'Total' choline esterase activity (c.mm. CO_2/c.c./min.)		'True' choline esterase activity (c.mm. CO_2/c.c./min.)	
	Average and range	Standard deviation	Average and range	Standard deviation
12 civilian prisoners, July 1946	51·56 (27·6–88·2)	18·60	0·807 (0·596–1·130)	0·143
The *same* 12 prisoners after 5 months on improved rations	62·90 (32·4–96·4)	18·00	1·050 (0·749–1·270)	0·127
19 under-nourished German civilians, September 1946	47·40 (29·8–63·5)	7·65	0·917 (0·710–1·140)	0·127
The *same* 19 civilians after 2 months high caloric diet, November 1946	75·20 (59·4–101·5)	13·00	1·020 (0·789–1·370)	0·145
The *same* 19 civilians after 5 months on German rations, April 1947	55·40 (39·3–82·2)	11·49	0·969 (0·775–1·330)	0·145

A rise in the choline esterase has twice been observed to follow an improvement in the diet (see table). Between July 1946 and December of the same year, twelve civilians in Siegburg prison gained an average of 10 kgm. in weight because they were given more food. The effect of this on the choline esterases in their sera will be seen in the table. The differences were statistically significant both for 'total' and for 'true' choline esterase ($t = 2·56$, $p = 0·05–0·02$ and $t = 4·43$, $p < 0·01$ respectively).

In the autumn of 1946, nineteen under-nourished German adults were given for experimental reasons an excellent diet, unlimited in quantity, for eight weeks. This produced an average rise in the body-weight of 10 kgm. and an increase in their mean 'total' choline esterase which was highly significant ($t = 12·2$, $p < 0·01$). The increase in 'true' choline esterase activity was also statistically significant ($t = 2·63$, $p = 0·02–0·01$).

When these men returned to their civilian rations in November 1946, most of them lost weight again, and their choline esterases fell also during the next five months. The decrease in total choline esterase was statistically significant ($t = 6·6$, $p < 0·01$). The diets were not controlled or supervised during these five months, and three of the men who managed to maintain their weights better than the others also maintained their serum choline esterases much better. It is not thought that these increases in choline esterase were due to the digestion, absorption and metabolism of fat setting free non-specific esterases into the serum, for when six men were given a supplement of 100 gm. of fat daily for three days there was no increase in the 'total' choline esterase found in their sera.

These results, and others which have not yet been published, suggest that the average level of the 'pseudo' enzyme in the serum is a delicate index of the state of nutrition of any group of men in Germany to-day.

It is hoped to publish the results of this work in full in the near future, and various aspects of it are being actively studied at the moment; but we think it may be helpful to those working on the enzymes to know at this stage that we have obtained these results. The knowledge may possibly assist them to establish the relationship of the enzymes to the liver and to the other organs involved in their functional activity.

Premortal Increase in the Output of Sodium and Chlorine in Fasting Rats

Kunstmann, in an experiment on himself[1], drank 10–20 litres of water daily, with an otherwise normal food intake. He felt fit during the experiment, his urinary output in sodium and chlorine sank to minimal values; but nevertheless his sodium chloride balance became negative. On about the thirtieth day of the experiment, his chlorine excretion rose to abnormally high values and he felt ill, so he ended the experiment. We attempted to reproduce this experiment with rats. We gave them maize washed out in water, and twice daily 10 ml. of a 5·5 per cent glucose solution subcutaneously. In this way we attained great quantities of a rather dilute urine; the animals slowly lost weight; but the output of sodium and chlorine showed no increase, even on the fiftieth day of the experiment, and we failed to obtain a negative salt balance.

We decided, therefore, to make the rats fast, without or with water *ad libitum*, with twice daily 10 ml. of a 5·5 per cent glucose solution subcutaneously; we collected urine specimens daily and analysed them for sodium, potassium, chlorine and nitrogen. In all cases, on the last day before death, the output of sodium and chlorine was three to six times as great as on the previous days. We varied our experiments by giving the rats free access to water, but no extra injections. In about half the cases we observed the same phenomenon: the last day's sodium and chlorine output was many times greater than on the previous days. With 2 per cent urea solution (10 ml. twice daily subcutaneously) we obtained the same result.

In some cases we succeeded in keeping the animals alive after the end of the experiment by giving them adequate food, so this phenomenon cannot be regarded as absolutely fatal. The fasting animals lived from four to nine days, and there seems to be no correlation between the duration of the experiment and the appearance of the increased sodium chloride output. No correlation was found between increased output of sodium chloride on one hand and sex, weight, room temperature, water intake, quantity of urine and nitrogen output of the rats on the other.

We have insufficient evidence to suggest the mechanism and cause of this increased output. We calculated according to Gamble, Ross and Tisdall's procedure[2] the loss of weight from the excreted amount of potassium, sodium and nitrogen and compared the data with the measured loss of weight. In most cases showing the increased sodium chloride output, the calculated loss exceeded the measured loss and this, with high serum sodium values, would suggest that the organism had some reserves of sodium chloride in 'dry' form, which are excreted after prolonged fasting. In other cases we found normal and even subnormal serum sodium levels as well. We realize that the existence or non-existence of 'dry' sodium chloride reserves is still a much discussed problem of physiology, and the evidence given above is not enough to give a positive answer. Further work on the mechanism involved is in progress.

Thyroid Gland as a Special Factor Influencing the Conditional Disposition to Infectious Diseases

There are several old and recent observations concerning the important effect of the ductless glands on disposition against infections and infectious diseases. From this point of view the role of the thyroid should especially be emphasized.

Some authors[1] suggest a specific role (specific bacteriostatic action) of thyroxine; but the majority[2-7] assume a non-specific effect on the defence mechanism of the organism.

It is more correct to speak of conditions rather than causes producing diseases, regarding the constitution not as a static but as a dynamic unity. I reported in 1938[8] on my investigations with Reid-Hunt's method. They favour the assumption that alterations in the quantity of thyroxine in the blood are closely related to infections. My further investigations with Euler's method[9] pointed to the marked increase of the thyroxine-level in serum during infectious diseases (smallpox vaccination). It seemed that this increase was parallel with the reaction of the body to the infection and closely related to the development and stimulation of the defence mechanism. I found at the same time[10] that the patients displaying a higher thyroxine-level were rather free from the complications due to secondary infection in scarlet fever.

Starting from these observations, I administered daily to 283 patients[11] suffering from scarlet fever 50 cgm. of fresh thyroid powder from their entry to hospital until their discharge. The experiments were carried out during one season, the patients came from the same district, and nursing, treatments, diet, etc., were identical too. The administration of thyroxine was carried out regardless of sex and age of the patients. The object of this experiment was to diminish the number and mitigate the severity of the complications both in first and in secondary infection. Thyreotoxicosis ensued only in one case. The number of control cases was 1,112.

The data are summarized below :

	Controls (per cent)	Treated cases (per cent)
Cervical lymphadenitis	25·6	6
Fever without any symptoms, total	13	3
recurrence—once	73	95
recurrence—twice	24	5
recurrence—three times	3	0
Nephritis, total	6	6
mild cases	44	70
severe cases	38	30
fatal cases	18	0

The table shows that the administration of the powdered thyroid gland did, as compared with the course of the controls, achieve an increased resistance to the complications, so much so that their absolute and relative number has diminished.

According to my observations (and in accordance with the findings of other authors[12]) the thyroid (system diencephalon – adenohypophysis-thyroid) seems to be an important point of the conditioned predisposition. Besides this, there seems to exist a close connexion between the allergic phenomena and the infectious diseases. Among other things a typical blood cholesterin-level[13], extremely mild allergic symptoms[14] in hyperthyroidism[15] and the well-known dehydrative effect of the thyroxine were observed.

It has been shown by the experiments cited that besides the antibacterial substances, conditioned disposition plays a prominent part in combating infections.

Effect of Feeding 2-Acetaminofluorene on the Adreno-Gonadal System of Rats

The administration of *p*-dimethylaminoazobenzene to female albino rats on a rice diet has been shown to cause a cessation of the œstral cycles two weeks after administration of the carcinogenic compound[1]. The weight of the ovaries was reduced, and histologically there was an almost complete absence of corpora lutea. In male rats the weight of the testes was reduced and spermatogenesis inhibited. The weight of the adrenal was found to be smaller in the male than that in the female rats, in conformity with the findings of Hatai[2]. There was no effect on the weight or histological appearance of the adrenal gland in either sex ; 78 per cent of these rats developed hepatic tumours[3].

In a new series of experiments 2-acetaminofluorene was fed to albino and piebald rats each weighing about 100 gm. They received a semi-synthetic diet in which 17 per cent of the caloric value was derived from protein and 30 per cent from fat ; the diet was supplemented with cod liver oil and greens. The 2-acetaminofluorene was added in a final concentration of 0·07 per cent. The weight of the rats was recorded weekly. All rats grew slowly (about 0·5 gm. daily), and no difference could be found between them and rats on the control diet. Vaginal smears were taken daily from ten females in each group. Rats were killed at intervals up to the 300th day, and those developing any disease other than tumour growth were discarded. The organs were removed immediately, weighed and fixed for histological examination.

The œstral cycle both of albino and piebald rats receiving 2-acetaminofluorene ceased in seventeen out of twenty rats ; that of the control rats remained normal. Histologically the ovaries showed a considerable number of very large corpora lutea (8–12), luteinization of the stroma and an almost complete disappearance of the follicles. The weight of the ovaries in the treated and control rats was much the same. Mean weights (mgm. per 100 gm. body-weight) : controls (16), 59 ; treated albinos (13), 51·7 ; piebalds (16), 59·0. (The figures in brackets give the number of rats in the group.)

The weight of the adrenals (mgm. per 100 gm. body-weight) of the *female* rats receiving 2-acetaminofluorene remained unchanged. The mean weights were : controls (10), 42·7 ± 2·9 ; treated females : albinos (13), 42·8 ± 4·0 ; and piebald (10), 42·7 ± 3·4. Histologically the adrenals were in most cases normal ; some showed degenerative changes in the zona glomerulosa and there was some cyst formation in the cortex. In male rats the weight of the testes was slightly but not significantly lower than that in the controls ; spermatogenesis was found in all instances. The mean weights (gm. per 100 gm. body-weight) were : controls (17), 1·43 ; treated albinos (12), 1·25 ; and piebald (11), 1·03.

The weight of the adrenals of *male* rats was increased, approximating that of the adrenals of female rats and being about 40–50 per cent greater than those of the male control rats. The mean weights were : controls (17), 27·4 ± 2·0 ; treated male albinos (11), 38·19 ± 3·4 ; piebalds (8), 39·7 ± 2·2, $P < 0{\cdot}01$. Histologically, the male adrenals showed hypertrophy of the cortex, most pronounced in the layers near the medulla. In some cases a well-developed juxta medullary eosinophilic zone was present.

No change in the weights of the other endocrine organs was noted. The weight of the liver increased in both sexes shortly after feeding 2-acetaminofluorene and before histological signs of tumour formation appeared. This increase seemed due to the deposition of fat in the liver cells. There were no changes in the weight of the other organs.

Eighty-five per cent of the sixty-three rats, whether albino or piebald of either sex, receiving 2-acetaminofluorene for more than twenty-one weeks developed tumours. These were located principally in the liver ; but tumours of other organs were also frequent, as found by others[4].

As in the case of *p*-dimethylaminobenzene, the administration of 2-acetaminofluorene caused cessation of the œstral cycle in female rats, but the histological picture of the ovaries was completely different; it seems that when 2-acetaminofluorene was fed, the organs which produce steroid hormones are affected. It produces in female rats a heavy luteinization of the ovaries and a consequent disturbance in the œstral cycle. The changes in the male adrenal make the gland similar to that of the females. How far these changes are related to the carcinogenic action of 2-acetaminofluorine is being investigated. In this connexion it is possibly of significance that two rats with normal œstral cycles had not developed tumours by the 300th day of the experiment.

I wish to express my indebtedness to Dr. G. Bourne for his help with the histological investigations and advice in the preparation of this paper. My thanks are also due to the British Empire Campaign for a grant supporting this work.

Electrophoretic Patterns of Lamb Serum Before and After Transfer of Colostrum

THE increase in the serum globulins resulting from the ingestion of colostrum has been demonstrated by Howe[1] and also by Schneider and Szathmary[2], who employed precipitation methods. Jameson and Alvarez-Tostado[3] also employed electrophoretic analysis to demonstrate such an effect when cow's colostrum is fed to man or the adult rat; and, with Sortor[4], they have studied calf serum at birth and at subsequent times. Similar investigations have now been made in connexion with the passive immunity produced in lambs by the transfer of colostrum.

After dialysis the lamb sera were diluted with buffer to 1·1 per cent protein concentration, and runs were carried out in the Tiselius[5] electrophoresis apparatus in phosphate buffer (*p*H 8·0, ionic strength 0·2) to obtain the patterns shown. Figs. 1 and 2 show, respectively, sera obtained from a lamb at birth and 24 hours later, after transfer of colostrum by suckling. Fig. 3 shows, for comparison, a sample of pooled sera from a dozen normal sheep. The following points emerge. First, the lamb sera contain a rather higher percentage of α-globulin than does the sheep serum. Secondly, the β-globulin peak is scarcely distinguishable at all in the lamb sera, whereas in the sheep serum it can be distinguished as a small peak incompletely separated from the γ-globulin, and containing a sharp spike, the β-anomaly (see Longsworth, Shedlovsky and MacInnes[6]). Finally, the γ-globulin, almost entirely absent from the serum of the lamb at birth, shows a very large increase after twenty-four hours. In the normal sheep the γ-globulin content is much lower.

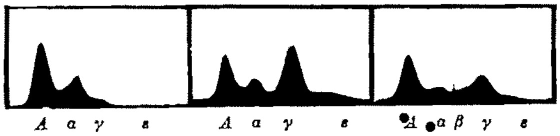

Fig. 1
LAMB,
BEFORE COLOSTRUM

Fig. 2
LAMB,
AFTER COLOSTRUM

Fig. 3
NORMAL SHEEP

Cathode-limb exposures are shown. Migration is from right to left. Peaks are designated thus: *A* = albumin; *α*, *β*, *γ* = *α*-, *β*-, *γ*-albumin; *ε* = *ε* salt boundary

Sera from eight lambs have been examined in the manner indicated, and the results shown are typical. Thus it appears that, as with other animals, so in the case of lambs the transfer of colostrum causes a remarkable increase in the γ-globulin. Advantage is taken of this transfer of γ-globulin from mother to offspring in the prophylaxis of certain diseases of the very young. In certain areas of Great Britain serious mortality occurs annually in young lambs from a disease which results from the ingestion of *Cl. welchii* type *B* organisms. The resulting enterotoxæmia is fatal to more than 90 per cent of affected lambs. The injection of in-lamb ewes in the autumn and spring with a vaccine prepared from suitable strains of the organism concerned produces antitoxin in the ewes' blood. At the time of lambing this antitoxin is present in the colostrum and the passive immunity acquired by the new-born lamb is sufficient to protect it during the first two critical weeks of life[7].

We are indebted to Mr. A. T. Glenny for advice on this work.

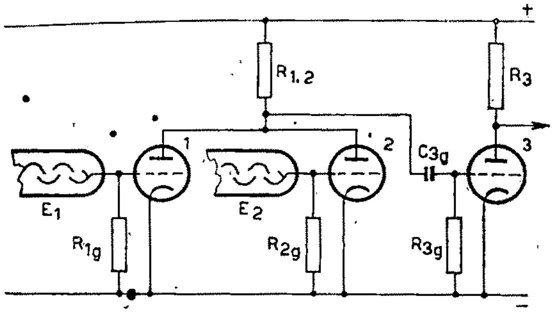
Coincidence Device of 10^{-8}–10^{-9} Sec. Resolving Power

COINCIDENCE circuits with resolving times much exceeding 10^{-6} sec. can be obtained by making use of electron multiplier tubes[1]. The device shown in the diagram is a modification of the Rossi type circuit. Ultra high-frequency electron tubes, lately developed, have been used. Because of the small inter-electrode capacities, the high mutual conductance and the small coupling resistances (50–100 ohms), the input pulses are not noticeably distorted by valves 1 and 2 and thus reach the grid of valve 3 without appreciable delay.

A difficulty which does not arise when coincidences between Geiger–Müller counters are recorded is as follows. While the input pulses obtained from Geiger–Müller counters are fairly uniform in size, the pulses arising from electron multipliers are subject to unavoidable random fluctuations. Thus the tubes 1 and 2 have to be operated at such a point of their characteristics that they tend to give equal output pulses independently of the size of the input pulse. This is achieved if tubes 1 and 2 have very sharp cut-off characteristics. In the tubes actually used the anode current was completely cut off by pulses exceeding 1 V. fed to the grid. The actual pulses received from the electron multipliers ranged between 1 and 10 V.

The tube 3 was biased so as not to respond to a pulse of 1 V. across $R_{1,2}$, corresponding to a single



input pulse, but so as to respond to pulses of at least 2 V., corresponding to coincidences.

The resolving power so far achieved is about 5×10^{-9} sec. The determination of this quantity was carried out—besides the usual method of counting random coincidences—by a direct method. The impulses of the same multiplier tube are fed into both inputs of the device, so that each impulse is recorded as an 'artificial coincidence'. If one of the leads connecting the multiplier to one of the inputs is increased by a length Δl, this side of the device will be reached by the impulse $\Delta t = \Delta l/c$ sec. later; for example, 1·5 m. corresponding to the resolving power given above. Because of this time-lag the amplitudes of the artificial coincidences decrease, and at a critical length they fade out entirely. By increasing the length of the other lead, too, the coincidences are made to reappear, demonstrating that fading-out of the coincidences was a consequence of the time-lag caused by the difference in length of the leads.

The device was designed chiefly for investigations in nuclear physics. At present, experiments similar to those of Bothe[2] are going on in the ultra-violet and visible region.

Further details will be published elsewhere.

Electron Multiplier Tube of Large Effective Cathode Surface Area

Electron multiplier tubes have been used in this Laboratory for particle counting[1], and their extremely short impulse period[2] makes them very useful research tools[3]. One disadvantage of these tubes is their small effective surface.

One method for increasing the effective surface is the following: the electron-optical image of a cathode of large surface area is projected on the first multiplying electrode of a multiplier tube of the usual dimensions. In this way a tube similar to the partition-type multiplier of Zworykin and Rajchman[4] was designed. The electrons are emitted by a cathode of spherical shell shape, and the image of the surface of the cathode is projected on the first multiplying electrode by an electrostatic lens. The cathode subtends an angle of 90° viewed from the focus of the lens. In this manner an effective surface of 100 cm.^{2} can easily be obtained.

The centre of curvature of the cathode is at the focus of the lens; the transit time of the electrons between cathode and first multiplying surface is very nearly the same for all electrons, regardless of their point of origin. This is most important in coincidence devices of very high resolving power.

The dimensions of the lens electrodes and the potentials thereon can be adjusted so that practically every electron emitted by any point of the cathode can reach the first multiplying stage without being captured by intermediate electrodes or repelled to the cathode.

In the experimental tubes, electrons could be released from well-defined points of the cathode. Some of the tubes were enlarged models, having electrodes covered by a thin layer of fluorescent material. In this way the incidence of the electrons was made visible. This method was very useful, especially in the first qualitative experiments.

Another possible way of increasing the effective surface of the electron multiplier tubes is to increase the length of all electrodes of a circular-type multiplier[4]. This method, however, would increase the capacity of the collector plate, which is a disadvantage from the point of view of the impulse period of the tube and the amplitude of the voltage pulse.

The development of the tube for the purpose of researches on cosmic radiation is going on.

Variation of Thermo-electric Power of Electronic Semi-Conductors with Vapour Pressure

When the principle of mass action is applied to explain the effect on the electrical properties of certain electronic semi-conductors having an ionic lattice structure, produced by varying the vapour pressure of one of the constituents of the substance, it is found that

$$n_f = KP_v^{1/n}, \qquad (1)$$

where n_f is the concentration of charge carriers, which may be free electrons or holes, K is an equilibrium constant, P_v is the vapour pressure, and n is a constant, negative for excess and positive for defect semi-conductors, which can be deduced from the chemical structure of the substance.

If this equation is introduced into the usual free-electron theory for the thermo-electric power of semi-conductors[1], equations may be obtained corresponding to the empirical equation

$$\frac{dE}{dT} \pm \text{const.} = -C_T \log P_v, \qquad (2)$$

where dE/dT is the thermo-electric power, taken as negative for excess and positive for defect semi-conductors, and C_T is a constant for a particular substance. From the theory C_T may be identified with $k/|e|n$, where k is Boltzmann's constant and e is the electronic charge, and a value for n thereby obtained.

Little experimental work has been performed on this subject except for a few spot readings by Wagner and his co-workers[2,3,4], made to test Wagner's differential thermo-electric circuit concept[5]. Assuming that these results obey equation (2) above, values of n have been calculated and are shown below for comparison with the values obtained from conductivity measurements :

Substance	Theoretical value of n	Value from conductivity measurements	Value deduced from thermo-electric measurements
Cu_2O	8	7	8·8
NiO	6	4	4·8
ZnO	6	4·3	6·1

The experimental results are not sufficiently comprehensive or accurate for a critical comparison, but it is noteworthy that in each case the value of n calculated from thermo-electric properties is in closer agreement with the theoretical than that obtained from conductivity measurements.

Experiments on various semi-conductors are being carried out and the results to date show that equation (2) is, in fact, obeyed. Details of the equations and their derivation will be published later.

Nuclear Models

IN a recent paper[1], H. A. Wilson has proposed a spherical shell model for the nucleus of a heavy atom. In this model the nucleus is represented as an inextensible, flexible, spherical shell the shape of which is maintained by the Coulomb forces between the protons. The radius of the shell is assumed to be $R = R_0 A^{1/3}$, where R_0 is a constant and A is the total number of nucleons in the nucleus, and, according to Wilson, the frequency of the nth mode of vibration of the shell is given by

$$\omega = \omega_0 (n^2 + n - 2)^{1/2},$$

where $\omega_0 = eZ/2R_0^{3/2}M^{1/2}A$.

A model of this type has much to recommend it, but calculations we have recently performed indicate that it is not entirely satisfactory. To give a density of energy-levels of 0·1 V. for an excitation energy of 6,800 kV. in uranium requires that $\hbar\omega_0$ should be about 378 kV. for this nucleus. The value of $\hbar\omega_0$ for any other nucleus can then be obtained by multiplying by the appropriate factor Z/A as indicated by the definition of $\hbar\omega_0$. When the value for $A = 120$ is used to calculate the spacing of the energy levels for an excitation energy of 8,000 kV., we obtain a spacing of 0·05 V., which is definitely not in agreement with the experimental evidence. This fact cannot, however, be used as an argument against Wilson's *general* idea, but only against the extrapolation of the condition of the inextensibility of the shell to high-excitation energies.

On the other hand, calculations based on the assumption that the neutrons and protons forming a heavy nucleus are contained in the same spherical volume leads to a value $R_0 = 1·56 \times 10^{-13}$ cm. from which the nuclear radius can be evaluated. This value is not in agreement with the value R_α of the same constant derived from the many-body theory of α-decay[2]. The discrepancy between the two values can, however, be removed by modifying the type of nuclear model used. The use of the statistical method of calculation imposes no restriction on the location of the volumes occupied by the protons and neutrons forming the nucleus, so we are at liberty to construct a model in which they occupy different regions of space.

If for simplicity we assume that the number of neutrons is equal to the number of protons, then they will occupy equal volumes. The simplest way of constructing a nuclear model in which the protons occupy a volume equal to that occupied by the neutrons but not identically situated is to consider that the neutrons form a central spherical core which is surrounded by a spherical shell of protons. The radius of the inner core is then $R_0 A^{1/3}$, while the external radius of the whole nucleus corresponds to $R_\alpha A^{1/3}$ of the α-decay theory. Since the volumes of core and shell are equal, we have immediately that $R_\alpha^3 - R_0^3 = R_0^3$, so that $R_\alpha = \sqrt[3]{2}\, R_0$.

Taking the value $R = 1·56 \times 10^{-13}$ cm. given by our calculations, we then obtain $R_\alpha = 1·97 \times 10^{-13}$ cm., which is in good agreement with the value 2·0(5) cited by Bethe. Furthermore, taking R_0 to be the radius of a proton, we find by a simple calculation that the proton shell in heavy nuclei is only one proton thick, so that each proton in the shell is in contact with at least one neutron of the inner core.

The details of the calculations will be published shortly in the *Proceedings of the Cambridge Philosophical Society*.

Spectrum of White Dwarfs

IN a recent paper, Blackett[1] has suggested that the Zeeman effect might be responsible for the peculiar absence of metallic lines in the spectra of most of the white dwarfs and may also contribute to the broadening of the hydrogen lines. Since this suggestion was given as one more argument in support of the theory of the magnetic field of massive rotating bodies, it may be of interest to point out that considerations of the internal constitution of white dwarfs seem to offer an alternative explanation of the peculiar features of their spectra.

Such an explanation may, in fact, be afforded by the strong separation of elements in the high gravitational field of white dwarfs. It has been shown[2] that we must expect in a white dwarf a core of heavy elements surrounded by a hydrogen layer. (In this paper I had assumed the inherent β-radiation to be forbidden (in the sense of the selection rules); but, as shown below, the results of Bethe and Critchfield are not in contradiction with astrophysical evidence.) Between them exists a mixed layer the thickness of which, proportional to the temperature and inversely proportional to the acceleration of gravity, is very small compared with the radius of the star. The decrease in concentration of heavy elements in the hydrogen layer is extremely rapid, so that the concentration of metals in the atmosphere could be many hundred negative powers of ten.

If the hydrogen layer is sufficiently thick, the metal lines should, thus, not appear in the spectrum. This case should correspond to stars like Wolf 489 or o_2 Eridani *B*. The presence of metal lines in the spectra of some white dwarfs is only possible when the hydrogen layer is very thin and the concentration of heavy elements great at the bottom of the non-degenerate outer part of the star. Convection currents, such as those found by Unsöld, could then carry heavy elements to the very surface of the star. This seems to be the model for a star like Van Maanen 2. The great proximity of heavy elements to the surface, and such convection currents, would be sufficient to explain the presence in the spectrum of lines of light metallic elements like calcium. The theory of production of lines in stellar atmospheres also indicates that collision damping should be sufficient to explain the broadening of lines of Ca^+. The weakness of lines of heavy elements such as iron should be connected with the strong separation of heavier elements in the gravitational field.

Such considerations about the thickness of the hydrogen layer agree also with calculations on the energy production. The main source of energy is represented by the reaction

$$^1H + {}^1H \rightarrow {}^2D + e^+,$$

and the ensuing reactions, the rate of which has been calculated by Bethe and Critchfield[3]. This rate is much greater than that corresponding to processes in the mixed layer, analogous to those occurring in the sun. For the white dwarfs we get in this manner an estimate for the thickness of the hydrogen layer which should be responsible for the actual energy production and which, in fact, turns out to be large compared with the thickness of the mixed layer for o_2 Eridani *B* and Wolf 489, and extremely small in the case of Van Maanen 2.

A more detailed account of the above ideas based on a fuller discussion of the constitution of the various types of white dwarfs will be given in a later paper. I wish to thank Prof. B. Strömgren for stimulating discussions on the subject.

The Bikini Bomb and the Seismology of the Pacific Region

Gutenberg and Richter[1] have recently published numerical travel-time data for *P* waves recorded at eight stations in the United States, following the detonation of an atomic bomb over Bikini on 1946 July 24. They point out the importance of these waves in checking travel-time tables, and use the results to test the accuracy of earlier tables[2] published by them. The purpose of this note is to compare the data with the Jeffreys – Bullen tables[3]; and, further, to investigate the precision with which the result of this comparison may be applied to the question of the structure of the Pacific region.

The eight recording stations were at distances from the place of detonation ranging from 69° to 78·6°. The excesses of the 'observed' travel-times of the first *P* waves over the times given in the Jeffreys – Bullen tables are found to be −1·6, −0·4, −1·6, −2·1, −1·1, −2·7, −1·1, −0·4 sec., yielding a mean of −1·4 ± 0·7 sec. (the time of detonation of the bomb is known within 0·1 sec.). To this must be added the mean ellipticity correction[4] of −0·4 sec., giving a mean residual of −1·8 ± 0·7 sec. (It is assumed that the data of Gutenberg and Richter relate to geocentric and not geographic latitudes.)

A residual of this order is to be expected, because of special features of the Pacific structure[5]. Thus the results of the Bikini bomb suggest no improvements to the Jeffreys – Bullen tables for epicentral distances of the order of 70°–80°.

On independent grounds, the Jeffreys – Bullen *P* tables are indicated as being accurate within standard errors of the order of 0·4 sec. for 'average' earthquakes. This would indicate that the travel time of *P* waves between Bikini and stations in the United States is less by 1·8 ± 0·8 sec. than the corresponding travel-times for average earthquakes (in which epicentres are in continental regions). This figure may be of some importance in subsequent investigations of the Pacific region.

Sublimation in the Atmosphere over the Oceans

THE results of measurements of the highest temperature at which ice particles were formed in a Wilson expansion chamber, using air at the Jungfraujoch Observatory, were recently reported[1]. Similar measurements have now been made in the air over the Atlantic and Pacific Oceans on board R.M.S. *Rangitiki*, N.Z.S. Co., during a voyage from London to Wellington (May 10–June 16, 1947).

Measurements made in the 'Horse Latitudes', in the North-East Trade Wind in the Atlantic and in the South-East Trade Wind in the Pacific, gave invariably − 41·2° C. as the ice threshold.

From these measurements and the previous ones at the Jungfraujoch it may be concluded with all probability that there are no nuclei of sublimation in the atmosphere at the cirrus-level, except possibly in cases where they are carried up from ground-level by the violent convection in thunderstorms originating over areas where the air contains industrial pollutions. In such cases the ice threshold will be some 9° C. higher, and owing to this, such areas might be more subject to showers.

My thanks are due to Sir Nelson Johnson for the loan of the necessary apparatus and to Capt. E. Holland of R.M.S. *Rangitiki* for providing facilities for the measurements.

Occurrence of Troilite

MINERALS described from the Daggafontein Gold Mine[1] were later made available to me for detailed study. They included typical brownish magnetic tabular pyrrhotite crystals 2·5 mm. wide by 0·5 mm. thick, showing steep pyramid, prism and basal pinacoid faces. Some were intimately associated with black nodules of a hydrocarbon and grey chlorite streaks in lumps of white, finely crystalline dickite.

One large and one smaller crystal identical in form with the majority were more like pyrite in colour and practically non-magnetic. These crystals contained 62·4 per cent of iron, which is nearer to troilite (usually only found in meteorites) than to pyrrhotite in the series pyrrhotite-troilite. The typical pyrrhotite contained 60·31 per cent of iron (kindly analysed by Mr. T. Steele). Troilite has been recorded from the Witwatersrand previously[2], but the occurrence of two distinct varieties of the pyrrhotite series together is worthy of note.

It is suggested that detailed studies of pyrrhotite crystals will prove terrestrial troilite to be more abundant than was hitherto considered.

Minimum Perceptible Energy and Brownian Motion in Sensory Processes

FOR all sense-organs there exists a lower limit to the minimum perceptible energy, which is set by the Brownian motion in the sensory equipment itself. The minimum perceptible energy must be so large that only a small number of spontaneous excitations by thermal motion can occur. The quantitative relations have been estimated tentatively in certain cases.

(*a*) *Vision.* The minimum perceptible stimulus corresponds to the absorption of a single light quantum by a molecule of visual purple in each of several retinal rods—about five according to Hecht *et al.*[1], or two according to Van der Velden[2]. Suppose that one rod only need be excited. The number of spontaneous thermal excitations will be approximately $q = \frac{N}{\tau} \exp - E/kT$ per sec., where E is the energy necessary to decompose a visual purple molecule and $\exp - E/kT$ is the probability that the essential part of the molecule has a thermal energy greater than E at a given moment (at 37° C., $kT = 4{\cdot}3 \times 10^{-14}$ erg). τ is the mean life-time of a given distribution of the energy; every second we have $1/\tau$ 'new' distributions. For molecules, τ is about 10^{-13} or 10^{-14} sec. (see ref. 3). Finally, N is the number of sensitive molecules in one cell. For applications, we can write our formula as

$$E = 2{\cdot}30\, kT \log \left(\frac{1}{q}\frac{N}{\tau}\right). \quad . \quad . \quad . \quad (1)$$

For the visual process, the calculation of the energy E which is necessary in order to avoid spontaneous excitations can be made with fair accuracy. For the rods, N is 4×10^9 (ref. 4). Strictly speaking, this was found for a frog retina, but it follows from the high sensitivity of the human retina (see ref. 2) that the concentration in dark-adapted human rods cannot be lower than about 10^9 molecules per rod. Hence $N/\tau = 10^{23}$, and according to formula (1) E must be $2{\cdot}3 \times 23\, kT = 53\, kT$ in order to experience less than one excitation per second. Even if ten excitations a second are admitted, E is not materially changed.

For the visual process the limit of 53 kT does not offer anything new, because from the sensitivity curves of the receptors it follows already that E is probably more than 70 kT. Moreover, the spontaneous excitation of only one rod does not give rise to the *sensation* of light; two excitations which occur within about 0·05 sec. are necessary[1,2]. (S. Hecht *et al.* arrive at about five quanta, but since the two-quantum hypothesis, developed by v. d. Velden, was checked by other observations, this number seems more probable.) Of course, the number of spontaneous *sensations* will be greatly reduced in this way, and this may be a reason why this remarkable 'coincidence mechanism' is present in the eye.

(*b*) *Excitation of a Nerve.* For other processes a similar reasoning can be applied, if the various constants are properly defined. As an example, we will consider the excitation of a nerve. For E should be inserted the energy which is necessary for the depolarization of an area O which is large enough to propagate itself. A reasonable value[5] for the energy per cm.^{2} is about 4×10^{-4} erg, so that O should be 3×10^{-9} cm.^{2} to have $E = 30\, kT$. (This value for O will only be assumed as a first approximation.) τ is unknown; it cannot be more than 0·001 sec., since after excitation the normal configuration is restored in about 0·001 sec.[5]. For N, the number of units any of which can start an excitation we should insert the total area of a nerve, divided by O. For a nerve, length 30 cm., diameter 5μ, $N = 3 \times 10^7$. From these data we find that in this case E should be about 25 kT (or more). Then $O = 3 \times 10^{-9}$ cm.^{2} or 2×10^{-6} cm. of the nerve. It is not probable that an area of depolarization of 2×10^{-6} cm. of a nerve is sufficient to propagate itself. This means that the nerve considered is very stable with regard to thermal excitation, and that 25 kT does not suffice for excitation. If the mechanism of the nerve were known in more detail, it would be possible to give a more elaborate discussion. Since the probability of excitation depends largely on the energy E, however, we can safely assume that for the nerve and probably *several other processes* the limit will be at least 25 kT.

(*c*) *Hearing.* For the process of hearing the limit of about 25 kT for one sense cell, mentioned above, is more important. This will be discussed in more detail in the near future in a paper to be published in *Physica*, but the leading idea is as follows. The minimum audible energy is some 300 kT. According to the present views, this energy is distributed over at least 1·5 mm. of the basilar membrane, or 1,000 sense-cells, so that one cell only receives 0·3 kT. This is obviously much too far below the limit mentioned in this letter to be accounted for by experimental errors. From this discrepancy interesting conclusions about the mechanism of hearing can be drawn.

Occurrence of *Elminius modestus* (Darwin) in British Waters

The observations on the existence of *Elminius modestus* on British coasts reported by Mr. M. W. H. Bishop[1] have been confirmed and extended in an independent investigation commenced by Messrs. Blacklock and Macarthur, Glasgow, in January 1946.

Some of our records of this species are listed below. It will be noted that *Elminius* is widely distributed and abundant on the south-east coasts of England, and, in fact, has been taken at every point which we have visited, where a suitable substratum exists, between Norfolk and Dorset. It occurs intertidally, mainly below mean tide-level, but may be found higher in protected situations, and also at depths down to at least 5 fathoms. Its habitat and settling behaviour appears to be in British waters exactly as described by Moore in New Zealand[2]. In the Essex Rivers it competes very successfully with *Balanus balanoides* in the lower part of the intertidal zone, but the latter has the advantage of slightly earlier settlement and longer life; under water it is rather less successful in competition with *B. crenatus* and *B. improvisus*. *Elminius* ranks as a dominant littoral organism in the estuaries of the Colne, Blackwater, Crouch and Thames.

We have also considerable data suggesting that this species is mainly confined to the south and east coasts of Britain. Careful examination of the foreshore and of underwater exposure panels has failed to reveal any *Elminius* at our stations at Brixham, Devon; Pierhead, Liverpool; Port Erin, Isle of Man; and Portree, Isle of Skye, though a sparse settlement has recently been recorded at Neyland, Pembrokeshire. Less rigorous examinations of material from Conway and the Blyth Estuary, Northumberland, suggest its absence from these localities.

Elminius modestus has a longer season of reproduction and continuous settlement than any other barnacle in British waters, and the spat has been observed to reproduce early in the same season in the Rivers Blackwater and Crouch[2]. Indeed, it seems theoretically possible from our growth-rate and breeding data that two complete generations may occur during summer in such an estuary, since fully developed nauplii may be found at any stage after a rostro-carinal diameter of 4–5 mm. has been attained.

RECORDS OF *Elminius modestus* (Darwin)

Locality	Occurrence	Earliest record
Brancaster, Norfolk	Not common	August 1947
Lowestoft, Suffolk	Frequent	August 1947
Rivers Colne and Blackwater, Essex	Abundant	Settlement, April 1 to October 10, 1946
N. Fambridge, Essex	Abundant	October 1945
Thames, below Gravesend	Common	September 1947
Thanet coast, Kent	Occasional	September 1947
Brighton, Sussex	Frequent	October 1947
Poole, Dorset	Common	June 1947
Neyland, Pembrokeshire	Occasional	August 1947

The present distribution of *Elminius* does not indicate clearly a recent dissemination from one or more centres, but appears to be that of a well-established species. It is abundant in the favourable environment of shallow muddy estuaries with high summer temperatures, rarer on sandy and chalky foreshores and absent where there is considerable wave exposure[3]. The very intense barnacle-fouling experienced in these muddy estuaries is due in considerable degree to *Elminius*, and in view of the frequent coastal traffic, its absence from ports in the south-west and west of England may indicate an unfavourable environment. It is possible that lack of interest in the Cirripedia until recently, the paucity of faunistic work on the south-eastern shores of Britain, and a superficial resemblance to *B. balanoides* have combined to give the immigrant freedom from recognition for some years. The simultaneous records of Bishop and ourselves in 1945 at places as distant as Fambridge and Chichester support this view.

A comparison between the introduction of *Elminius modestus* and the invasion of the Essex rivers by *Crepidula fornicata* in about 1880 may be of interest. The latter species has succeeded in colonizing submarine levels of the same environment and, spreading rapidly at first, achieved a similar distribution over a period of forty–fifty years[4].

A fuller account of its distribution, development and breeding habits in British waters will be published at a later date.

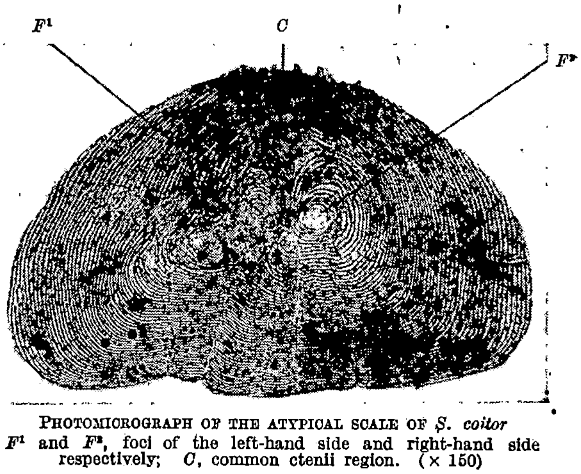
An Atypical Scale of *Sciæna coitor* (Hamilton)

In the course of studies of the structure and development of ctenoid scales of certain Indian fishes[1], an atypical scale was encountered (see accompanying illustration. It was found on the body of a male *Sciœna coitor* which measured 20 mm. in length. It was located in the middle region of the trunk on the fifth row below the lateral line. The neighbouring scales and those belonging to the other regions of the body were also critically observed but none of them showed any breach of normal development.

The most interesting feature of this scale was the presence of two foci instead of one. Both the foci lie in the middle zone of the scale. The focus of the right-hand side (F^2) was circular, while that of the left-hand side (F^1) was more elongated. The focus of the right was bounded by more or less complete concentric circuli. The circuli encircling the corresponding focus were extremely longitudinal and consequently incomplete. Of the two foci, the right



PHOTOMICROGRAPH OF THE ATYPICAL SCALE OF *S. coitor*
F^1 and F^2, foci of the left-hand side and right-hand side respectively; *C*, common ctenii region. (× 150)

one was larger than the left. Ctenii were at the formative stage, the deposition being laid. Seven of them (*C*) were conspicuous. They were devoid of basal components. The ctenii region occurred in such a position as not to come exclusively under the ambit of any particular focus, since it lay in the middle line passing between two foci. Eight radii had appeared and they extended centripetally towards the foci.

The foci, on being surrounded by their own circuli, could be taken to represent two scales at the incipient developmental stage. It might be imagined that at an early period of development, owing to some developmental irregularity probably caused by arrested growth, the inferior layers of these two incipient scales were fused to form a common lower layer. The hyalodentine of each of them, which was already calcified, retained its identity as the focus in spite of fusion of their lower layers. Thus the presence of two foci was explained. Thereafter by this union the rest of the features which were laid down by the activity of the inferior layer were common to both foci. Thus it appeared that two incipient scales merged so as to give the appearance of a single scale. The nature of ctenii being common to both the foci could be explained, because the ctenii were formed as delayed deposition, as previously shown by Ganguly and Mookerjee.

Resistance to Inanition in Grass Seedlings

SOME years ago I found that grass seedlings which were in competition with other grasses older than themselves were able to remain alive for several months, although growth, in the sense of increase in size, could not take place[1]. In these experiments the competition of the older plants operated by the removal of mineral nutrients from the soil surrounding the young seedlings, and by the exclusion from the latter of light. The tolerance of the latter was so pronounced that an inquiry was started into the general ability of grass seedlings to survive inimical conditions.

The results can be summarized as follows:

(i) Increase in size of seedlings may be completely inhibited by a lack of mineral nutrients, but with this factor alone operating and with full light, the seedlings survive indefinitely.

(ii) Seedlings from which light is completely excluded remain alive for periods determined by the temperature prevailing; for example, at 22° C. survival does not exceed 20 days, whereas at 9° C. survival may extend to 18 weeks. At the end of this time, on the admission of light, chlorophyll is formed and normal development can proceed. Resistance to inanition is independent of the food reserves in the caryopses, and of the presence of chlorophyll. This behaviour is shown by seedlings grown *in vitro*, and in soil; and seedlings from seeds sown in the autumn may not appear above the soil until the following spring. Low mineral nutrition, and the admission of light at low intensities, or for intermittent short periods, increases the longevity of the seedlings.

(iii) The well-known ability of seeds to develop after desiccation during the initial stages of germination is shared in a lesser degree by grass seedlings which have developed two or three leaves. After six days air-drying at 14° C., survival is approximately 20 per cent, and the survival period can be considerably extended by intermittent moistening of the seedlings.

(iv) All the commoner species of British grasses show this ability to resist inanition and desiccation; but no dicotyledonous species so far tried has possessed it.

Mauthner's Cells in the Larvæ of Anuran Amphibia

IN a previous communication[1], confirming the occurrence of Mauthner's cells in the larvæ of *Rana*, each axon process was described as dividing into two similar fibres, each of which decussated separately. Subsequent work, while confirming the existence of this condition in other batches of material, has shown that it is not invariable. In many instances the axon process remains undivided, at least in the region of the medulla oblongata.

Although variability of this type is apparently unique, my records show clearly that it is not associated with any marked differences in the maintenance of equilibrium, the locomotory habits and general behaviour of living larvæ.

Demonstration of the Heart Beat

I SHOULD be interested to know whether any physiologist who is also a smoker has noticed the following phenomenon, and whether it has been previously reported. Choose a quiet room, fill the mouth with tobacco smoke, and blow gently out through a very small aperture between pursed lips. Careful observation of the fine jet of smoke will show that it has a definite periodicity—that of the heart beat. With a delicately controlled jet it is even possible to make the heart blow a smoke ring at each beat.

It is evident that the heart is giving a pulse of pressure to the air in the mouth, just as does the hand when tapping the stretched diaphragm of the well-known box used for the demonstration of smoke rings. The pressure pulse may be communicated directly through the heart wall, or perhaps it is given by way of the arteries in the throat and mouth. It is possible that observation of air-pressure in the mouth by means of a quick-acting micromanometer might give useful information about the condition of the arteries responsible.

NATURAL AMŒBIC INFECTIONS IN LABORATORY RODENTS

By Dr. J. D. FULTON and L. P. JOYNER
National Institute for Medical Research, London

DURING the course of chemotherapeutic experiments on *E. histolytica*, the need for a suitable laboratory host for this parasite became early apparent. Jones[1] has obtained some interesting results by using young rats weighing 20–33 gm. for this purpose. We were, however, rather perturbed by the degree of infection with amœbæ which occurred in the animals of an age suitable for experimental work, when examined by us as a preliminary to their use in experiments of the above nature.

We therefore investigated the incidence and degree of natural infection in other laboratory animals which might prove suitable hosts. For this purpose we made a careful examination of the intestinal contents of white rats, cotton rats (*Sigmodon hispidus*), hamsters (*Cricetus auratus*) and Orkney voles (*Microtus orcadensis*). Wenyon[2] has indicated that amœbic infection is widespread in the animal kingdom. The amœba of the rat and mouse was first described by Grassi[3] and both were named by him *E. muris*. Numerous investigations on the rat parasite have since been recorded and in our case were made for comparative purposes. Wenyon[4] gave a clear description of *E. muris* in the mouse, pointing out that in fresh and stained preparations it had a striking resemblance to *E. coli*, as previously noted by Grassi. The character of its nucleus in stained sections agreed closely with Schaudinn's description for the latter parasite. Brug[5] described a second and rarer amœba present with *E. muris* in the rat intestine which resembled *E. histolytica*. He considered the new parasite was identical with the amœba of human dysentery and that the rat was a possible source of amœbic dysenteric infection for humans. Kessel[6] later introduced a new nomenclature for the amœbæ present in rats and mice, but his views have not yet met with general acceptance. Recently Neal[7] has described the presence of an amœba in golden hamsters differing from *E. histolytica*, with which he was able to infect young rats by feeding cystic forms of the organism. The presence of amœbæ in the cotton rat and the Orkney vole has not so far been reported. All the animals which we examined were normal specimens of known age except in the case of a few hamsters which had been used to maintain a strain of *L. donovani*.

Methods

Examination of cæcal contents was carried out after killing the animal with chloroform, and a rough count of the number of amœbæ present in fresh specimens made. Ten minutes was spent on each of six coverslip preparations before the absence of amœbæ in any animal was recorded. Examination was also made for the presence of cysts after concentration of the whole contents of the large intestine by the method of Yorke and Adams[8], and sometimes further concentrated by the zinc sulphate method. By means of a micrometer eyepiece, measurements of a hundred trophozoites and fifty cysts were made of the amœbæ of each animal species. Stained smears of both forms of the parasite were also made, as well as of sections of cæcum, especially in those cases in which infections were heavy, the latter in order to note whether any lesions of the gut wall were present. Smears fixed in Schaudinn's solution were stained by the iron-hæmatoxylin method of Heidenhain and counterstained with aqueous eosin. Prolonged differentiation was necessary to demonstrate nuclear structure. Sections were fixed in Bouin's solution and stained by the above method.

Distribution of Amœbæ

It was found, as shown in Table 1, that approximately 50–70 per cent of each animal species was infected with trophozoites; but the percentage of animals with cystic forms was considerably less. The intensity of infection varied greatly from animal to animal in each species. In general, one to twenty trophozoites were seen per hundred microscopic fields, using 1/6 in. objective and × 6 eyepiece, but in the case of a few white rats as many as thirty parasites were present per field. In hamsters and voles the highest number recorded was five to ten per field, but in cotton rats trophozoites were nearly always scanty and the heaviest infection seen was about one per field, while cysts were even more difficult to find in that animal.

TABLE 1. INCIDENCE OF AMŒBIC INFECTION

Animal	No. examined	% with trophozoites	%with cysts
Hamster	58	53	24
Orkney vole	41	68	19
Cotton rat	72	55	5
White rat	35	65	—

Quite early it became apparent that if trophozoites were very scanty or absent, the chance of finding cysts was negligible, and our methods were modified accordingly. Age groups from two weeks up to more than a year were included in these examinations. In no case was infection detectable in the youngest group; but in the case of white rats, about half were infected at the age of three to four weeks. Cotton rats and hamsters were infected at the same age, and the heaviest infection recorded for hamsters was seen in an animal four weeks old. Voles were not found to be infected before six weeks of age and only a few younger animals were available for examination. The presence of amœbæ in any of these animals was unaccompanied by symptoms or lesions of the gut wall.

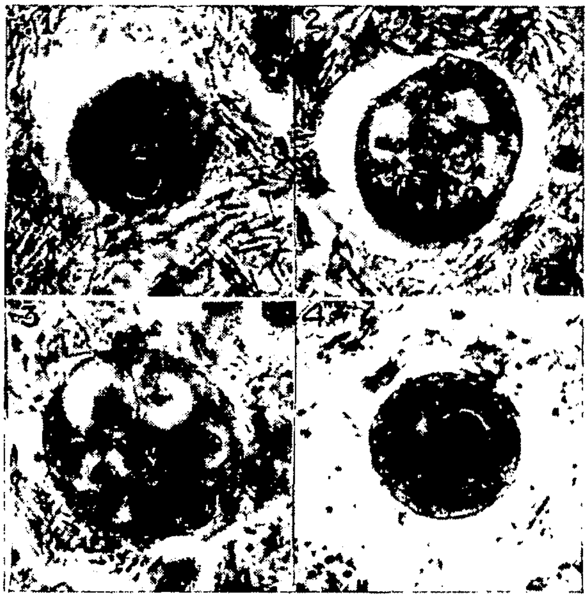
TABLE 2. DIAMETERS OF AMŒBÆ (IN MICRONS)

Host	Trophozoites Limits	Trophozoites Mean	Cysts Limits	Cysts Mean
Hamster	14·4–28·0	18·8	16·2–24·0	20·4
Cotton rat	13·8–26·4	18·6	14·4–19·2	15·6
Vole	13·2–24·0	18·3	12·5–17·6	14·6
White rat	16·3–32·5	20·1	13·7–24·0	17·3

As shown in Table 2, considerable variation in size of trophozoites was encountered, but their mean diameters for the different animals were approximately the same. The variation in size of cysts was not so great, and again there was considerable agreement among the different species of animal. The average diameter of the cysts recorded by us for the hamster is greater than that for trophozoites of the same animal, a result which may have depended partly on the number measured and partly on the considerable variation among trophozoites themselves.

Morphological Characters

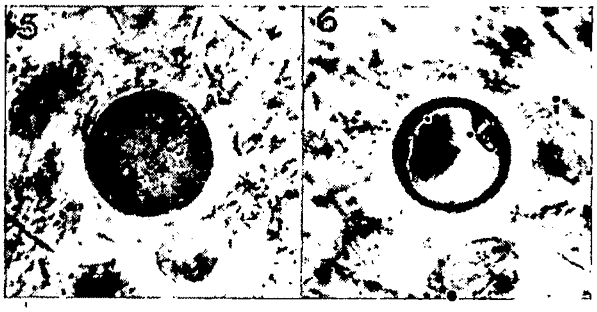
The following description of morphological characters is applicable to the parasites from the different hosts. In living preparations much of the activity of the amœbæ is confined to changes in shape without directive locomotion, pseudopodia being simply extended and withdrawn. The pseudopodia are at first composed of clear ectoplasm into which the endoplasm later streams. Several clear pseudopodia composed solely of ectoplasm may be extended in quick succession in several directions, so that at one particular moment an amœba may possess more than one pseudopodium. The ectoplasm is a narrow layer and is frequently only made visible during the formation of pseudopodia, while the endoplasm is granular and contains many vacuoles. The food matter is extremely variable and was seen to include bacteria, plant debris, and degenerated cells, probably of other Protozoa. The nucleus is also visible in the living amœba as a clear spherical inclusion surrounded by refractile granules.



Figs. 1–4. PHOTOMICROGRAPHS OF TROPHOZOITES FROM THE FOUR DIFFERENT HOSTS. × 1,000
1. HAMSTER. 2. COTTON RAT. 3, WHITE RAT. 4. VOLE

In fixed and stained preparations (Figs. 1–4), the ectoplasm is again indistinct; the endoplasm is usually vacuolated. The spherical nucleus generally has a uniform peripheral chromatin layer composed of fine granules in contact with one another and closely applied to the nuclear membrane; but in a few instances one or two condensed masses of chromatin were situated in the peripheral layer. The karyosome is compact and eccentrically placed within the nuclear membrane. The region between the karyosome and this membrane is occupied by a fine achromatic network and may contain a few chromatin granules.

In fresh cysts, chromatoid bodies were not noted with certainty. The maximum number of nuclei visible after treatment with iodine was eight; the karyosomes were usually eccentrically placed. The presence of glycogen was demonstrable in the usual way; it appeared to be more abundant in those cysts with few nuclei. In stained preparations of cæcal contents of the hamster, vole and white rat, binucleate cysts containing a large vacuole were encountered (Figs. 5 and 6) similar to those described by Wenyon in mice. In mature cysts the nuclear characters were similar to those of the trophozoites.



Figs. 5 and 6. PHOTOMICROGRAPHS OF BINUCLEATE CYSTS FROM TWO HOSTS. × 1,000
5. WHITE RAT. 6. HAMSTER (ONE NUCLEUS OUT OF FOCUS)

Attempts at cultivation were consistently made with fæces containing trophozoite forms from all sources as well as with concentrates of cysts on the media described by Dobell and Laidlaw[9], but without success. At best, survival was obtained over a 48-hour period in some cases, but subculture never succeeded, and amœbæ loaded with starch grains so common in stock cultures of *E. histolytica* and *E. coli* were not observed. The addition of acriflavine in a final concentration of 1/10,000 to the cultures, which is sometimes successful in restraining overgrowth of accompanying bacteria as described by these authors, did not materially improve our results, nor did cultivation at temperatures of 37° and 40° C.

Summary

It is clear from these numerous examinations of fresh and stained preparations that the amœbæ present in the different animal species investigated are very similar, as judged by size, distribution and morphology. Red blood cells were never seen within these amœbæ, which was in marked contrast to the findings when experimental *E. histolytica* infections were produced in the same animals. Parasites were present in the cæcal crypts, but no damage to the gut wall was ever apparent, although this is common in infections with *E. histolytica* in these animals. The amœbæ are therefore not pathogenic in their natural habitat and in this respect as well as in morphological characters possess many of the characteristics of *E. coli*. It is quite probable that the parasites described from these different sources are strains of the same species. We have not, for obvious reasons, attempted any cross-infection experiments. It is of interest that the cotton rats showed this amœbic infection shortly after their arrival in Great Britain although segregated from all other animals here. It was of further interest that a small percentage of these same animals should be found infected with *Hymenolepis nana*. A similar infection was present in hamsters, an observation which has recently been reported by Watson[10].

The bearing of these results on the choice of a suitable laboratory host for experimental infections with *E. histolytica* in relation to the chemotherapy of amœbiasis is under investigation.

Our thanks are due to Mr. F. Welch of this Institute for the photomicrographs.

SCIENCE IN SOCIAL AFFAIRS

ON November 22, a conference of social scientists, convened by the Association of Scientific Workers, was held at Gas Industry House, London. The chair was taken by Mrs. W. Raphael, of the National Institute of Psychology, and the principal speakers were Prof. V. Gordon Childe and Mr. Roy Innes, general secretary of the Association.

The primary aim of the meeting was to enlist support for a draft report on "The Furtherance of the Social Sciences" prepared by a committee of the Association and shortly to be published. The meeting was the third of its kind, the first having been held in October 1945 to explore the interrelations between natural and social science, at which a Joint Sciences' Committee had been set up, and the second in December 1946 to consider the future of the social sciences. Some months earlier, the Joint Sciences' Committee had been reconstituted as the National Committee on the Social Sciences of the Association. The conference was well attended by workers in the cognate social disciplines at universities, Government departments and research institutes.

In her opening remarks, the chairman observed that social scientists are becoming a distinct and self-conscious body of workers, which may be due partly to the unpopularity which they share, particularly among some sections of the Civil Service, but more because the demand for their services is growing; although well-qualified persons are in short supply. The conference, she said, had the practical aim of inviting support for certain resolutions included in the draft report. This document had been prepared against the background of the report of the Clapham Committee on "Provision for Social and Economic Research", which was considered by many competent to judge as altogether too timid in its recommendations. She thought the national situation was such as to demand a much more vigorous approach to the whole problem of placing the social sciences upon a sound footing.

Prof. Gordon Childe illustrated the development of the social sciences by briefly sketching the history of anthropology, drawing a parallel with the growth of natural science; in both cases theory and practice had been closely interwoven. In the eighteenth and nineteenth centuries, traders, travellers, missionaries and Government representatives had begun to have direct dealings with primitive peoples in Africa, North America, the Pacific and other far-flung areas. Generally speaking, in spite of good intentions they were seriously handicapped in the concepts at their disposal, which had been assimilated in their own society. A theoretical basis for the understanding of other cultures was lacking. For example, they tended to assume that ownership of land everywhere conformed to the canons of Roman law. Their methods were thus as unscientific as primitive efforts to control the wind by appealing to a 'wind god', and injustice and administrative difficulties were the result. Nevertheless, the accumulated descriptions of primitive customs were suitable as data for scientific study and led to the discovery of new facts.

Both in Great Britain and in the United States the theoretical background of early anthropologists had been borrowed from the idea of evolution in the form of Lamarckism. To Tylor, Taylor, Morgan and others, property under capitalism and Christian marriage seemed to be the culminating forms of these institutions. The new study of prehistoric archæology arose out of the rectification of the theory of unilateral evolution which had long been a stumbling-block. Prof. Childe remarked that the inadequacy of early anthropological theory no more means that social science is impossible than the exposure of the phlogiston theory disproved the existence of chemical science.

In commenting on the proposed report, he pressed the need for 'pure' research to proceed side by side with the application of its results, and with this end in view financial provision should be forthcoming, new academic chairs and other posts created in the right numbers, and ample opportunities for work in Government service. Early students of anthropology, like their colleagues in the natural sciences, were men of leisure and private means, a source of supply which has run dry. The first academic anthropologists were drawn from other disciplines or from the ranks of administrators or retired Civil servants. Although this first generation was somewhat sterile in matters of theory, it produced students trained to observe primitive life, who returned from their field experience equipped with new interpretations. Anthropology had advanced in response to social needs. Prof. Childe referred in passing to the Euclidean methodology of academic economics, a subject which, like anthropology, has been lately regenerated by the infusion of the results of realistic experience.

The Clapham Report he thought rather out of date in its outlook, particularly in the modesty of its claims, which was due to a pessimistic view of the availability of qualified personnel. Reluctance to expand on these grounds, while admitting the need for new posts, sets up a vicious circle. Nor did he agree with the Clapham Committee's view that social scientists do not need expensive apparatus for research; their demands, he believed, are comparable with those of natural scientists, though their 'laboratories' may be sited overseas.

Prof. J. D. Bernal, in opening the discussion, said that the draft report was admirable in the way it set out the role of the social sciences as experimental disciplines; but it needed strengthening and extending in certain particulars. The report dealt with the internal position in these subjects and not with their link with the natural sciences. Like Prof. Childe, he singled out economics for special comment. Economists, he suggested, regard materials and technique as constant factors, while taking prices, market trends and interest rates as variables, whereas natural scientists take the reverse position. In fact, both sets of factors are variables. Hence the need for multi-disciplined research teams, which could be most useful in relation to present economic difficulties. A more immediate return could usually be expected from social than from natural science, inasmuch as the improvement of incentives, morale and organisation involved less delay and less dislocation than competition for capital goods. Experiments in social science, Prof. Bernal agreed, are costly, and he referred to the experimental houses now being studied by the Ministry of Works. The whole sociological investigation may cost a million pounds before it is finished. It may also happen, as sometimes occurs in the natural sciences, that a large-scale inquiry fails.

Prof. Bernal also agreed that it is urgently necessary to create senior posts in the social sciences, even if the available candidates have not attained eminence or maturity of years. In the early nineteenth century it was not usually decided to leave university chairs of science vacant rather than appoint persons who had not yet achieved fame. For example, Hamilton became professor of physics at Dublin at the age of twenty-two. If this practice were followed in the social sciences, the whole level of activity in the field might be raised. In any event, Prof. Bernal was doubtful whether so-called 'maturity of judgment' is an essential condition for success as a social scientist.

Prof. Bernal pointed to the value of regionalization in social science, by which he means the cultivation of local surveys in which people living in the area participate. Every area should have a team of social and natural scientists for this work, and out of this would come that co-operation between observer and observed which is so vital in social science. Indeed, this distinction might better be obliterated altogether.

Subsequent speakers expressed sympathy with the substance of the draft report and its recommendations, subject to certain amendments.

Prof. T. H. Marshall thought that the inadequacy of the financial need as assessed by the Clapham Committee is now fully recognized, and it would be a pity if the new report were committed to a definite figure. Grants should not be confined to universities; Government departments, research institutes and voluntary bodies concerned with social services or the development of techniques also need support. He felt that the position of sociology in the universities is extremely serious, facilities for study or research being virtually non-existent. The invariable difficulty of deciding on an occupant for a chair could be dealt with as suggested by Prof. Bernal.

Prof. Marshall argued in favour of permanent social research or survey units at universities, providing for some posts which do not carry teaching duties. The factor of size of the institution should also be examined. In a large institution, administrative and supervisory burdens are so great that they prevent the professor from getting on with his proper work. The solution is to be found in creating more senior posts and in delegating much of the teaching.

The plea for more senior posts in the universities was strongly supported by Dr. M. Fortes and several other speakers, without fear of suitable persons not being available. Dr. Fortes also compared standards. It seemed to him that at Oxford it is possible to win a higher degree in physical science by the patient manipulation of instruments without the investment of much thought; but in the social sciences the path is more difficult. The order of priority in the establishment of new university appointments in the various social sciences should, he felt, be carefully scrutinized and also the location of posts in areas where particular types of inquiry could most profitably be pursued.

The practice of the Royal Society in not admitting social scientists to membership received adverse comment. It is absurd, one speaker suggested, for ancient religious and political prejudices to determine limits of this kind; but speedy change of policy is unlikely, since the last reform of the Royal Society, initiated in 1833, has not yet been fully achieved.

A proposal in the draft report envisages an organisation of the same type as the Medical and Agricultural Research Councils, with advisory panels the chief function of which would be to stimulate research through the distribution of funds. Objections to this proposal were of two kinds: first, that a body might result interested in welfare to the exclusion of research, and second, in the absence of an independent body such as the Royal Society, social research would become dominated by Government control with all the possible ensuing dangers. Prof. Bernal believes that something of the kind is certainly needed if only to establish the intrinsic importance of the field, and he suggested that two bodies, one official and one independent, might serve the purpose. Another speaker favoured a council in the form of a 'federation' of social research units in Government departments and elsewhere. The most notable omission from the Clapham Report, he said, was the failure to recommend the setting up of social research units in Government departments like the Ministries of Labour, Health, and others primarily concerned with human organisation and relations. This would not preclude the use of mixed research teams when necessary. A social science research council, if formed, should be rooted in research units of this type as a condition of its success. It was eventually agreed to refer back for further clarification the whole section dealing with the proposal for a social science research council.

Mr. R. Innes, general secretary of the Association of Scientific Workers, said that the Association has always supported the idea of the unity of all branches of science in respect of their common interests and problems. It therefore welcomed the initiative displayed in preparing the report, and the executive committee had approved the recommendations in principle. The draft report had been circulated for comment to some 250 persons known to be active in the field. When the revised document was printed, the widest discussion would be needed wherever the possibility existed of implementing the recommendations. In these discussions natural scientists should take part, for they did not always fully appreciate the significance of the work of their colleagues. It was the hope of the Social Sciences' Committee that those present as well as others would help to implement the recommendations at universities and elsewhere. The Social Sciences' Committee would try to take a leading part in this. He added that a survey is in preparation of the fields of work, methods of training and career prospects in the social sciences.

Finally, the Conference adopted four resolutions: (i) urging publication of the report; (ii) supporting in general its recommendations; (iii) inviting the Association to support all steps leading to implementation; and (iv) requesting the Association to submit the report for the consideration of the Lord President of the Council, the Minister for Economic Affairs, the University Grants' Committee, the Vice-Chancellors' Committee and other individuals and organisations concerned.

JOHN COHEN

INTERNAL STRESSES IN METALS AND ALLOYS

On October 15 and 16, a symposium on internal stresses in metals and alloys was held in the rooms of the Institution of Mechanical Engineers. It was organised by the Institute of Metals, in association with the Faraday Society, the Institute of Physics, the Institution of Mechanical Engineers, the Iron and Steel Institute, the Physical Society and the Royal Aeronautical Society, and was intended to bring together all classes of investigator interested in the subject, and to enable them to compare their points of view. In this it was quite unexpectedly successful, for the large lecture room of the Institution of Mechanical Engineers was filled throughout the programme, and discussion continued with a reasonably good balance between the different interests for the whole of the allotted time.

The proceedings were opened by Colonel P. G. Gueterbock, president of the Institute of Metals, and were divided into four sessions. The first dealt with the measurement of internal stresses. A considerable number of methods have been employed, but none is really convenient and reliable. The trend of the discussion suggested that for the measurement of the stresses which are broadly distributed through the mass of the metal (the *macro* or *body stresses*) the method of suitably cutting the article and measuring the resultant distortions is still the most generally applicable, though it has the disadvantage that it usually involves the destruction of the article. Some speakers thought that the technique of this method has not been adequately studied and developed. The X-ray method emerged as clearly the most suitable for the measurement of stresses which vary considerably within short distances (the *micro* or *structural stresses*); while those methods which depend on the measurement of properties such as electrical resistivity, magnetic properties and damping capacity proved to be open to criticism. The existence of variations of these properties can readily be demonstrated, but it is always difficult to decide in a particular case how much of the variation is due to internal stress and how much to other causes. Some time was devoted to the lattice strains detected by X-ray methods in plastically deformed metal. It is coming increasingly to be realized that, on account of its polycrystalline structure, plastically deformed metal is a mass of diverse stresses and strains; that this is also the case in plastically deformed silver chloride was elegantly demonstrated by Mr. J. F. Nye by the use of polarized light.

The afternoon of the first day was devoted to sixteen papers on the origin and control of internal stresses in metals. So many papers could scarcely be discussed fully in one afternoon, but the great variety of the conditions which can give rise to internal stresses in metals was brought out very vividly, and it was possible to pick out those questions which exercise the minds of the engineer and metallurgist at the present time. The possibility that internal stresses may cause distortions in components of high-speed machinery is a source of anxiety, for lack of balance can induce dangerous stresses; and it is more than likely that some special treatments designed to give strength or toughness result in higher internal stresses than should be tolerated. In some aluminium alloys the treatment which gives the freedom from internal stresses may result in liability to stress corrosion effects, and a nicely balanced treatment is necessary if the producer is to err on neither side. The last word has not yet been said on the influence of the stresses left behind by the welding process, and although there is no evidence that they are necessarily harmful, most engineers prefer to remove them if it is at all possible. On the other hand, the advantages to be obtained by deliberately introducing compressive stresses at the surface of components are regarded as demonstrated; but it is also felt that more, and more complete, data are needed on the effect of these stresses on the fatigue limit of the component.

The second morning was devoted to the effects upon metals of the stresses distributed on a microscopic scale, and produced a general discussion of the theory of the strength of metals. Sir Lawrence Bragg opened with an attractive development of his theory of the effect of crystallite size on strength, and, emphasizing the necessity of thinking in terms of strain rather than of stress, directed attention to the great difference in the mobilities of simple and complex faults in crystal lattices. Several speakers referred to the uncertainty of present measurements of crystallite size, and the ultimate conclusion appeared to be that measurements of crystallite size, X-ray line broadening and mechanical properties are wanted, carried out on the same specimens, and under widely varying conditions. A recurrence of interest in the conditions at grain boundaries was noticeable, and the vexed question of the ability of dissolved hydrogen to burst solid steel, which is so important in connexion with the defects known as hair-line cracks, was also debated. In this argument, much depends on what is assumed about the molecular condition at room temperature of the dissolved hydrogen, on which subject we are still insufficiently well informed. Little disagreement is now expressed about the origin of the internal stresses associated with reactions in the solid state, such as precipitation hardening and the formation of martensite. The complementary question of the effect of stresses on the course of the transformations is not so clear, the distinction between the effects of stress and of plastic deformation not always having been kept in mind.

The final discussion, which dealt with the effects of stresses distributed on a macroscopic scale, was largely concerned with stress corrosion cracking, and revealed a considerable unanimity of opinion. There were differences in the estimates of the susceptibility of different materials to this type of failure, and of the importance of particular factors; but all speakers agreed that corrosive conditions favourable to the production of localized pits, together with sufficient tensile stress at the surface of the metal to cause plastic deformation at the roots of the pits, are the essential factors. The well-known cracking of certain stressed metals in the presence of molten tin or lead does not, however, fit very well into this picture. A second theme which ran through this discussion was the spontaneous cracking which sometimes occurs in steels, particularly hard steels, in the presence of high internal stresses. Mr. J. F. Russell showed some very impressive examples of such ruptures in large steel ingots and forgings, but in practice the phenomenon has occurred chiefly in welded hard steel plates, and has caused some anxiety. Corrosion appears not to be concerned in this case, and the reason why the cracks appear only after the lapse of time is not yet clear. The cracks can, however, be prevented by suitable choice of the composition of the steel, and, more important, by ensuring that the steel is not put into use in an excessively hard condition.

In all, thirty-six papers were presented at the symposium and these, together with a report of the discussions, will be published in the Special Reports and Monographs series of the Institute of Metals. The symposium left a strong impression of the diversity and importance of the problems associated with internal stresses in metals, and the published account will prove to be a most valuable source of information.

GROUND BLOCKS OF THE CONTINENTS AND OCEAN BOTTOMS*

By PROF. H. CLOOS
Geologisch-palæontologisches Institut, Bonn

DURING the last twenty or thirty years, the scientific conceptions of the structure and development of the earth's crust have been widely influenced, if not dominated, by the Wegener theory of continental drift and by the idea of orogenetic phases dividing the structural history into short but world-wide times of movement separated by intervals of rest or of mere 'epeirogenetic' oscillations. The first theory disrupted the lateral, the second one the vertical (temporal) connexions. But within the same decades, the growth of geological knowledge of nearly all continents, combined with the results of submarine and even of geophysical investigations, pointed in another direction. They led to the conclusion that the major structural zones and units of the earth are much older than they formerly seemed, and that they indicate a long and strong continuity from the very first stages of the globe up to the present. It seems that from early geological time, the crust has been divided into polygonal fields or blocks of considerable thickness and solidity, and that this primary division formed and orientated the later movements.

My own contributions to this extensive problem date from 1910, when I first investigated the influence of old Tertiary faults upon young Tertiary folds within the Swiss Jura Mountains near Basle. Later on they dealt with the Rhinegraben, with the primary limits of the Rhenish Schiefergebirge, the Pre-cambrian stages of important block boundaries in Norway and Sweden, with the conservative development of Silesia and the Bohemian mass, with the Harz Mountains, with North-East and South Africa, with certain areas in North America, and the Atlantic structure, the Azores and the Red Sea. Among the many important observations of other scientific investigators in different countries, Dixey's discovery of an older Nyasa fault-trough in Africa is the latest but not the least. Sonder, in his papers on Europe and Central America, laid stress upon the straight direction of certain old and persistent lineaments.

To start with the blocks, or fields, themselves, their limiting walls are to be considered as thick zones of a highly variable behaviour and history, and should be called 'geofractures' or 'geosutures', analogous to the similar terms 'geosynclines' and 'geanticlines'.

The critical features of these ancient and deep units and of their limiting zones are: (1) stratigraphical traces of tectonic movements in earlier geological times; (2) the connexion with plutonic and volcanic activity in early and recent times, etc.; (3) their relations to deep-seated earthquakes of linear arrangement (down to 500 or even 700 km.); (4) the length of the limiting zones (up to several thousand kilometres); (5) the size of the blocks, which varies between 500 and 1,200 or even 1,500 km. in diameter. My experiments and the known physical and technical observations show that there exists a geometrical relationship between the mutual distances of the dissecting joints and the thickness of the dissected sheet.

The crust pattern formed by these ancient geosutures displays several astonishing regularities. Within the three northern continents, blocks of north–south trend limited by meridional sutures are predominant. In North America, eight such fields can be counted; in Europe, eight north of the young mountain ranges in the south; in Asia, a few more. In the Mediterranean girdle, east–west zones prevail. On the Atlantic bottom, longitudinal zones of oblique directions are well known. Their analogy and connexion with terrestrial zones lead to the conclusion that they are the submarine representations of the ancient continental lines. It seems that many continental slopes belong to the deepest, oldest and most important block boundaries, an opinion already included in the well-known theory of the 'permanence' of the continents and oceans.

As areas of different horizontal and vertical displacement, the great thick permanent ground blocks influence the sedimentation on their upper surface, and also the magmatic cycles on their under surface within their interior and along their limiting walls. Being older than most of the other tectonic features of the globe, they influence the preparation, the origin and the development of the folded mountain ranges as well. Roughly speaking, within the two main thermodynamic girdles, each block has its own folded range. The structural relations between the younger folding and the older configuration of the respective blocks vary broadly according to the direction of the folding movement relative to the pre-shaped contour of the field. Longitudinal ranges, for example, are usually straight (Urals). Transverse ranges are suspended between the marginal sutures either as garlands or festoons, or in a sigmoidal manner or both (Füllhorn of the Alps). Thus attempts to unite the different folded arcs into uniform and endless 'slings' can be replaced by their individual adaptation to pre-existing units of the crust.

In certain examples, the deformation of a broad superficial area (like the Rocky Mountains in the United States or the corresponding area in Western Europe) can be derived from a more or less homogeneous deformation (for example, a simple torsional shear) of the supporting block. In a recent experiment I succeeded in imitating the structure of the Rocky Mountains. A sheet of liquid clay lies on a square wire net. Films of thin paper impregnated with water lie closely on the smoothed surface of the clay. A minute torsion of the wire net suffices to produce the Rocky Mountain uplifts with their typical details and their oblique arrangement. The mutual distances of the individual uplifts are proportional to the number of sheets of paper applied, that is, to the thickness of the sheet of sediments. If the cover of paper is omitted and the other conditions are unaltered, the experiment produces the faults of the adjacent Basin and Ranges field. This variation corresponds exactly to the natural model.

---

* Summary of the presidential address given to the annual meeting of the Geologische Vereinigung at Bonn on April 29, 1947, under the title, "Die Grundschollen der Festländer und Meere. Entwurf eines konservativen Erdbildes"; a detailed account is being published in the *Geologische Rundschau*, Stuttgart, No. 2 (1947).

Consequently, the tectonic deformations of the crust and the main features of its surface history can be more easily and better understood if we do not connect the visible structures directly with the supposed underground forces (subcrustal currents, convection as an effect of thermodynamic alterations, etc.). It is simpler to introduce an anisotropic and heterogeneous aggregate of pre-formed units which act as supports for the superficial material and as points of attack, as levers, and as instruments of transportation for the underground causal forces.

PRESERVATION OF THE *KAURI* IN NEW ZEALAND

In a series of short newspaper articles in New Zealand, Prof. V. J. Chapman (professor of botany at Auckland University College) gives the conclusions he has reached on a problem of much interest to botanists and tree-lovers the world over, namely, the preservation of that remarkable tree, the *kauri* (*Agathis australis* Salisb.).

The only surviving extensive block of natural forest carrying big *kauri* is Waipoua Forest, covering some 30,000 acres and in the care of the State Forest Service. Here the *kauri*, including trees of outstanding size, occurs scattered throughout, mainly in groups. It is claimed that this tree may exceed even the Sequoias in timber content, owing largely to the remarkable way in which the trunk holds to the cylindrical form instead of tapering considerably towards the crown. Younger trees and saplings are to be found, but only in limited numbers. Experimental sowings or plantings have not always been successful, and though the N.Z. Forest Service is now more or less prepared to guarantee regeneration of this species, its critics do not yet appear convinced —a matter which it should be easy to settle on the spot.

Two main questions have arisen: What steps should be taken to ensure the protection of an adequate number of the existing big trees and the perpetuation of the species; and if for this purpose areas are excluded from green fellings, should dead and dying trees be utilized before they decay? It is alleged that the Forest Service has not hitherto publicly guaranteed complete protection from interference for any part of the forest, not even for the roadside strip, and that when felling for timber, usually takes all trees down to 30 in. in diameter and all dead and unhealthy trees fit for milling.

In Prof. Chapman's party, when he made the inspection of the forest on which his articles are based, the botanical and amenity interests were strongly represented, but unfortunately there does not appear to have been an experienced forester with them. To get the disinterested forestry point of view, he referred the matter as just another instance of a general problem to the sylviculturist of the Indian Forest Research Institute, and to the present reviewer, who has for many years campaigned among his colleagues and others for the preservation of outstanding trees and adequate samples of the forest types of which they form part: neither knew that Prof. Chapman intended publication. Meanwhile, the New Zealand Institute of Foresters has published a well-reasoned account of its view (*J. N.Z. Inst. Forest.*, 5, No. 3, 173–175; 1946).

There seems to be agreement that a portion or portions of the forest should be excluded from fellings with suitable safeguards against change of policy, as has already been done by the N.Z. Forest Service in a working plan already six years old. All living trees on a fairly wide strip on either side of the State highway should be, and indeed are, to be kept untouched in this way, for in New Zealand, as in Great Britain, the truth is that appreciative as a large section of the general public may be of woodland amenities and big trees, it rarely goes far from the road. A certain number of exceptional trees should obviously also be specially protected, and access provided: this also has already been decided on.

Scientific interests, including those of forestry itself, call for the preservation of a further compact block of forest (not a narrow strip), which would be excluded from ordinary management. One or two areas of about 250–500 acres each might be suggested, and there is a good case in favour of leaving in them even dead trees standing or fallen, as it is very likely indeed that some part of the fauna is dependent on the dead and decaying wood for its existence and survival. We understand one such area has already been set aside for the purpose.

Over the rest of the forest, normal management for timber production can be permitted. It is remarkable how fully the amenities of a forest area can be maintained with such management where it is the settled policy so to maintain them: the New Forest in England provides an example, thanks to the care of the deputy surveyor, for it is almost incredible that more than two dozen sawmills were working there throughout most of the war-years with so little consequent loss to the amenities or even change in appearance. Prof. Chapman urges that in the managed portion, *kauri* should be retained as the principal species, just as in Britain it has been decided in certain forests that broad-leaved trees should not be replaced by conifers: we believe this to be desirable and that the State Forest Service is willing to agree. But just how that will be done is not yet known, for on the information before us the *kauri* is a baffling tree, and a good deal more systematic research work will have to be done before it can be regenerated to order. Recorded information makes it clear that rather special conditions are required for the successful germination of the seed and establishment of the resultant plant; it is, however, not yet adequately known what those conditions are, though, as with many other trees, a primary requirement appears to be exposure of the mineral soil from its excessive covering of humus. The grouped occurrence, though by no means a unique feature in forest vegetation, has repeatedly been described, and studies are needed on soil and vegetational differences inside the groups and outside: the *kauri*, of course, itself influences the soil in which it grows and on which it showers its dead leaves and twigs. There is also a question of fungal association with the roots, which may incidentally play some part in the difficulties experienced in the nursery with this species. The importance of greater concentration on this research is underlined by the recommendation that until it is well under way only dead timber should be removed.

We feel sure that agreement will soon be reached in these matters, as there are no serious difficulties in meeting the requirements of both sides in the controversy. The forester of to-day has been trained to realize the amenity and biological aspects of the handling of forests equally with the timber-getting and economic aspects. The New Zealand Forest Service is fully competent to apply the agreed policy to this important forest and is the obvious authority to do so: its research staff is expanding, and though the problems presented by this exceptionally interesting tree are perhaps complex, they should be quite capable of solution in a few years. Meanwhile, it is as well that keen interest should be taken in the preservation for future generations of one of the most remarkable trees of the world. H. G. CHAMPION

ELECTRICAL PROPERTIES OF SOIL AND WATER AT CENTIMETRE WAVE-LENGTHS

THE electrical properties of the materials forming the earth's surface have always been of interest to the radio physicist and communication engineer, since the propagation of long and medium waves is markedly dependent upon the absorbing effect of the ground. At shorter wave-lengths, for which the radiation can be transmitted more freely through the lower or upper atmosphere, the reflexion coefficient of the earth's surface plays an important part in the propagation of the waves. More recently, the varying reflexion coefficient due to the different electrical properties of the different portions of the earth's surface has been used with conspicuous success in a radar method of navigation.

At moderate radio frequencies, the appropriate properties of soil and water can be determined by placing samples of the material in question in a condenser of suitable size and shape; and the results of many measurements made in this way at frequencies up to 100 Mc/s. have been described by R. L. Smith-Rose[1]. A laboratory method of measuring the electrical properties of salt-water solutions has also been used by R. Cooper[2] at frequencies up to more than 4,000 Mc./s., corresponding to wave-lengths down to 7 cm. Alternatively, the reflexion coefficient of the surface of the ground can be measured directly, for example, by the standing-wave method developed by J. S. McPetrie[3], who with J. A. Saxton[4] has used this technique at various frequencies up to about 600 Mc./s. (wave-length 50 cm.). At the still higher frequencies of 3,300 Mc./s., corresponding to a wave-length of 9 cm., L. H. Ford and R. Oliver[5] have investigated the direct reflexion of radio waves from a wide range of surfaces including bare ground, both level and in ridges, ground covered with vegetation, fresh water and salt water approximating in composition to sea water. More recently, this free radiation technique has been extended by J. A. Saxton and J. A. Lane[6] to the experimental determination of the dielectric properties of water for wave-lengths of 1·24 and 1·58 cm.

With the growth and development of radar techniques in recent years, the above-mentioned British work has been supplemented by the work of other investigators, notably in the United States, some of whom have paid particular attention to the measurement of the reflexion coefficient of sea water at the small grazing angles met with in radar practice.

A report, which has recently been submitted to *Nature*, describes measurements of the dielectric properties of soils and water at a wave-length of 3·2 cm. (frequency 9,400 Mc./s.) carried out at the University of Texas as part of the programme of the United States Office of Naval Research. The report is by Prof. A. W. Straiton and C. W. Tolbert, and is of interest in so far as particular attention was devoted to the measurement of the properties of the dry, sandy soil found in Arizona where the Navy Electronics Laboratory had a site for special radio experiments. The measurements were made by placing samples of the material in a wave-guide or other suitable circuit arrangement, and measuring the phase-difference and attenuation caused by transmission through different thicknesses of the material. From such observations the dielectric constant and conductivity of the dry Arizona soil were found to be 3·2 and 10^9 E.S.U. respectively. (A conductivity of 10^{10} E.S.U. corresponds to 1·1 Mhos/metre.) Similar measurements made on dry sandy loam taken from near the University Laboratory in Texas gave values for the dielectric constant of 2·8 and $0{\cdot}7 \times 10^8$ E.S.U. for the conductivity. The authors of the report point out that the Arizona soil shows a conductivity of about three times as high as that obtained by Ford and Oliver[5] for very dry sandy loam in Great Britain, while the value for the Texas soil is much smaller. It is suggested that the considerable iron content of the Arizona soil may account for the higher conductivity in this case. This is scarcely consistent, however, with the results of further measurements made by the authors on samples of the Arizona soil sifted through screens of various sizes of mesh. The samples of smallest size of particle contained no free iron, but showed the highest conductivity. Furthermore, measurements made on the sample of medium-size particles varied from 6×10^8 E.S.U. when loosely packed into the container to more than 10×10^8 E.S.U. when very tightly packed. As was the case for measurements made by earlier investigators, the conductivity of the soils from both Arizona and Texas was found to increase several times when the samples were moistened with fresh water.

In a somewhat similar way, measurements were made under the same conditions on distilled water, and on a sample of sea water from the Gulf of Mexico. For the fresh water, at a temperature of 23° C., the dielectric constant was found to be 67 and the conductivity about 10^{11} E.S.U. (12 Mhos/metre); while for the sea water, which had a salt content of 2·2 per cent, the values obtained were 65 and 15×10^{10} E.S.U. (16 Mhos/metre) respectively for a temperature of 28° C. These values are in reasonably good agreement with the values deduced by Saxton[7] from a theoretical study of the anomalous dispersion of water combined with the results of measurements made at shorter wave-lengths than those used by Straiton and Tolbert. This recent work thus appears to form a useful extension of our knowledge of the electrical properties of soil and water at the frequencies corresponding to very short radio wave-lengths.

FORTHCOMING EVENTS

(*Meetings marked with an asterisk * are open to the public*)

Monday, January 12

Farmers' Club (at the Royal Empire Society, Craven Street, Strand, London, W.C.2), at 2.30 p.m.—Prof. D. B. Johnstone-Wallace: "Pasture Management and Animal Behaviour".

Institution of Electrical Engineers, London Students' Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 7 p.m.—Sir Arthur Fleming: "The Place of the Engineer in the Post-War World".

Tuesday, January 13

Institution of Chemical Engineers (at the Geological Society, Burlington House, Piccadilly, London, W.1), at 5.30 p.m.—Mr. B. Edgington: "Detergency".

Illuminating Engineering Society (at the E.L.M.A. Lighting Service Bureau, 2 Savoy Hill, London, W.C.2), at 6 p.m.—Mr. C. R. Bicknell: "Applications of Modern Flash Discharge Tubes".

Oil and Colour Chemists' Association, London Section (at the Royal Society of Tropical Medicine and Hygiene, Manson House, 26 Portland Place, London, W.1), at 6.30 p.m.—Colonel L. Urwick: "Scientific Management".

Conway Discussion Circle (at Conway Hall, Red Lion Square, London, W.C.1), at 7 p.m.—Mr. Lancelot L. Whyte: "Science and the Next Development in Man".*

Society of Instrument Technology, North-West Section (at the College of Technology, Manchester), at 7.15 p.m.—Mr. A. J. Young: "Some Impressions of Modern American Instrumentation".

Wednesday, January 14

Society of Chemical Industry, Microbiological Panel of the Food Group (joint meeting with the Society for Applied Bacteriology, at the Medical Society of London, 11 Chandos Street, London, W.1), at 2.15 p.m.—Mr. P. C. T. Jones: "Decomposition of Resins by Micro-organisms in the Soil"; Dr. D. M. Webley: "Microbiological Changes in Compost"; Mr. M. J. Geoghegan: "Influence of Micro-organisms on Aggregate Formation in Soil".

Geological Society of London (at Burlington House, Piccadilly, London, W.1), at 5 p.m.—Scientific Papers.

Institute of Petroleum (at 26 Portland Place, London, W.1), at 5.30 p.m.—Mr. R. B. Richards: "The Structure and Properties of Ethylene Polymers".

Institution of Electrical Engineers, Radio Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. D. M. Heller and Mr. L. C. Stenning: "Reference-Crystal-Controlled V.H.F. Equipments".

Society of Chemical Industry, Plastics Group (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 6.30 p.m.—Mr. E. G. K. Pritchett: "Recent Advances in the Chemistry of the Phenol-Aldehyde Condensation".

Society of Dyers and Colourists, Northern Ireland Section (at the Queen's Hotel, Belfast), at 7.30 p.m.—Mr. G. Brearley and Mr. J. Starkie: "The Hydrosulphites—their Preparations, Properties and Textile Applications".

Thursday, January 15

Institution of Mining Engineers (at the Institution of Civil Engineers, Great George Street, London, S.W.1), at 11 a.m.—Fifty-fourth Annual General Meeting.

Institution of Electrical Engineers (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. D. E. Lambert and Mr. J. C. Christie: "Standardization of Switchgear".

Royal Aeronautical Society (at the Institution of Civil Engineers, Great George Street, London, S.W.1), at 6 p.m.—Mr. O. N. Lawrence: "Gas Turbine Accessory Systems".

Pharmaceutical Society (at 17 Bloomsbury Square, London, W.C.1), at 7.30 p.m.—Mr. A. G. Fishburn: "The Place of Pharmaceutical Research in Medicine".

Royal Society of Tropical Medicine and Hygiene (at Manson House, 26 Portland Place, London, W.1), at 7.30 p.m.—Symposium on "Leprosy" (to be opened by Dr. Ernest Muir).

Friday, January 16

Institution of Mechanical Engineers (at Storey's Gate, St. James's Park, London, S.W.1), at 5.30 p.m.—Film on "The Screen in relation to Engineering Training" (introduced by Mr. H. R. Hockley).

Institute of Navigation (at the Royal United Services Institution, Whitehall, London, S.W.1), at 5.30 p.m.—Squadron Leader R. H. Blackmore: "Grid Navigation and its Allied Problems".

University College London (at Gower Street, London, W.C.1), at 5.30 p.m.—Prof. C. A. Hart: "Modern Influences on the University Aspect of Professional Training in Surveying" (Inaugural Lecture).*

Institute of Physics, Electronics Group (joint meeting with the Manchester and District Branch, in the New Physics Theatre, The University, Oxford Road, Manchester), at 7 p.m.—Dr. J. G. Wilson: "The Cloud Chamber".

Paper Makers' Association (Technical Section), Northern Division (at the Engineers' Club, Albert Square, Manchester), at 7 p.m.—Mr. F. North: "Some Factors Affecting the Application of Dyestuffs to Paper".

Saturday, January 17

British Psychological Society (in the Physiology Theatre, University College London, Gower Street, London, W.C.1), at 2.30 p.m.—Mr. Alastair Heron: "Adolescent Reactions towards the Idea of Education for Parenthood".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Principal of the Ministry of Supply School of Electronics, Malvern—The Chief Superintendent, T.R.E., Great Malvern, Worcs., quoting Ref. 5/138/JFA (January 17).

Assistant Agricultural Economist (Grade B)—The Registrar, The University, Bristol 8 (January 17).

Lecturers (2) in Mathematics—The Clerk to the Governing Body, Battersea Polytechnic, Battersea, London, S.W.11 (January 24).

Lecturer in Child Health—The Registrar, The University, Manchester 13 (January 24).

Senior Lecturer in charge of the Department of Electrical Engineering under the Professor of Engineering—The Registrar, The University, Sheffield (January 31).

Principal Scientific Officer (physicist, preferably with good experience of military operational research), a Senior Scientific Officer (experimental physicist, preferably with good experience of the scientific investigation of the performance of military weapons and equipment), a Senior Scientific Officer (biologist or botanist or qualified in an associated science, with experience of military operational research and military training and of the scientific investigation of the performance of military equipment), a Senior Scientific Officer (mathematician with experience of military operational research), and a Senior Scientific Officer (mathematician with experience of the application of statistical methods to physical problems preferably in the field of weapon performance), at the Military Operational Research Unit, Byfleet—The Secretary, Civil Service Commission, Scientific Branch, 27 Grosvenor Square, London, W.1, quoting No. 2056 (January 31).

Cow and Gate Fellowship for research into problems associated with nutrition in infants and children—The Registrar, The University, Manchester 13 (January 31).

Divisional Manager of (*a*) the Animal Products Division, (*b*) the Agricultural Products Division, (*c*) the Minerals Division, (*d*) the Civil Engineering and Works Division, (*e*) the Factory Division, and (*f*) the Fisheries Division—The Director of Administration, Colonial Development Corporation, Dover House, Whitehall, London, S.W.1 (January 31).

Instructor in Poultry Husbandry and Poultry Manager at the College Farm—The Registrar, University College of Wales, Aberystwyth (February 1).

Director of the Marine Laboratory, Aberdeen; Principal Scientific Officers, Senior Scientific Officers, and Senior Experimental Officers, in the Ministry of Agriculture and Fisheries and the Scottish Home Department—The Secretary, Civil Service Commission, Scientific Branch, 27 Grosvenor Square, London, W.1, quoting No. 2088 (February 10).

Meteorologists in the East African Meteorological Service—The Director of Recruitment (Colonial Service), Colonial Office, 15 Victoria Street, London, S.W.1 (February 21).

Professorship of Pathology and Bacteriology—The Secretary, Welsh National School of Medicine, 10 The Parade, Cardiff (February 21).

Professor of Pure and Applied Mathematics in the Royal University of Malta—The Secretary, Universities Bureau of the British Empire, 8 Park Street, London, W.1 (February 28).

Research Assistant for work on vitamins in relation to nutrition and allied microbiological investigations, and an Experimental Officer with experience in routine analysis of foodstuffs, blood and excreta—The Secretary, Rowett Research Institute, Bucksburn, Aberdeenshire (February 28).

Assistant Keeper to be responsible for the Zoological Collections in the Manchester Museum—The Registrar, The University, Manchester 13 (February 28).

Lecturer in Statistics in the United College, St. Andrews—The Secretary, The University, St. Andrews (February 28).

Assistant Lecturer in Geography—The Registrar, The University, Manchester 13 (March 31).

Senior Scientific Officer to the International Red Locust Control Service at Abercorn, Northern Rhodesia—The Director, International Red Locust Control Service, Abercorn, Northern Rhodesia (March 31).

Lecturer in the Physics Department—The Secretary, Northampton Polytechnic, St. John Street, London, E.C.1.

Agricultural Zoologist in the Malayan Union—The Director of Recruitment (Colonial Service), Colonial Office, 15 Victoria Street, London, S.W.1.

Lecturer in the Department of Mathematics—The Principal, Borough Polytechnic, Borough Road, London, S.E.1.

Lecturer in the Chemistry Department—The Secretary, King's College of Household and Social Science, Campden Hill Road, London, W.8.

Laboratory Assistants—The Director, British Paper and Board Industry Research Association, St. Winifred's Laboratories, Welcomes Road, Kenley, Surrey.

Agricultural Chemist (Pyrethrum) by the Government of Kenya—The Crown Agents for the Colonies, 4 Millbank, London, S.W.1, quoting M.N.17954.

Fisheries Development Officer in Nigeria—The Director of Recruitment (Colonial Service), Colonial Office, 15 Victoria Street, London, S.W.1.

Senior Assistant in Physics—The Director of Education, The Polytechnic, 309 Regent Street, London, W.1.

Director of the Canterbury Museum, Christchurch, New Zealand—The Secretary, Universities Bureau of the British Empire, 8 Park Street, London, W.1.

Laboratory Technician (Grade B)—The House Governor and Secretary, Gordon Hospital, Vauxhall Bridge Road, London, S.W.1.

Technician in the Department of Physics—The Secretary, University College London, Gower Street, London, W.C.1, quoting Physics/1.

IMPORTS OF SCIENTIFIC AND TECHNICAL BOOKS

As one of the measures deemed necessary for the reduction of British expenditure overseas, and particularly for the conservation of 'dollar' resources, an announcement from the Board of Trade early last autumn re-introduced the system of licensing imports of books and other literature. Certain classes of books were completely excluded, and others, including scientific and technical books, were admitted up to a limiting money value. During the War, the licensing had, of course, been in operation; but there was the additional need at that time for extreme economy in the use of shipping space, which made restrictions almost inevitable.

Now that import licensing has again been in operation for some months, it is time to take stock of the position. From the first it was obvious that the restrictions, although directed against foreign books generally, would affect chiefly the supply of American publications, for these formed the greater proportion of the literature imported into Great Britain, especially in the fields of science and technology. This made the position particularly serious, for there was a shortage of such literature due to the difficulties of the war years. During that period, potential writers of scientific and engineering text-books in Britain were mostly occupied in work which claimed their whole time and attention, and much of it was done under conditions of secrecy which are only now being relaxed. Further, stocks of standard books had steadily diminished, and lack of labour and of maintenance in the printing works of the country, as well as shortage of paper, prevented—and still prevents—publishers from replenishing them. Thus new works were few and far between, and older books were only available from time to time and often in small numbers, a circumstance which in itself has led to higher costs of production through the increased proportion of overhead costs chargeable to each volume. With the lifting of war-time restrictions, a steady flow of American books into Britain began; they were welcome, in that many war-time developments of science and industry thus became known for the first time outside the small numbers of those who had been directly concerned in them.

The general terms of the restrictions, so far as they affect scientific and technical publications, were stated in an article in *Nature* of October 4, p. 448. Publishers in Britain are granted licences to import foreign books in bulk up to the value of 100 per cent of their pre-war imports; in applying for licences, titles of individual books and country of origin must be quoted.

The position of the individual who wishes to purchase a foreign book is, however, not so widely known. Under the present regulations and so far as American scientific and technical literature is concerned, anyone may place an order for books, journals and periodicals with publishers or their agents in the United States, provided the book or journal is imported as a single copy through the post. This permits monthly parts of scientific journals to be sent to individuals, libraries, etc., in Great Britain. Application for the necessary dollars for purchase money must be made to a bank, or for a money order at a post-office. The order for books, etc., can be sent directly to the United States by the purchaser, or on his behalf by a bookseller, provided the latter is willing to apply for the currency and to arrange for the book or journal to be sent by post directly to the address of the individual placing the order. Within the framework of the general policy of restricting imports of books, the licensing authorities are doing whatever they can to meet the needs of individual purchasers.

Hence the main difficulties at present met by the individual in Britain wishing to purchase American scientific and technical books or to subscribe for American learned periodicals are twofold: he has to make application for the necessary currency, and it is very unlikely that he will be able to examine a book before purchase. In any event, there is bound to be delay in supplying his need.

That an enormous reduction in British expenditure in the 'dollar' areas of the world is necessary will not be gainsaid. Books and periodicals have already made a contribution by the adoption of 'austerity' production methods, including poorer quality and thinner paper, smaller type, smaller margins, etc.; it is sufficient to turn back to a pre-war issue of *Nature* to realize at a glance some of the economies which have been made. The whole policy of restricting the flow of literature should be reconsidered in the light of world affairs.

From the long-term point of view, there never was a time when the free flow of information was so important for world peace and progress. In the turmoil following a great war, the interchange of literature can be a potent factor in promoting mutual understanding and tolerance; and it can prepare the way for the wider knowledge which can only come from the personal visits possible in more settled conditions. In this connexion, there is always the danger that a system of individual licences, although it may be devised solely with the view of controlling expenditure, may become in effect a form of censorship. Whatever the present intention, there seems little to prevent the over-zealous or the doctrinaire who may hold the reins of authority from discriminating against a particular book. This aspect relates particularly to historical and cultural literature, and its significance should not be overlooked at a time when rival political ideologies are threatening to divide the world more effectively than ever before. It is not so important in the field of technology, where the restriction is more likely to be imposed by the exporting country; but the very possibility that a form of censorship can grow out of a licensing system tends to arouse suspicion.

Turning now to the short-term view, there is a strong case for the removal of restrictions on the import into Britain of scientific and technical literature. particularly that from the United States. Publication of recent scientific and industrial developments has been lagging increasingly behind during the war years; and now, when the emphasis is on more and more production, and economy in man-power and processes, it is essential that the most up-to-date information should be available with as little delay as possible. In his presidential address to the Royal Society on December 1, Sir Robert Robinson quoted figures showing the serious time-lag in the publication of the Society's own papers; and he added that other societies were in worse case. The columns of "Letters to the Editors" in *Nature* reflect a similar delay. The President of the Board of Trade has undertaken to assist publications devoted exclusively to research by providing the paper required for prompt production of communications; though there will be difficulty in obtaining labour to enable them to make full use of this concession. Meanwhile, however, there is considerable material of significant value in books and periodicals, of American origin in particular, likely to be of immediate service for the progress of knowledge, in the drive for increased efficiency and in the training of students and technical workers.

It is often said that up-to-date literature is one of the most important tools of the research worker. This is an under-statement; new books and current periodicals are the life-blood of a progressive society. It is hard to believe that the potential value of the knowledge and experience incorporated in books has been weighed against the saving of dollars achieved by limiting imports of literature into Britain to 100 per cent by value—ignoring the substantial increase in prices—of pre-war imports, apart from such purchases as individuals may choose to make.

TRANSMISSION IN NERVES

Die Signalübermittlung im Nerven

By Prof. Alexander v. Muralt. (Lehrbücher und Monographien aus dem Gebiete der Exakten Wissenschaften, Band 14: Reihe der experimentellen Biologie, Band 3.) Pp. 354. (Basel: Verlag Birkhäuser, n.d.) 38.50 Schw. francs.

PROF. v. MURALT and his collaborators in Bern have taken up and developed the technique for the isolation of single frog's nerve fibres invented by the Japanese, Kato and Tasaki. As a result of optical and biochemical investigations of great technical ingenuity, he has developed theories about the mechanism of conduction in nerve which might be described as unorthodox. The basic unit of conduction is supposed to be the internode of medullated nerve fibres, and v. Muralt believes that each is separated from the next internode by a transverse membrane at the node of Ranvier. Unfortunately his pictures do not provide decisive evidence of the existence of transverse membranes crossing the entire axon at the node. The optical appearances which they show are well known to histologists and are usually considered as representing the abrupt end of the myelin layer. His belief in the existence of this membrane was strengthened by the observation that in dying fibres it was sometimes seen to be blown out in the direction of one segment or the other. But the figure demonstrating this effect is not convincing and would be taken by most to show a modified portion of myelin rather than a membrane across the axon. However, the exact details of the node of Ranvier and the nature of the structure called by Cajal the cementing disk still remain very obscure, and v. Muralt's provocative study will certainly stimulate further investigation.

It will be appreciated that if each section of the axon is separated from its neighbours by a complete membrane, all our basic ideas of the neuron as a unit would have to be abandoned; we should be left with each internode as a piece of protoplasm enclosed on all sides by a membrane but not containing a nucleus! It would take much evidence to persuade us of this; a 'membrane' allowing the passage of a 'trophic' influence only and hence dividing the cell into compartments would be a novelty. There is, however, no reason from study of nerve fibres with ordinary methods to suppose that the axon is divided in this way. Preparations fixed and stained in a great variety of ways show that the substance of the axon is continuous across the nodes; it is the myelin which is interrupted. Moreover, if the 'segmented' arrangement is essential for nerve conduction, what is the condition in non-myelinated nerves, large and small, in which we can be as near certain as we can of anything that there are no transverse membranes? Prof. v. Muralt does not ignore this problem, but his solution is to say that the unmedullated fibre is a limiting case in which the whole contents consist of material with "membrane properties". Surely when we speak of a membrane we refer to an entity which separates, and to speak of a fibre as all membrane is repugnant to sense. He admits that this theory "bedarf experimenteller Stutzung, um der sehr spekulativen character zu verlieren"; but will any amount of experiment suffice? His hypothesis is quite categorical that "das Aktionspotential entsteht durch Depolarisation der Quermembran des markhaltigen Nerven" (p. 254). The velocity of conduction is therefore determined by the distance apart of the membranes and the field intensity at them. Such a view is not inconsistent with some of the evidence about the action potential; but unfortunately Sanders and Whitteridge have recently shown that in regenerated nerves, where the nodes are all at small distances apart, the conduction velocity nevertheless increases with diameter as in normal nerves.

With all these doubts we can scarcely for the time being take the theory of the "Quermembran" as the basis for treatment of conduction in nerve. But it would be very unwise to reject v. Muralt's work because it is built around a doubtful hypothesis. The hypotheses are relatively unimportant; what he has done is to devise methods of very great beauty for the measurement of many of the physical and chemical changes which go on in a nerve fibre. Merely to list them is to show the astonishing range of his technical achievement. Included in this book are accounts of a direct current amplifier and methods of measuring the birefringence of nerve, and its X-ray diffraction patterns (unfortunately he does not give any indication whether he has found changes in birefringence of single axons during conduction). Other methods have allowed him to measure the minute chemical outputs of the nerve. Aneurin is estimated by several independent methods, including spectrographic methods and the polarograph, which makes use of the characteristic influences of dissolved substances on mercury-water interfaces. Acetylcholine and potassium are estimated by more conventional methods. He gives us in this book all too few of the actual results of these determinations, but combines his information into a theory of the "action substances" of a nerve. An action substance is any substance necessarily taking part in any particular reaction. Thence for nerve "jeder Stoff, der im Aktionszustand des Nerven gebildet oder verändert wird, und ein unentbehrliches Glied in der Kette der Aktionsreaktionen ist" (p. 272). Acetyl-choline is the first of these substances, and he believes it to be liberated in the activity of all parts of all nerves, including those not cholinergic. Aneurin is also liberated from all nerves and is the second action substance, potassium the third, and A_4, a substance related to aneurin and revealed by the 'polarograph' but not yet identified, is the fourth. An attempt is made to suggest how these four substances liberated from nerve during activity are related to the other changes known to occur. The resulting scheme is one of the most interesting parts of the book but, as the author realizes, speculative to a degree that makes discussion at this stage scarcely possible. It remains to be seen whether this approach to the "action substances" will prove profitable.

As if these physical and chemical considerations were not enough, v. Muralt has also included in his recent work a study of degeneration and regeneration of nerve, again using many methods. One of his most beautiful demonstrations is of the course of the decline in acetyl-choline content during nerve degeneration, beginning as early as the fifth hour and proceeding to zero. Aneurin concentration begins to fall a little later and proceeds only to 45 per cent of normal. Acting upon the presumption that a brain extract should stimulate nerve growth, much study was made of a "neuroregenerative growth-substance", *N R*, able to stimulate regeneration. Methods for estimating rates of regeneration by study of recovery after incision of the rabbit's cornea and after interruption of the phrenic nerve or of the nerves to the whiskers are suggested. Results are given here only for the cornea test; though suggestive they are not satisfactorily demonstrative of a stimulating effect, in view of a very large variability. It is not possible to discuss the possible nature of these substances until the method of extraction is published. It may be that the extracts produce an influence on regeneration of the cornea rather than on the rate of advance of new nerve fibres down the peripheral nerve trunks, no method of accelerating which is known.

This book is evidence of the very great activity of the Hallerianum in Bern during recent years. One is left reeling after such a feast of new techniques and new ideas, and we may hope that v. Muralt will be able to help us recover by astringent doses of further figures and discussions. J. Z. YOUNG

A STUDY OF JAPANESE CULTURE

The Chrysanthemum and the Sword

Patterns of Japanese Culture. By Ruth Benedict. Pp. vii + 324. (London: Secker and Warburg, Ltd., 1947.) 12*s*. 6*d*. net.

IN her recent book, "The Chrysanthemum and the Sword", Dr. Benedict deals with the Japanese along lines similar to, if not as clearly defined as, those in her earlier "Patterns of Culture". To quote Prof. Franz Boas, she "is concerned rather with the discovery of fundamental attitudes than with the functional relations of every cultural item". These fundamental attitudes, she believes, colour and condition the whole of Japanese outlook and behaviour.

The author reveals the following fundamental attitudes in the Japanese character: a strict love of social order involving unswerving loyalty to the Emperor and varying degrees of respect or discriminatory behaviour towards each member of society in accordance with his status; a habitual sense of shame coupled with a fear of ridicule and ostracism; a due regard for bodily pleasures, yet a great insistence on self-discipline and a belief in the superiority of the spirit over material power; and finally a complicated and rigid system of obligations and reciprocity. These obligations are the great sanction of Japanese culture; they range from duty to the Emperor, one's parents, family and ancestors to a proper respect for one's good name and reputation (*giri* to one's name). They are especially interesting in that they are eventually concerned with the rite of *seppuku* or *harakiri*.

So far, the work is an excellent general text-book study of Japanese psychology. It is clearly and, so far as one is able to judge, correctly elucidated and interpreted. For example, much of Dr. Benedict's analysis is borne out by Dr. Embree's field study of Suye Mura; and her elaborate description of the sanctions of obligation and reciprocity well explains the virtual pacifist reaction of the Japanese since August 1945. On the other hand, the book suffers from the author's self-confessed lack of first-hand experience in Japan. The system of mutual co-operation in the country districts, stressed so heavily by Dr. Embree, receives scant mention from Dr. Benedict. Its importance cannot be underrated, for refusal of co-operation is a very strong sanction in village life. Moreover, although the above listed fundamental attitudes may be widespread in the urban districts, one wonders how far they strictly apply to the Japanese peasant, "whose primary object", to quote Embree, "is to raise good rice and get along amicably with his neighbours". Such a man, like Falstaff, surely believes that the man who has honour is "he who died o' Wednesday"; and a punctilious observance of "*giri* to one's name" (often culminating in suicide) is something he acquires when he comes into contact with the Army or some other urbanized institution.

Finally, in analysing these fundamental attitudes, Dr. Benedict is rather prone to attribute them to the Japanese, but to minimize them in, or even exclude them from, the nations of the Western world; whereas they exist in both, perhaps emphasized to a different degree. For most of the traits given it would be by no means impossible to find parallels to them among the nations of Europe and even in the United States. It would be hypocritical to deny the existence of a shame complex (as opposed to a sense of guilt) in the West; and the Japanese belief in the superiority of the spirit over material power is reflected in many of our own maxims and proverbs.

It seems, therefore, that we may accept Dr. Benedict's analysis of Japanese fundamental attitudes as substantially true; but that we should be unwise to apply them on too wide a scale. Moreover, we must remember that the differences in outlook that she finds between the Japanese and ourselves are differences of degree rather than of kind.

PETER LAWRENCE

ENZYMES IN BACTERIA

The Chemical Activities of Bacteria

By Dr. Ernest F. Gale. Pp. iv+200. (London: University Tutorial Press, Ltd., 1947.) 8*s*. 6*d*.

IN an age long past, biochemistry was the science of food and waste products, the study, it was unkindly suggested, of the letter-box and the dustbin. The limitations of this approach to the chemistry of life were first discarded half a century ago, when intracellular metabolic enzymes were separated intact from the yeast cell. But though the microbiologist may claim that the science of enzymology (like the name) originated in his field, our knowledge of the cellular chemistry of bacteria lagged far behind the rapid progress made with yeast and animal tissues. Only during the last decade have the technical difficulties of extracting intracellular enzymes from the bacterial cell been overcome; at the same time, the usefulness of the washed suspension technique (employing intact cells) has been much enhanced by such tools as the deficient-culture technique and isotope methods. How rapidly the investigators of bacterial metabolism have made up the lost ground will amaze even those readers of Dr. Gale's book who are familiar with this field. But the intensive study of individual metabolic processes must not lead to neglect of the larger physiological system of which they are but the component parts. The bacterial cell is more than "a collection of enzymes surrounded by a semipermeable membrane".

One fundamental problem is kept continually before the reader, however. The reaction of the organism to its environment is peculiarly suitable for study among micro-organisms, since the environment may be precisely defined in simple chemical terms and the organism responds very rapidly, natural selection taking place within a community within a matter of hours. Dr. Gale himself has made extensive study of the relation between enzymic constitution and environment and the part this plays in the continued life of the organism in changing and perhaps unfavourable circumstances. But it is difficult always to avoid 'missing the wood for the trees'. Thus adenosinetriphosphate, once regarded simply as a 'phosphate-carrier', is now known to be the one essential product of perhaps the majority of catabolic processes. Text-books seldom give this vital point the emphasis it deserves, and the student may puzzle his way through the complex chemical cycles by which the bacterium produces its 'acid and gas' without fully realizing what it is all for. The specialist, of course, knows already: and it is essentially for the specialist that this book is written.

Dr. Gale has done a great service by collecting and critically examining much scattered material within a small space. He has achieved this by confining himself mainly to those topics (and they are many) on which he can claim to speak with acknowledged authority. Others are dealt with more briefly; but the reader is directed to authoritative reviews through a small number of carefully selected references. Duplication is thus avoided, but at the risk of giving the student an unbalanced view. Preliminary chapters make the book complete by introducing the non-bacteriological reader to the bacterial world (yeasts and moulds are not dealt with in this book), while a final chapter on the practical details of bacteriological technique invites him into a field peculiarly full of pitfalls for the unwary.

H. K. KING

Surveying for Young Engineers

By S. Wright Perrott. Pp. viii + 232. (London: Chapman and Hall, Ltd., 1946.) 10*s.* 6*d.* net.

THIS book is a revised and greatly enlarged edition of the author's "Surveying for Schools", originally published in 1930. It is designed to give practical assistance to the young and inexperienced surveyor. The author has thus wisely widened the scope of his earlier volume in order to provide a more complete exposition of the subject, while still concentrating upon the practical point of view in dealing with the field and office work. The text consists of twenty-eight chapters devoted to the practical methods employed in making surveys, an explanation of the necessary instruments, and the preparation of relevant plans. Some good advice is given on the important work of checking, and the book is excellently illustrated by drawings, maps and plates depicting some of the instruments to be used. No instrument, however, is described until its practical use has been fully explained. A useful index is included; but no exercises are provided since the course is intended mainly for practical field work. Formal mathematical treatment has also been avoided—the only form of calculation needed being simple arithmetic.

As the author points out, most of the text-books on the subject are academic productions, planned with a view to examination requirements; but the field is the right place in which to lay the foundation of surveying. Hence, the emphasis on practical outdoor work.

The book is well printed and got up, and should be of much use to those beginning the study of surveying.

Elements of Mechanism

By Peter Schwamb, Allyne L. Merrill and Walter H. James. Sixth edition, revised by Prof. Venton Levy Doughtie. Pp. xi + 428. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1947.) 4 dollars.

THIS somewhat unusual type of text-book originated in 1885 from printed notes used by Prof. Peter Schwamb at the Massachusetts Institute of Technology. In its present form, the book is in thirteen chapters dealing with motion, vectors, velocity, acceleration, linkages, transmission of motion by direct contact, cams, rolling contact, gears, trains of wheels, belts, ropes, chains, pulley blocks, screws, screw threads, pawls, escapements, etc. The whole course thus provides an authoritative book on the fundamental principles of kinematics applied to mechanical movements. In this edition, not only have recent data on the subject been added, but also laboratory problems emphasizing practical applications of theory are included for the first time.

As Prof. James points out in the preface to the fifth edition, "A study of the elements of mechanisms . . . is intended primarily to give the student familiarity with, and practice in thinking about, the application of the fundamental principles of kinematics in a specific field, namely, the field of mechanical movements".

The text is, in relevant sections, treated mathematically, frequent use being made of the simpler methods of the calculus, and is profusely illustrated both by clearly drawn diagrams and blocks lent by manufacturers. An index is provided; but no answers to the problems are given as solutions are expected to be done graphically. The whole course has been skilfully mapped out in an interesting manner and should be of much use to technical students.

F. G. W. BROWN

Hydraulic Measurements

A Manual for Engineers. By Prof. Herbert Addison. Second edition, revised and enlarged. Pp. xii + 327. (London: Chapman and Hall, Ltd., 1946.) 21*s.* net.

THE need for a second edition of this admirable manual within a relatively short time amply justifies the encomiums which were paid to the first edition on its publication in 1940. It was, in fact, an appropriate and even a necessary adjunct to the same author's "Text Book of Applied Hydraulics", and clearly it has been found helpful by a number of engineers and students engaged on problems connected with liquid flow. The opportunity has been taken to amplify the original text by adding some new paragraphs to improve the balance of the work, and at the same time to bring it up to date. These additions have been introduced in such a way as not to disturb the arrangement of the original material, which remains unaltered. Hydraulics is largely an empirical science, and the application of reliable standards of measurement is necessary to its satisfactory development. New methods, some of them indirect, as in the case of the Allen salt-velocity principle, are continually being evolved, and, among other recent improvements, the author notes the adoption of standardized forms of pipe inlet in the Annis suction pipe meter now being used in that type of differential head meter. The manual will be found enhanced in usefulness by its revision and extension.

B. C.

The Yale Collections

By Wilmarth S. Lewis. (Published on the Foundation established in Memory of Curtis Seaman Read of the Class of 1918 Yale College.) Pp. xv + 54 + 13 plates. (New Haven: Yale University Press; London: Oxford University Press, 1946.) 11*s.* 6*d.* net.

YALE was founded on a collection of books. This short survey of the collections of books, manuscripts, objects of art, natural history and anthropology which have come to Yale during the past two and a half centuries has been written to indicate their extent and variety, which are not generally known even in New Haven. If the library is the heart of a university, the other collections are the basic food of research. It is therefore sad to see that the author finds it necessary to justify the existence of "what many consider a frill". The survey briefly describes the history and contents of the library and its specialized collections, the art gallery, the Peabody Museum and the Anthropology Museum. It has space to mention only by name many other valuable collections and the splendid researches which have resulted from their study. The illustrations include an interesting photograph of a restoration of the first Yale College library as it was in 1742, with the actual books presented by Newton, Halley, Bishop Berkeley and others on the shelves.

The printing, paper and make-up of the volume are worthy of their subject, but the text contains a number of colloquialisms that jar on British ears.

L. HARRISON MATTHEWS

CHROMOSOME MULTIPLICATION AND REDUCTION IN SOMATIC TISSUES

THEIR POSSIBLE RELATION TO DIFFERENTIATION, 'REVERSION' AND SEX

By Prof. C. LEONARD HUSKINS
University of Wisconsin

CYTOLOGY, which began as a purely descriptive science, bifurcated early in this century into 'karyology' and 'experimental cytology'. By 1925 the karyologists had, as Schrader[1] points out, assembled a mass of data with far too few unifying concepts. These were furnished in the period 1925–35 by a closer union with genetics, in which John Belling and C. D. Darlington[2] played predominant parts, and cytogenetics became the most rapidly developing branch of cytology. When in 1942, as a Guggenheim Fellow, I attempted to write an advanced text-book I began with the assumption, then common to most cytogeneticists, that a synthesis was possible on the basis of generally accepted theories, with only minor modifications and adequate citation of exceptions. I ended with the opinion (cf. ref. 1) that some of the exceptions no longer 'proved the rule' but rather demanded basic revisions of the theories[3]. Of the new research approaches that seemed necessary, one promising line open to the cytologist appeared to lie in the union of cytogenetics with experimental cytology.

A beginning was made at McGill University in collaboration with Prof. George Scarth and a joint student, Herbert Stern[4,5]. The War, and at its end Scarth's retirement, deferred developments. A year ago it became possible to begin assembly of a research team at the University of Wisconsin, and a programme was initiated. Two features of it: (*a*) the determination of chromosome constitution in differentiated tissues, and (*b*) the experimental production of meiotic ('sexual') divisions in somatic tissues, have reached a stage at which the basic discoveries may be outlined and their possible significance discussed.

It is now well known to cytologists, though not yet taken into account by most biologists[6,7], that many animal and plant tissues are characteristically polyploid or polytene (any distinction between these is in part arbitrary, and in any event lacks significance for issues considered herein; both may, presently, be termed polysomaty or endopolyploidy). Geitler, who earlier did much of the best work on animal tissues, in 1940[8] recorded polysomaty in thirteen plant species and eleven tissues of these, including infected ones. He concluded, however, that no generalizations could be made regarding its significance since: (*a*) the data are too scattered, and (*b*) we know that differentiation can proceed either with increase in cell size, and therefore possible polysomaty, or by increase in cell number with all cells presumably remaining diploid. Since 1940 many new cases of polysomaty have been reported, including the very recent ones in flower-buds and succulent leaves by Geitler's students Lauber[9] and Jähnl[10]; but no possible rationale for their occurrence has been suggested other than our own[11]. White[12] sums up the situation in animals as follows: "The whole process of histological differentiation in insects seems to be intimately bound up with this phenomenon of endopolyploidy, each organ and tissue having its own characteristic degree of ploidy, some being entirely composed of one type of cell while others are mosaics of cells with different multiples of the fundamental diploid number. To what extent endopolyploidy occurs outside the Insecta is not known at present, but there are indications that it is fairly widespread in many groups of animals. In the vertebrates conditions are not favourable for counting the chromosomes in somatic resting nuclei, but measurements of nuclear volumes (Jacobj 1925–1935) suggest that in some mammalian tissues several size classes of nuclei exist, and it is possible that these correspond to different degrees of polyploidy."

TABLE 1

HETEROCHROMATIC BODIES IN RESTING NUCLEI OF *Rhœo discolor*

Mm. from tip	No. of nuclei	Mean No. hetero.	*S.D. M*	Variance
1	190	11·1	2·11	4·47
2	100	12·1	2·8	7·81
3	99	18·1	4·7	22·09
4	101	20·6	4·97	24·74
5	101	21·3	5·02	25·29

Differences of means: 1 : 2, not significant
1 : 3, not significant
1 : 4, $9{\cdot}5 \pm 4{\cdot}74$ $P = 0{\cdot}045$
1 : 5, $10{\cdot}2 \pm 4{\cdot}79$ $P = 0{\cdot}04–0{\cdot}03$

In 1946 we began, with a possible rationale in mind, an investigation of the extent of polysomaty in plant tissues commonly assumed to be diploid. Roots of *Rhœo* were chosen for a first test as these have, in their chromosomes, heterochromatic regions that can be stained in energic ('resting') nuclei. These first studies, with L. Steinitz[11], indicated that a very large proportion of differentiated cells behind the meristematic region are polysomatic (see Table 1). The test is, however, too indefinite and too subjective, particularly because the heterochromatic regions vary so much in size and fuse so readily. To count the actual chromosomes it is necessary to induce mitosis in cells that ordinarily would probably not divide again. It is, however, then necessary to avoid the induction of polysomaty by the treatment employed. Indole-3-acetic acid in dosages which we consider meet this latter requirement have enabled us to determine that 25–35 (maximum 75 in one root) per cent of the differentiated cells *that are induced to divide* in *Rhœo* roots are polysomatic. (The data of Table 1 indicate that, if all cells could be induced to divide, the proportion seen to be polyploid would be much higher.) We also found both statistical (Table 2) and direct (pairing with chiasma formation) evidence that reduction occurs from polyploidy to diploidy, as Berger[13] found in *Culex*, and we saw several haploid nuclei[11,14].

Repetition of the experiments, by Rhona Leonard, on barley gave similar results. At the same time, it was found by R. E. Duncan and J. G. Ross that the older nuclei of untreated maize endosperm are polytene[11]. The total data on polysomaty now make it clear that the axiom that all cells of a plant or animal body have the same chromosome and genic constitution is, quantitatively at least, invalid. In exceptional cases involving 'chromatin diminution' it has long been known that it may be invalid qualitatively, though the presumed absence of genes in heterochromatin complicates this issue. We have under way tests which may possibly help to determine whether, in a more sophisticated sense dependent on a concept of gene structure developed later herein, it lacks general validity.

TABLE 2

Treatment	No. of roots	Hours after treatment	Region	Chromosome number										Per cent polyploid
				n	$2n$				$4n$		$5n$	$6n$	$8n$	
				Chromatid number per chromosome										
				2	2	4	6	8	2	4	2	2	2	
Rhœo discolor	6	0–6	Meristem		22									0

			Diff'd		82	12			4			2		18·0

Caspersson[15] found that at pachytene of meiosis when the paired chromosomes become microscopically four-partite there is a very high nucleic acid content. His conclusion "that nucleic acid plays a role in the synapsis or in the division of the chromonemata or in both" seems basically sound. His further conclusion[16] that thymonucleic acid has a role in gene reduplication is, however, based on the premature, if not completely inacceptable[17], identification of chromosome substance with gene and the view that gene reproduction and chromonema splitting coincide. This latter is one of the commonly accepted concepts of cytogenetics that has long seemed to require reconsideration. More than fifteen years ago Nebel, McClintock, Huskins and Smith and others (see ref. 18) showed cytologically that each chromatid in a meiotic tetrad is at least a double, if not a multiple structure, though it behaves as a unit in genetic segregation and usually, if not always as is commonly assumed[2], in its breakage and mutational response to X-radiation. Nebel[19] and I also had what we considered clear evidence of doubleness before pairing. Further, for more than twenty years many of the most cautious cytologists (see ref. 20) have held that the chromosomes of somatic divisions are double at anaphase and therefore contain twice as many strands as genetic evidence leads us to expect. (That the same opinion has also been held on faulty grounds is irrelevant.)

In meristematic cells of onion root-tips treated with sodium ribose nucleate (Swartz Lab. Inc. Sample *SN* 4509) by M. Kodani[21] in the course of his studies on the effects of nucleic acids and related compounds on the production of 'lampbrush' chromosomes, I recently found chromosome pairing and reduction divisions, similar in essential respects to those of the germ cells. It should be stressed that, as mentioned above, we had previously found several cases of reductional divisions in differentiated tissues in our indole-3-acetic treated materials, and with Caspersson's conclusions in mind I was looking for them in these slides. Otherwise, for the reasons given below, they would probably have been missed in the initial slides in which they occurred rather infrequently. By using 4 per cent sodium nucleate solution for 5–19 hours Kodani increased the number to several per cent of the total number of dividing cells and made it possible for us to make a detailed analysis.

The possibility that only chance association and distribution of chromosomes was involved has been eliminated by L. Steinitz in experiments on *Rhœo* roots. In them catenations of several chromosomes, instead of simple pairs, occur as in their germ cells. An 8 per cent solution for six hours has produced this effect in the majority of dividing nuclei.

Some of the pairing in onion roots is with chiasmata, some without. Further tests using structurally modified homologous chromosomes, which will bear on the chiasma-crossing-over relationship, are therefore under way.

From consideration of the cytological literature and our own, unpublished, data and especially since the recent evidence of somatic reduction in cotton[23], we conclude that our sodium nucleate treatments have only increased the frequency, by abnormal dosage with substances normally present, of a process that occurs naturally but infrequently without treatment. When pairing and reduction-type divisions occur in large numbers, as in our later experiments, they cannot long be missed. If they occur only occasionally, as in normal material, they would usually be missed by the cytologist for two reasons: (*a*) spindle formation and kinomere orientation on it are abnormal and the general appearance of the first reductional division is that of a cell squashed in preparation; (*b*) the second division is commonly abortive. When abortive, two nuclei are formed, each with the normal diploid chromosome number (instead of four with the haploid number as when they are not abortive), and in a structurally homozygous organism these two nuclei are indistinguishable, to the cytologist, from the products of a normal mitosis. In a genetically heterozygous organism, however, the result would be seen, as somatic segregation or 'crossing-over' for two homozygous cells, one with the two dominants and the other with the two recessive factors, can result. It is possible that many of the known cases of somatic segregation and/or crossing-over in *Drosophila*, other animals and plants occur in this way. The demonstration of this mechanism may further have significance for the phenomenon of 'saltation' in fungi lacking known sexual stages, and perhaps in bacteria[24].

Sometimes one of the two reduced nuclei divides before the other and before a cell wall is formed between them—as it often does in pollen mother-cell meiosis. This gives sixteen chromosomes at one end of the cell and eight at the other, and, of course, furnishes particularly convincing evidence that a true reduction division and not merely a random segregation of chromosomes has taken place.

The observations render more acceptable the oft-reported cases of chromosome pairing in tumours, particularly since a high nucleic acid content has been found in many tumours. In itself this may be quite distinct from any question of the *origin* of the tumours. However, in so far as the somatic cell mutation theory of cancer is acceptable, our observations indicate that such 'mutation' may well be somatic segregation in an organism heterozygous for a gene or genes that predispose to tumour susceptibility. The recent work of Greenstein[25] and Potter *et al.*[26] indicates that the changes involved are enzymatic in nature, as are the effects of many gene changes.

Sporadic cases of genome segregation, of which those in strawberries[27] and oats[28] are the most striking, also receive one highly plausible rationale from our observations. To get segregation of ancestral genomes from an allopolyploid it is theoretically necessary only to have pairing and segregation of homologous chromosomes in somatic tissue of the germ track prior to a normal meiosis in which there is pairing and segregation of the ancestral homœologues as in the hybrid diploid ancestor. Experiments are therefore being set up in which we shall attempt to abstract ancestral species from polyploids. This may have a bearing on the currently highly controversial[29] problem of 'relic' species.

The simple cytogenetic concept of the chromatid as a unitary string of genes seems to be entirely adequate for crossing-over and the Mendelian transmission of hereditary differences, though not as much so for the data on the production of such differences as is commonly supposed (cf. mosaics). Along with its corollary, the earlier concept of the gene as a unitary organic molecule, it has been a hindrance to thought on the gene as a physiological unit. It is now clear that the gene which acts as a unit in genetic segregation must in some sense be a multiple unit, since its microscopically visible habitat, the chromatid, is at least double. Current concepts of the protein molecule as made up of a number of identical lamellæ give us a model for the gene that seems to fit all present cytological and genetic data and open up the way for new theories of gene action. In particular they permit us to investigate the simplest of all possible hypotheses—and, as Muller[30] points out, one of the earliest—namely, that the gene acts as a physiological unit just as it does in inheritance by reproducing itself, or, more specifically, its platelets. (By using the term 'gene' to refer, for the present, either to a platelet or a multiplicity of platelets we are adding only one new concept to the several already subsumed under that term.) The axiom of chromosome and genic identity of all cells in a plant and animal body, which is now shown to be an incomplete and perhaps misleading concept, has previously prevented serious consideration of this hypothesis—see Wright[31], in which he points out that on the accepted theories of gene structure and identity of all cells a gene could reproduce itself only once between each nuclear division. This limitation as applied to platelets no longer holds. The discovery of nuclei with chromosome, and especially chromatid, numbers other than an exponential power of two (Table 2) may be of very great, though indirect, significance in this connexion. The next and most difficult step in the testing of this hypothesis is to determine whether all parts of a chromosome and all genes reproduce at the same rate. There is already much evidence that heterochromatin and 'differential regions' do not—included in this evidence is that of R. E. Duncan[32], who has further unpublished data that fall in line.

The concept we currently favour is that the gene, and its visible manifestation or habitat the chromatid segment or 'chromomere', must continuously be reproducing itself in all living tissues by the production of new platelets. Failure to do so would be one means of 'chromatin diminution'. Possibly this is what Goldschmidt has in mind[33] when he remarks that it occurs only in organisms with a limited cellular reproduction.

Wright[31] has pointed out that a mutation in one of the postulated lamellæ of a gene may (conceivably by "the same mechanism as involved in the duplication process") be restored rapidly or spread through them all. Gulick[17] considers this highly probable and adds that since genetic stability is founded on stability of chromosome organisation, natural selection will be expected to have ensured that restoration occurs in the majority of cases. The relative rarity of mosaicism is therefore expected even on the lamellar hypothesis of gene structure, while its occasional occurrence is thereby readily explained.

It may well be, of course, that polysomaty is not so direct an indication of the mode of gene action as the present hypothesis postulates. That it has *some* relation to the physiological activity of the gene now seems self-evident. Since the above data on higher plants, insects, and mammals were evaluated there have come to hand the papers of Subramaniam[34] claiming a relationship of "endopolyploidy" to enzymatic activity in yeasts and indicating its probable significance in the macronucleus of ciliates. It begins to look as if continued mitoses are essential to the preservation of diploidy. The significance of this possibility for theories on the isolation of the germ plasm are obvious.

To summarize the argument from the data on somatic reduction: A combination of four steps, each of which is now firmly established as occurring normally (and with higher frequency in experiments with normally occurring environmental substances or influences in unusual dosages but within a range consistent with viability), is sufficient to account, theoretically at least, for all the basic cytogenetic and evolutionary features of sex. They are, to state a hypothetical case for the purpose of exposition: (1) endomitosis (as an alternative to the nuclear fusion usually proposed) in a haploid organism giving rise to diploid tissue; (2) complementary mutations (it is, for the moment, irrelevant whether genic or chromosomal) in the two sets of chromosomes which render either one individually less efficient than the combination of both; (3) somatic reduction, with or without crossing-over; (4) fusion of reduced nuclei (or, in dikaryonts, of cells). These give us the cytogenetic essentials of sex without sexes or sexuality. All successive developments of sexuality may be viewed as adaptive mechanisms facilitating the orderly sequence of the reduction and fusion. On this simple view 'incompatibility' reactions are the evolutionary forerunner of ordinary sexuality, though reversion can, obviously, occur. The number of complementary heterothallic forms is unlimited ; the number of true sexes is limited to two because there must be very close association of many adaptive features. All the above issues have, of course, been considered by many writers and especially clearly by Darlington[36]. Beadle's[35] scheme has similarities but also fundamental differences ; he, further, accepts Darlington's conclusion that nuclear fusion and meiosis must have arisen simultaneously, which is not necessary in the above scheme. Our contribution, regardless of hypothetical significance, is the experimental production of the third, and previously most inexplicable, step, and from Stern's[5] work a suggested experimental technique for the production of fusion within a single organism. Our scheme has one advantage over others in that somatic reduction may in some cases (cf. ref. 22) have immediate selective value for the tissue involved and not only for the progeny[36].

To conclude, the occurrence of polysomaty and polyteny in differentiated tissues and of somatic reduction divisions equivalent to both complete and incomplete meiosis are established, and also the optical doubleness (if not the multi-strandedness) of the chromatid which is nevertheless the *unit* of Mendelian segregation. The speculations on the possible significance of the data are predominantly of the nature of working hypotheses which can, though to very varying degrees, be tested. Their validity, or lack of it, at this stage is therefore immaterial to their possible usefulness. Further obvious speculations on issues such as the relationship of the postulated platelets to 'plasmagenes', etc., are not indulged in since we see at present no way for the cytogeneticist to test them.

It must be emphasized that though I accept full and sole responsibility for all statements above, the work is that of a team in which I have the collaboration of three senior and seven junior associates. In the detailed publications to follow, authorship and accrediting will indicate the particular contributions of each in so far as this is possible with a team the members of which, to end on a cytological analogy, are, like cells, individual units at the level of differentiation, that is, in their special studies, and sub-units at the integrative level, that is, in the general programme. Financial support is provided by the Wisconsin Alumni Research Foundation and, through the award of one fellowship, by the National Research Council, Committee on Growth.

THEORY OF ELECTROKINETIC EFFECTS

By F. BOOTH

H. H. Wills Physical Laboratory, University of Bristol

THE purpose of this article is to summarize the present position of the theory of electrokinetic phenomena and to present certain new mathematical results I have obtained, the details of which will be published later.

In electrokinetic phenomena we are concerned always with the electrical double layer at the boundary between an electrolyte and a solid. Two types of theoretical problem arise in considering the effects of this double layer, depending upon whether equilibrium, or non-equilibrium irreversible conditions (in the thermodynamic sense), prevail. An example of the first type of problem is the determination of the mechanical force between two solid particles at rest immersed in an electrolyte also at rest. This problem, of fundamental importance in colloid chemistry, has been solved successfully by Verwey[1] after many abortive attempts by other workers. The second type constitutes the subject matter of this article ; here dynamic rather than static conditions prevail, and we have to determine various consequences of the effect of the double layer on the flow of an electrolyte past a solid surface. These electrokinetic effects have, apart from their intrinsic interest, important industrial and biological applications[2]. The main electrokinetic phenomena are :

1. *Cataphoresis or electrophoresis* ; this is the motion of the particles in a suspension when an electric field is applied (Reuss, 1808).

2. *Electro-osmosis* ; this is the flow of a liquid through a capillary when an electric field is applied parallel to its axis. Closely related is the effect known as *electro-osmotic pressure* ; if the flow through a horizontal capillary is prevented, a difference of pressure develops between the ends when the field is applied (R. Porret, 1816).

3. *Streaming potentials* ; the potential set up between the ends of a capillary when an electrolyte is forced through it (Quincke, 1859).

4. *Sedimentation potentials*. A suspension of particles, if allowed to settle, sets up a vertical electric field (Dorn, 1878). A very similar effect is the difference of potential which develops between the nodes and antinodes set up by stationary sound waves in a suspension (see, for example, Hermans[3]).

5. *Electroviscous effect*; this is the increase of the effective viscosity of a solid suspension owing to the double layer on the particles.

Other effects may be suggested; for example, the double layer must influence the rate of diffusion of particles in suspension.

The classical theory of effects (1) to (4) is due to Helmholtz[4] and Smoluchowski[5]. For electro-osmosis they gave, for the mean velocity of flow,

$$\bar{v} \doteq \frac{E\varepsilon\zeta}{4\pi\eta}. \qquad (1)$$

Here E is the field-strength, ε the dielectric constant of the liquid, ζ the potential difference across the double layer, η the coefficient of viscosity. Smoluchowski's contribution was to insert ε in (1) and to show that the assumption for the capillary, of a uniform cross-section normal to E, could be discarded. Thus (1) holds for a closely packed powder with electrolyte filling the interstices. It is thus easily seen that the velocity U of cataphoresis will also be given by (1), U replacing $\bar{v}$, and ζ now being the electrokinetic potential of the particles. For, suppose we have a fixed but *isolated* particle; at a large distance the mean streaming velocity will be given by (1). But this system is equivalent to a *stationary* liquid and a *moving* particle.

The field set up in streaming potentials is

$$E = \frac{\varepsilon p\zeta}{4\pi\eta\sigma}, \qquad (2)$$

where p is the pressure gradient and σ the specific conductivity of the electrolyte. By an argument very similar to that we used to relate U to $\bar{v}$, equation (2) can be used to find the field set up in sedimentation. This is

$$E = \frac{1}{3}\,\frac{\varepsilon\zeta g\,(\Delta - \Delta')}{\pi\sigma\eta}, \qquad (2')$$

Δ being the particle density and Δ' the fluid density.

These formulæ only apply provided that the thickness of the double layer at each point of the interface is *small* compared with the radius of curvature at that point.

Although the Helmholtz–Smoluchowski formulæ have been extensively used for the analysis of experiments, they have undergone considerable criticism and modification in recent years. Let us first examine the phenomenon of cataphoresis; physically, this is the simplest effect but it is the most difficult one to treat mathematically. One obvious limitation of the Helmholtz–Smoluchowski theory is the restriction on the thickness of the double layer. This is not likely to be serious in effects (2) and (3), but evidently may not apply in cases (1), (4) and (5) for very small particles. For cataphoresis, Henry[6] obtained a formula which did not require this restriction on the thickness of the double layer. For non-conducting spherical particles he obtained

$$U = \frac{\varepsilon E\zeta}{6\pi\eta}\left[1 + \frac{1}{16}b^2 - \frac{5}{48}b^3 - \frac{1}{96}b^4 + \frac{1}{96}b^5 + \frac{1}{8}b^4 e^b\,E_i(b)\left(1 - \frac{b^2}{12}\right)\right], \qquad (3)$$

where $E_i(x) = \int_x^\infty \frac{e^{-u}}{u}du$, $b = \chi a$, a is the particle radius, and

$$\chi^2 = \frac{4\pi e^2}{\varepsilon kT}\sum_{i=1}^{s} n_i z_i^2.$$

The summation is over the s ionic species present in the electrolyte, n_i being the concentration, z_i the valency. Since χ^{-1} is a measure of the double layer thickness, b represents the ratio of the radius a to this thickness. The function in brackets tends to 3/2 for b large, and to 1 for b small; hence in the limit (3) agrees with Smoluchowski's formula.

Henry's treatment, however, contains a serious blemish, for in order to obtain (3), he had to assume that the charge distributions on the surface and in the electrolyte remain spherically symmetrical when the field is applied; this is certainly incorrect, since the ions will tend to fall behind the particle, causing excess of charge there and a deficit in front, as compared with the equilibrium charge density. This behaviour is known as the 'relaxation effect' in the theory of electrolytes.

Various attempts have been made to remedy this defect; one by Hermans[7] and another by Komagata[8] are valueless since they contain fundamental mistakes. More recently, Overbeek[9] and, independently, the present writer[10], have given generalizations of Henry's formula. I find a general expression for U in the form

$$U = \frac{EeQ}{6\pi\eta a}X_1(b) + \frac{E}{6\pi\eta}\sum_{r=2}^{\infty} Q^r e^{2r-1} a^{-r} (\varepsilon kT)^{1-r} \left[q_r X_r(b) + Y_r(b, q_\mu, t) + Z_r(b, q_\mu\, q_\mu^*, t)\right]. \qquad (4)$$

Qe denotes the total charge on the particle when at rest, q_μ the set $(q_2, \ldots q_r)$; q_μ^* the set $(q_3^*, \ldots q_r^*)$; also

$$q_r = \sum_{i=1}^{s} n_i z_i^{r+1} \Big/ \sum_{i=1}^{s} n_i z_i^2, \text{ and}$$

$$q_r^* = \varepsilon kT \sum_{i=1}^{s} n_i z_i^{r-1} w_i^{-1} \Big/ \pi\eta e^2 \sum_{i=1}^{s} n_i z_i^2,$$

where w_i is the ionic mobility of the ion of type i. The functions X_r, Y_r and Z_r are very complicated, although it can be shown that they all, except X_1, tend to zero as b tends to zero or to infinity; the X_r are functions of b only, but Y_r and Z_r may contain certain surface parameters which we have indicated by t in (4). The physical significance of the three terms in the square brackets is as follows: X_r represents a contribution to U due to the *symmetrical* part of the field around the particle. These terms, when r is greater than 1, do not appear in Henry's formula (which is identical with the first term of (4)) because he adopted the Debye–Hückel approximation, namely, that $\zeta e/kT \ll 1$; $\zeta e/kT$ may reach values of about 4, so that this approximation is not good. Y_r represents a contribution to U due to the distortion of the field, but *not* involving the ionic mobilities; that is, distortion not due to relaxation; Z_r is the contribution due to relaxation. So far, the expansion has been worked out as far as the Q^4 terms for *symmetrical* electrolytes (that is, electrolytes with equal numbers of positive and negative ions, or with $q_{2r} = 0$), though work is proceeding on the more difficult case of unsymmetrical electrolytes.

To obtain formula (4) it is first necessary to derive the spherically symmetrical part of the field. At distance r from the centre, the potential of this field is found to be

$$\psi_1 = \sum_{m=1}^{\infty} Q^m e^{2m-1} (\varepsilon a)^{-m} (-kT)^{1-m} \lambda_m(\chi r). \qquad (5)$$

The functions λ are obtained by transforming the differential equation for the potential into an integral equation. By analogy with (5) we write for the distortion of the potential of the ionic atmosphere

$$\varphi(r,\theta) = E \sum_{\nu=1}^{\infty} \sum_{n=0}^{\infty} Q^{\nu} e^{2\nu} (\varepsilon kT)^{-\nu} a^{1-\nu} \lambda_{\nu,n}(r) P_n(\cos\theta), \quad (6)$$

θ being the angle co-ordinate. Provided ψ_1 and φ are known, U can be calculated. Hence the problem is resolved into the determination of the functions $\lambda_{\nu,n}$. They are found from the equations of motion of the electrolyte and of the ions.

A serious difficulty for any theory of cataphoresis is to obtain satisfactory boundary conditions for the solid-liquid interface. We have no exact knowledge of the structure of the interface, and indeed it is from experiments like electrophoresis that we must derive information. Hence it is very desirable, if possible, to formulate basic assumptions on the surface state, in as broad a manner as possible, precluding specific mechanisms. It has been possible to derive (4) with the following simple assumptions about the interface:

(I) The thickness of the region in which the surface charge resides is small compared with the particle radius.

(II) The charge in this surface region is immobile.

(III) The surface charge density at any point is an explicit function of the ionic concentrations in the adjacent electrolyte and of the temperature only. (The surface parameters in (4) are partial derivatives of this function with respect to n_i.)

Assumption I is almost certainly true; II may be incorrect, but surface conductance is unimportant provided $\sigma_s \ll \sigma a$ (where σ_s is the surface conductance). Assumption III is more speculative but it seems very plausible; for example, in conjunction with assumption II, it would certainly be valid for a surface charge produced by adsorption of ions.

Overbeek expresses U in a series of powers of ζ (up to the third power). Using (5) to relate Q and ζ, his results should give formula (4) correct to Q^3; agreement seems fairly satisfactory although his method is rather different from ours. He employs, however, a more restrictive assumption than III above, namely, that the charge density on the surface is fixed; this cannot be strictly correct. Another basic assumption made by Henry is that the 'inertia terms' in the equations of motion of the electrolyte can be dropped. It can be shown that this is equivalent to assuming that U is proportional to the field strength E—a result often experimentally confirmed. A more exact formula for U [11], taking into account the inertia terms, is

$$U = \frac{EeQ}{6\pi\eta a} X_1(b) + \sum_{r=2}^{\infty} (EeQ)^r \eta^{-2r} [W_r(b) + O(Q)]. \quad (7)$$

The series of functions W_r, of which the first two members have been found, are, like X_r, Y_r and Z_r, very complicated. Oseen's linearized equations were used to deduce (7); in fact, the problem is closely related to a well-known problem of hydrodynamics—the determination of the drag on a sphere moving through a liquid. The most complete solution of this problem is due to Goldstein[12], and we have used his analysis extensively.

Another improvement of Henry's formula is to take into account the effect of surface conductance. For an insulating particle with a surface conductance σ_s, and with a thin double layer, we find[13] that the right-hand side of (3) should be multiplied by the factor $\sigma a(\sigma_s + \sigma a)^{-1}$, where σ is the ordinary bulk conductance of the electrolyte. The importance of the surface conductance effect evidently depends upon the relative magnitudes of σ and σ_s. Some experiments by Rutgers[14] suggest that the interface may possess very high surface conductance; hence surface conductance may be of great importance in interpreting the results of cataphoresis measurements. It is natural to inquire if a formula of type (4) might be given in this case. There are no additional mathematical difficulties, but unfortunately we require much more detailed assumptions than I–III for the conditions at the surface. For example, we should require the rate of 'condensation' of ions on to the surface and the rate of 'evaporation'.

Another problem under consideration is the determination of the rate of electrophoresis for solid particles in the form of ellipsoids. This should be of use in biological applications where spherical particles are not always available, for example, in the investigation of proteins.

We shall now consider the sedimentation potential. Smoluchowski's formula for the sedimentation potential, like his formula for electrophoresis, applies only to a *thin* double layer. I have extended this to the general case[15] by using methods similar to those for formula (4). As is to be expected, the removal of the condition $b \gg 1$ introduces a complicated function of b and of the surface parameters on the right-hand side of equation (3).

Finally, we come to the electroviscous effect. The first calculation of the effective viscosity η of a solid suspension of spheres in a liquid of viscosity η_0 was made by Einstein[16], who found

$$\eta = \eta_0 \left(1 + \frac{5}{2}\frac{v}{V}\right), \quad . \quad . \quad . \quad . \quad (8)$$

where v is the volume of solid, V of the suspension. This formula only applies for $v \ll V$. A better formula was given by Guth[17], who added the term $109v^2/14V^2$. Smoluchowski[18] in 1916 pointed out that a charge on the solid particles should increase the viscosity, and published without proof the following formula:

$$\eta = \eta_0 \left(1 + \frac{5}{2}\frac{v}{V}\left[1 + \frac{1}{\sigma\eta_0 a^2}\left(\frac{\zeta\varepsilon}{2\pi}\right)^2\right]\right). \quad (9)$$

Later, Krasny-Ergen[19] gave a proof; his equation being identical with (9) except for the multiplication of the last term by 1·5. Both formulæ only apply for a thin double layer. I have, however, succeeded in finding a formula for η, without this restriction[20]. The more general formula does not agree with equation (9), and I believe that Krasny-Ergen's treatment is incorrect. With this, we conclude our account of recent theoretical developments.

Much further work remains to be done, but at this stage it would seem that a thorough experimental check of theory would be more valuable than continued elaborations of the latter. The most useful procedure would be the determination of the electrokinetic potential ζ for a given surface and electrolyte by as many different methods as possible. The results would indicate if the theory required drastic or only minor modifications. In reading the literature, the impression is inescapable that in the past much effort has been wasted because experimentalists have confidently used formulæ without realizing their limitations, or at any rate without attempting to ascertain, so far as possible, whether basic assumptions for their validity were satisfied in their work.

Only when a theory is well tested can it be applied to new experimental data and conclusions drawn therefrom with a reasonable degree of certainty.

OBITUARIES

Dr. Charles Bolton, F.R.S.

The death on December 6 of Charles Bolton, at the age of seventy-seven years, removes one more member of that distinguished band of clinicians who, during the opening years of the century, so successfully combined general consulting practice and fundamental research. The impulse to contribute to the knowledge of his subject was undoubtedly the result of his early contacts. When Bolton went to University College, London, the Medical School had not yet separated from its parent body, and the department at University College combined both clinical and pre-clinical subjects and housed all the laboratories. At that time the medical faculty comprised a galaxy of talent. Thane and Schafer were at the height of their powers, and were soon to be joined by Bayliss and Starling. On the clinical side were Ringer, Barlow, Rose Bradford, Victor Horsley and Sidney Martin. Coming into this atmosphere as he did, fresh from an apprenticeship in general practice, Bolton was, as he often told later, first astonished and bewildered, and then inspired. He never lost the scientific enthusiasm then aroused. Following medical qualification, he began investigations on the bacteriology of typhoid fever and the morbid anatomy of diphtheria. These attracted sufficient attention to gain for him, in 1903, the Grocers' Company research studentship, and so the opportunity for laboratory research. This he utilized so well that five years later he was appointed, on a part-time basis, first director of the new Graham Research Laboratories at his own Medical School. This post he held until 1914, when it was merged with the lectureship in pathology—which Bolton also held—in a single whole-time post to which the late Prof. A. E. Boycott was appointed. But Bolton continued to work part-time in the Graham Department until the outbreak of another war, in 1939, closed his Medical School and so brought to an end his researches. In the intervening quarter of a century Bolton had been a busy general consulting physician, in wide demand, and with no source of livelihood but his practice. Yet, throughout that time, at least one afternoon a week was reserved for research.

Bolton will be remembered chiefly for his work on two subjects: the formation of tissue fluids and œdema, and the production of peptic ulceration. His interest in œdema and ascites sprang directly from clinical observations and particularly those on a case of illness which, nowadays, would be diagnosed as constrictive pericarditis. At this time the teaching of his friend Ernest Starling, that the rate of formation of tissue fluid was determined by the balance of hydrostatic and osmotic pressures across the capillary membrane, was gaining acceptance. Bolton set himself to determine the factors concerned in ascites. Re-reading his work to-day, it is impressive to note how often Bolton's conclusions, once regarded as strange, have been vindicated by subsequent discoveries. By direct experiment he showed that increased venous pressure in itself could not account for the ascites, and he clearly stated: "The abnormal output of lymph leading to dropsy is primarily conditioned by the nutritive state of the capillary wall". Thirty years later, Landis reached the same conclusions from his demonstration of the deleterious effect of anoxia on capillary permeability. Again, the increased blood volume in cardiac failure had been discovered by Lorrain-Smith, and was then considered to be one of the causes of dropsy. Bolton grasped clearly that, under such abnormal conditions, fluid may be lost into one part of the body so that the remainder becomes dehydrated. He wrote: "The increase in blood volume must, therefore, be looked upon as a secondary phenomenon and due to an effort of the animal to make up its normal quantity of blood in the anæmic areas, and to replace the fluid lost as dropsy". Modern measurements of blood volume, cardiac output and tissue-fluid spaces would essentially confirm this conclusion, which seemed so strange when first enunciated.

Bolton's main contribution to our knowledge of peptic ulceration concerned the conditions necessary to produce acute ulceration. By injecting suspensions of one animal's gastric mucosa into another species, he was able to produce an anti-serum which, on intraperitoneal injection into the donor species, caused acute ulceration in the stomach. The interesting point then emerged that the gastro-toxic serum produced no visible effect on the gastric mucosa unless this were in contact with acid gastric juice. Neutralize the acid and no ulcers occurred; augment it directly, or by suitable feeding, and ulceration was increased. Clearly the gastrotoxin had produced a definite, if invisible, temporary damage to the gastric mucosa which deprived it of its natural resistance to acid. Bolton believed that such damage occurred in the course of disease, and so led to acute ulceration. With Cruveilhier he believed that chronic peptic ulcers originated as acute ulcers; but although he tried repeatedly, he could not prevent the healing of the acute ulcers he produced by gastrotoxins. By artificially delaying the emptying of the stomach, by augmenting acidity, he succeeded in delaying, but not in preventing, healing. It now seems probable that, if he had only maintained a consistent hyperacidity, he might have seen his acute ulcers become chronic. Nevertheless, he had clearly appreciated the importance of acidity in exaggerating and delaying the healing of gastric lesions; and it was on that basis that he formed his therapy of these illnesses.

Personally, Bolton was a massive Yorkshireman with a typical dry humour. He possessed a remarkable power of effortless concentration which rendered him cheerfully impervious to all distractions. Yet he was never unapproachable, and once his attention was captured he could be most helpful. To colleagues and students alike he was uniformly genial and unaffected. Undoubtedly Bolton was fortunate in the times in which he began his professional work, for seldom can conditions have been more favourable for the combination of clinical practice and research. The solid bases of descriptive medicine and morbid anatomy had been laid, and physiology had sufficiently advanced to become applicable to clinical problems. The methods of approach and the techniques required for clinical research differed little from those used in routine practice, and the extra knowledge necessary for research, at that stage in the development of medicine, was not yet so large as to demand the whole of a man's attention and time. The business of living was also easier, and consultants could afford time for other activities than practice. Such a coincidence of conditions could only be transient, and with its disappearance the combination of private consultant and research worker began to disappear, so that now it is hard to find an example, outside certain specialties. Yet, if our medical schools are not to become simply technical institutes, if something more than technology is required in the training of a physician, then effective steps to prevent the separation of medical research and practice must be taken.

It must again be made possible for men like Bolton to devote adequate time to investigating their subjects. Undoubtedly the conditions now required will be very different from those which sufficed in the spacious Edwardian days when he flourished; but the ideal which inspired Bolton is still there, and, given the opportunity, its devotees will fulfil it.

H. P. HIMSWORTH

Dr. Emily Berridge

DR. EMILY M. BERRIDGE, who died on October 8, in her seventy-sixth year, has slipped away from the world of science as unobtrusively as she lived in it. But live in it she did her whole life long, devoting her life to research from her youth, when she was encouraged by her father, himself an experimenter, and by her head-mistress, Miss Arnold of the Dulwich High School, to make science her career. In 1894 she went up to the Royal Holloway College as an entrance scholar in natural science, and it was here she began research work in botany (under Prof. Margaret Benson).

Dr. Berridge's published researches fall into two distinct groups. The early papers, studies on fossil plants, and on the groups Gnetales and Amentiferæ, published mainly in the *Annals of Botany* and the *New Phytologist* between 1905 and 1914, bear the mark of her early training in Dr. Benson's special field of botany. The later papers, studies in bacteriosis published in the *Annals of Applied Biology* between 1921 and 1930, recall her colleague Dr. Paine, in whose laboratory at the Imperial College of Science and Technology, London, she worked during these years. The explanation of this complete change in type of research is to be found in her war work, 1914–19, which was done with Dr. Ernest Glynn in the Thompson Yates Laboratory, University of Liverpool, on agglutination of dysentery bacteria and the preparation of serum.

Not only did Dr. Berridge carry out research herself but she also gave generously of her time, thought and money to young postgraduates just starting on research. The extent of her generosity will never be known, for her gifts were mostly made anonymously. She was shy and diffident about her own work and so truly humble that only those who worked with her knew how good it was; just as only those who served with her on research committees knew of the quick grasp of essentials, the sound judgment and the unassailable integrity of mind and purpose that she brought to the discussion of any problem.

E. M. BLACKWELL

Dr. André Kling

DR. ANDRÉ KLING died on August 8, 1947, at the age of seventy-five. Receiving his education and early training in Paris, he was appointed in 1911 director of its municipal laboratory. The frauds in food and wine, to restrain which the laboratory had been founded under Charles Girard, were now declining, but the First World War opened to the laboratory new fields of activity. The Explosives Service, initiated by Girard during the anarchist bomb panics, was now developed for the disposal of unexploded German missiles; and Kling's leadership was an example of personal courage no less than of professional ability. His experience and success in this field led to his appointment as scientific adviser to the French General Staff. Working in this capacity at the front line on explosives and war gases, he earned the Croix de Guerre and membership of the Legion of Honour.

After the War, Kling interested himself effectively in the internationalization of analytical methods and standards. During the nineteen-twenties he presided over the International Union of Chemistry's Commission on Pure Substances for Research, to which he presented a report which led to the inception in 1928, under his presidency, of a separate Commission of Analytical Chemistry. In France, he was a pioneer in the formation of the Société de Chimie Industrielle, in which he held office on various occasions.

In actual chemical work, the name of Kling is perhaps most readily associated with the analytical separation of the metals of Groups III and IV. He was also, however, the author of numerous papers on methods of food examination, and, outside the analytical field, on the high-temperature hydrogenation of aromatic compounds. This work, even after his official retirement, continued to the end of a life wholly dedicated to his profession.

Prof. J. Masson Gulland, F.R.S.

DR. JESSE P. GREENSTEIN, chief of the Biochemistry Section, U.S. Public Health Service, writes: "The loss of Prof. J. M. Gulland to the scientific world is deeply regretted by his colleagues in the United States who knew the man and admired his personality and achievements. Gulland was one of a group of distinguished foreign guests at the Cold Spring Harbor Symposium held in June 1947. He was easily the dominant figure at that conference, and the charm and ease of his manner, his gentle critical spirit, together with the scholarliness and incisiveness of his thinking, evoked general admiration and affection. Gulland's investigations in the field of the nucleic acids revealed a meticulous and sound approach, and were of great interest and still greater promise. It is indeed a sad misfortune that we should have lost him."

NEWS and VIEWS

British Association: Annual Meeting

Sir Henry Tizard was installed as president of the British Association at a meeting held at Burlington House on January 9, when the Committees of Sections met to draft the outlines of their programmes for the forthcoming annual meeting, to be held this year during September 8–15 at Brighton. Emphasis will be given to scientific subjects which have a bearing on the economic crisis; a preliminary programme will be issued in the beginning of April.

The officers of the Association for the present year are as follow: *President*, Sir Henry Tizard; *General Treasurer*, M. G. Bennett; *General Secretaries*, Dr. Edward Hindle and Sir Richard Southwell; *Presidents of Sections*, Sir Lawrence Bragg (Physics and Mathematics), Prof. John Read (Chemistry), Dr. A. E. Trueman (Geology), Prof. H. Graham Cannon (Zoology), Lord Rennell of Rodd (Geography), Sir Hubert D. Henderson (Economics), Wing-Comm. T. R. Cave-Browne-Cave (Engineering), R. U. Sayce (Anthropology and Archæology), Prof. H. Hartridge (Physiology), Prof. A. Rex Knight (Psychology), Prof. J. R. Matthews (Botany), W. O. Lester Smith (Education), Dr. G. Scott Robertson (Agriculture).

International Geological Congress

Sir John Anderson has accepted the office of honorary president of the General Organising Committee for the eighteenth session of the International Geological Congress, which is to be held in Great Britain this summer, and will welcome the delegates and members at the first meeting of the General Assembly. Prof. H. H. Read, president of the Geological Society of London, has succeeded the late Sir Thomas Holland as president of the General Organising Committee and president-designate of the Congress. More than a thousand geologists from countries overseas are expected to attend the Congress; the total attendance, including British geologists, is likely to approach two thousand. Twenty-eight Governments and about 160 universities and scientific institutions have already accepted invitations to be represented by official delegates. The meetings of the Congress will be held during the period August 25–September 1 in the Royal Albert Hall and the lecture theatres of the Royal Geographical Society and the Imperial College of Science and Technology. Sir Edward Bailey and Prof. O. T. Jones will deliver special addresses on the structural history of Britain.

The list of subjects to be discussed at the sectional meetings of the Congress is as follows: (A) problems of geochemistry; (B) metasomatic processes in metamorphism; (C) rhythm in sedimentation; (D) geological results of applied geophysics; (E) geology of petroleum; (F) geology, paragenesis and reserves of the ores of lead and zinc; (G) geology of sea and ocean floors; (H) Pliocene – Pleistocene boundary; (J) faunal and floral facies and zonal correlation; (K) correlation of continental vertebrate-bearing rocks; (L) earth movements and organic evolution; (M) other subjects. In addition, problems of African geology will be considered at open meetings of the Association des Services Géologiques Africains; and selected palæontological topics will be discussed by the International Palæontological Union. A series of meetings on the mineralogy and geology of clays will be organised in conjunction with the Clay Minerals Group of the Mineralogical Society. In addition to the thirty-two geological excursions previously announced, five more excursions are being organised; two of these will visit East Anglia, one will visit Jersey, and two others will demonstrate the general geology of Scotland, and the hydrogeology of England and Wales. There will also be a series of day and half-day geological excursions. Full details of the excursion programme and of other arrangements for the Congress can be obtained from the General Secretaries, 18th Session International Geological Congress, Geological Survey and Museum, Exhibition Road, London, S.W.7.

International Congress of Anthropological and Ethnological Sciences

The third session of the International Congress of Anthropological and Ethnological Sciences (which met in London in 1934 and Copenhagen in 1938) is to be held under royal patronage at Brussels-Tervueren, during August 15–23, 1948. The president will be Prof. Ed. De Jonghe (University of Louvain); secretary, Prof. Frans M. Albrechts (University of Ghent, director of the Museum of the Belgian Congo); treasurer, Prof. Fr. Twiesselmann (University of Brussels, curator of the Royal Museum of Natural History). The subscription for full members is £2 2s.; for associates 200 Belgian francs. The Congress will meet in twenty-four sections, covering all branches of anthropological and ethnological research. Communications must be sent in typewritten synopsis, of not more than 200 words, to the Secretary before June 1; the full text and illustrations before July 1. Provision will be made for films and sound-records. There will be several exhibitions in connexion with the Congress; and excursions during August 24–28. Accommodation may be reserved either in the 'Cité Estudiantine' of the University of Brussels at 165 Belgian francs a day; or in hotels through Wagon-Lits-Cook, 17 Place de Brouckère, Brussels; approximate cost, room 100–200 Belgian francs; meals, 75–125 Belgian francs. Formal dress will not be required for any of the functions. The Organising Committee will endeavour to obtain currency facilities and reduced fares. Correspondence should be addressed to the Secretary, Musée du Congo Belge, Tervueren.

Embryology of Monsters

A recent issue of *Ciba Symposia*, a journal produced by a pharmaceutical firm, contains two informative articles on monstrosities in embryological development. The first, by Dr. Hamburger, professor of zoology in Washington University, St. Louis, is a general account of natural and experimentally induced maldevelopments. The second, by Dr. Wolfgang Born, of the Department of Fine Arts of Louisiana State University, traces the course of monstrosities, real and imaginary, as they appear in painting, sculpture and mythology. It is interesting that Dr. Born is a son of the Gustav Born who was one of the founders of experimental embryology, and one of whose main discoveries was that two halves of a divided amphibian embryo will fuse together if they are kept in apposition. It is widely believed that this finding was one of those brilliant outcomes of an accidental observation. In the course of Born's studies on regeneration, some tadpoles were halved just after hatching. To enable him to distinguish individual larvæ on which he was working, he left a part of the skin of the back intact after having halved the bodies. To his surprise he found next day that the halved larval bodies the dorsal skin of which had been left intact had re-united and healed together.

This observation led Born to the fundamental discovery that it is possible to join together as a chimæra the half of an embryo of one amphibian species with that of another. This fact provides the basis for the many transplantation and grafting experiments out of which much of experimental embryology as we know it to-day has developed. The centenary of Gustav Born's birth takes place in 1951, and it is to be hoped that the occasion will be properly celebrated by the publication of a commemorative volume tracing the story of his work and its subsequent development. The present issue of *Ciba Symposia* is a reminder of his very great contributions to experimental embryology, and of the widespread interest which the subject of monstrosities has always aroused.

Simultaneous Recording of Related Oscillograph Traces

DURING the War, the frequent need in such fields as ballistics, and the study of mechanical shock and vibration, to obtain information about the temporal variation of quantities, and in particular the interrelationship of these variations, led to a considerable use of the cathode ray oscillograph and moving-film technique. The methods of obtaining several records at once so as to permit a study of this interrelationship included the use of double-beam oscilloscopes, electronic switches for beam splitting, ganged cameras, and the photographing of a number of screens on the same film. Messrs. Cossor designed a unit comprising a 70-mm. film camera facing the screens of two double-beam tubes, and provision was made for ganging three such instruments together. The problem became more difficult, however, when it was desired to record some fifteen traces on the same film, as it was obviously impracticable to photograph fifteen oscilloscopes in line and still retain reasonable trace amplitude. To meet such a requirement, Messrs. Avimo Ltd., Taunton, have produced a series of units, employing up to fifteen 1½-in. cathode ray tubes photographed through mirrors on 70-mm. film or paper. The apparatus is robust and portable, and has a range of film speeds of 1–50 in./sec. The optical reduction factor is 2·5, and a microscope is provided to allow observation of the traces during recording. Of particular importance is the provision of adjustments to permit the alignment of the tubes so that each deflexion shall be normal to the film motion and all the deflexions shall be colinear.

Rubber Developments

Rubber Developments is a new illustrated quarterly, issued gratis by the British Rubber Development Board, Market Buildings, Mark Lane, London, E.C.3. The primary purpose of the journal is to direct attention to fresh or extended applications of the use of rubber, and it is addressed more to the potential user than to the manufacturer of rubber. The first number, consisting of 40 pages, contains articles on the rehabilitation of rubber estates in Malaya, liquid latex, engineering with rubber, and 'Positex', as well as other features. It is interesting to note that there are now six pamphlets available describing 'Positex' and its applications to woollens, cotton, linen and other yarns, and felts, and also its use as a textile printing paste. The British Rubber Development Board is a non-profit-making organisation, deriving its funds from a cess on raw rubber exported from the British production areas. The Board works in association with corresponding units in France and Holland, the work being co-ordinated on an international basis by the International Rubber Development Committee, the area allocated to the British Board comprising the British Empire and the United States.

Unasylva: A Forestry and Forest Products Review

THE first number of *Unasylva*, a new, illustrated, bi-monthly magazine of forestry and forest products, published by the Food and Agriculture Organisation of the United Nations, is dated July–August, 1947. Editions are being issued both in English and French, and a Spanish edition is planned for the near future. The aim of the journal is to shed light on all problems connected with forestry, to compare the methods used in different countries and to present the opinions of experts in the various fields. It is realized that the nations working together through the Food and Agriculture Organisation cannot hope to achieve their main objectives if due regard is not paid to the vast forests of the world. Conservation of those that perform useful social or protective functions is essential; their soils must be used wisely if productivity is to be maintained, and improved methods of processing and utilizing forest products need to be found. In the first number, Sir John Boyd Orr, director-general of the Organisation, contributes a foreword, while articles relating to the disappearance of the tropical forests of Africa, forest utilization, and the growth of the world's forests appear under the sub-heading "Problems". In the section dealing with "National Situations" are papers on timber shortage or timber abundance in the United States, and forest and forest products research in Canada, while a further part is devoted to a description of the scope and framework of the Forestry Division of the Food and Agriculture Organisation. Distributing agents for the new magazine are being selected for various countries and areas. Meanwhile, orders are being taken by the Documents Office, FAO, 2000 Massachusetts Avenue, N.W., Washington 6, D.C., U.S.A.

Physical Chemistry at the Mellon Institute

A DEPARTMENT of Research in Physical Chemistry has been established at the Mellon Institute of Industrial Research, University of Pittsburgh, to conduct fundamental investigations in its domain for professional and public benefit. Since its beginning, the Mellon Institute has recognized the need of fundamental scientific research as a background and source of stimulus for investigations in applied science. The Institute has therefore supported extensively disinterested investigations planned within the organisation and focused on the study of more basic problems than those usually pursued in researches in applied science or technology. This new Department of Research in Physical Chemistry will supplement the Institute's work in pure science, carried on since 1911 and formally organised under the Department of Research in Pure Chemistry in 1926 and the Department of Research in Chemical Physics in 1946. The Department of Research in Pure Chemistry specializes in the organic, biological and pharmaceutical fields. As investigations in pure science are completed, the results are published and widely disseminated. Dr. John R. Bowman, who has been appointed head of the Department of Research in Physical Chemistry, has distinguished himself in applied mathematics, particularly as employed in the analysis of chemical engineering problems, and in petroleum chemistry, especially in his comprehensive original work on distillation. He was born in New York, in 1910, and educated at the University of Pittsburgh and at the California Institute of Technology. Since 1935 he has been at the Mellon Institute, on the multiple fellowship of the Gulf Research and Development Co.

Public Libraries in Germany

H. SCHURER'S paper "Public Libraries in Germany", published as No. 5 in the German Educational Reconstruction Series (15 James Street, London, W.C.2), gives a readable account of the development of the public library system in Germany and of the two schools of thought, neither favouring open access to the shelves, which influenced that development down to the Nazi regime; it also deals with the part which the system could play in the educational reconstruction of Germany. The ideas of Walter Hofmann and his school in making book selection the decisive intellectual task of library service, with all its implied demands on the library staff, are set forth in some detail and should be of considerable interest to those engaged in library work in Britain, whether in the public library service, in the universities or in industry and commerce. The special characteristics of the tradition of German librarianship are of international significance, and a chapter in L. R. Wilson and M. F. Tauber's book on the university library suggests that that tradition has already made its influence felt in the United States as a positive contribution in library service. As regards the immediate future in Germany, apart from the restoration of damaged buildings and the recovery of lost stocks, Mr. Schurer considers that the main task will be the negative one of undoing most of the work of the Nazis, including the elimination of Nazi literature from book collections, removal of ardent Nazis from responsible positions, the preparation of new readers' guides and the training of library workers. Furthermore, he considers that the principle of open access must now be adopted, and he looks to a steady increase in the number of readers and to a healthy development of local and regional efforts rather than national or centralized efforts.

Glasgow Art Gallery and Museum

COMMENDABLE enterprise in making the natural history department attractive to visitors has been shown recently by the Glasgow Art Gallery and Museum. Despite special difficulties caused by enemy action during the War, considerable material has been salvaged and displayed as a series of habitat groups in an Animal Court at the Museum. The first and second arches contain representative samples of African and Indian animals, and the others in preparation will display animals of Australia and the Scottish Highlands. To accompany each display the Museum is publishing a series of attractive booklets in which each animal typified is described and illustrated. "Animals of Africa" and "Animals of India" are already available.

Medical Sub-Section of the Library Association

THE first ordinary meeting of the newly formed Medical Sub-Section of the Library Association was held at the National Institute for Medical Research on January 2. In welcoming the seventy or more members and guests, Dr. C. R. Harington, director of the Institute, spoke of the increasingly important part played by library services in the modern medical world and of the invaluable aid that specially trained librarians could give to those engaged in medical practice and research. Dr. G. Popjak gave an illuminating talk on recent developments in nuclear physics and their medical applications; his exposition of the manufacture of radioactive isotopes was much appreciated. Miss Ethel Wigmore, librarian to the Medical Research Council and a member of the Committee of the Medical Sub-Section, then described the work of the Library of the Institute, and this was followed by a conducted tour. The members were especially interested in the system of indexing current periodical literature pending the issue of the *Quarterly Cumulative Index Medicus*, and in the very comprehensive subject-index to the large collection of reprints.

Institution of Electrical Engineers: Awards

THE triennial award of the Coopers Hill War Memorial Prize and Medal, which fell in 1946 to the Institution of Electrical Engineers, has been made by the Council to Mr. E. C. Cherry, for his paper on "Analogies between the Vibration of Elastic Membranes and Electro-Magnetic Fields in Guides and Cavities".

No award having been made in 1946 of the Page Prize for the best thesis in lieu of the Associate Membership Examination of the Institution, the Council has awarded two Page Prizes for 1947: one to Mr. D. T. Hollingsworth for his thesis entitled "An Account of the Development of the Accessories for a Cable with the Dielectric under Pressure"; and the other to Mr. M. K. Taylor for his thesis entitled "The Transmission of Voice Frequencies by Height Modulated Pulses of Constant Recurrence".

Announcements

APPLICATIONS are invited for research fellowships, normally of the value of £600 per annum, founded by Imperial Chemical Industries, Ltd., tenable in the University of Cambridge and available for research in physics, chemistry, biochemistry, engineering, metallurgy, pharmacology, chemotherapy, or related subjects. Applications should be received not later than April 30. Regulations governing the award of the Fellowships may be obtained from the Secretary of the Board of Research Studies, The Old Schools, Cambridge, to whom all applications should be addressed.

A PRELIMINARY announcement under the title "Photostat Copies of German Scientific and Technical Papers" appeared in *Nature* of September 27, 1947, p. 427. It has now proved possible to reduce the cost of this service and a revised charge of 6*d*. per page, irrespective of number, is now being made.

ERRATUM.—Mr. A. B. Wardrop and Dr. R. D. Preston write: "In our recent article entitled "Organisation of the Cell Walls of Tracheids and Wood Fibres" in *Nature* of December 27, p. 911, we inadvertently allowed the same mistake to occur in three places. The legends to the abscissæ of Figs. 3 and 4 should read 'Angle of section to *transverse* plane' and the word 'increasing' (p. 912, line 8) should read 'decreasing'."

LETTERS TO THE EDITORS

Audio-Frequency Radio Waves from the Sun

The recent discovery of solar radio noise, in the range 30–1,000 megacycles, raises the question whether lower frequencies may not also exist. Variable magnetic fields exist on the sun and probably in the stars as well. Small and rapid pulsations of spot fields may well occur, even though detection of the variations, by studies of the Zeeman effect, will prove difficult. Nevertheless, we may expect that these changing fields will produce electromagnetic radiations the maximum wave-lengths of which are comparable to stellar dimensions. Such low-frequency radiation will escape from the sun in the presence of a steady magnetic field, like those found in sunspots.

Partial absorption of such waves in the solar atmosphere may produce the observed high excitation of chromosphere, prominences and corona. In the earth's atmosphere, similar absorption may be responsible for the luminosity of the night sky and, possibly, also for the aurora polaris. The concentration of the latter in a zone near the magnetic poles may arise from the tendency of accelerated ions to spiral around the lines of magnetic force.

To explain the observed terrestrial effects as the action of solar electromagnetic waves, we require voltages of the order of 0·01–1·00 volts per cm. We postulate the existence of frequencies in the range of from 1 to, say, 500 cycles per sec., though the extent of the range is unimportant for our argument. These long waves will be diffracted around the earth and hence may well cause effects on the dark, as well as on the sunlit, hemisphere. With these assumptions, one readily calculates that an amplitude of at most several gauss, with the appropriate frequency, in the field of a spot can produce the desired radiation.

The total energies involved in the radiation are roughly equivalent to that from an area of normal photosphere about equal to that of a spot. Hence, we further suggest that the emission of radio energy provides a simple mechanism for cooling the spot.

The long-wave emission may account for many ionospheric phenomena, such as sporadic *E*. The waves will cause any 'seed' ionization to spread—a sort of multiplier effect. Some phases of ionospheric storms may also be explained as due to heating of the layers by the absorbed radiation. The waves will have a similar action on meteor trails, the growth and persistence of which are difficult to explain in terms of the meteor itself. The voltages and wave-lengths are sufficient to produce, in regions of low density, high-energy particles, like the softer components of cosmic rays. We suggest that the phenomenon here discussed may be the source of cosmic rays. We suppose that the harder components arise in stars the magnetic variations of which are much more intense than for the sun.

The suggestions made above demand experimental verification. As a first step in the study, we have constructed a large loop antenna, connected to a tunable audio amplifier. With this device, we have detected the existence of variations of the order of magnitude herein suggested, and of frequencies from 25 cycles (the lowest limit of the amplifier) to about 400 cycles.

Further experiments are in progress to determine whether we can attribute the effects to electromagnetic waves of solar origin, or whether we must assign them to micropulsations of the earth's magnetic field.

Showers of Penetrating Particles

The intensity of several 'components' of the cosmic radiation varies with atmospheric depth more rapidly than the intensity of the so-called total radiation (curves of Pfotzer and Millican): for example, showers of penetrating particles measured with a counter arrangement vary according to an exponential law $e^{-x/d}$, where x is the atmospheric depth in gm./cm.^{2} and $d \sim 100$ gm./cm.^{2} [1]. The cross-section for the collision of a primary shower-producing particle with a nucleus in air is of the order $2 \cdot 5 \times 10^{-25}$ cm.^{2}. Neutrons, protons, multiple nuclear disintegrations, large bursts and slow mesons show similar rapid decrease with increasing depth.

The present remarks will chiefly refer to the showers of penetrating particles. Some of them contain at least four particles each penetrating 20 cm. lead, as we have observed by means of eight-fold coincidences between eight counters arranged in four telescopes scattered on an area of 4 m.^{2}. Each counter was surrounded on all sides by 10 cm. lead. The frequency of these showers in S. Paulo (altitude 800 m.) was 3×10^{-4} min.$^{-1}$. Examination of experimental data on the density of particles in such showers, the existence of penetrating particles in extensive showers and the variation of meson intensity and spectral distribution at high altitudes (and at great depths) leads us to the following conclusions: the majority of mesons are produced in groups (in collisions of primary protons or secondary protons and neutrons with nuclei), with a multiplicity increasing with energy in accordance with the scheme suggested by us earlier[2].

Here we limit ourselves to the discussion of one argument. There is a striking difference between the slow variation with atmospheric depth of the frequency of single penetrating particles (chiefly mesons) as measured by a telescope (curves of Schein, Jesse, Wollan and of Ehmert), and the rapid exponential variation with depth of the frequency of penetrating showers measured by us[1]. Obviously, a telescope indicates the arrival of every meson the trajectory of which lies inside the solid angle defined by the counters. The collision process which gives rise to these mesons can take place at great altitudes above the telescope (for example, at 20 km. above), provided their life-time is long enough and their energy is not too low. Thus the telescope measures the integral intensity of mesons produced inside the solid angle defined by the telescope, whereas the large-angle arrangement of 4-fold or 8-fold coincidences used by us can only register bunches of particles created locally at distances of not more than a few hundred metres above the arrangement. Indeed, if, for example, the centre of the shower is located at 10 km. height above the arrangement, the angular spread of the penetrating particles will give rise to an average distance between the points of arrival of two mesons on a horizontal plane (at 10 km. below the centre) greater than the distance between the telescopes of our arrangement, and no coincidence will be registered. Thus the exponential variation with atmospheric depth in our experience refers to penetrating showers produced locally.

The rapid increase of the number of slow mesons and neutrons with altitude leads us to associate these particles with local penetrating showers of low energy. The high-energy, long-lived mesons, observed at sea-level and underground, are probably produced also in groups, giving rise to extensive penetrating showers. The cross-section for these processes must be of the same order of magnitude or even greater than the value found by us for local penetrating showers. In all these collisions, energetic secondary nucleons can arise and thus the formation of cascades of nucleons and mesons must be expected.

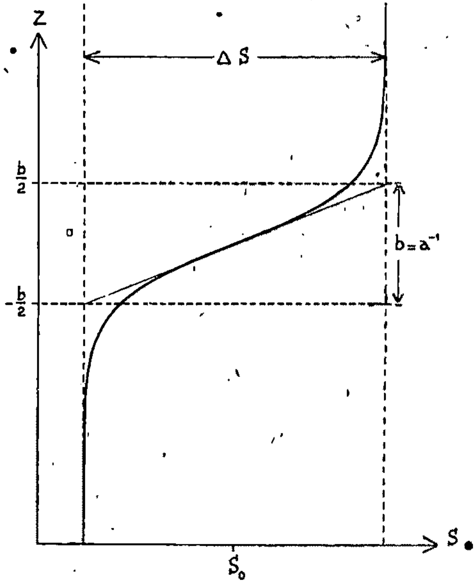
Internal Waves in Certain Types of Density Distribution

Dealing theoretically with internal gravitational waves in vertically inhomogeneous incompressible fluids, many authors have assumed discontinuities, at certain levels, either in the density or in its first derivative with respect to the vertical co-ordinate, z. Fjeldstad, on the other hand, by using numerical integration, gave an approximate solution of the problem for long waves in certain general, continuous density distributions between a free surface and a rigid bottom.



DENSITY DISTRIBUTION REPRESENTED BY A GRAPH OF THE SPECIFIC VOLUME S (THE ABSCISSA) AGAINST THE VERTICAL CO-ORDINATE z (THE ORDINATE)

It has now proved possible to deal with certain continuous density distributions analytically and find complete solutions which are not restricted to the longer wave-lengths.

The density distribution is of the general type shown in the accompanying graph; the relative variation of density is supposed to be small. The fluid is supposed to be incompressible and to be at rest in the non-perturbed state, whereas, in the perturbed state, an internal wave is propagated in the x-direction.

The perturbation is supposed to be small. If we describe the simple harmonic wave motion by means of a stream function

$$\varphi(x,z,t) = \varphi(z) \exp i(mx - nt),$$

it appears that $\varphi(z)$ may be found with, in general, sufficient accuracy as a solution of the equation

$$\frac{d^2\varphi}{dz^2} + \left(\frac{gdS/dz}{c^2 S_0} - m^2\right) \varphi = 0, \qquad (1)$$

where $S(z)$ is the specific volume in the unperturbed state, S_0 is the mean specific volume, $c = n/m =$ velocity of propagation.

As an analytical representation of $S(z)$ we have chosen $S = S_0 + \frac{1}{2} \Delta S \tanh (2z/b)$, where ΔS is the total variation of the specific volume, b is the thickness of the transition layer (see graph). The differential equation (1) then becomes

$$\frac{d^2\varphi}{dz^2} + \left(\frac{g \Delta S}{bc^2 S_0 (\cosh (2z/b))^2} - m^2\right) \varphi = 0. \qquad (2)$$

If the fluid extends to infinity both upwards and downwards, we have as boundary conditions, that φ must remain finite or become zero, when $z \rightarrow \pm \infty$. This is an eigen-value problem.

The differential equation (2) can be solved by means of certain transformations, the solutions being expressed in terms of hypergeometric series. The eigen-values of m, in terms of c, are given by

$$bm = \sqrt{1 + \frac{bg \Delta S}{c^2 S_0}} - (2k + 1), \; k = 0, 1, 2, 3, 4$$

. . ., etc., m being positive.

This yields relations between the wave-length $L = 2\pi\lambda$ and the period $T = 2\pi\tau$, which may conveniently be described by

$$\frac{g \Delta S}{b S_0} \tau^2 = k(k + 1) \left(\frac{2\lambda}{b}\right)^2 + (2k + 1) \left(\frac{2\lambda}{b}\right) + 1.$$

When $\lambda \rightarrow 0$, the period approaches a minimum value for all modes (namely, for all values of k):

$$T_{\min} = 2\pi \sqrt{\frac{bS_0}{g \Delta S}} = 2\pi \sqrt{\frac{S_0}{g(dS/dz)_{\max}}}.$$

It appears that any solution $\varphi_k(z)$ has k zeros for finite values of z; for $z \rightarrow \pm \infty$ it tends to zero exponentially.

It is easy to extend the theory to the case of a rotating fluid (the atmosphere or the ocean on the rotating earth). In this case, the same relation as exists between τ and λ in the previous (non-rotating) case now exists between τ and $\lambda\sqrt{1 - (2\omega_z\tau)^2}$, ω_z being the angular velocity of rotation around the vertical axis.

Further details will be given shortly in a paper by the author in the *Mededelingen en Verhandelingen van het Koninklijk Nederlands Meteorologisch Instituut*, de Bilt, Netherlands.

Electronic Waves and Thibaud's 'Particles'

An inadvertent omission from my earlier communication[1] of the universal constant $(-e/c)$, which should multiply the right of equation (5), and, therefore, both sides of equations (11) and (12), involves that the predicted rate of energy loss by electronic wave radiation is now some 14·4 times as large. Writing $v_r = v \cos \theta$, the corrected formula (12) now reads

$$(-ec)\,\frac{\overline{A}_r}{r} = \frac{e^4}{2mc^2} \cdot \frac{v \cos \theta}{r^3} \cdot \psi\psi^* \doteqdot$$

$$(3{\cdot}24)10^{-31}\,\frac{v \cos \theta}{r^3} \cdot \psi\psi^* \quad . \quad . \quad . \quad (12a)$$

The radiation is now seen to depend on an even power of the charge, and so can be of negative sign only for values of θ which make cos θ negative. An element of an electron beam is seen to radiate nothing in its equatorial plane, a maximum in the forward direction, and a negative maximum in the backward direction.

This fact, coupled with the smallness of the numeric in (12a), suggests the conclusion that electrons accompanied by the assumed spherical electronic waves (of low and substantially uniform group velocity) would not lose observable energy in transit. Indeed, integration of (12a) over all possible values of θ gives zero for a cylindrical beam, neglecting complications due to the effects of beam-forming or beam-receiving electrodes. For an expanding beam a small net rate of loss, and for a converging beam a small net rate of absorption of energy are predicted; but for electrons and all heavier particles the effect is negligible, frequently even when the restriction to nearly uniform motion is waived.

If, however, extremely light particles should come in for consideration, these conclusions might well be reversed in respect of such particles. In this connexion we must give careful attention to the beautiful researches of Jean Thibaud[2], in which he seems to establish the mass of the neutrino at $10^{-11}\,m_0$, where m_0 is the rest mass of an electron. In addition, the neutrino is, according to Thibaud, endowed with a charge, small compared with that of an electron. The term 'electrino' is suggested to cover the particle; but since Thibaud finds both positive and negative neutrinos, we should obviously need 'positrinos' as well. From the preliminary values quoted, it would appear that the radiation-rate divided by the kinetic energy of Thibaud's particles may be up to ten thousand times the corresponding ratio for electrons. For such particles moving in a non-uniform electric field, it is conceivable that this brings the radiation loss to an observable order of magnitude.

At all events, Thibaud[2] finds his particles are liable to gain or lose energy when traversing zones of intense gradient: ". . . the particle appears to suffer appreciable loss of energy per unit length of path—loss due doubtless to a radiation which is no longer negligible as for an electron".

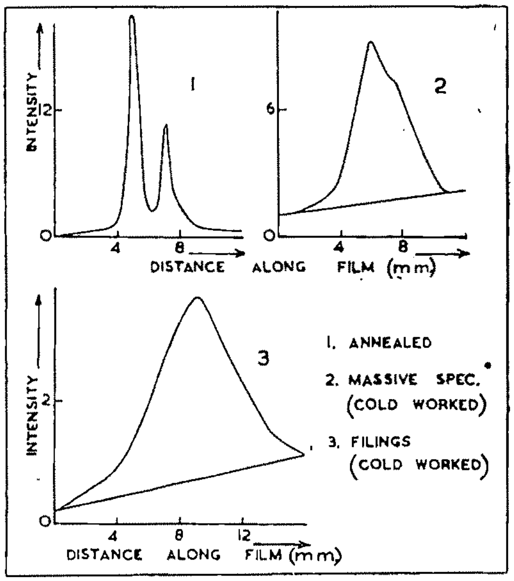
X-Ray Diffraction Rings from Deformed Solid Metal and Metal Powders

The changes in crystalline texture of metals subjected to plastic deformation can be studied by following the increase in diffusion of the X-ray reflexions from the atomic planes. The correct procedure should be always to obtain the reflexions direct from the metal in the normal solid state. But for convenience much work has been based on the circular camera technique, where the test specimen has to be in the form of powder. The metal has been reduced to powder by filing, and measurements made of the breadth and intensity of the X-ray reflexions from the filings. These values have been compared with the breadth and intensity of the reflexions after the filings have been annealed and the effect of deformation thereby removed. The difference has been taken to represent the effect of the cold plastic deformation produced by the action of filing. Then it has been assumed that the same differences would exist between the annealed and plastically deformed state in the solid metal; also that the theoretical conclusions would be applicable directly to interpretation of the structural changes produced by plastic deformation of the solid metal.

We have considered it worth while examining these assumptions by experiment. The results are interesting and may serve to direct attention to a factor which does not appear to have been recognized in previous work.



We have compared the diffraction rings from solid metal, in the form of flat tensile specimens of iron, with the diffraction rings of filings taken from the same specimens. The tensile specimens were plastically deformed by stretching to increasing extents in order that a measurement might be made of the characteristic maximum diffraction broadening which, it has been shown, is reached after progressive deformation, and which has a specific value for a particular metal[1]. This maximum line-broadening was then compared with the breadth of the diffraction rings from the filings. For this purpose the filings were formed into a flat layer of powder, so that they might be examined by X-rays under exactly the same conditions as the flat tensile specimens.

The tests showed that the diffraction rings from the filings in all cases were broader to a striking extent than the maximum broadening obtained from the deformed solid specimens. The effect is illustrated by the accompanying microphotometer traces, obtained by traversing the typical (310) diffraction ring given by cobalt $K\alpha$ radiation. Fig. 1 is from the annealed strain-free metal, and shows the sharply resolved α_1- and α_2-components of the diffraction ring. Fig. 2 shows the broadening of the ring when a tensile specimen is extended by the amount giving the maximum diffusion; at this stage the α_1- and α_2-components are just discernible in the original photograph. Fig. 3 shows the much broader ring obtained from filings; the α_1- and α_2-components have diffused into a single halo, and, in fact, measurements indicated that the line-width was approximately twice the maximum obtainable from the solid metal. The filings referred to in Fig. 3 were taken from an annealed test specimen and represent the least deformation introduced by the action of filing. Filings taken from the plastically deformed specimens tended to give rings which were even broader. The above comparison proves, therefore, that the physical condition of the filings cannot be taken as representative of the condition of the plastically deformed solid metal, as it has been in the past.

We think the explanation will follow from recent observations on the stress-strain curves for the atomic lattice. This work, carried out on metals in the normal solid state, has shown that homogeneous plastic deformation leaves the iron lattice with permanent strains which are directional[2]. Thus after a tensile test-piece has been extended in tension the lattice spacings perpendicular to the axis remain with a residual compression, while spacings parallel to the axis exhibit an expansion, and spacings at intermediate inclinations vary in a regular manner between the two extremes. The diameter of a diffraction ring from such a specimen, since diameter depends on spacing, varies according to the angle between the reflecting planes and the axis of the specimen. This variation does not affect the inherent diffusion of the diffraction ring, because only one direction relative to the axis is photographed at one time; thus the ring can have an enlarged diameter or a contracted diameter, but not a range of diameters. If, however, the metal is reduced to filings, then the lattice expansions and contractions will be oriented at random in the powder. The diffraction ring in a photograph from the filings will be the resultant of rings varying in diameter between the extremes which correspond to the most expanded and most contracted values. Therefore the ring will possess an abnormal and adventitious diffusion in which the inherent broadening characteristic of deformation of the solid metal will be lost.

This view could be tested by measurements of the mean diameter of the diffraction rings from the solid specimen and from the filings. The broad back-reflexion ring from a stretched tensile test-piece photographed with the incident X-ray beam at right angles to the specimen showed an increase over the same ring from the undeformed material; this corresponded to a directional increase in the lattice spacing parallel to the axis, which would be expected from the above-mentioned work. The broader ring from the deformed filings, however, showed no change compared with the annealed material. This confirmed the view that the deformed filings contained a mixture of tensions and compressions oriented at random in a manner which is foreign to the deformed metal in the solid state.

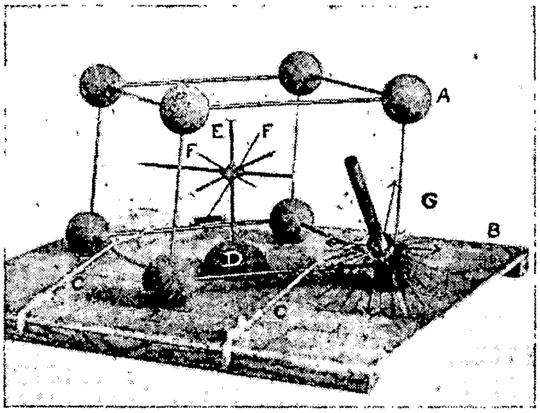
A Simple Universal Model for Representing the Optic Orientation of Biaxial Crystals

IN dealing with crystals of low symmetry, a model showing the orientation of the indicatrix axes with respect to the external form helps greatly in visualizing the optical characters which will be presented by sections parallel to different faces. I have found the model described below extremely useful for this purpose, both in the study of new material and as an aid to the appreciation of published optical data. It is readily constructed from simple materials and can be adjusted to represent the optic orientation in any biaxial crystal to a degree of approximation which depends mainly on the data available.



The external form of the crystal is represented by the framework *A* (see figure), which is built up from cork balls and finely pointed brass rods, the correct angles being secured by comparison against paper templates. It usually suffices to show only the principal faces developed, for it is the sections parallel to these faces which are likely to be of most interest. The approximate inclination of secondary faces with respect to the indicatrix axes can be judged by holding a sheet of mica against the framework in the appropriate position. Only a few sets of rods are needed to build up a wide variety of models, convenient lengths being 4, 6, 8 and 10 in. The framework is secured by spring-tensioned cords *C* to the plywood baseboard *B*, in the centre of which is glued one half of a large cork ball *D*, serving as support for the indicatrix axes *E*. Each axis carries at one end a small disk marked with the appropriate symbol, while the other end is prolonged and finely pointed. By thrusting one or other of these pointed ends into *D*, the axes can be erected in any orientation with respect to the framework *A*. Two thin wires *F*, pivoted on β, represent the optic axes and can be set at any angle.

The case shown in the figure is that of the monoclinic $K_2SO_4,MgSO_4,6H_2O$ with {001} and {110}, and will serve to illustrate the use of the model. The axial plane is (010), $2V$ is 48° (+), and X is almost normal to (001), so that sections parallel to this face give a nearly centred obtuse bisectrix figure, as is immediately apparent from the model. The emergence of the optic axes, and thus the type of interference figure, on a {110} face may be made out very clearly by shifting the framework (while preserving the correct orientation with the aid of the squares marked on the baseboard) so that the axes project through the face. The extinction directions on the face may be determined by means of the sighting protractor G. This consists of a thin glass plate marked with two double arrows at right angles, and thinner radial lines at intervals of 10°. At the centre of the plate and at right angles to it is cemented a short length of thin brass tubing. The model is supported on the floor by means of a stand and clamp, with the face in question horizontal and uppermost. A thick sheet of mica is laid across the face, and on top of this is placed the protractor, which is then moved until, on looking from above, the origin of the indicatrix axes is seen to be in line with the axis of the brass tube and the double arrows bisect the projected angles between the optic axes. By the law of Biot and Fresnel the arrows then represent the extinction directions on the face. With a carefully constructed model this method gives the correct extinction angle to within about 5°. A rougher but more convenient method is simply to view the optic axes through the face, along a direction normal to it as nearly as can be judged, and find the positions at which a rod laid across the face bisects the projected angles between these axes.

Mode of Action of Acridine Antibacterials

Two years ago, it was shown[1] that, in a series of 107 acridines, marked antibacterial activity was, for the most part, confined to those substances which exist mainly in the form of cation at pH 7·3. Apparent exceptions to this rule have since been examined more closely and some important gaps in the series closed.

1-Hydroxyacridine, which possesses antibacterial activity greatly in excess of what could be predicted from its feeble ionization, has been shown to owe this biological effect to an entirely different chemical property, namely, to its ability to combine with metabolically important trace metals. This has opened up a fruitful field of investigation, with the result that antibacterial properties ascribable to this metal-chelating effect have been demonstrated in several other heterocyclic series that bear a hydroxyl-group *ana* to a ring-nitrogen[2].

The enhanced activity of 5-amino-1-hydroxyacridine is a further example of this phenomenon, but two of its isomerides seemed to form exceptions to the cationic rule. Using an approximate correction to derive the pK_a value in water from the pK_a value as determined in 50 per cent alcohol, it appeared that 5-amino-2-(and -3-)hydroxyacridines were sufficiently well ionized (71 and 98 per cent respectively) to command a greater antibacterial activity than was actually found. Re-examination of all four hydroxy derivatives of 5-aminoacridine has shown, rather surprisingly, that they produce a high proportion of zwitterions at pH 7·3, an effect not previously reported for simple phenolic amines. The use of a Hilger absorptiometer has permitted determination of the pK_a values directly in water[3], thus dispensing with the correction which is inapplicable when zwitterionic species are present. The corrected figures are given in the accompanying table (Nos. 22–25; the numbering of the previous paper[1] is retained for ease of reference). It is seen that the new values fall into line with those obtained from the other acridines and add further support to the correlations already found.

The synthesis of 1 : 5- and 4 : 5-diaminoacridines (Nos. 2*a* and 4*a*) completes the set of amino-derivatives of the important antibacterial, 5-aminoacridine. These showed antibacterial activity of the intensity expected from their high degree of ionization.

The inclusion of 2-dimethylaminoacridine (47*a*) provides the first tertiary mono-aminoacridine for the series. The lowered response to Gram-negative organisms (compared with the corresponding primary amine) forms the third example of such an effect in this series (the others being 2 : 8-*bis*dimethylaminoacridine and 2-dimethylamino-7-aminoacridine). This suggests that hydrogen bonding may make a contribution to the action of the primary amines on these bacteria.

Arsenolysis and Phosphorolysis of the Amylose and Amylopectin Fractions of Starch

Doudoroff, Barker and Hassid[1] showed that the addition of arsenate to sucrose phosphorylase from *Pseudomonas saccharophila* catalyses the decomposition of sucrose to glucose and fructose, the reaction being:

$$\text{sucrose} + H_2O \xrightarrow[\text{arsenate}]{\text{sucrose phosphorylase}} \text{glucose} + \text{fructose}.$$

We have found that the addition of inorganic arsenate to potato phosphorylase will also cause the liberation of glucose from starch according to the reaction:

$$\text{starch} + H_2O \xrightarrow[\text{arsenate}]{\text{potato phosphorylase}} \text{glucose}.$$

Apparently an intermediate glucose-1-arsenate is formed which does not accumulate but is decomposed rapidly to glucose and arsenate.

However, there is a distinct difference in the limit to which arsenolysis of amylose and of amylopectin proceeds when potato phosphorylase is used. Whereas amylose is practically completely decomposed to glucose by this enzyme in the presence of arsenate, amylopectin is degraded in this process only to approximately 54 per cent (see table).

Likewise, it has been observed that potato phosphorylase acts towards amylose and amylopectin in a similar manner in the process of phosphorolysis. Under conditions in which the amount of amylose is insufficient to allow equilibrium to be reached between glucose-1-phosphate and inorganic phosphate, the amylose is almost completely phosphorolysed to glucose-1-phosphate, but only about 57 per cent of the amylopectin is converted to this ester.

It is interesting to note that such behaviour is characteristic also of β-amylase[2]. In the well-known hydrolytic reaction, amylose is broken down by β-amylase almost completely to maltose, while amylopectin is degraded by this enzyme only to the extent of about 55 per cent. It can therefore be postulated that, like β-amylase, potato phosphorylase acts upon the branched amylopectin through the process of arsenolysis or phosphorolysis, attacking the non-reducing ends, splitting off successive terminal glucose fragments (β-amylase splits off maltose), until it encounters an obstruction. The obstruction is considered to be a modified structure, which is a 1,6-glucosidic linkage at or near the point of branching. With amylose, which has an unbranched structure and therefore no such linkages, arsenolysis or phosphorolysis continues until the whole molecule is degraded. This difference in behaviour of potato phosphorylase towards the amylose and amylopectin components of starch constitutes further evidence that the former component is linear while the latter is branched.

PHOSPHOROLYSIS AND ARSENOLYSIS OF AMYLOSE AND AMYLOPECTIN

Enzyme digest for phosphorolysis consists of 0·05 *M* sodium phosphate and 0·05 *M* sodium maleate buffers at *p*H 6·65, 2 ml. potato phosphorylase preparation. Total volume of digest, 8 ml. Incubation at 30°.

Enzyme digest for arsenolysis consists of 0·05 *M* sodium arsenate and 0·05 maleate buffers at *p*H 6·65, 6 ml. of potato phosphorylase (different preparation than used above). Total volume of digest, 36 ml. Incubation at 30°.

Substrate	Starch added (mgm./ml.)	Starch phosphorolysed (as percentage of total glucose esterified, ± 3) after		Starch arsenolysed (as percentage of total glucose esterified, ± 3) after	
		4½ hr.	7 hr.	12 hr.	24 hr.
Potato amylose	1·0	102	100	88	89†
,,	2·0	66	65*	85	88†
,,	4·0	35	35*	—	—
Potato amylopectin	0·5	56	60		
,,	1·0	57	58	51	54
,,	2·0			48	53
Tapioca amylopectin	0·5	56	58		
,,	1·0	55	56		

* Starch incompletely phosphorolysed because equilibrium between glucose-1-phosphate and inorganic phosphate had been reached. Excess of starch does not affect the equilibrium.

† The fact that the reaction does not go to completion is probably due to the small amount of retrogradation of amylose that occurs during the experiment.

Reaction of Boric Acid with Polysaccharides

MANY polyhydroxy compounds of low molecular weight are known to form complexes with boric acid in aqueous solutions, as numerous investigations (Böeseken *et al.*) have shown. These complexes are much more easily obtained from cyclic glycols possessing the *cis* configuration than from the *trans* isomers. One boric acid molecule may react with either one or two 1,2-glycol molecules; in the latter case a 'boron spirane' is formed.

No systematic and theoretical investigations concerning boric acid – polysaccharide compounds have been published. Irany[1] studied the effect of boric acid on various substances of high molecular weight in the absence of water. Cross-linking was observed especially in substances in which the macromolecules carried non-adjacent hydroxyl groups. The Pharmacopœia Helvetica V mentions the incompatibility of borax with gum arabic (gel formation). The gelification of aqueous solutions of *Ceratonia siliqua* mucilage by borax has been observed repeatedly[2].

It is to be expected that polysaccharides characterized by adjacent hydroxyl groups in the *cis* configuration will form boron spiranes in the presence of water. If chain molecules are employed, this reaction should lead to the formation of three-dimensional networks (gelification). Experiments with numerous polysaccharides of known composition[3] have shown that only those substances possessing the postulated configuration tend to form chelate esters: mannan from tubers of *Orchis morio*, mono-glycol ester of alginic acid (polymannuronic acid) and galacto-mannans from the endosperm of *Ceratonia siliqua* and *Trigonella fœnum græcum*. Aqueous solutions containing even less than 0·3 per cent polysaccharide are transformed into jellies by the addition of borax, provided that the degree of polymerization of the chain molecules is sufficiently high. Because of its more spherical macromolecules and its low content of rhamnose[4], gum arabic, even at extremely high concentrations, possesses only a small tendency to jellify. Aqueous solutions of the methyl and mono-glycol ester of pectic acid (polygalacturonic acid) do not jellify when borax is added. However, cross-linking takes place, if the monoglycerol ester which carries the required diol group is used.

All the above-mentioned jellies are not formed under acidic conditions. The gels are liquefied by treatment with compounds of low molecular weight which are known to form complexes with boric acid (for example, mannitol, fructose, glycerol, but not sucrose). Their mechanical properties (ropiness, plasticity) can be explained on the assumption that the cross-linkages are not fixed but perpetually destroyed and rebuilt.

It is of interest to note Lopatkin's observation[5] on the agglutination of *B. Shiga-Kruse* by boric acid. This micro-organism produces a polysaccharide which contains rhamnose[6]. Certainly many other mucilages found in animals, plants and micro-organisms will react with borax in a similar manner to the above-mentioned substances. The reaction described might prove to be valuable to macromolecular chemistry and bacteriology. Adjacent hydroxyl groups in the *cis* configuration can thus be identified.

These investigations will be published in full elsewhere.

Constitution of Monazite

X-RAY examination of monazite has been carried out by Hadding[1], Gliszczynski[2] and Parrish[3], and the space group and crystal class uniquely determined. According to Goldschmidt[4], the thorium which is usually present is 'captured' during crystallization of the phosphate from its parent magma because of its favourable ionic size. To compensate for the increased cationic charge of the thorium ion, the resulting lattice must possess a defect structure in which some of the sets of equivalent cationic positions are only partially occupied. The quantity of thorium which can be tolerated in such a structure is not known, but monazites the thoria content of which varies from nil to at least 18 per cent (approximately 0·2 atoms per atom of rare earth element) have been reported[3,5].

While there is agreement about the gross structure of the mineral, the role of certain minor constituents, particularly silica, has not been satisfactorily explained[5]. Many components reported in monazite analyses are undoubtedly due to the presence of a considerable proportion of extraneous heavy minerals which, because of high specific gravity or other factors, have not been removed from the sample. This is the case with much of the iron, tin, chromium, titanium, and probably zirconium in samples of alluvial or littoral origin. Petrographic examination reveals that even single crystals of monazite are seldom free from inclusions of foreign substances. Microscopical observations reveal a much greater degree of homogeneity, however, in some fine-grained monazites obtained from beach sands, natural processes having effectively separated the grains from associated minerals.

The proportion of inclusions in such material is scarcely sufficient to account for the percentage of impurities given by chemical analysis of the sand, even after allowance has been made for the small quantity of extraneous material (insoluble in sulphuric acid) which remains in the sand after repeated magnetic and other separations. It is not unreasonable, therefore, to suppose that some at least of the 'impurities' occupy positions in the lattice of the mineral, for example, silica (usually present to the extent of about 0·5–1 per cent), lime (about 0·2 per cent), urania (about 0·2 per cent UO_2), and other oxides in smaller amounts. Thus calcium and tetravalent uranium, like thorium, could be easily accommodated because of favourable ionic size[4,6].

Marshall[7] has commented on the replacement of silicon by phosphorus in certain silicate structures. A similar replacement appears to occur in certain varieties of zircon rich in phosphorus[8]. The reverse phenomenon is observed in the apatite minerals wilkeite[9] and ellestadite[10], and in the mineral abukumalite, for which Shin Hata[11] has found the ratio Si/P to be 4. The replacement of silicon by phosphorus arises from the comparable size and regular tetrahedral structure of the groups SiO_4 and PO_4[6,12,13]. The possibility arises, therefore, that silica in monazite is present in the phosphate lattice to the extent of about 1 silicon atom for 23 phosphorus atoms. A defect structure with some unoccupied anionic positions would compensate for the increased charge of the phosphorus ion. Conceptions such as these would account both for the variable quantities of thorium and silicon in the lattice and for the variable thorium to silicon ratio observed, thus overcoming the difficulties of the earlier theory of solid solution of thorium silicate in rare earth phosphate, a theory which was shown to be untenable because it demanded constancy of the thorium to silicon ratio.

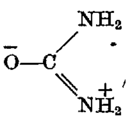
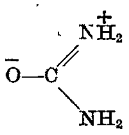
Structure of Urea

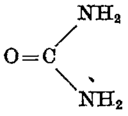
Considerable evidence[1] has been presented for the polar structures I and II as important contributory forms of urea in aqueous solution and in the solid state. This view has been criticized by Bell, Gillespie and Taylor[2] on the grounds of electrometric titration data. The observation that buffering of urea solutions can only be detected at low *p*H values has been interpreted by these authors to mean that urea is a weak monacid base having the uncharged structure III. This result, however, would appear to be compatible with the polar structure of the molecule.



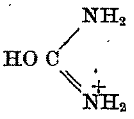
I



II

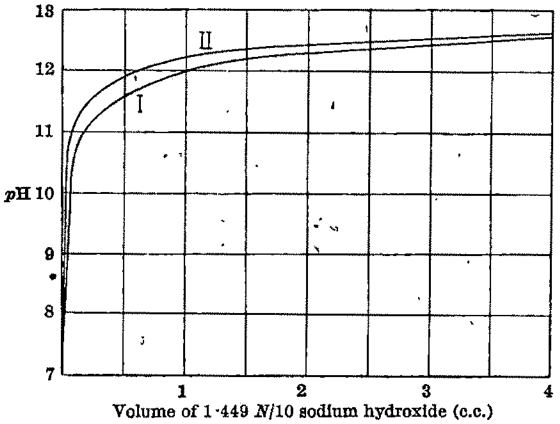


III



IV

Either resonance structure I or II may be regarded as a substituted amidine in which the normal basic strength of this group has been considerably increased by the strong anionoidal characteristic of the attached O^- ($+I$; $+T$). This amidine ion would impart strong acid properties to the hydroxyl group of structure IV, of which urea may be regarded as the acid ion. The acid titration of urea may then be regarded as the back titration of a strong acid ($K > 10^{-1}$), and the alkaline titration as the back titration of a strongly basic substituted amidine, of such strength that buffering is absent in aqueous sodium hydroxide (cf. Bjerrum[3] on the titration data of amino-acids).



I, 10 c.c. $N/100$ benzamidine hydrochloride; II, 10 c.c. water

In support of this view the titration of benzamidine hydrochloride with sodium hydroxide (see graph), in which the O^- of urea may be regarded as having been replaced by the less anionoidal phenyl radical, shows slight buffering. The dissociation constant as computed from these data is of the order of $K_{20} = 10^{-2 \cdot 3}$.

Spread of Detonation in High Explosives

In a recent communication[1], W. C. F. Shepherd makes the interesting observation that in the initial stages of detonation in a cylindrical cartridge of high explosive initiated with a detonator, a phase, referred to as the pre-detonation phase, is often noticeable during which the rate of propagation of the reaction is much lower than the stable value finally established. Moreover, "with progressively stronger initiators, the extent of the pre-detonation phase was correspondingly reduced and the rate of propagation during this phase was increased until, finally, there was no perceptible delay in the inception of detonation".

Having had occasion to study this phenomenon, we can confirm that, in certain high explosives, the detonation set up by a detonator may be of a lower order than that which eventually develops. In such cases, there is an initial unstable phase during which the reaction accelerates more or less rapidly until a point is reached at which the rate of detonation changes abruptly to a much higher value. This phenomenon is fairly common among liquid and gelatinous explosives and is illustrated in photographs Nos. 2, 7 and 10 of a previous paper by one of the present writers[2]. It is not generally known, however, that this effect can be produced in granular solid explosives like crystalline or granulated T.N.T. or tetryl, and that, under suitable conditions, such explosives exhibit the property, usually attributed only to liquid and gelatinous explosives, of being able to propagate detonation at two distinct velocities.

Fig. 1

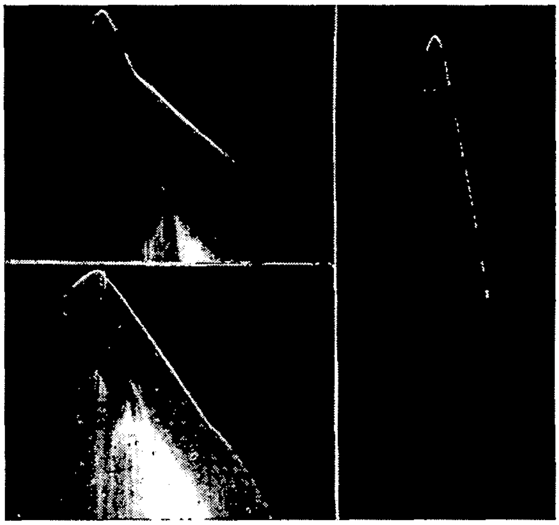

Fig. 3 Fig. 2

The photograph reproduced in Fig. 1 illustrates the case where the initial regime is unstable and, after travelling a certain distance, changes abruptly to the higher detonation level. This record, which is almost identical with that of Shepherd, was obtained with a 1-in. diameter cartridge of granulated tetryl, size 20–30 B.S.S., cartridged at a density of 0·94 gm./c.c. and initiated with a No. 6 A.S.A. detonator. As Shepherd points out, the length of the initial phase varies with the strength of the initiator and can be eliminated altogether by using a sufficiently powerful initiator. Another interesting feature is that it also depends on the grist of the explosive, the density of packing, and the diameter of the cartridge. With high-density compressed cartridges, as used by W. Weibull[3], the high-velocity regime is usually set up immediately, even with detonator initiation. On the other hand, with low-density packing, as used by Shepherd, the low-velocity regime may be initiated first. In the latter case, by using a sufficiently narrow cartridge, or, alternatively, a sufficiently coarse grist of explosive, the low-order detonation can be made to travel throughout the full length of the cartridge (at least a metre) at a rate which is both uniform and repeatable. It appears, therefore, that the explosive has a specific and stable 'low' velocity of detonation under these conditions. On the other hand, if a sufficiently powerful initiator is used, the same cartridge propagates detonation at a greatly enhanced speed, the rate of detonation being again uniform and repeatable.

Figs. 2 and 3 illustrate this point and show the 'low' and 'high' velocities of detonation in identical cartridges of granular solid explosive. The explosive in this case was flake T.N.T., size 20–30 B.S.S., cartridged at a density of 1·0 gm./c.c., the diameter of the cartridge being 1 3/16 in. The cartridge in Fig. 2 was initiated with a No. 6 A.S.A. detonator and gave a velocity of detonation of 1,120 m./sec.; that in Fig. 3 was initiated with a 12·5 gm. tetryl pellet and gave a velocity of detonation of 3,660 m./sec. The length of the cartridge in each case was 10 in., but tests with cartridges up to 1 metre in length showed no indication of any significant change in velocity of detonation with distance along the cartridge.

It is interesting to note that the low-velocity detonation appears to be characterized by incomplete decomposition of the explosive in the sense that some of the original explosive remains chemically unchanged. Visual evidence of this is to be found in the fact that the cloud formed on detonating T.N.T. or tetryl in the open appears white when detonation occurs at the low velocity and black when the high velocity is operative. It will also be seen from the photographs, especially Fig. 1 where the transition point is represented, that the luminosity is much more intense in the high-velocity region than in the low. The presence of undecomposed explosive in the residue remaining after a shot has also been confirmed by chemical tests; and it is remarkable that, even with a sensitive explosive like nitroglycerine, a considerable proportion of the explosive may be scattered without decomposing if the cartridge is below a certain diameter and is initiated with a detonator below a certain strength.

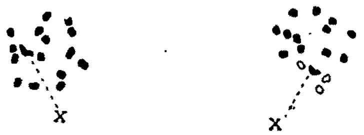
Chromosome Number of *Sesamum laciniatum* Klein

Sesamum laciniatum is a wild species which is reported to occur with another wild species, *S. prostratum* Retz., in south India[1]. The two species resemble each other closely in their morphological characters except for the fact that the leaves of *S. laciniatum* are more deeply pinnatifid than those of *S. prostratum*. Besides these two wild species, the only other representative of this genus in India is *S. orientale* L. (= *S. indicum* D.C.), which is the common cultivated *til*.

Cytogenetical studies on *S. orientale* and *S. prostratum* have been in progress in this laboratory for some years past[2,3,4]. Attempts were made to collect seeds of *S. laciniatum* for the inclusion of this species in the studies in progress, and some were obtained in November 1945 through the courtesy of one of the postgraduate students of this Division, Mr. Syed Murtaza Hasan, who collected them from plants growing in the vicinity of Hyderabad (Deccan). More seed of this species was also obtained later from plants growing in the Coimbatore district in South India.

Fig. 1



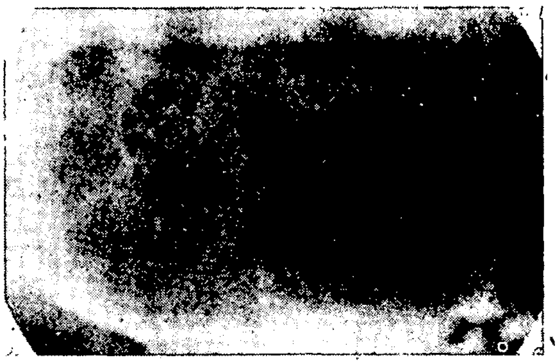


Fig. 2

The seeds were germinated after removing their tough seed coats, and a few plants were raised to maturity and identified as belonging to the species *S. laciniatum*. Aceto-orcein preparations of pollen mother cells were examined for chromosome number. It was noticed in a large number of cells, at metaphase II, that the chromosomes were distributed as 16 + 16 at the two poles (Figs. 1 and 2). The somatic chromosome number of this species was also determined in the root-tip cells as 32 (Fig. 3). It is not surprising that the chromosome number of this species is the same as that of *S. prostratum*, namely, $2n = 32$, considering its close similarity to the latter in morphological characters and distribution in Nature. One peculiarity was, however, noticed in that almost invariably, at second meiotic metaphase, one chromosome in each group of daughter chromosomes was very much less stained than the others and also showed very much less condensation (Fig.

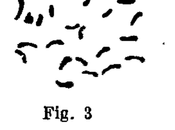

Fig. 3

1, *x*). Further studies on this species are in progress.

It may be mentioned in this connexion that recently Raghavan and Krishnamurthy[5] have reported the chromosome number of this species as $2n = 28$.

Mustard-gas Mutation in *Aspergillus nidulans*

THE production of 'biochemical mutants' of fungi by means of ultra-violet or X-radiation has been reported by Beadle and Tatum[1,2] (*Neurospora* spp.), Fries[3,4,5,6] (*Ophiostoma* spp.) and Pontecorvo[7] (*Aspergillus* and *Penicillium* spp.). Following the use of mustard-gas (β,β′-dichlorodiethyl sulphide) in producing mutations in the vinegar fly (*Drosophila melanogaster*) by Auerbach and Robson[8], this reagent has been used by Horowitz *et al.*[9] to produce mutations in *Neurospora* spp. A method for isolating strains of *Aspergillus nidulans* deficient for a specific amino-acid, cystine, from a mixture of mutants produced by mustard-gas, is now described. These special mutants grow normally in presence of cystine but are unable to grow with sulphate as sole sulphur source.

A dark green 'conidial' strain of the mould, called *A*69 by Dr. Yuill who kindly supplied it, was found by Dr. Pontecorvo to be particularly suitable for the production of X-ray mutants. Seven-day cultures on 10 cm. Petri dishes of maltwort-agar were each exposed to the vapour from three drops of mustard-gas on a 3·5 cm. Whatman No. 1 paper ; ⅜-in. disks of mycelium were removed. Those in which the viable count had dropped to about 3,000 (on cystine-containing medium) were used for isolation of mutants. Spore-suspension from a disk was incubated for 16 hr. in a thin layer of liquid cystineless medium (sulphate as source of sulphur). The suspension was then filtered through glass wool to remove a greater part of the already germinated spores, that is, those capable of using sulphate. By this means the number of viable spores were reduced 10–15 times. The technique is an adaptation of one used by Fries[10]. The resultant suspension was plated on cystine-containing medium.

At this stage in various experiments there have been noted morphological mutants of many types ; for example, white, yellow, yellow-green and cinnamon 'conidial' types, many white and one purple 'mycelial' types, 'perithecial' types and pigment producers. In the experiment quoted, 68 different morphologues (mostly white types) appeared from 640 viable spores. A control test on non-exposed material gave two morphologues out of 1,480. Dr. Pontecorvo has made similar observations on X-ray mutations.

Material from each colony was inoculated on to solid cystineless medium. Those inoculations which only grew a few spidery threads were tested on cystineless and cystine-containing media. Those giving no growth or only a few spidery threads on the former were checked against both media again. Four such isolates were obtained.

To date, thirteen such mutants have been obtained. Some of these tested by Dr. Pontecorvo form 'balanced' heterokaryons with some of his mutants deficient for certain amino-acids.

Full details of media, methods and observations on the exact nature of the biochemical deficiencies will be published elsewhere.

A Vasodilator, Adrenolytic Substance in Aglomerular Fish Kidney

EXPERIMENTS were performed on aglomerular fish kidneys to establish the presence or absence of vaso-active substances. This communication deals with the presence of an adrenolytic, vasodilator substance in extracts of the aglomerular kidneys of the toadfish (*Opsanus tau*). The material extracted was tested for its vasodilator properties on the peripheral blood vessels and capillaries of the frog (*Rana pipiens*), and also for its adrenolytic ability, that is, ability to neutralize and protect against the vasoconstrictor effect of epinephrine.

Material and Methods. Toadfish (*Opsanus tau*), a marine fish which is a normal inhabitant of the deep waters of the Atlantic coast, were obtained by seining in Buzzards Bay off Woods Hole, Mass., and brought to the Marine Biological Laboratory. The fish were kept in aquaria supplied with a continuous stream of sea water and treated as indicated below. The fish were removed from the aquarium and placed in a solution of sea water containing 5–7·5 per cent of ether, C.P. Some fish were anæsthetized by being placed in a bucket containing cracked ice. The fish used varied in size from 8 to 10 in. in length. When anæsthetized, they were placed in a holder ventral side uppermost, and the abdomen opened by a V-shaped incision, commencing above the anal aperture, and extending anteriorly along both sides up to the pectoral fins. The kidneys were dissected free and weighed. Immediately after weighing, they were ground with sand and acid alcohol (95 per cent ethyl alcohol to which 0·1 per cent concentrated sulphuric acid had been added ; *p*H approximately 3·5). After being thoroughly homogenized, enough acid alcohol was added to make the final volume approximately 4 ml. for each gram of kidney. Material and solvent were then placed in a shaker, shaken for twelve hours and treated further according to the method previously published[1,2].

The final product was dissolved in distilled water in an amount in which 1·0 ml. represented the equivalent of material obtained from 1·0 gm. of toadfish kidney. In preliminary chemical tests, it was found to be protein-free (sulphosalicylic acid test), negative with the biuret test, *p*H 4·5–5·0.

The vasodilator effect was studied in the web of medium-sized frogs (*Rana pipiens*). Frogs were pithed and the circulation in the web was observed with a low-power microscope. In the control studies of ten frogs, the diameter of the capillaries was 12–15 microns. The amount of epinephrine injected sufficient to bring the circulation in the web to a standstill was determined by injecting increasing doses beginning with 10 gamma of stock solution (1 : 100,000). 1 ml. of toadfish kidney extract prepared as indicated above was then injected into the lateral lymph sac, and the effect on the capillary vessels, a-v anastomoses, arterioles and venules observed. After the effect was fully established, amounts of epinephrine equal to that required to arrest the circulation were then injected, as well as multiple dosages (2–10 times the amount). In the ten frogs thus studied, all showed a definite increase in the diameter of the capillaries to 20–30 microns following the injection of toadfish kidney extract. In nine out of ten frogs there was complete protection against subsequent administration of epinephrine in doses varying from 100 to 500 gamma (1 : 10,000–1 : 2,000).

Similar results have been reported with an extract obtained from mammalian kidneys, named 'tubulin'[3].

Extracts of toadfish liver similarly prepared failed to produce vasodilation or neutralize or protect against epinephrine in similar dilutions.

A more extensive report of these studies will be published in the near future.

I wish to express my thanks to Dr. Charles Packard, director of the Marine Biological Laboratory, Woods Hole, Mass., for the material and laboratory facilities made available for these studies.

Quantitative Relation Between Salt Accumulation and Salt Respiration in Plant Cells

LUNDEGÅRDH[1,2] has shown how the salt or anion respiration could provide a mechanism of accumulation by transporting anions into the cell. This hypothesis postulates a mechanism whereby anions are transported by an electron carrier (probably cytochrome) in the direction opposite to electrons, and whereby cations exchange for hydrogen ions; both electrons and hydrogen ions enter into the formation of water in the respiratory process. Both ions of a salt are accumulated.

If the Lundegårdh hypothesis is valid, the maximum rate of accumulation should occur when each electron leaving via the oxidase system is exchanged with an anion from the external solution. In this respiration all the molecular oxygen concerned in the process is combined to form water, and each molecule of oxygen therefore requires four electrons and four hydrogen ions. The maximum rate of salt accumulation should therefore be 4 gm. mol. monovalent salt accumulated per gm. mol. oxygen utilized, or,

$$\frac{\text{salt accumulation}}{\text{salt respiration}} = 4.$$

This quantitative relationship is not shown in Lundegårdh's results[3]; but experiments with carrot tissue indicate that, under appropriate conditions, the ratio approaches the theoretical value.

In all experiments, the salt respiration-rate has been taken as the difference between the rate in water and rate in salt solution, which, in well-washed carrot tissue, is equivalent to the cyanide-sensitive respiration[4]. The rate of accumulation, taken over the few hours immediately after the initial equilibration[5], is at its maximum. The results of experiments with various batches of carrots are given in the accompanying table.

Concentration of potassium chloride	No. of observations	Mean of ratio $\frac{\text{Accumulation-rate}}{\text{Respiration-rate}}$
0·00063 *M.*	2	0·44 ± 0·16
0·00125	2	1·60 ± 0·73
0·0025	1	2·09
0·005	6	2·26 ± 0·41
0·01	19	2·88 ± 0·84
0·02	16	2·78 ± 0·62
0·03	4	3·00 ± 0·23
0·04	6	3·17 ± 0·79
0·05	8	3·39 ± 0·70
0·06	4	3·38 ± 0·37

At the higher concentrations the ratios approach the hypothetical value. Both salt accumulation and salt respiration-rates increase asymptotically with increasing concentration, but the salt respiration-rate approximates to the asymptote at lower concentrations than does the salt accumulation-rate. This accounts for the significantly lower ratios observed at low concentrations. Results of the same order of magnitude have been obtained with other halides on carrot tissue, and with beet tissue[6] and barley roots[7].

Comparison of these with other relevant data in the literature indicates that: (1) low concentrations give low ratios; this probably accounts for the low ratios calculated from Lundegårdh's results with low concentrations of salt on wheat roots; (2) at higher concentrations when neither accumulation nor salt respiration is limited, the ratio approaches that required by the theory of ion transport by an electron carrier.

This work will be published in full elsewhere. We wish to express our thanks to Prof. J. S. Turner and Dr. J. R. Vickery.

Aggression, a Component of Post-Epileptic Automatism in *Peromyscus*

CONVULSIVE seizures of rodents have been described in rats[1-4] and in *Peromyscus*[5]. Although various types of convulsive seizures exist, the epileptic form is common to all the strains of animals in which a seizure can be precipitated by specific sounds (audiogenic), and is also induced by other methods. This type has the following general form: a period of disorientated running is succeeded by a clonic phase or by clonic-tonic convulsions, terminating either in a spastic state, catalepsy or exhaustion.

Our studies on a strain of epileptic *Peromyscus* (*maniculatus-artemesiæ*, received from Dr. L. R. Dice, Ann Arbor, Michigan) have revealed a new component of the behaviour in the post-convulsive phase. While convulsing two litter-mate animals together in the same enclosure, the animal which recovered first from the fit made a savage attack on the other, biting and holding it with the fore-paws.

Typically we have observed 'bouncing' convulsions lead to a prostrate clonic phase during and after which the jaws of the mouse are constantly in motion, and it may sometimes bite its own feet. The animal recovers while still undergoing clonic movements, and then runs and hops round the cage with retroverted head. In this phase it will follow and attack other mice or attack models and occasionally attempts to bite the floor. Sometimes the attacks are interrupted by clonic movements which loosen its hold on the attacked object. Otherwise it may crawl over the model, attacking it in many places, or make repeated sallies at the same model. Finally, it halts, shaking with ears extended, hairs on the back erect and with its head and tail raised.

Referring to the latter part of the 'bouncing' fits, Watson[5] says, "After 5 to 20 seconds of clonic convulsions most of the mice in this condition will take hold of the cotton which surrounds the tin enclosure in which they are tested; they hang along the cotton with their feet or teeth for several minutes until they are able to walk away". This attitude, we suggest, is really an attack. Hamilton[2], describing the post-convulsive symptoms of his rats, mentions that "After the convulsive attack the animal relapses into a 'coma' which may last from a few seconds to as long as thirty minutes. If it is of short duration the animal usually is subsequently hypersensitive, squealing, jumping and biting violently when touched," and "During the later stages of the coma the animal may make aimless head movements from side to side or chew on objects that reach his mouth, such as sawdust, other rats, his own paws and frequently his tail, which because of a characteristic sitting position is readily accessible".

This behaviour is in many respects the same as that discovered by us, except that the 'coma' prevents the animal from making an assault. Apparently, observers working with *Peromyscus* have missed this component of the fits because they have only reported observations on solitary animals. Later work on a number of animals of both sexes has confirmed our original observation, the aggression, occurring towards the end of a 'bouncing' clonic convulsion with marked regularity in young animals. Not only do they make attacks on cage mates which are not attacked between fits, but they chase and attack other mice. The attacks are also made on models and in the presence of a number of different models, such as a stuffed *Peromyscus* pelt, a cotton-wool roll and a 'Plasticine' model; the wool- and fur-covered models are attacked preferentially. The aggression is, therefore, part of a co-ordinated phase of behaviour and is thus an automatism. This suggests that the hopping and running of the mice in this phase are also automatic phenomena, due to a "return of activity to the lower centres" before the derangement of the neural mechanism has been restored to normal[6].

In view of the close similarity of audiogenic convulsions in *Peromyscus* and rats, it would be interesting to know if post-convulsive aggression occurs in any of the different strains of rats subject to this type of abnormal behaviour.

As aggression is a component of post-ictal automatisms in man[6], the discovery of an aggression in the behaviour of *Peromyscus* following audiogenic seizures adds a further point to the evidence suggesting a close similarity between this type of abnormal behaviour in rodents and epilepsy in man.

Absorption of Protein and Bacteria from Normal and Infected Joints

KNEE joints of rabbits were infected by intra-articular injection of staphylococci. In some cases a diluted solution of a standardized staphylococcus filtrate was used instead. The absorption of protein from the joint cavity was tested by means of 5·5 gm. per cent solution of human hæmoglobin in isotonic saline containing 10 mgm. per cent of calcium. Living radioactive bacteria used in absorption tests were prepared by growing *Mycobacterium phlei* on a Sauton substrate containing radiophosphorus.

The following observations were made. During the first hour of infection, the absorption of hæmoglobin is increased above normal. Two to three hours after infection, the rate of absorption of hæmoglobin is temporarily decreased below normal. The decrease lasts only a few hours. Heparinization of the animals prevents this decrease of absorption; instead, an increased absorption of hæmoglobin, as great as during the first hour after infection, prevails for several hours. The absorption of radioactive bacteria injected one hour after the infection is greatly reduced whether heparin is given or not. In joints inflamed by means of a diluted culture filtrate, the absorption of hæmoglobin is increased far above normal. This increase is partly prevented by large doses of desoxycorticosteroneacetate. Desoxycorticosteroneacetate, however, has no effect on the absorption of hæmoglobin from normal joint cavities.

The results confirm previous statements by Menkin[1] that in staphylococcus inflammation the absorption of colloids is partly blocked by fibrin clots. The formation of these clots is prevented by heparin. The fact that the absorption of radioactive bacteria is blocked in spite of heparin shows that this block has a different origin. Control experiments on benzene-poisoned animals are in progress in order to investigate if the partly blocked absorption of bacteria depends on leucocytic action.

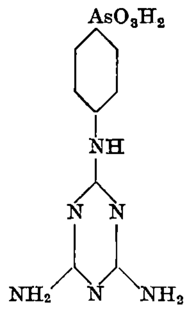
'MELARSEN' AND 'MELARSEN OXIDE'

By J. WILLIAMSON
May and Baker Research Fellow

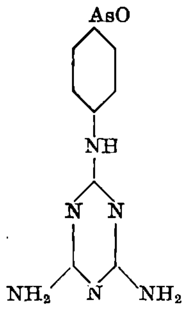
and DR. E. M. LOURIE
Director, Department of Chemotherapy,
Liverpool School of Tropical Medicine

Activity Against Tryparsamide-Resistant Trypanosomes

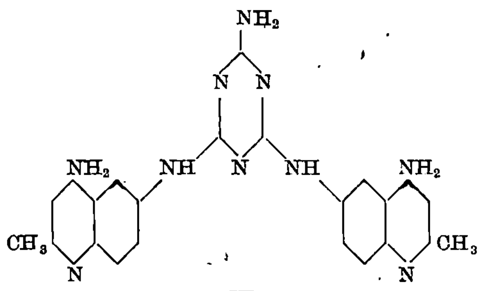
THE melaminyl arsonate, 'Melarsen', that is, the di-sodium salt of 4-melaminylphenylarsonic acid [I], and the corresponding arsenoxide, 'Melarsen oxide' [II], have been suggested for the therapy of *T. gambiense* sleeping sickness[1,2,3]. The most recent published statement on field trials of the latter compound is by Van Hoof[4], who mentions that it is effective against cases of tryparsamide-resistant sleeping sickness. There seems, however, to have been no publication, as yet, of any trials in laboratory infections which might give solid support to the expectation of efficacy in such cases. We have therefore tested the point by comparing the action of 'Melarsen oxide' on our laboratory strain of *T. rhodesiense* and on its tryparsamide-resistant offshoot. (*T. rhodesiense* is not normally sensitive to tryparsamide and other arsenicals, but in the course of many years of mouse-passage our strain has acquired a high degree of sensitivity, and tests against laboratory infections of this strain have proved to be a reliable screening method for the selection of compounds for use against *T. gambiense* infections in man.)



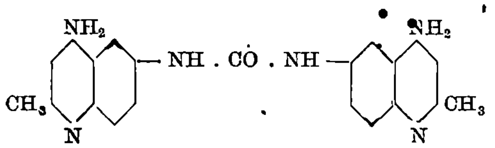
I



II



III



IV

Mice were treated on the second day after intraperitoneal inoculation of 2×10^4 trypanosomes, when the blood contained about 1 to 10 parasites per microscope field (⅙th obj.). 'Mapharside', 3-amino-4-hydroxyphenylarsenoxide, was used instead of tryparsamide to confirm that the tryparsamide-resistant offshoot had retained its resistance unimpaired since this character was acquired eighteen years ago[5].

TABLE 1. EFFECTS OF 'MAPHARSIDE' AND 'MELARSEN OXIDE' ON INFECTIONS OF THE PARENT STRAIN AND TRYPARSAMIDE-RESISTANT OFF-SHOOT OF *T. rhodesiense* IN MICE

Drug	Trypanosome strain	Dose (intraperitoneal), mgm./20 gm.				
		0·2	0·1	0·025	0·015	0·01
'Mapharside'	Parent	4 4C	5 5C	10 1C 9R	33 1C 29R 3N	15 8R 7N
	Resistant	8 8N	5 5N			
		0·05	0·025	0·01	0·005	0·0025
'Melarsen oxide'	Parent	4 4C	4 3C 1R	4 4C	17 8C 9R	19 1C 15R 3N
	Resistant	4 4C	4 4C	4 3C 1R	4 3C 1R	4 2R 2N

Results shown as follows:
4 1C 1R 2N = 4 mice treated; 1 cured (blood permanently cleared of trypanosomes), 1 relapsed (blood temporarily cleared), and 2 not affected (blood not cleared).

Table 1 shows that (*a*) the tryparsamide-resistant offshoot has retained a full measure of resistance, and (*b*) 'Melarsen oxide' is equally as efficacious against the resistant as against the parent strain.

'Melarsen' also was shown, by similar tests, to be equally effective against both strains.

Interference by 'Surfen C'

The commonly used term 'arsenic-resistance', in reference to trypanosomes resistant to aromatic arsenicals such as tryparsamide, 'Atoxyl', 'Mapharside', etc., has long been recognized as a misnomer, since it is the non-arsenical substituted phenyl radical rather than the mere presence of arsenic which may determine whether or not a compound is active against so-called 'arsenic-resistant' trypanosomes. Thus, it has been known since the time of Ehrlich that 'Atoxyl'-resistant trypanosomes are sensitive to arsenophenylglycine and to other aromatic arsenicals containing an acetic acid or carboxyl substituent[6,5,7]. This feature has again been given prominence by Eagle's introduction of γ-(*p*-arsenosophenyl)butyric acid, active against tryparsamide-resistant trypanosomes[8]. King and Strangeways[7] suggested that such carboxyl-substituted arsenoxides differ from others in their mode of fixation on, or entry into, the trypanosome cell, while the ultimate lethal mechanism (presumably an inactivation of essential —SH groups) is the same for all types of arsenoxide. We have provided further circumstantial support for this view in arguments depending on the finding that *p*-aminobenzoic acid interferes with the trypanocidal action of Eagle's compound but not with that of 'Mapharside', while glutathione interferes with the action of both[9].

With the demonstration of 'Melarsen oxide' as a representative of a further class of arsenoxide active against tryparsamide-resistant trypanosomes, it became of interest to find out whether suitable interference experiments might provide similar circumstantial evidence for the view that this type of arsenoxide also differs from others in its mode of fixation on the trypanosome cell, but not in the essential mechanism of its lethal effect.

The obvious type of compound in which to seek for the property of selective interference with 'Melarsen oxide' would be a substance containing the melamine nucleus. Such a compound is 'Surfen C', bis(2-methyl-4-amino-6-quinolyl)melamine [III], which is itself a chemotherapeutic agent of significant activity against *T. congolense* and *T. brucei*[10]. It also exercises some action on our strain of *T. rhodesiense*. In the experiments below, mice were infected with the parent strain of *T. rhodesiense* and treated under the standard conditions of timing and degree of infection mentioned above; in these circumstances more than 24 hours elapse before the blood becomes free of trypanosomes after treatment with 'Surfen C' even in maximal doses.

Table 2 gives the results of a number of interference experiments and shows that while *p*-aminobenzoic acid interferes selectively with Eagle's compound, 'Surfen C' interferes similarly with 'Melarsen oxide'.

TABLE 2. SELECTIVE INTERFERENCE: *p*-AMINOBENZOIC ACID AGAINST γ-(*p*-ARSENOSOPHENYL)BUTYRIC ACID (EAGLE'S COMPOUND), AND 'SURFEN C' AGAINST 'MELARSEN OXIDE'

Treated with (intraperitoneally)	Main treatment preceded 5 min. by		
	—	*p*-Aminobenzoic acid (70 mgm./20 gm.)	'Surfen C' (4 mgm./20 gm.)
'Mapharside' 0·015 mgm./20 gm.*	cl	cl	cl
Eagle's compound 0·015 mgm./20 gm.*	cl	n	cl
'Melarsen oxide' 0·003 mgm./20 gm.*	cl	cl	n

Each cell of the table represents results of treating at least eight mice.

*ED$_{95}$, that is, dose causing temporary disappearance of trypanosomes from the blood in 95 per cent of mice (estimated by probit analysis of numerous trials).

cl = blood cleared of trypanosomes in 24 hours.

n = blood not cleared of trypanosomes in 24 hours.

Other tests showed that glutathione interferes equally with the action of 'Melarsen oxide' and of the other arsenoxides. If, then, glutathione interference be accepted as evidence that the essential mechanism of lethal action is by interference with —SH constituents of the parasite cell[11], we may conclude that 'Melarsen oxide' (like Eagle's compound) shares this mode of action with other arsenoxides, but that it differs in its fixation on, or route of entry into, the trypanosome, this fixation or route being selectively blocked by 'Surfen C'.

It is reasonable to suppose that it is the melamine nucleus of 'Surfen C' which determines the selective nature of its interference with 'Melarsen oxide'. If this were so, then no such selective interference should be exercised by 'Surfen' [IV], which differs from 'Surfen C' by having a carbamide instead of a melamine linkage between the two quinoline systems[10]. This anticipation was substantiated by interference experiments in respect of 'Surfen' and the three arsenoxides. It was found, however, by examining the blood at hourly intervals within eight hours of treatment, that instead of complete absence of any interference with the three arsenicals (as found in similar tests of 'Surfen C' with 'Mapharside' and Eagle's compound, respectively), 'Surfen' does exercise some degree of interference with each of the three arsenicals. The significance of this non-specific interference will be elaborated elsewhere, but meanwhile it is established that the interference of 'Surfen C' operates selectively against 'Melarsen oxide', and presumably depends on the presence of the melamine system in both compounds*.

The facts, therefore, warrant the view that while the ultimate lethal mechanism of 'Melarsen oxide' is the same as that of other arsenoxides (by inactivation of —SH groups, perhaps of the pyruvate oxidase system[12]), it has a radically different means of fixation on, or entry into, the trypanosome cell, and it is this difference which may underlie the fact that it is active against trypanosomes resistant to the more usual type of arsenical. We have recently reached a similar conclusion in connexion with antimalarials. Representatives of the earlier pyrimidine prototypes of 'Paludrine', such as 3349 [13], are active against 'Paludrine'-resistant *P. gallinaceum*, and we have connected this finding with the conception that the pyrimidine precursors of 'Paludrine' share with the latter a common (but unknown) ultimate mode of lethal action on the malaria parasite, while differing in their mechanisms of attachment to, or entry into, the parasite cell[14].

This work was supported by grants from the Medical Research Council. We are obliged to Messrs. Parke Davis and Co. for supplies of 'Melarsen' and 'Melarsen oxide'.

* *Note added in proof.* This supposition has been further supported by finding that melamine itself interferes with the therapeutic action of 'Melarsen oxide', but not of 'Mapharside' or Eagle's compound.

INTERNATIONAL STUDY OF RHEOLOGY

International Joint Committee on Rheology

IN December 1945 the International Council of Scientific Unions instituted a Joint Committee on Rheology, with representatives of the International Unions for Physics, Chemistry, Biological Sciences, and Geodesy and Geophysics, to which afterwards was added the International Union for Theoretical and Applied Mechanics. The International Union of Physics will act as 'mother union' for this Committee.

The Committee held its first meeting during September 8–9, 1947, in London. It was decided that its terms of reference should be to co-ordinate research and to investigate problems concerning the deformation and the flow of matter, and the following were nominated as officers for the year 1947–48: *Chairman*, Dr. Th. von Karman, Pasadena, Cal.; *Vice-chairman*, Mme. A. Dobry-Duclaux, Paris; *Secretary*, Dr. J. M. Burgers (van Houtenstraat 1, Delft, Holland); *Committee*, P. Eggleton, H. Eyring, A. Frey-Wyssling, G. van Iterson, jun., G. W. Scott Blair, R. Signer and Sir Geoffrey Taylor. The Committee intends to act as a central body for establishing contact between scientific men and societies engaged upon work in rheology. For this purpose it has chosen the following subjects for its initial activities: nomenclature; abstracting work in rheology; standards of high viscosity. A report on the nomenclature of deformations, prepared in Holland during the War under the auspices of the Committee for the Study of Viscosity and Plasticity of the Royal Netherlands Academy of Sciences (Amsterdam), was considered at the meeting. This report, after modification as a result of discussion, will be submitted both to the members of the Committee and to co-operating societies and groups, with an invitation to send in criticisms and, if desired, new proposals.

As regards abstracting work in rheology, a report will be prepared on what is already being done in this subject, and contact will be established with the United Nations Educational, Scientific and Cultural Organisation. Finally, information will be collected on materials suitable as standards of viscosity of the order of 10^6 poise and more.

International Rheological Congress

An International Rheological Congress will be organised by a Dutch committee, to be held in Scheveningen (near The Hague), during September 21–25, 1948. The Joint Committee intends to hold a meeting during this Congress, at which the information gathered can be discussed and eventually brought before the Congress. The provisional programme includes the following topics: recent developments in the theory of viscosity; nomenclature; fundamental experimental methods; solutions of macromolecular substances; Russian work on rheology; relations between stress and strain in complicated systems; abnormal substances and abnormal phenomena of flow; psycho-physical aspects of rheology; rheological problems in biology; rheology in industry.

An agreement has been reached with the Elsevier Publishing Company, Inc., of Amsterdam, to publish the Proceedings of the Congress in book form. Preprints of all papers will be forwarded to participants at least a month in advance of the Congress. Remarks in discussion will be included in the final edition of the Proceedings. Those intending to present papers should communicate with the principal secretary, Dr. R. Houwink, Rubber-Stichting, Julianalaan 134, Delft, Holland. Manuscripts must be received before May 1, 1948. A maximum of 3,000 words, formulæ and diagrams included, should not be exceeded, and the organising committee must, in consequence of present restrictions, reserve the right to cut down papers.

It is proposed that in the sectional meetings every speaker will give only a short account of his paper or mention the most important points, so that ample time will be available for discussion. The time to be allotted to each paper, inclusive of discussion, will be at most thirty minutes, but may perhaps have to be reduced if many papers are presented.

Due to generous support from Dutch industry and from some Dutch scientific societies, it will be possible to fix the Congress fee for participants at approximately f. 10 (£1), which it is hoped will also cover the cost of the preprints. It does not, however, include the price of the final edition of the Proceedings, which can be fixed only when all papers have been received. The organising committee will assist in obtaining accommodation at Schevingen.

The members of the organising committee are: J. M. Burgers (*Chairman*), R. Houwink (*Principal Secretary*), H. Kramers, A. J. Staverman, R. N. J. Saal, A. van Rossem, H. C. den Daas.

RESULTS OF THE CONTINUOUS USE OF AN AMMONIUM PHOSPHATE FERTILIZER ON RICE IN LOWER BURMA

By D. RHIND, O.B.E., and U TIN
Dept. of Agriculture, Burma

CULTIVATORS in parts of the Irrawaddy delta complained that after a few years use of an ammonium phosphate fertilizer on rice lands, they had continually to increase the dose in order to obtain the same response. An experiment was devised to test this opinion[1,2].

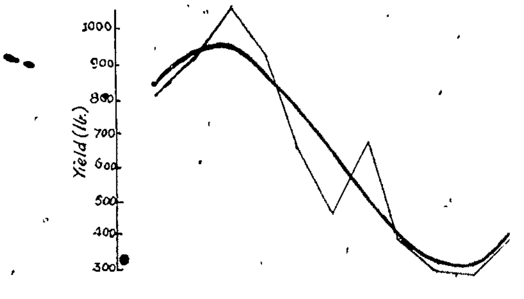
A proprietory ammonium phosphate fertilizer, the one complained of, was applied repeatedly for eleven years to a series of plots replicated five times on Myaungmya Farm in the Irrawaddy delta. The experiment continued from 1930 until 1940 inclusive, when it was interrupted by the War. The soil is a recent, acid alluvium; the rainfall averaged 93·14 in. a year during the period of the experiment; the variety of rice was the pure line *Ngasein* C14–8. The soil analysis is given in Table 1.

TABLE 1. MYAUNGMYA FARM SOIL

Insoluble residue	68·82		
Soluble silica	0·01	Stones, gravel and fine gravel	nil
Ferric oxide (Fe_2O_3)	6·06		
Alumina (Al_2O_3)	10·95	Coarse sand	1·1
Lime (CaO)	0·15	Fine sand	8·4
Magnesia (MgO)	0·63	Silt	24·6
Potash (K_2O)	0·25	Fine silt	54·7
Soda (Na_2O)	0·14	Clay	11·5
Sulphuric acid (SO_3)	0·15		
Phosphoric acid (P_2O_5)	0·01		
Carbon dioxide	0·08		
Organic matter-combined water	8·16		
Moisture lost at 100° C.	4·55		
Manganese oxide (Mn_3O_4)	0·04		
Organic carbon	1·85		
Organic nitrogen	0·15		
Available P_2O_5	0·0016		
Available potash	0·0137		
*p*H	5·3		

The fertilizer contained 18·20 per cent of nitrogen and 18·43 per cent of P_2O_5, and was applied at the rate of 100 lb. per acre shortly before transplanting. Cultivation methods were those normal to the area, seedlings being raised in unmanured nurseries and transplanted. Rice in the Irrawaddy delta is grown continuously without rotation as a single monsoon crop.

In every year the yields of the manured plots were significantly higher than the unmanured, and this is the normal effect of ammonium phosphate fertilizers on soils of this type. The point which the following analysis brings out, and which is important, is that after the first few years there was a decline in the response to the fertilizer, though at the end of the experiment there was still a significant increment over the unmanured plots.



DIFFERENCES IN YIELD OF PADDY GRAINS OF TREATED AND UNTREATED SOILS, 1930–40 (IN LB.); THIRD DEGREE POLYNOMIAL. SMOOTH CURVE, CALCULATED; STRAIGHT LINES, OBSERVED.

A polynomial of the third degree (see graph) has been fitted to the variability of the differences between the yields per acre of the treated and untreated plots. The calculated differences agree well with those found (Table 2).

TABLE 2. CALCULATED AND ACTUAL DIFFERENCES IN YIELD OF PADDY PER ACRE OF MANURED AND UNMANURED PLOTS. MYAUNGMYA FARM

Year	Actual differences over control in lb. per acre	Calculated differences over control in lb. per acre
1930	808	833·8
1931	908	932·4
1932	1062	939·7
1933	928	878·4
1934	647	771·2
1935	470	640·7
1936	695	509·7
1937	413	400·6
1938	332	336·4
1939	321	339·5
1940	431	432·6

The total variance contributed by the variation in differences in yield from year to year has been analysed into (1) the amount due to average rate of deterioration, (2) slow changes other than steady deterioration, and (3) annual causes. The smoothed curve shows the actual course and extent of the slow changes in mean differences in yields. The analysis of variance is given in Table 3.

TABLE 3. ANALYSIS OF VARIANCE

Sources of variation	Degrees of freedom	Sum of squares	Mean variance	*F*
Deterioration	1	498491·06	498491·06	35·52
Slow changes	2	88108·66	44054·38	3·139
Annual fluctuation	7	98228·46	14032·64	

The variation due to deterioration (represented by a linear function) is significant, but that due to slow changes is not reliably greater than the residual variance. The secular changes in yield differences examined are given in Table 4. The measures x_2', x_3', and x_4' of the component of change can be compared with the residual *S.D.*

TABLE 4. SECULAR CHANGES IN YIELD DIFFERENCES

Component	lb. per acre
Mean difference	+ 637·7
x_2'	− 706·0
x_3'	− 8·8
x_4'	+ 296·7
S.D.	± 118·4

The linear regression coefficient is − 67·3 ± 13·7 lb. per acre per year.

After an initial rise in the first three years, the yield differences significantly decreased during the remainder of the period of eleven years when the fertilizer was repeatedly applied. We refrain from speculation on the causes of this result. The cultivators were justified in their complaint. There is clearly need for caution before advocating the prolonged use of artificials without thorough tests in the field, and for further investigation into the causes of the present results. Conclusions based on incomplete results as reported in the Myaungmya Farm Reports from 1931 to 1941 are erroneous.

NUTRITION AND CANCER

A SYMPOSIUM arranged by the New York Academy of Sciences and held in December 1946 on "Nutrition in Relation to Cancer" covered a wide field and included a number of interesting articles which have now been published*. The paper by Dr. E. L. Tatum on chemically induced mutations and their bearing on carcinogenesis deals mainly with mutations induced in *Neurospora* and *Escherichia coli*, where the mutations have made the organisms more exacting in their nutritional requirements. Dr. W. J. Robbins, dealing with the botanical contributions to the cancer problem, suggests that the autonomous growth of plant tumours induced by *Phytomonas tumefaciens* is due to their ability to produce indoleacetic acid. In discussing the nutrition of tissue cultures, Dr. P. R. White indicates that if mammalian cells could be grown in controlled synthetic media, then the nutritional techniques used in the study of mutations in *Neurospora* could be applied to cancer tissue and carcinogenesis. This might give more insight into the relation of carcinogenesis and mutations involving changes in nutritional requirements.

The induction of cancer in animals is often greatly affected by diet. Dr. A. Tannenbaum describes how the restriction of the calorific intake of animals reduces the incidence of spontaneous mammary tumours, lung adenomas, hepatomas, sarcomas, and skin tumours, in mice treated with 3 : 4-benzpyrene. Restriction of calorific intake, however, has little effect on growth of established cancer. Perhaps the most interesting results of the effect of diet on carcinogenesis are seen in the experiments on hepatoma induction with azo dyes. Such experiments, carried out at Wisconsin, are described by Dr. J. A. Miller, and results obtained at the Memorial Hospital by Dr. C. J. Kensler. A high content of riboflavin in the liver reduces the chance of tumour development. Treatment with carcinogenic azo dyes tends to reduce the riboflavin content of the liver; but the carcinogenic action can be neutralized by adding riboflavin to the diet. Dr. J. White, Dr. F. R. White and Dr. G. B. Mider find that the incidence of leukæmia in mice treated with methylcholanthrene is not reduced if the dietary lysine or tryptophane is reduced to levels which prevent growth. On the other hand, reduction of the cystine intake to such a level did reduce the incidence of leukæmia in mice treated with methylcholanthrene.

Two independent groups of workers in the United States have produced tumours in rats by feeding choline-deficient diets. Dr. R. W. Engel, Dr. D. H. Copeland and Dr. W. D. Salmon of Alabama describe pathological changes including cancers which were seen in the lungs, liver, subcutaneous tissue, pancreas

* "Nutrition in Relation to Cancer", by Charles Glen King, John J. Bittner, D. H. Copeland, R. W. Engel, C. J. Kensler, George W. Kidder, G. Burroughs Mider, J. A. Miller, Harold P. Morris, William J. Robbins, W. D. Salmon, Albert Tannenbaum, E. L. Tatum, Florence R. White, Julius White and Philip R. White, *Ann. New York Acad. Sci.*, 49, Art. 1, 1–140.

and bladder in fourteen out of eighteen rats maintained on such low choline diets for five to eleven months.

Although it may seem disappointing that after so much study of cancer the fundamental cause or nature of it is unknown, the papers referred to above show advances. The carcinogenic process can often be influenced by diet, which means that the process can be resolved into separate parts, and this must help in the understanding of the process. Many of the speakers at the symposium compared carcinogenesis to mutations. Both cancer and mutations can be induced in living organisms by similar agents. The hypothesis that cancer is a somatic mutation relates carcinogenesis to other biological changes and the stability of the nuclear and cytoplasmic genes.

E. Boyland

SURVEY OF RADIO NOISE

It has long been appreciated that satisfactory radio communication depends upon the establishment at the receiving station of a minimum strength of signal above the prevailing noise. During the War, it became clear that the study of atmospheric noise-level and the limitation which it imposes on signal reception has received far less attention in recent years than the study of radio wave propagation. In 1943, the Radio Research Board, in co-operation with British inter-Service organisations, considered that it was desirable to supplement our existing knowledge of the nature, origin and prevalence of atmospherics, with particular reference to their effect on radio reception in various parts of the world. It was recognized that this would involve the carrying out of a long-term programme of research in order to place our knowledge on a satisfactory basis in relation to other advances in radio reception technique. Before embarking upon such long-term research, the Board recommended that a survey of existing knowledge in this field should be made as soon as possible; and it is in consequence of this recommendation that Radio Research Special Report No. 15, entitled "Survey of Existing Information and Data on Radio Noise over the Frequency Range 1–30 Mc./s.", has recently been published by the Department of Scientific and Industrial Research (London: H.M. Stationery Office. 3*s.* net).

This report has been prepared in the Radio Division of the National Physical Laboratory by Dr. H. A. Thomas and Mr. R. E. Burgess. Some 180 published papers on the subject were examined, together with data and measurements made available by certain commercial and government organisations operating radio services in Great Britain. The report covers radio noise of all types, whether of atmospheric, cosmic or man-made origin; but the scope of the work has been limited to radio frequencies between 1 and 30 Mc./s. (wave-lengths 10–300 metres), since most of the medium- and long-distance communication and broadcasting is conducted within this range, and the efficiency of such services is determined and even severely limited by the strength of the noise prevailing at the receiving station.

In most circumstances, atmospheric noise is the main factor limiting long-distance reception and communication; all thunderstorms, with their accompanying lightning flashes, within a range of several thousand miles are potential sources of disturbance. The most prominent centres of such storms are the large land areas, and particularly those in the tropics such as Africa and America during their local summer seasons, although these storm centres can drift out over the oceans to considerable distances. In each locality the thunderstorm activity varies with the season and during the day, and it is usually greatest under summer conditions and during the local afternoon. But the radio waves originating in a lightning flash can travel to great distances and may cause considerable disturbance at a receiving point where the above conditions do not apply.

The report deals also with the measurement of the strength of noise and its direction of arrival, and it is in these fields that active research is now in progress with the view both of obtaining a better understanding of the origin and nature of radio noise of all types, and also of developing techniques of limiting or mitigating the effects of these disturbances to radio communication. Such investigations are now being started in various parts of the world, and this report provides a good foundation as a comprehensive presentation of existing knowledge.

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, January 19

ROYAL PHYSICAL SOCIETY OF EDINBURGH (at the Royal Scottish Geographical Society, Synod Hall, Castle Terrace, Edinburgh), at 5.15 p.m.—Dr. James Davidson: "Biology and the Detection of Crime".

CHEMICAL SOCIETY, SOUTH WALES SECTION (joint meeting with the UNIVERSITY COLLEGE OF SWANSEA STUDENTS' CHEMICAL SOCIETY, at University College, Swansea), at 6 p.m.—Dr. Philipp Gross: "The Physical Chemistry of some Vacuum Metallurgical Processes".

INSTITUTE OF WELDING, NORTH LONDON BRANCH (at the Royal Society of Tropical Medicine and Hygiene, Manson House, 26 Portland Place, London, W.1), at 7.30 p.m.—Mr. S. M. Reisser: "The Welding of Bridges and Buildings".

Tuesday, January 20

ROYAL SOCIETY OF ARTS, DOMINIONS AND COLONIES SECTION (at John Adam Street, Adelphi, London, W.C.2), at 2.30 p.m.—Mr. A. T. Newboult: "Reconstruction in Malaya".

SOCIETY OF CHEMICAL INDUSTRY, AGRICULTURE GROUP (in the Physical Chemistry Department, Royal College of Science, Imperial Institute Road, London, S.W.7), at 2.30 p.m.—Dr. S. J. Rowland: "Recent Studies in the Composition of Milk".*

ROYAL ANTHROPOLOGICAL INSTITUTE (at 21 Bedford Square, London, W.C.1), at 5 p.m.—Mr. John M. Mogey: "The Community in Ulster".

EUGENICS SOCIETY (at the Royal Society, Burlington House, Piccadilly, London, W.1), at 5.30 p.m.—Dr. H. Harris: "Sex Limitation in Human Genetics".*

INSTITUTION OF CIVIL ENGINEERS (at Great George Street, London, S.W.1), at 5.30 p.m.—Symposium of Papers on "Winter Conditions and the Civil Engineer". (Mr. Stanley Mehew: "Roads"; Mr. W. K. Wallace: "Railways"; Mr. H. J. B. Manzoni: "Municipal"; Mr. Ben Howorth: "Drainage and Inland Navigation"; Prof. D. Brunt, F.R.S.: "Meteorology".)

INSTITUTION OF ELECTRICAL ENGINEERS, RADIO SECTION (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Discussion on "To What Extent does Distortion Really Matter in the Transmission of Speech and Music?" (to be opened by Mr. P. P. Eckersley).

SOCIETY OF CHEMICAL INDUSTRY, CHEMICAL ENGINEERING GROUP (at the Geological Society of London, Burlington House, Piccadilly, London, W.1), at 5.30 p.m.—Dr. C. H. Desch, F.R.S.: "Abrasion, Erosion and Corrosion".

INSTITUTION OF THE RUBBER INDUSTRY (at Caxton Hall, Caxton Street, London, S.W.1).—"Industrial Design in the Rubber Industry".

Wednesday, January 21

ROYAL MICROSCOPICAL SOCIETY (in the Hastings Hall, B.M.A. House, Tavistock Square, London, W.C.1), at 5 p.m.—Annual Meeting; Dr. R. J. Ludford: "Relation between Cellular Structure and Functional Activity" (Presidential Address).

INSTITUTION OF ELECTRICAL ENGINEERS, TRANSMISSION SECTION (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. E. T. Norris: "The Lightning Strength of Power Transformers".

BRITISH INSTITUTION OF RADIO ENGINEERS, SCOTTISH SECTION (at the Heriot-Watt College, Edinburgh), at 6.30 p.m.—Mr. W. D. Oliphant: "Acceleration of Sub-Atomic Particles".

Royal Institute of Chemistry, London and South-Eastern Counties Section (at the Wellcome Research Institution, 183 Euston Road, London, N.W.1), at 6.30 p.m.—Dr. H. N. Linstead: "Science and Parliament".

Society of Dyers and Colourists, Midlands Section (at the King's Head Hotel, Loughborough), at 7 p.m.—Mr. G. C. Grundy: "Non-Textile Uses of Dyestuffs".

Chemical Society, Eire Section (joint meeting with the Irish Chemical Association, in the Department of Chemistry, Trinity College, Dublin).—Prof. Wesley Cocker: "Santonin".

Thursday, January 22

Linnean Society of London (at Burlington House, Piccadilly, London, W.1), at 5 p.m.—Scientific Papers.

London Mathematical Society (at University College, Gower Street, London, W.C.1), at 5 p.m.—Mr. A. D. Booth: "Recent Developments in Electronic Computing".

Mineralogical Society (at the Geological Society of London, Burlington House, Piccadilly, London, W.1), at 5.15 p.m.—Scientific Papers.

Institution of Electrical Engineers, Installations Section (at Savoy Place. Victoria Embankment, London, W.C.2), at 5.30 p.m. —Mr. B. Feldbauer: "The Design of Contactors with regard to their Industrial Application".

Chemical Society, Nottingham Section (in the Chemistry Lecture Theatre, University College, Nottingham), at 6 p.m.—Prof. Brynmor Jones: "Some Aspects of Aromatic Substitution".

Society of Dyers and Colourists, West Riding Section (at the Great Northern Victoria Hotel, Bradford), at 7.15 p.m.—Prof. J. B. Speakman: "The Formation of Polymers in Wool".

Chemical Society (at Burlington House, Piccadilly, London, W.1), at 7.30 p.m.—Scientific Papers.

Chemical Society, Edinburgh Section (joint meeting with the Local Sections of the Royal Institute of Chemistry and the Society of Chemical Industry, at the North British Station Hotel, Edinburgh), at 7.30 p.m.—Dr. H. T. Openshaw: "Some Recent Developments in Alkaloid Chemistry".

Friday, January 23

Mineralogical Society, Clay Minerals Group (at the Geological Society, Burlington House, Piccadilly, London, W.1), at 10 a.m.—Discussion on "Clay Minerals as Catalysts".

Chemical Society, Southampton Section (joint meeting with the Southampton University College Chemical Society, in the Physics Lecture Theatre, University College, Southampton), at 5 p.m.—Prof. E. C. Dodds, F.R.S.: "Synthetic Organic Chemistry in relation to Biology".

University College London (in the Department of Physiology Theatre, Gower Street, London, W.C.1), at 5 p.m.—Dr. E. Ashworth Underwood: "The Heritage of Medicine" (further lectures on January 30, February 6, 13, 20 and 27).*

Institution of Mechanical Engineers (at Storey's Gate, St. James's Park, London, S.W.1), at 5.30 p.m.—Mr. T. A. Crowe: "Gas Turbine and Marine Propulsion" (Thomas Lowe Gray Lecture).

Manchester Statistical Society, Statistical Methods Study Group (in the Society of Architects' Room, Textile Institute, 16 St. Mary's Parsonage, Manchester), at 5.45 p.m.—Mr. J. R. Jarmain: "Density Standards in Assessing Housing Needs".

Society for Visiting Scientists (at 5 Old Burlington Street, London, W.1), at 7.30 p.m.—Discussion on "The Growing Points in Science" (to be opened by Prof. J. S. Mitchell and Dr. K. Weissenberg).

Saturday, January 24

Biochemical Society (at the British Postgraduate Medical School, Ducane Road, London, W.12), at 11 a.m.—Scientific Papers and Demonstrations.

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Director of a new Vegetable Research Station—The Chairman, Organising Committee, Vegetable Research Station, Ministry of Agriculture, Block 4, Bickenhall Mansions, Baker Street, London, W.1 (January 24).

Senior Lecturer in Physics and Electronic Engineering at the Ministry of Supply School of Electronics—The Chief Superintendent, Telecommunications Research Establishment, Great Malvern, Worcs., quoting 5/138/JFA (January 24).

Engineer in the Audio Frequency Section of the Research Department in London, Engineers (2) in the Field Strength Section of the Research Department at Oxford, and Senior and Junior Engineers in the Designs Department in London—The Engineering Establishment Officer, B.B.C., Broadcasting House, London, W.1 (January 24).

Senior Lecturer in Aerodynamics, a Senior Lecturer in Mathematics, a Responsible Lecturer in Electrical Engineering, a Lecturer in Mechanical Engineering, a Lecturer in Production Engineering, and a Teacher of Engineering Drawing, —The Principal, Royal Aircraft Establishment Technical College, Farnborough, Hants (January 24).

Research Physicist—The Director, Institute for Industrial Research and Standards, 45 St. Stephen's Green, Dublin (January 24).

Power Station Chemist—The Borough Electrical Engineer and Manager, Halifax Electricity Department, 19–23 Northgate, Halifax (January 26).

Soil Conservation Officers in the Soil Conservation Branch of the Irrigation Department, Southern Rhodesia—The Office of the High Commissioner for Southern Rhodesia, 429 Strand, London, W.C.2 (January 31).

Senior Lecturer or Lecturer in the Department of Physiology —The Registrar, The University, Sheffield (February 7).

Lecturer in Chemistry at Auckland University College, New Zealand—The Secretary, Universities Bureau of the British Empire, 8 Park Street, London, W.1 (February 21).

Chair of Pathology in the University of Cape Town—The Secretary, Universities Bureau of the British Empire, 8 Park Street, London, W.1 (February 21).

Chair of Mathematics at Queen Mary College—The Academic Registrar, University of London, Senate House, London, W.C.1 (February 24).

Readership in Bacteriology at St. Thomas's Hospital Medical School—The Academic Registrar, University of London, Senate House, London, W.C.1 (February 26).

Senior Professional Officer in the Tobacco Branch of the Division of Agriculture and Lands, Southern Rhodesia—The Secretary, Office of the High Commissioner for Southern Rhodesia, Rhodesia House, 429 Strand, London, W.C.2 (February 27).

Assistant Keeper (Class II) in the Departments of (*a*) Physics and Geophysics, (*b*) Chemistry, Astronomy and Optics, (*c*) Industrial Engineering, (*d*) Air and Water Transport, (*e*) Science Library—The Director and Secretary, Science Museum, South Kensington, London, S.W.7, endorsed 'Assistant Keeper' (February 28).

Lecturer in Geography at Raffles College, Singapore—The Secretary, Inter-University Council for Higher Education in the Colonies, 8 Park Street, London, W.1 (February 28).

Chair of Agriculture in the University of Ceylon—The Secretary, Inter-University Council for Higher Education in the Colonies, 8 Park Street, London, W.1 (February 28).

Senior Lecturer in Mechanical Engineering, a Senior Lecturer in Aeronautical Engineering, a Senior Lecturer in Civil Engineering, a Lecturer in Electrical Engineering, and a Lecturer in Mechanical Engineering, at Auckland University College, New Zealand—The Secretary, Universities Bureau of the British Empire, 8 Park Street, London, W.1 (March 1).

Lecturer in Pharmacology at Makerere College, Uganda—The Secretary, Inter-University Council for Higher Education in the Colonies, 8 Park Street, London, W.1 (March 25).

I.C.I. Research Fellowships in Bacteriology, Biochemistry, Chemical Engineering, Chemistry, Chemistry of Leather Manufacture, Chemotherapy, Colloid Science, Colour Chemistry and Dyeing, Engineering (Civil, Electrical or Mechanical), Fuel and Refractories, Metallurgy, Pharmacology, Physics, Textile Industries (Protein Chemistry)—The Registrar, The University, Leeds 2 (April 30).

Senior Lecturer in General Bacteriology in the University of Sydney—The Secretary Universities Bureau of the British Empire, 8 Park Street, London, W.1 (Sydney, May 1).

Technician (Grade B) in the Pathological Laboratory—The House Governor and Secretary, Queen Mary's Hospital for the East End, Stratford, London, E.15.

Experienced Biochemical Technician for the Department of Physiology—The Professor of Physiology, Medical School, King's College, Newcastle-upon-Tyne.

Chemists and Assistants for the development of methods of combating the corrosion of iron and steel—The Personnel Officer, British Iron and Steel Research Association, 11 Park Lane, London, W.1, endorsed 'Corrosion'.

Field Zoologist in Kenya to undertake work in connexion with a survey of tsetse distribution in the Colony—The Director of Recruitment (Colonial Service), Colonial Office, 15 Victoria Street, London, S.W.1.

Junior Laboratory Technician with experience of simple histological techniques—The Secretary, Marie Curie Hospital, 66 Fitzjohn's Avenue, Hampstead, London, N.W.3.

Research Chemist—The Director of Research, British Leather Manufacturers' Research Association, 1–6 Nelson Square, London, S.E.1.

Senior Post in the Metallurgical Department—The Director, Tin Research Institute, Fraser Road, Greenford, Middx.

Graduate in Physics or Engineering to undertake experimental work in connexion with small heating equipment—The Assistant Secretary, British Coal Utilisation Research Association, 13 Grosvenor Gardens, London, S.W.1.

DEMOCRACY IN INDUSTRY

ALTHOUGH the importance of mobility of labour as part of the price to be paid for social security and the condition of full employment which Government action, irrespective of party, will now be expected to maintain has been emphasized repeatedly since Lord Beveridge first formulated his proposals in the report of 1944, the implications are still far from being appreciated in many quarters. They are not even fully recognized by the Government, as is indicated in Mr. Isaacs' introduction of the Control of Employment Order ; and the way in which that Order has been received further demonstrates the same fact in other sections of the community. Even in the support which the Prime Minister and Sir Stafford Cripps have given to the reinstatement and extension of the practice of joint consultation in industry, which proved so successful during the War, there is little indication that the extent to which one of the major driving forces of industry has been weakened and is disappearing is fully realized. Nor does current discussion on incentives take adequate account of the fact that, while fear is happily disappearing as a goad to work, no positive enthusiasm is taking its place.

This, however, is the point at which discussion of incentives in industry, industrial efficiency and management are linked up with those larger questions of the relation of industry to the State which are being raised simultaneously by the changes in industrial organisation witnessed in the establishment of the National Coal Board and the nationalization of transport. Notable attempts are being made to deal constructively with these questions : Mr. W. D. Brown's paper on "Principles of Organisation" and Col. L. Urwick's on "Morale", both contributed to the Manchester College of Technology's series of Monographs on Higher Management, like an earlier one of Mr. G. G. Renold's on "The Employer and the Social Fabric", are recent examples, while the same questions are dealt with from a rather different point of view by C. Reaveley and J. Winnington in a recent book, "Democracy and Industry".*

Miss Reaveley and Mr. Winnington, as so frequently happens, are stronger in delineating the weaknesses and faults of the old system of industrial competition than in their positive suggestions for its replacement ; but they have much to say about the effects of competitive mass production on personality, that should be taken into account by all concerned to build up an efficient system of co-operation whether within industry itself or in society as a whole. They paint a black picture of conditions in industry, but one which is generally accurate, even if some statements are rather too sweeping. A factory may be a totalitarian institution ; but it is not necessarily so, as they suggest. Again, factory life does often corrode the nobility of reason, but there is no inherent reason why it should.

What stands out most clearly from this study is the futility and impracticability of considering factory and industrial life apart from that of the society.

---

* Democrac[illegible] Industry. By C. Reaveley and J. Winnington. Pp. 176. (Lo[illegible]atto and Windus, 1947.) 16s.

which the factory and industry exist primarily to serve. Unless the relations between industry and the community are satisfactory, we cannot hope to get that sense of purpose on which Miss Reaveley and Mr. Winnington rightly lay such stress, and their book is to be welcomed for the clear way in which the relations between industry and the democratic State are displayed. They point out frankly the danger of an industrial position in which conditions of employment steadily atrophy the very qualities on which freedom and democracy depend, and it was time that someone emphasized that the process goes on whatever political party is in power.

Democracy makes large demands on the moral and spiritual, as well as on the intellectual, ability of a people, and no system of education will be adequate to develop and preserve such qualities if conditions of employment are such as to inhibit or discourage their use. That is the real danger springing from the sense of frustration, however caused, on which the authors of this book dwell at length, and we must take steps to counter it effectively, just as we must meet the danger inherent in propaganda and train and encourage men to exercise critical judgment and individuality.

There is a further danger of which rather less specific warning is given. The difficulty is due in part to the powerful institutions which we have inherited from the past. But those institutions cannot be destroyed without stripping ourselves of our greatest strength. In so far as they are archaic, they endanger development and no longer fully serve the needs of society; but they are also the focus of social cohesion and the legacy of the wisdom of our fathers. Rightly understood, they can be adapted to the needs of to-day without sacrificing their funded strength, and the real test of our democracy is its capacity to use the institutions it has inherited to foster spiritual freedom and creativeness. It is a moral as well as an economic problem, and the intensity of the drive for efficient production must not be allowed to encourage practices which destroy the purpose and freedom of those who do the work.

Without discussing the more profound economic changes which may be needed, Miss Reaveley and Mr. Winnington suggest three immediate steps which should help to diminish the clash between the present industrial system and democracy. In line with the trend of Mr. W. B. D. Brown's suggested principles governing the economic and social aspects of organisation and industrial justice, they suggest first that juster methods of dismissal should be inaugurated on a wide scale, and summary and unjust dismissal no longer be used as a means of spurring production. Urgent inquiry is necessary into the efficacy of the methods that have already been tried with some success. Secondly, they insist on the importance of training of management, and particularly the training of foremen, and of the lower supervisory grades; though equally they stress the necessity of such training as well as technical training for the works manager. That aspect is already receiving fairly general attention, even if some time must elapse before full effect can be given to [illegible] policy as was advocated in the report of the Urwick Committee. Its importance has been stressed in most of the reports of the 'working parties' of the Board of Trade; but more attention might be given by the Government to the promotion of conditions which make efficient management easier. The question of incentives for management, too, requires more attention than it has yet received, and Miss Reaveley and Mr. Winnington make an important point in directing attention to the value of the support of a strong professional ethical tradition, and the way in which specific training for management can help to develop such a tradition. Further, they rightly emphasize that Government cannot well demand higher standards of industrial management without itself setting the example of a high standard of management in its own departments.

Elsewhere Miss Reaveley and Mr. Winnington are disposed to overlook the importance of the technical man, and they nowhere show evidence that they realize how essential is his contribution if we are to ensure that the processes and operations of industry are directed to objectives which are materially worth while, and as such can be satisfying and supply the worker with a sense of social purpose or professional pride or craftsmanship. But they have an eye for detail which can count; such as the value of the contribution from women who bring to their work in the factory their house-pride, the weakness of adult education in relation to industrial workers, and the way in which the factory can be hostile to the purpose of the home as well as to the qualities on the exercise of which the continuance of democracy depends. Their third proposal, for the wider and wiser use of joint consultation, is a plea for experiment in this direction so as not only to secure the greater interest and closer co-operation of the worker, but also to develop those qualities of responsibility which democratic citizenship needs. They suggest, too, that we need to explore afresh the problem of recreation and the use of leisure, that we need fresh creative experiment in social activity, a modern tradition of community life, with the restriction of working hours and a different type of education that are involved in a community life which the industrial or agricultural worker is physically able to share.

Mr. W. D. Brown, in the paper referred to at the beginning of this article, suggests that the major malaise of industry is lack of participation on the part of many, and that we should seek both to wean executive authority from its authoritarian attitude and to demonstrate to workers that the objectives of an industrial undertaking are sufficiently useful in the social sense, and sufficiently in their own interests in a national sense, to justify their participation. The formal committees which are set up in industry may well be regarded as class-rooms for the development of spontaneous joint consultation and participation, and Mr. Brown indicates principles of consultation which may help to avoid some of the pitfalls which the joint production committees have encountered. These principles should certainly be carefully considered by all those concerned to implement the plans for the re-establishment and extension of joint consultation in industry which the Government regards as so important a means of increasing production.

Industry undoubtedly requires the full development of the consciousness of a common aim or purpose before it can give of its best; and joint consultation should promote this consciousness. It is even more important than the tapping of the constructive ideas and practical experience of the men in immediate contact with the daily problems of an industrial firm in its factories or workshops, on which the system of joint consultation is intended to assist management to draw. Indeed, that contact will not be complete and spontaneous and fruitful unless the sense of common purpose is first developed. We have to remove the obstacles in the minds of men which, as Mr. David Lilienthal has observed, are the real barriers to effective co-operation and the utilization of our mechanical resources without detriment to human personality.

This is why, as Col. Urwick insists, morale and the general assumption of individual responsibility for some share in the national task is the fundamental problem, and why it is imperative that, while shedding the idea of domination which has been associated with industrial management in the past, we should develop the idea and capacity of leadership, about the nature and exercise of which our war-time experience has taught us so much. Leadership respects personality and encourages initiative, and it is not too much to say that Britain's recovery from the present economic crisis depends on the extent to which, not merely in industry but also in Government institutions and the public corporations, we can replace the climate and tradition of domination by one of co-operation, with true leadership summoning forth the initiative and enthusiasm of the individuals who follow. Indeed, one of our dangers is that we may make the mistake of believing that changes in organisation in the field of government, such as nationalization of industry or transport or in the means of co-operation such as the production committees, may in themselves develop leadership.

Organisation may contribute much, but how much depends on the men who use it; the ultimate problem is that of the men whose capacity for leadership at all levels is the means of creating morale. No one concerned with the conduct of industry, on the technical, the administrative or the trade union side, can ponder too deeply on the meaning of some of our war-time experience; the points of particular importance have been expounded by, for example, Field-Marshal Montgomery, General Slim, Mr. Bernard Fergusson in his book "The Wild Green Earth" and Col. Urwick in his analysis of the lessons of Stalag XIB. In matters of training and tradition, the encouragement of initiative and the development of an effective substitute for the satisfaction of craftsmanship, the fostering of a sense of social as well as of industrial purpose and of personal responsibility, there is still much to be done and to be learnt; Mr. Fergusson's appeal for the lessons of the Burma campaign to be applied to our industrial and social life is as impressive as General Slim's stress on the spiritual and intellectual foundations of morale. We are only at the beginning of the development of real scientific management, and it should be noted that Col. Urwick, like other observers, does not fail to point out how comparatively weak industry has been from this point of view in the lower levels of supervisory staff.

There is indeed much in Col. Urwick's paper that is stimulating to the industrial scientist and to all those who hold positions of administrative responsibility in industry. Valuable as will be the contribution that the wider provision of courses of training in management will make, we do not need to wait on that for the constructive thinking and the application of experience learnt, sometimes at bitter cost, in other fields. The task of building morale, like that of fostering co-operation, is one that can be undertaken by all men and women of goodwill engaged in industry whether on the management side or on that of the trade unions. It must be undertaken without preconceived ideas, by those willing to experiment but able to respect the individuality and personality of others even when they hold differing views. These are necessary conditions for a fruitful issue from the new plans of the Government for joint consultation in industry; but if the task is undertaken in this way, we may well find that not only has industry greatly increased its efficiency and productivity, but also that simultaneously industry has been knit more closely to the purpose and traditions of the State in which it functions, and that the clash between the purposes and ideals of the home and of democracy and those of industry has at last been eliminated. There can be no doubt that the newly established Committee on Industrial Productivity, and in particular its sub-committee, under the chairmanship of Sir George Schuster, on human factors affecting industrial productivity, should be able to make important contributions to that end; but its work will only reach full fruition when all engaged in industry give their full support, and when Government policy and administration no longer obscure the declared objectives.

METHODOLOGY IN ETHNOGRAPHY

The Dynamics of Clanship among the Tallensi

Being the First Part of an Analysis of the Social Structure of a Trans-Volta Tribe. By Dr. Meyer Fortes. (Published for the International African Institute.) Pp. xx+270+16 plates. (London, New York and Toronto: Oxford University Press, 1945.) 30*s*. net.

THIS is a book of considerable interest, both as an account of a little-known area in the northern territories of the Gold Coast and as an example of some present-day trends in social anthropology. The Tallensi are a primitive agricultural people about 350,000 strong who inhabit the densely populated area between the White and the Red Volta. They are as 'backward' as any in the Gold Coast, and Fortes' previously published material shows their low level of diet and the annual periods of starvation or, at any rate, privation, to which they are liable[1].

Taleland has no fixed boundaries and no central machinery of government. Its population is mixed owing to the constant introduction into Tale country of kindred, but not entirely similar, ethnic groups. Fortes is concerned to discover how these clans or sub-clans of varied origins are integrated to form the group commonly known as the Tallensi. He believes that this integration is achieved by a common pattern of kinship which binds the separate elements together as effectively as political machinery, and which makes it possible for alien groups to be incorporated by a fiction of common descent. An ancestral cult and the joint performance of annual rites to an earth goddess enforce the unity of the different groups by constantly expressing it. Fortes uses the kinship terminology recently employed by Evans-Pritchard in the latter's description of the social structure of the Nuer of the Anglo-Egyptian Sudan[2], and he develops it in an elaborate and very systematic way. Words such as 'kinsmen' or 'clan', which have inevitably been used in a variety of different ways, are discarded or re-defined, and the author substitutes a series of more precise terms which reflect the origin of the different descent groups in a constant process of fission from a common stock. Such groups are classified as minimal, major, or maximal 'lineages', and primary or secondary segments, to indicate the type of fission which has taken place, and the rules of seniority within the group.

The system of relationships which governs human behaviour in this small and very primitive society is expressed in diagrams, geometrical figures, and metaphors derived from the mechanical and biological sciences, such as planes of cleavage, parallelograms of balanced structure, fusion, fission and segmentation. This treatment of ethnographical material raises interesting methodological questions. The last twenty or thirty years have seen the emergence of social anthropology as an observational science. Field studies of primitive communities have reached a new standard of detail and have been made on the basis of longer and more intensive investigations and by means of a much closer participation in the lives of the people studied. The recent adoption of observational techniques common to other social sciences, such as case histories, social survey, and statistical methods of different kinds will extend the area over which observations can be considered valid and make it possible to estimate more closely the degree of variation from different norms of behaviour.

But the range of anthropological observation was already very wide. Anthropologists have repeatedly claimed that they studied cultures as 'wholes', and that their task was to show the inter-relation of the different aspects of human behaviour, whether economic, legal, religious or political, which go to make up the traditional heritage distinguishing the little Tale from the little Londoner. It is still probably true to say that one of the most distinctive contributions that the anthropologist has made to the social sciences is this concept of culture, which allows him to speculate over wider fields than those open to the more specialist social sciences, such as economics or law.

How, then, is the social anthropologist to deal with the mass of detail with which the new field techniques provide him ? How, in other words, is he going to be able to record more and more about more and more ? Malinowski solved the problem in one way by isolating particular institutions associated with fundamental human needs, such as family and kinship, or economic organisation, and proving with the utmost detail the inter-relation between, say, material culture, knowledge, law, beliefs and social organisation as they enable man to fulfil these particular needs[3]. The work was so detailed that this arch-exponent of the unity of human culture did not, in fact, describe the whole of the culture of the very small island with which he dealt, nor did he proceed on the basis of his detailed field observations to develop comparative studies.

Fortes, together with Radcliffe-Browne, Evans-Pritchard and other followers of Durkheim, follows another course. These writers attempt to achieve simplicity by the rigid limitation of their material to one particular aspect of culture, that is to say, the system of social relationships or social groups, to which they give the name 'social structure', and which they describe with a mathematical precision as abstract as the enunciation of some economic law. This is interesting and stimulating work. Anything which makes for precision of terminology in young sciences is valuable, and Fortes certainly challenges us to think out our kinship terminology anew. There are, however, elements of danger in the experiment he has made. The isolation of structural problems must be in a sense artificial, and Fortes' book shows some of this weakness. Groups do not exist *in vacuo.* They follow organised activities in particular environments ; they obey rules, accept beliefs, and build up an illogical tangle of sentiments and values. Their success is limited by their material equipment and the biological laws to which they are subject. All these different factors make for the infinite variety of human behaviour, and in the context of actual life there are no rigid groups but a variety of possible principles of relationship, some of them quite conflicting. The Tale lineage system is incomprehensible until the geometrical diagrams and symbols in which Fortes expresses it are re-interpreted in terms of ritual, agricultural activities, systems of land tenure and of housing and methods of warfare. Some of the complexity of his descriptions is doubtless due to a rather confused prose style ; but it is also the result of his attempt to isolate an aspect of social structure—in this case, a descent system—from the whole institution of marriage, family life and economic activities from which it springs. Surely anthropologists will have to bring order into the increasing variety of their material by adopting definite conventions for the outline descriptions of the main aspects of culture (activities, structure, beliefs, norms, values) and its major institutions. Detailed accounts of special aspects analysed for comparative purposes will be facilitated by such systematic descriptions. Simplification by elimination of relevant data may lead not only to faulty emphasis but actually to a greater complexity in the presentation of material.

There also seems to be an element of danger in Fortes' attempt to express field data in terms of philosophical abstractions, although such abstractions can obviously be made once the concrete data have been presented. Fortes himself was trained as an experimental psychologist and later in the intensive type of field-work developed by Malinowski. It is clear from passing references what a mass of concrete data he has collected. But his material is often presented in the form of metaphors that were common in the philosophical sociology of the beginning of this century rather than in the language of the observational sciences. Such phrases as "the polar opposites of the idea of unity, arising out of the very same balance of social forces that make unity possible", or the suggestion that Tale society is "a mosaic counterbalanced by cleavages" can have no possible verification in terms of the recorded data or the formalized views expressed by the people themselves. Is it not possible that younger generations of anthropologists, lacking Fortes' scientific training, may come to believe that the framing of a logical system of human relationships and its diagrammatic presentation are more valuable than the analysis of the cases which make for variation ? In other words, may not such work lead to the minimum of observation rather than to the maximum amount ? It was the fashion twenty years ago to rail against the 'arm-chair anthropologist'. Will not such work lead to a movement which might be described as 'Back to the arm-chair' ? For this reason the present reviewer regards Fortes' book as an important, stimulating, and in many ways a brilliant book, but also, from the point of view of scientific method, a somewhat disturbing one.

THE WAR EFFORT OF A GREAT ENGINEERING ORGANISATION

Men and Volts at War

The Story of General Electric in World War II. By John Anderson Miller. (Whittlesey House Publication.) Pp. xi+272+123 plates. (New York and London: McGraw-Hill Book Co., Inc., 1947.) 19*s*.

THE sub-title of this volume is "The Story of General Electric in World War II", but in content it goes a good deal beyond this scope, and tends to become rather a history of the American war-machine, in which one sees at every turn the applications of the products of the General Electric Co. and the achievements of its scientific workers and engineers in dealing with new war problems. Although the author has avoided saturating his volume with statistics, one is struck by the immensity of the war output from the General Electric Group of factories with their 175,000 workers—output stated to be three times that previously attained.

While many new devices were developed for war purposes by the Company, a great proportion of its effort involved only a modification of its existing products to meet special war requirements; and the great problem in this connexion was the organisation of plant, tools, productive equipment and personnel to meet the stupendous output involved. Such organisation required continual adjustment to satisfy the ever-changing war requirements. Only a company possessing very great resources in scientific and technical personnel, production organisation, and plant and equipment could effect the adjustment required in so incredibly short a time, and in so efficient a manner. The existence of this and other great manufacturing companies was one of the most vital of America's war assets, because they could so rapidly be adapted to war needs. The rapidity with which emergency problems arising in remote theatres of war were solved was remarkable. It is interesting, also, to note that the technical developments that had been undertaken many years previously were of immense war-time usefulness, electrical ship propulsion and the turbo supercharger being two such developments. The author correctly points out that whereas the First World War was largely mechanical in its engineering character, the Second World War was marked by electrical engineering applications, notably in radar, signalling, communications, aircraft, gun ranging, a multiplicity of instruments, welfare, health and medicine.

In a foreword, Charles E. Wilson, president of the General Electric Co., says that since it would be impossible to mention all to whom credit is due, the story of the Company's war-work has necessarily been written without emphasis on the contributions of particular individuals. This is rightly so; but one would like to pay special tribute to the management of this great engineering organisation which had the courage, initiative and resource to shoulder staggering burdens under the greatest possible pressure of time, and with the minimum opportunity to assess in detail the extent of the problems involved in relation to the facilities of materials and personnel available.

The volume is a fine work, well written and excellently produced with many small 'packets' of well-titled illustrations on art paper inserted at intervals. There is a good index and the appendixes which describe General Electric Co. plants and their war production are noteworthy.

A. P. M. FLEMING

CO-OPERATION BETWEEN MEDICAL AND AGRICULTURAL PHYSIOLOGY

The Problem of Fertility

Proceedings of the Conference on Fertility held under the auspices of the National Committee on Maternal Health. Edited by Earl T. Engle. Pp. viii + 254. (Princeton, N.J.: Princeton University Press; London: Oxford University Press, 1946.) 21*s*. net.

THE practical application of the science of the physiology of reproduction lies in two distinct fields, that of human medicine and that of animal husbandry. The bringing together of workers in these two fields to discuss recent research on the problems of fertility, the results of which are set forth in this book, should have important repercussions in the future, not only for applied, but also for pure science. It is evident from a study of the various chapters that a comparison of the reactions of different species throws considerable light on their different physiological balances and opens the way for advances in disentangling the mechanisms involved. Striking differences exist between species in respect to the methods whereby ovulation can be induced and in the biology of the spermatozoa. In this book recent research work on these subjects has been described in papers by different specialists, and the discussion which followed is reported.

Among the various papers presented, Asdell describes the different patterns of œstrous cycles, and points out that the response to hormones depends not only on dose but also upon the response thresholds, which vary in the different species. Work on ovulation and œstrus in sheep and goats is reviewed by Phillips, Fraps and Frank, who quote many references to recent work, particularly in connexion with the breeding season, optimum time to breed and responses to administration of gonadotrophins. Casida contributes an important paper on the induction of ovulation and subsequent fertility in domestic animals, in which he discusses super-ovulation, and concludes that the potential fertility of the ova that were ovulated by the use of pituitary gonadotrophins was affected markedly by the phase of the reproductive cycle at the time of treatment. Ovulations that were induced during the luteal phase yielded eggs of low fertility. The ovary at the time of ovulation is described by Corner. A review of the hormonal control of ovulation, with extensive references to the literature, is presented by Cole, who concludes that while ovulation can be produced regularly in certain species with several gonadotrophins, the response in primates is a haphazard one.

Pommerenke and Viergiver report observations on the cervical mucus and the menstrual cycle, Simmons discusses the cervix uteri in infertile matings, and Abarbanel gives details concerning spermatozoa and the cervical mucus. In an important paper on the glycolysis, viability and fertility of bovine spermatozoa as influenced by their concentration, Salisbury reports full fertility from dilutions of up to 1 : 100 stored for a limited period of up to about four days. Macleod discusses the metabolism and motility of human spermatozoa, and Berliner the biology of equine spermatozoa. Chang reports experiments on the fertilizing capacity of rabbit spermatozoa and shows that the large number of ova ovulated by gonadotrophin injection does not require a proportionately larger number of spermatozoa for fertilization.

Methods employed in the artificial insemination of cattle are briefly described by Bartlett, and experiments on the effect of synthetic thyroprotein on sterility in bulls are reported by Reineke.

This book not only provides a good source of information for workers in this field, but also should act as a stimulus to further research work on the problems of fertility.

GRAMMAR SCHOOL SCIENCE

The Teaching of Science in Secondary Schools

Compiled by a Joint Committee of the Incorporated Association of Assistant Masters and the Science Masters' Association. Pp. xi+292. (London: John Murray, 1947.) 8*s*. 6*d*. net.

AT the outset we must say that this is the most useful book on the practical problems of the teaching of science in grammar and 'public' schools which has yet appeared. It is the work of a committee of the Incorporated Association of Assistant Masters and the Science Masters' Association. About thirty members, for the most part science masters in public and grammar schools, were assisted by two hundred corresponding members. The result is a book which deals honestly and practically with every problem of the teaching of science at this level. It will prove of special value to teachers in grammar schools and in the education departments of the universities, and much of the book will be of value to those who teach science elsewhere, although the special problems raised by the subject in the secondary modern schools do not receive any attention. In a community the life and prosperity of which can only be sustained by the intelligent and continuous application of the principles of science, and in a civilization which can only continue by a real appreciation of the philosophy and methods of science, it is more than ever necessary that there should be effective teaching of science in all post-primary schools. With the groups of higher intelligence we must ensure that the claims of science, both as a cultural and as a utilitarian subject, are not only understood but also are adequately catered for. Industry and administration attract many well-qualified science graduates who formerly would have entered the teaching profession. The present work does well to deal with the problem of the training of the science teacher in his student days.

The book begins with a succinct account of the history of science teaching in Britain, and its aims and functions. It deals with the problems of school certificate, higher school certificate and university scholarship examinations critically, and comments, "the type of examination imposed often prevents a broad treatment of the subject and tends to reduce science teaching to the memorizing of facts and their reproduction as examination answers". The council of the Incorporated Association of Assistant Masters recently reaffirmed its opinion that in schools with the lower age of entry, the school certificate should normally be taken at the age of sixteen after a five-years course, and it is with this policy in mind that it is considered that the absolute minimum of time which should be allotted to science in the secondary school is two hours per week (three teaching periods) between the ages of ten and twelve, and four and a half hours (six or seven teaching periods) between the ages of twelve plus and sixteen plus. "It cannot be emphasized too strongly that in many instances the apparent failure of science teaching is due to the neglect of this recommendation (made as long ago as 1918) by headmasters and education authorities."

The book deals with laboratories and other science rooms, their equipment and the maintenance of apparatus and supplies. It wisely stresses the value of 'scientific handicrafts' as a part of the equipment of every science teacher. One is impressed by the detailed and comprehensive advice, the result of many years of experience on the part of a large number of practical teachers, in these sections.

The book goes on to give an account of the various methods of science teaching: short and effective sections deal with the project method, group methods, the Dalton plan, class discipline, syllabuses and courses, historical, anecdotal and biographical methods, topic, concentric and unit plans. It has some interesting remarks to make concerning the heuristic method, the psychological development of children in its relation to science teaching. The correlation between the teaching of science and that of other subjects is not forgotten. Other chapters deal with advanced course work, examinations, optical and other aids in teaching, the training of science teachers, first aid in the laboratory and the science teacher and the law. There are useful appendixes on facilities for further instruction in science, examples of 'new type' examination questions and a good bibliography. W. L. SUMNER

THE THEORY OF PRIMARY CALCIFICATION IN BONE

By Dr. MARCEL J. DALLEMAGNE

Laboratory of Experimental Surgery, University of Liège, Belgium

THE theory of primary calcification was advanced in 1928 by Kramer and Shear[1] to explain the stages of mineral precipitation in bone in course of formation. If this theory is to apply to the process of ossification submitted by Roche[2], it will refer to the beginning of the fourth stage, that of the deposit of salt in organic bone.

According to Kramer and Shear, bone salt is not tricalcium phosphate, but is, at any rate at the beginning of calcification, secondary phosphate containing calcium and phosphorus in the quantitative ratio of 1·29. These authors refuse to admit the existence of tricalcium phosphate as a chemical entity and they consider the nature of bone salt to be quite unknown; their hypothesis is that the Ca/P ratio which chemical analysis reveals in bone attains to the normal value of adult tissue (± 2·20), since dicalcium phosphate absorbs lime or carbonate in course of the calcification.

This opinion is derived from the following:

(1) If the classic formula $Ca_3(PO_4)_2$ is attributed to tricalcium phosphate, the formation of this salt must result from a reaction of the fifth order, the possibility of which is open to dispute. Shear and Kramer[3] affirm that they have never been able to obtain proof of the existence of a compound having this formula.

(2) Kramer and Shear refer to the experimental results of Holt, La Mer and Chown[4] and apply to them the solubility product law. Their opinion is that the precipitation of phospho-calcium salt takes place only at the moment when the solubility product of dicalcium phosphate $pK_{sp} = [Ca^{++}] \times [HPO_4^{=}]$ is attained in the liquid phase. This precipitate does not, therefore, correspond to the tertiary salt but to the secondary salt of the type termed by mineralogists 'brushite'.

In an attempt to verify these results obtained in the realm of physical chemistry by experiments on animals, Kramer and Shear made rats rachitic, then cured them and examined the nature of the salts freshly deposited in the osteoid tissue.

They expected to find a Ca/P ratio corresponding to that of dicalcium phosphate; but, on the contrary, they found that the calcium and the phosphorus formed a quantitative ratio greater than that of tertiary salt (1·94).

Although these results constitute a set-back to the theory of primary calcification, it has later been supported by important arguments in its favour.

The chemical study of bone callus[5,6], of the embryonic bone and tooth[7], and of bone of periostic origin[8], reveals that young osseous tissue is far richer in phosphorus as compared with calcium than the adult bone. Fig. 1 shows the evolution of the Ca/P ratio in bone of periostic origin. In tissue of recent formation its value is very low, but it increases progressively as ossification takes place; it passes 1·29, the value of secondary phosphate, and 1·94, that of tertiary phosphate; it then goes beyond this figure and, following the precipitation of calcium carbonate, halts around 2·20, the characteristic figure of adult bone.

One would gladly interpret these results by submitting that, at a certain point in the development of bone, its salt corresponds to brushite susceptible of being transformed into tricalcium phosphate following molecular changes due to local physico-chemical conditions.

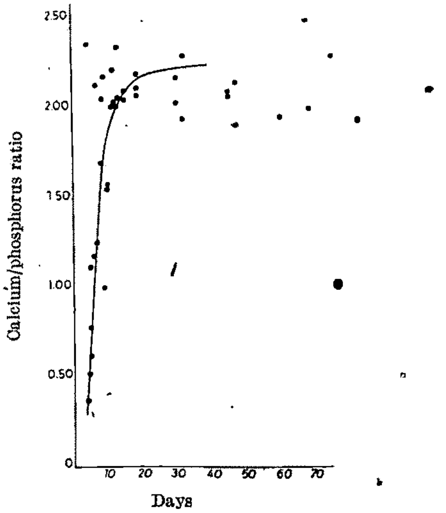

Fig. 1. RISING VALUE OF THE CALCIUM-PHOSPHORUS RATIO DURING OSSIFICATION OF THE HYPERTROPHIC PERIOSTEUM

The possibility of the presence of brushite in young bone is also indicated in the results of Ettori, Grangaud, Benoit and Clavert[9]. These authors study the chemical nature of bone formed in the medulla of some of the long bones following œstradiol administration to pigeons. They determine both calcium and phosphorus together in the newly formed medullary trabeculæ as in the surrounding old diaphyseal bone; they find calcium and phosphorus in a quantitative ratio often nearer to that of secondary salt than to tertiary salt; pigeons are treated from five to a hundred days with a daily injection of 0·25 mgm. of œstradiol dipropionate (the lowest Ca/P ratio would seem to appear after twenty days of treatment).

After examining the whole field connected with primary calcification, we begin to wonder if the arguments which sustain this hypothesis are very convincing.

If the smallest Ca/P ratio found by Roche and by ourselves in bone in course of formation equalled that of secondary phosphate (1·29), which is the salt of calcium and phosphorus richest in the latter element and the least soluble, there would be no doubt. How are we to explain by Kramer and Shear's theory that in very young bone the Ca/P ratio may be less than 1·29? We have found 0·35, and Roche has observed still lower values.

Following these considerations, we proceeded to work out the American authors' theory experimentally from its foundations.

If we add lime to phosphoric acid so as to register *p*H continuously, we obtain the curve (broken line) of Fig. 2. The *p*H rises regularly until a precipitate appears; at this point it falls temporarily. The formation of the precipitate clearly retards the alkalinization of the liquid phase by the lime. The *p*H begins to rise again when the concentration of the anions in solution appreciably diminishes.

At whatever point on the neutralization graph the precipitate phase appears, it always corresponds to tricalcium phosphate; this is demonstrated both chemically and physically[10].

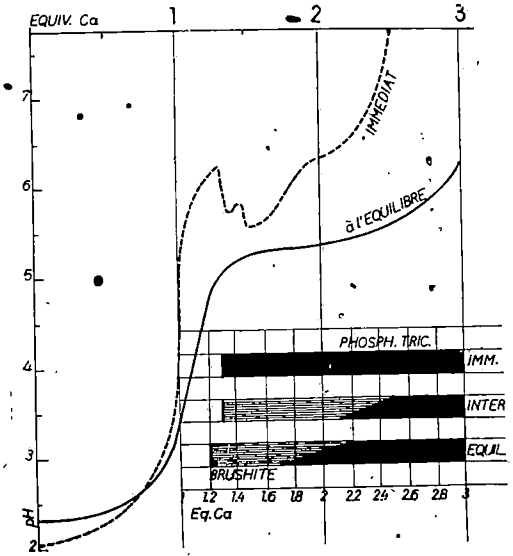

Fig. 2. TITRATION CURVES OF PHOSPHORIC ACID NEUTRALIZED BY LIME ; - - - -, DURING NEUTRALIZATION ; ——, AFTER EQUILIBRIUM. INSET, NATURE OF THE SOLID PHASE AT DIFFERENT TIMES

We are also able to fix each stage of the process of neutralization in separate preparations which we can preserve until equilibrium is obtained; if we take *p*H readings after 15 days, we do not register the same curve : it is much more regular and it has descended in the course of establishing the equilibrium (Fig. 2, full line). This descent is due to precipitation which has slowly taken place and to modifications undergone by the solid phase ; the space between the two curves is the greater because of the abundance of the latter. The composition of the liquid phase has been modified during the establishment of equilibrium, and so has that of the solid phase ; the precipitate is no longer the same at all points of the curve.

From 1·2 to 1·7 equivalents of lime, the precipitate consists of pure brushite. From 1·7 to 2·3 equivalents it is a mixture of tricalcium phosphate and brushite, with the latter gradually diminishing as a greater quantity of lime is added to the acid. Beyond 2·3 equivalents of lime, the solid phase consists of pure tertiary salt.

In the course of establishing this equilibrium, which requires only a few weeks, the precipitate has undergone an intermediate evolution. The original tertiary salt was completely transformed into brushite from 1·3 to 2·05 equivalents of lime and partially from 2·05 to 2·50 equivalents. Brushite, therefore, within certain limits develops and then regresses. This is due to the inverse operation of two reactions : one tends to form brushite at the expense of tertiary salt and the other consists in hydrolysis of the brushite, resulting in reforming tertiary salt.

If the first precipitate formed on contact of the ions Ca^{++} and $PO_4^{\equiv}$ always corresponds to tertiary phosphate, is it possible that, in bone in course of calcification, the neutral salt originally crystallized alters to brushite and then returns to its original condition ? Such a conception in no way agrees with observations which have been made on the deposit of mineral matter in the osseous tissue during growth.

In the course of another series of experiments, we made a particular study of the liquid phase in equilibrium with the precipitate[11]. We observed that in preparations containing brushite crystals, the product $[Ca^{++}] \times [HPO_4^{=}]$ is equal to the solubility constant of secondary salt (Fig. 3, circles). On the other hand, wherever tertiary salt is pure in the solid phase, the liquid phase is under-saturated with secondary salt (Fig. 3, points), and its mineral composition obeys the law $pK_{sp} = [Ca^{++}]_3 \times [PO_4^{\equiv}]_2$. Consequently, in a certain zone of the neutralization graph, although tertiary salt is present, the ionic product corresponds to the solubility constant of secondary salt because the solid phase contains brushite. Nevertheless, in certain samples, there is so little of the latter, on well-defined portions of Fig. 2, that chemical analysis fails to reveal it and returns a Ca/P ratio corresponding to tertiary salt. It can be observed optically only. Kramer and Shear, who do not make use of the optical method of research and of characterization of crystals, have admitted that the total of the precipitate corresponds to dicalcium phosphate with the addition of lime and carbonate ; although it contains only very occasional crystals drowned in the mass of neutral salt ; but these crystals suffice to condition the saturation of the liquid phase with respect to dicalcium phosphate. Further, the zone of the neutralization graph in which the liquid phase is under-saturated with secondary salt and the precipitate entirely constituted of tertiary salt and containing no brushite has not been examined by Kramer and Shear.

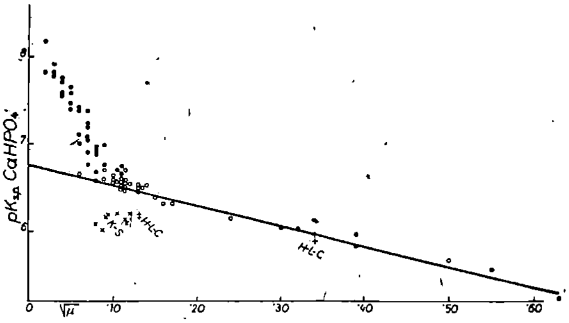

Fig. 3. EFFECT OF THE IONIC STRENGTH OF THE LIQUID PHASE ON THE SOLUBILITY CONSTANT OF DICALCIUM PHOSPHATE

o , Solid phase contains brushite crystals ; ● , solid phase consists of tertiary salt only ; *H-L-C*, values obtained by Holt, La Mer and Chown ; *K-S*, values obtained by Kugelmass and Shohl.

In spite of these authors' observations, the existence of tertiary salt must be admitted as a possibility.

We have also worked out Ettori, Grangaud, Benoit and Clavert's experiments, choosing the condition which enabled them to obtain the lowest Ca/P ratios in pigeon's bone. Unlike Ettori, we prefer, for greater precision, to separate the newly formed bone from the old bone and determine the calcium and phosphorus that both contain. We have never found the Ca/P ratio to be less than that of tricalcium phosphate. So as to confirm the absence of brushite in folliculinic bone by a more exact process than chemical analysis, we measure the refractive index of old bone cortex and of new medullary bone, freed from their organic matter by prolonged boiling in glycerine containing 6 per cent potash.

		Refractive index of mineralized bone (λ = 589·1 A.)
Pigeons control	cortical bone	1·595
	old medullary bone	1·595
Pigeons treated	cortical bone	1·591 ± 0·0004
	new medullary bone	1·590 ± 0·0018
Cattle	cortical bone	1·590
a-Tricalcium phosphate		1·590

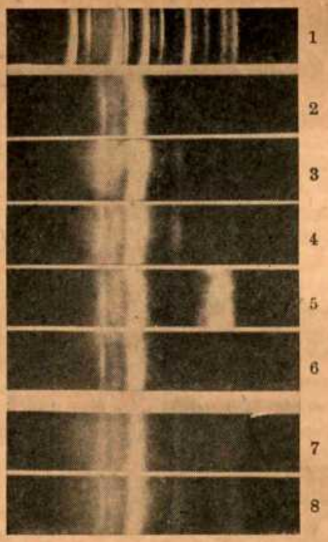

Fig. 4 X-RAY PHOTOGRAPHS OF DICALCIUM PHOSPHATE (1), OF FOLLICULINIC BONE (2–6), AND OF NORMAL DIAPHYSEAL PIGEON BONE (7–8)

As is shown in the accompanying table, the refractive index of new and of old mineralized bone exactly corresponds to that of α-tricalcium phosphate, the hydrated form of tertiary salt[12].

In collaboration with H. Brasseur, we submitted old bone and folliculinic bone to X-ray diffraction, and we obtained in every instance the radiogram of α-tricalcium phosphate, which is very different from that of dicalcium phosphate[13].

These radiograms are grouped together in Fig. 4.

There remains only to consider the opinion of Kramer and Shear in respect to tricalcium phosphate.

We are enabled to characterize tricalcium phosphate in its two forms, hydrated and non-hydrated, by the use of X-ray diffraction and by precise chemical research in collaboration with H. Brasseur[14]. The principal salt present in bone, isomorphous to apatite, is constituted of three molecules of $Ca_3(PO_4)_2$ combined with two molecules of water. When heated to 700° C., the latter are eliminated and tricalcium phosphate answers to the classic formula $Ca_3(PO_4)_2$. Heated to 900°, with a stoichiometrically defined amount of calcium chloride, of fluoride, of carbonate or of oxide, it combines with the latter to form a true apatite.

There is therefore no longer any doubt as to the nature of the stable chemical composition of tricalcium phosphate.

Greenwald[15] introduced an important element which might, if supported by new experimental proofs, cause a modification in the arrangement of the atoms of calcium and of phosphorus in the formula of tricalcium phosphate and which would furnish an answer to Kramer and Shear's objection relative to the manner of formation of tertiary salt. Greenwald submits that tricalcium phosphate is a salt of the acid $HCaPO_4$, the existence of which he thinks he has observed in solution, both in the ionized and non-ionized form. Thus, tricalcium phosphate might originate in course of a second-order reaction which agrees perfectly with the manner of its experimental formation. In its hydrated form, then, α-tricalcium phosphate would correspond to the formula $[Ca(CaPO_4)_2]_3.H_2(OH)_2$.

Thus the theory of primary calcification, having lost both its experimental and theoretical foundations, fails to explain the mechanism of calcification.

How then can we explain, apart from the theory of primary calcification, the progressive rise of the Ca/P ratio in bone in course of formation ?

It is clear that the ions $PO_4^{\equiv}$, when freed from phosphoric esters in the course of the second phase of ossification, must attach themselves to an organic element, for at this point we do not find a sufficient quantity of mineral cations in the bone to constitute an insoluble compound with phosphorus. Possibly it may be to the pre-osseous organic substance itself that they become attached ? But we can say with certainty that by whatever means the $PO_4^{\equiv}$ ions may be fixed in the precursor of the bone ossein, the Ca/P ratio of bone in formation continually rises because the microcrystals of α-tricalcium phosphate are progressively deposited in a tissue rich in $PO_4^{\equiv}$ ions. It is but a coincidence that the Ca/P ratio touches the value 1·29 and in no way explains the presence of brushite in bone in course of formation.

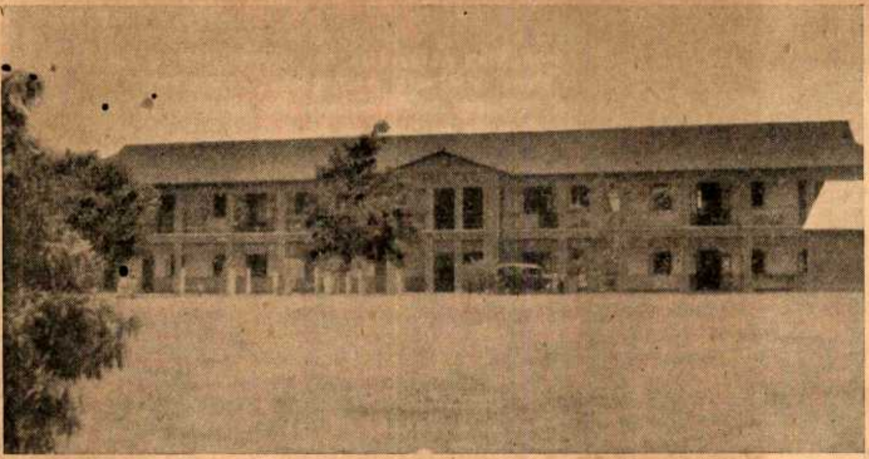
THE WEST AFRICAN CACAO RESEARCH INSTITUTE

By O. J. VOELCKER

A STATEMENT made by the Secretary of State for the Colonies in the House of Commons in 1946 disclosed the fact that a sum of £1¼ million was to be set aside from the profits of the West African Cocoa Control Scheme for cacao research in West Africa. This decision gave effect to the proposal put forward by the previous Government[1].

That a sum of this magnitude should be devoted to research on one specific crop is a matter of considerable interest and importance in the history of agricultural research in the British Colonial Empire. The reason for research on this scale is not far to seek. The territories of the Gold Coast and Nigeria normally produce for export about half the world's 600,000 tons annual consumption of cacao beans, and the wealth of the Gold Coast, and to a lesser degree that of Nigeria, is intimately bound up with the production of cacao. Within recent years, pests, diseases and the degradation of certain soils have led to marked reduction in crops.

The genus *Theobroma* is not indigenous to Africa. The introduction of *Th. cacao* to West Africa is generally considered to have taken place in the



THE WEST AFRICAN CACAO RESEARCH INSTITUTE, TAFO

latter part of the nineteenth century. Over certain areas climatic and edaphic conditions proved favourable for the growth of cacao, and its cultivation by peasant farmers spread rapidly. The migration of pests and diseases from indigenous vegetation to cacao might have been expected under these conditions and has, in fact, occurred. There is evidence that equilibrium has not yet been reached between cacao and indigenous pests and diseases, and further trouble must be expected.

Prior to 1930 cacao research throughout the world had not been impressive, and cacao might well have been termed the Cinderella of tropical plantation crops. In West Africa little attention had been paid to selection, and none to controlled pollination or to methods of propagation; experiments designed to investigate the best methods of growing cacao were few and far between. There were, however, notable exceptions, and among these may be mentioned Cotterell's investigations into the capsid pests *Sahlbergella singularis*, Hagl. and *Distantiella theobroma*, Dist., and Dade's work on black pod disease (*Phytophthora palmivora*), Butl.

In 1930 the Department of Agriculture, Nigeria, followed some years later by that of the Gold Coast, commenced programmes of cacao research on a small scale. Stimulation was further afforded by the inauguration of planned cacao research at the Imperial College of Tropical Agriculture, Trinidad.

The observed deterioration of cacao farms in the Eastern Province of the Gold Coast led, in 1938, to the creation of a research station at Tafo in that Province, to investigate the causes of deterioration and to provide facilities for other lines of cacao research in the Gold Coast. One year later, Posnette demonstrated that much of the deterioration was due to virus disease—commonly known as swollen-shoot. The significance of the discovery of a lethal virus disease of cacao became fully appreciated in London; this and disturbing reports on the prevalence of capsid pests throughout the West African cacao belt resulted in a visit in November 1943 by Sir Harold Tempany, agricultural adviser to the Colonial Office. It was then decided to broaden the scope of the work being done at Tafo to cover all fundamental problems affecting the crop in West Africa. As part of the research programme it was considered necessary to gain reliable information on the conditions prevailing on the cacao farms: the presence or absence of specific diseases and pests, the age of the trees and the location of the farms themselves. The Governments of the Gold Coast and Nigeria, financed to the extent of £105,000 from the £1¼ million, agreed to put in hand at once surveys to provide these data. The adjacent French Colonial Governments also agreed to survey the cacao farms in their territories.

Within the first few months of the commencement of these surveys, small outbreaks of cacao virus disease were discovered in Nigeria. The disease was also found to be widely distributed through the Gold Coast and Ivory Coast, but has not yet been disclosed in the Cameroons. Delay in the discovery of these sources of virus infection and in devising control measures would have jeopardized the whole future of West African cacao.

It stands to reason that the immediate programme of research is to devise control measures against the two major menaces to West African cacao, namely, virus disease and capsid pests. The long-term programme includes fundamental work on the physiology of cacao (edaphic and climatic factors limiting growth and yield), the breeding of improved varieties and the evolution of technical methods of growing cacao and preparing the beans for market. Constant attention will always have to be paid to minor pests and diseases, since experience has shown that these may become of major importance.

The Institute came into being on April 1, 1944, with a European establishment of twenty approved during the year. It has been deemed inexpedient immediately to increase the staff to twenty-seven as recommended by the Cocoa Research Conference held in London in 1945[2]. The establishment consists of a director, a principal research officer, specialists in the Divisions of Pathology and Botany, Entomology, Soil Science and Agronomy, and a secretary. Normally the head of each Division will be a senior specialist. The African staff includes forty technical assistants.

Since 1944 rapid expansion has taken place at Tafo to cater for the increased staff and research activities. The existing laboratories have been purchased from the Gold Coast Government and extended; plans have been drawn up for the erection of permanent houses to replace the ten temporary bungalows, for an administrative building, quarters for African staff and for other permanent structures. Pipe-borne water is to be supplied, and the old station of 270 acres has been increased by the acquisition of a further 640 acres. Detailed topographical, geological, soil and vegetational surveys as well as an aerial photographic survey have been made of the Institute's land. Four experimental sub-stations and one started by the Department of Agriculture in 1940 have been set up in the vicinity of Tafo, and an entomological sub-station has been started in Nigeria.

In spite of the inevitable difficulties of recruiting staff and of obtaining equipment and apparatus, the first three years of the Institute have been productive of results of great importance to the West African cacao industry. This achievement has been made possible by working in the closest collaboration with the Departments of Agriculture, from which the Institute has taken over and developed several lines of investigation initiated prior to 1944.

Much remains to be explored in connexion with swollen-shoot disease; but the field vectors are now known and considerable data have been accumulated concerning the viruses and virus strains causing this disease. While no example of immunity in *Th. cacao* has been discovered, work on tolerance is leading to results which may be of more than academic interest. Control of the disease in the field by rogueing infected trees has been proved, and this method is being adopted with vigour by both the British and French West African Governments.

Although no practical control of capsid pests of cacao has yet been proved, small-scale trials with recently developed insecticides are giving promising results. The system of cacao farming adopted by the Africans and their lack of mechanical skill will, however, act as a severe handicap to the use of mechanical apparatus on which chemical control so largely depends. Unfortunately, no success has yet been obtained on the biological control of cacao capsids. The discovery by the Institute that much of the damage formerly ascribed to capsids alone is, in fact, due to subsequent invasion by the fungus *Calonectria rigidiuscula* (Berk et Brme) Sacc. further complicates the problem.

Definition has now been given to soils in West Africa which are suited to permanent cacao cultivation, and it has been shown that the presence of virus disease or capsid pests is in no way dependent on the type of soil on which cacao is grown. A rapid method of soil surveying, based on the American system, has been evolved by the Institute, and the Gold Coast and Nigerian Governments are now considering putting into effect soil surveys, one object of which would be to assess the area of actual and potential land suited to permanent cacao cultivation.

A valuable collection of varieties of *Th. cacao* has been introduced from the West Indies, South and Central America, and is now established at Tafo. Marked differences in growth are already apparent, and many varieties exceed the West African Amelonado (a lower Amazon type) in robustness. Seven species of *Theobroma* other than *Th. cacao* have also been introduced. The collection is by no means complete; but it will be surprising if that now established by the Institute does not produce plant material of the utmost value either through resistance to diseases or pests, or through increased yields. There is the further possibility that certain varieties may thrive on soils which are not suitable for the growth of West African Amelonado, and thereby extend the range of cacao cultivation.

An ordinance passed in March 1947 by the Gold Coast Government provides for the legal establishment of the Institute and for a statutory committee to control and administer it. After meeting the expenditure on the surveys, the recurrent expenditure of the Institute during 1944–47, and the extraordinary expenditure at Tafo, a sum of some £850,000 remains. The interest from this, fortified by the periodic sale of investments, will provide the Institute with means of meeting recurrent expenditure over the next twenty years.

EXHIBITION OF INDIAN ART

IT must at the outset be confessed that to those who know India the Exhibition of Art from India and Pakistan at the Royal Academy, London, is a little disappointing. Since architecture could not be exhibited, it could not really be comprehensive of Indian art; but even so, and in spite of a few superb examples of the carvers' and the armourers' craft, some fine cast bronze and a few magnificent carpets, the bulk of the exhibition consists of sculpture and of painting in miniature. Textiles in general are poorly represented. Nor is all the exhibition very happily displayed. In the first gallery, the material on which small objects are shown is badly chosen in regard to colour, and the labelling is sometimes questionable; the Mohenjodaro copper bull (No. 5) is probably a species of sheep or goat, and the so-called girdle (No. 29) is really too long (4½ ft.) for that purpose, and was probably a neck ornament like some very similar that still survive in at least one marginal area.

The sculpture is inevitably disappointing. Reft from its architectural background, most of it on a very small scale, it would have stood more concentrated grouping than it has received, and it is little helped by a background which fails to show it up. How much difference an appropriate background can make can be judged by the marble arch from Bikanir (No. 279). Even in its own surroundings, and seen on the scale of Ellora, Madura, or Seven Pagodas, Indian sculpture is not easy to appreciate—probably because it is impersonal in style, and the individuality one looks for in European sculpture is suppressed here and subordinated to an abstraction. Indian sculpture bears perhaps to European much the same relationship as the ballet bears to the drama: it is generalized, and individuality is absent. It is possibly significant, therefore, that some of the most attractive sculptures are figures which have lost their heads, like the red sandstone Bodhisattva (No. 207), which is perhaps the best piece in the exhibition, though the magnificent horse from Konarak (No. 276) runs it very close. This horse, it is true, has a head; but it is a live, individual head and it is difficult to suppose that the living prototype had not a personal name given him. An eleventh-century basalt Brahman from Orissa (No. 302) is notable, and among the wood carvings a sixteenth century carving of Krishna (No. 293) in the same gallery.

But the most substantial part of the exhibition is the very large series of Rajput and Mughal paintings. These have much in common with the miniatures in illuminated medieval manuscripts, and the fascination of their execution and conception is often enhanced by their naïvety. On the whole, the Rajasthani and Kangra paintings please more than the Mughal. This is perhaps to be expected, since Muslim painters must often have worked with some misgiving at their infringement of religious injunction, while no such inhibition would trouble a Hindu. There was something particularly suggestive of a Book of Hours about No. 662—Krishna sheltering Radha from the rain, and the Kangra paintings of the heroine, the cat, and the lovebird (No. 652), of Krishna and Radha by moonlight (No. 655), of the messenger's arrival in a storm (No. 680), or of Krishna with the *gopas* (No. 684), struck one in passing as particularly attractive. If one must select among the Mughal paintings, Mansur's hornbill (No. 911) and the portraits of Murad on an elephant (No. 1100), of Muhammad

Riza Kashmiri (No. 1107), of Khan-i-Dauran (No. 1118), of Shah Daulat holding a globe (1124), may be mentioned, while two drawings of a lady at her toilet and a boy holding fruit (No. 1139) are noticeable for the effect obtained with a greater economy of line than the general style of the period would lead one to expect. Very interesting were drawings of Europeans as seen by seventeenth century Indian painters, and the unexpected Mughal copies of Dürer's "Virgin and Child" (No. 1217) and his "St. John the Evangelist" (No. 820), and a sixteenth century Indian drawing of St. Matthew.

But all these very remarkable series of Indian paintings suffer from inadequate description. More explanatory labelling would not have disturbed the general effect, and apart from the crying need for it in regard to so many of the paintings, it should be explained, for example, that the thumb ring (No. 793) was used for drawing a bow; unnecessary inaccuracies, such as describing an obvious pheasant as a "jungle-cock" (No. 896), could easily have been avoided. Moreover, some of the miniatures with the greatest intricacy of detail (for example, No. 534) are hung too far above the eye line, and it is tiresome to find the order of pictures in the catalogue failing from time to time to correspond with the order in which they are hung.

No notice of this exhibition would be complete without mention of the admirable Mughal jade and crystal vessels in Gallery X—No. 1088 in particular—and of the Girdlers' Company's Indian carpet woven for them in 1634. A good many of the modern Indian paintings could have been omitted without loss. On the other hand, it was a pleasant surprise to meet the paintings by British artists in India, the Zoffanys, including Colonel Mordaunt's Cock Match in particular, Tilly Kettle, George Chinnery, and the rest. It is a pity that in Clive's set of ivory chessmen exhibited in the same room the respective sides were mixed when they were set out.

It is to be feared that this account may read a little captiously. That is not ingratitude for such a magnificent feast of the beautiful as has been provided, but rather a feeling that it has not been cared for quite as devotedly as it deserves.

J. H. Hutton

OBITUARIES

Prof. E. C. C. Baly, C.B.E., F.R.S.

The death on January 3 of Prof. E. C. C. Baly, emeritus professor of inorganic chemistry in the University of Liverpool, deprives the scientific world of a vivid and stimulating personality. He was born in 1871, his father, E. E. Baly, being an official of the Bank of England in London. He obtained his scientific training at University College, London, but instead of taking the conventional B.Sc. course he proceeded direct to the Institute of Chemistry qualification. Attracted always to research, particularly in its more romantic aspects, Baly must have found the atmosphere under Ramsay at University College very congenial. Like his chief, Baly loved an element of daring in his investigations, and generations of Liverpool students rejoiced to hear him tell the story of the discovery of the rare gases. This he did with obvious enjoyment and conscious artistry. It was at University College that he acquired his great skill as an experimenter. Indeed, his powers as a glass-blower became legendary. Even after he had suffered the loss of an eye as a result of an explosion in the laboratory, his skill was unimpaired.

Baly was one of the pioneers of spectroscopy. His work on the spectra of the rare gases was a model of its kind, and showed how the artistic side of his temperament was matched by a capacity for careful and precise work of an exhausting nature. He early showed an interest in absorption spectra in relation to chemical constitution, and a long series of papers with colleagues who later earned great distinction laid the foundations of a subject which has grown increasingly important. Baly was elected a fellow of the Royal Society in 1909. He held the post of assistant professor of chemistry and lecturer in spectroscopy during 1903–10 at University College. In 1910 he succeeded Campbell Brown as Grant professor of inorganic chemistry at Liverpool, and held the chair until his retirement in 1937.

Baly's "Spectroscopy" first appeared in 1905 and earned a great reputation as a valuable monograph. The second edition (1912) was nearly 700 pages in length, and the third edition appeared in three volumes in 1927. A fourth volume on absorption spectra of organic compounds was projected, but by that time Baly had transferred his main interest to photosynthesis, a book on which appeared in 1940. The attempt to summarize the vast literature of spectroscopy was a tremendous task, necessitating for a chemist unusually wide reading of physical and astrophysical papers. Over many years Baly prepared reviews of the progress of inorganic chemistry for the Annual Reports of the Chemical Society. Although many will remember him primarily as an adventurous researcher, his great contributions as a scholar should not be forgotten.

During the First World War, Baly became deputy inspector of high explosives for the Liverpool area, and at the end of the War he was awarded the C.B.E.

The post-war 'bulge' found the research laboratories at Liverpool crowded with keen ex-Servicemen, and Baly at the height of his powers. With characteristic courage he threw himself into the very difficult task of imitating in the laboratory the photosynthetic processes occurring in the living plant. In this work he was for a time joined by Prof. (now Sir Ian) Heilbron. The results of these and later researches attracted attention all over the world. They gave a powerful impetus to the continuing attack on a very complicated problem about which much still remains to be elucidated.

Baly's great personal charm, his enthusiasm and his persuasive advocacy, his skill as a musician and his feats as a mountaineer, his verve as a scientific worker and his labours on the councils of the Chemical Society, the Royal Institute of Chemistry and the British Association of Chemists will preserve his memory in many different circles. During his twenty-seven years at Liverpool he gave distinguished service to the University in many capacities.

In 1902 Baly married Miss Ellen Agnes Jago, who, with four sons, survives him.

R. A. Morton

Sir Robert Greig

By the death on November 29 of Sir Robert Blyth Greig, Great Britain has lost a very eminent administrator who in particular did much to further agricultural education and research. A son of George Greig, of Balcurvie in Fife, he was born in March

1874, and his farm upbringing undoubtedly influenced his career. On leaving school he spent a short time in a bank; but farming was in his blood, and after attending classes at the University of Edinburgh, under Prof. Wallace, he went to Canada where, as a very young man, he became manager of a large ranch in Alberta.

On returning to Britain in 1897, Greig was appointed lecturer, first at Cheshire Agricultural College, and later at the Durham College of Science, Newcastle-on-Tyne. In 1903 he married Maud, a daughter of the late Sir George Hunter of Newcastle. In the same year he went to the University of Aberdeen as Fordyce lecturer in agriculture, and during the next eight years took a leading part in building up the high reputation of the University Agricultural Department and the North of Scotland College of Agriculture.

In 1911 Greig was appointed inspector of agriculture under the Board of Education, but had scarcely taken up his duties when he was invited to become one of the three commissioners of the newly formed Board of Agriculture for Scotland, and in 1921 was made its chairman. In 1928, when the Board became the Department of Agriculture for Scotland, Sir Robert became its permanent secretary, and he held this post until he retired in 1934.

In the First World War he served with the Royal Scots in France, and was awarded the M.C. He was knighted in 1919. He held the honorary degrees of LL.D. (St. Andrews), and D.Sc.

Sir Robert travelled widely, visiting Canada, the United States, Australia, and various European countries on agricultural missions, and he was one of the British delegates to the Ottawa Conference. In 1929 he was president of Section M (Agriculture) of the British Association at its meetings in South Africa and, with Lady Greig and their daughter, visited Rhodesia and Kenya on the return journey. In the course of the tour he was in great demand to give talks to farmers and planters; I had the privilege of being with their party, and recall vividly the enthusiasm at these meetings.

During his official career, Sir Robert served on many important committees and councils, including the Carnegie Trust for the Universities of Scotland, of which he became chairman, the University Grants Committee, and the Agricultural Research Council. He was at one time chairman of the River Forth Conservancy Board, and was very active in the establishment of the Imperial Agricultural Bureaux, of which he became the first chairman. In 1940 he became chairman of a Scottish committee to encourage food production in private gardens and allotments, and devoted much time and energy to this work during the War.

Probably Sir Robert will be best remembered for his great services to agricultural education and research. During his period of office at the Department of Agriculture, no fewer than six research stations, now well known throughout the world, were set up in Scotland. These deal with animal nutrition, animal diseases, animal genetics, plant breeding, dairying, and soils, and their establishment was due, in great measure, to Sir Robert's foresight and enthusiasm for research. With the Macaulay Institute for Soil Research he had particularly close connexions, for he was a great personal friend of the founder, the late Mr. T. B. Macaulay, of Montreal, and he never spared himself in furthering the various schemes of agricultural betterment in Lewis and elsewhere in Scotland promoted by Mr. Macaulay. At the time of his death he was chairman of the council of management of the Macaulay Institute. His sincerity and profound knowledge of Scottish agriculture gained for him the respect and confidence of the farming community, and his friendship and encouragement meant a great deal to those of us who were closely associated with him.

When he retired at the age of sixty, Sir Robert was far too vigorous and active to settle down and do nothing. He became a director of the London, Midland and Scottish Railway, and one or two other companies, and threw himself with his usual zest into the new interests without, however, neglecting the old. Perhaps he overtaxed his strength and his death was unexpectedly sudden, but probably he would have wished it so.

It was something of a surprise to find Sir Robert was seventy-three when he died, for he remained so energetic and so youthful in spirit and appearance. His great personal charm and sense of humour made friends for him wherever he went, and those privileged to visit 'Shaws', his delightful home on the outskirts of Edinburgh, will always cherish memories of a charming host and a happy family circle. He is survived by Lady Greig, three sons and a daughter.

W. G. Ogg

Mr. H. W. Pugsley

Herbert William Pugsley, the eminent amateur botanical systematist, died at Wimbledon on November 18. He was born at Bristol on January 24, 1868, and educated at the Grammar School there. At the age of seventeen he went to London to be coached for the Civil Service Examinations, and entered the Department of the Accountant-General of the Navy in 1886, where he remained until his retirement in 1928. After joining the Service he studied privately and obtained his B.A. degree of the University of London in 1889.

He was accustomed to spend his leave studying the floras of Great Britain and of central Europe, particularly of Switzerland, often in company with E. G. Baker and the late C. E. Salmon, who also accompanied him to North Africa in search of daffodils. Ever painstaking and critical, he soon became one of the leading British botanists—to use the general term for those engaged on the study of the flora. Of a quiet demeanour, he worked in close and friendly co-operation with the majority of his contemporaries, but had little patience with those whose identifications he considered slipshod—and occasionally said so.

Pugsley's first important work was on the British capreolate fumitories in 1902: he continued his interest in the genus, and published a monograph of *Fumaria* and *Rupicapnos* in 1919. He was also well known for his researches on *Euphrasia*, and his revision of the British *Euphrasieæ* appeared in 1930. He was interested in narcissi and grew them in his garden for about fifty years: he wrote on the *Poeticus* group in 1915 and monographed the sub-genus *Ajax* in 1933. Orchids had a continued fascination for him, and he wrote several papers on them, particularly the marsh orchids. The British robertsonian saxifrages also attracted him, and he revised the section in 1936. For many years he was engaged on a monograph of the British *Hieracia*. This, which he regarded as his *magnum opus*, is to be published by the Linnean Society, and the last batch of proofs was received during the week of his death. So far as I know, the only recognition of his work was the award of the William Herbert Medal of the American Amaryllis Society in 1940.

His manuscripts were a delight to edit—page after page of foolscap clearly written, with no alterations or erasures.

A little inclined in his later years to dilate on the investigation in hand, he was always willing to give what help he could, particularly to beginners: he was an excellent field naturalist.

He was a keen collector of water-colours, particularly of the Bristol School, and was a well-known frequenter of the sale rooms.

He had six sons, one of the surviving three being Prof. A. J. Pugsley, professor of civil engineering in the University of Bristol.

J. RAMSBOTTOM

Prof. B. Bavink

THE death occurred recently of Prof. Bernhard Bavink, an eminent German teacher of natural philosophy. His great work, "Ergebnisse und Probleme der exakten Naturwissenschaften", is internationally known. His last book, published in 1947, is entitled "Was ist Wahrheit in den exakten Naturwissenschaften ?". He was one of the few men of science who never lost sight of the 'whole' while commanding very specialized knowledge of the sciences. His publications and lectures always attempted to bridge the gulf between modern, technically informed science and the sphere of faith and ethics and all the higher spiritual values. Bavink was born on June 30, 1879, in East Friesland. His last years were sad. A son of seventeen was called up towards the end of the War and was killed. An older son had been a prisoner of war in the U.S.S.R. and died from typhoid fever when he was just expected to go home. In the same year a daughter, lacking the necessary care and food, died of tuberculosis. At the time of his death, Prof. Bavink was on the point of taking a chair at the Stuttgart Technical College.

WE regret to announce the following deaths:

Dr. C. W. Kimmins, chief inspector of the Education Department, London County Council, during 1904–23 and president in 1929 of Section L (Education) of the British Association, on January 12, aged ninety-one.

Dr. John Marshall, reader in mathematics in the University of London (Bedford College), on January 16, aged fifty-seven.

NEWS and VIEWS

Geological Society: Awards

THE council of the Geological Society has made the following awards: Wollaston Medal to Sir Edward Bailey, formerly director of the Geological Survey of Great Britain, in recognition of his researches on the mineral structure of the earth, especially the stratigraphy, structure and petrology of Scotland; Murchison Medal to Dr. J. Phemister, of the Geological Survey of Great Britain, in recognition of his important researches on the igneous and metamorphic rocks of the northern Highlands and his valuable contributions to petrology, mineralogy and geophysics; Lyell Medal to Prof. A. H. Cox, professor of geology at University College, Cardiff, for his researches, particularly on the stratigraphy and petrology of the Lower Palæozoic rocks of Wales; Prestwich Medal to the Abbé Henri Breuil, for his researches on the Quaternary, and especially for his investigations, begun in France, on the succession and correlation of Pleistocene deposits by their contained human artefacts; Wollaston Fund to Dr. J. G. C. Anderson, of the Geological Survey of Great Britain, in recognition of his researches on metamorphic and economic geology and particularly of his work on the Moine and Dalradian rocks of Scotland and Eire; Murchison Fund to Dr. F. W. Cope, of the Geological Survey of Great Britain, for his researches on the stratigraphy and palæontology of the Carboniferous rocks of Derbyshire and adjacent regions; Lyell Fund in two moieties to (1) Dr. Dorothy Rayner, lecturer in geology in the University of Leeds, for her outstanding work on the Mesozoic fishes, notably on the neurocranium, and relationships of the holosteans; and (2) Mr. W. D. Ware, for his researches on Carboniferous stratigraphy and palæontology in South Wales.

Institution of Electrical Engineers: Awards

THE following have been elected to honorary membership of the Institution of Electrical Engineers: Sir Thomas Purves, for his distinguished work in electrical engineering, and his services to the Institution, of which he was president in 1929; and Admiral Sir John Cunningham, First Sea Lord and Chief of the Naval Staff, in recognition of the outstanding part played by him in stimulating the application of electrical techniques in the Royal Navy and the contributions made by officers of the Royal Navy to the applications and development of electrical science and engineering.

The Faraday Medal of the Institution of Electrical Engineers has been awarded to Prof. M. L. E. Oliphant, Poynting professor of physics in the University of Birmingham, for his distinguished work in nuclear physics and his original discoveries in the physical sciences, particularly in the realm of electromagnetic oscillations, their production, study and use. The Faraday Medal is awarded by the Council of the Institution, not more frequently than once a year, either for notable scientific or industrial achievement in electrical engineering, or for conspicuous service rendered to the advancement of electrical science without restriction as regards nationality, country of residence, or membership of the Institution.

Industrial Research in East Africa

THE report of the East African Industrial Research Board for the year ended December 31, 1946 (Nairobi. 1*s*. 6*d*.), includes the report of the acting chairman, Mr. H. B. Stant, and separate reports on the progress of the main research projects. The most important of these for agriculture in East Africa is the calcination of rock phosphate with soda ash; a further forty tons of the silicophosphate obtained have been prepared in the pilot rotary kiln for field experiments. The ceramics branch has developed a new technique for building bricks by bonding non-plastic quarry waste with the minimum of highly plastic clay and firing in a kiln to give a building block cheaper than dressed natural stone. Advice has been given to the commercial pottery branch of the Industrial Management Board, and the production of alternative low-cost building materials has received attention, particularly murram, a natural formation consisting of coarse materials, rotten rock or concretionary iron ironstone bonded with clay. Promising results have been obtained in the extraction of pyrethrins from fresh flowers by a three-stage counter-current process, and a hæmoglobin digestion method has been developed for the assay of papain. Further work has been carried out in connexion with the manufacture of totaquina, including improved methods of analysis and study of the conditions for the maximum recovery of quinine and cinchonidine. A method of testing samples of diatomites as filter aids was standardized, and the amelioration of the pollution of streams by effluents from coffee and sisal factories was studied intensively; small-scale plant trials indicate that at least 90 per cent purification of the coffee effluents can be effected by biological filtration. Work was completed on the tannin content of different varieties of mangrove bark.

World Supplies of Oils and Fats

The address "Rebuilding Europe's Fat Supplies the Problem and How to Meet It", delivered by the chairman of Lever Brothers and Unilever, Ltd., at the annual general meeting of that company on September 8, has been reprinted, with a graph and a series of statistical appendixes (Pp. 24. Lever Bros. and Unilever, Ltd., London). The survey of pre-war, war-time and post-war supplies leads Mr. G. Heyworth to the conclusion that there is at present an annual world shortage of some four million tons of oils and fats, and although supplies can be increased, the process will be slow. The tendency for producing countries to consume a greater part of their own products, as well as the tendency towards a heavier consumption of milk, particularly in the United States and Great Britain, and the serious decline in the production of oils and fats in Western Europe, are new contributing factors; and it is estimated that the world production for 1947 will have been about two and a half million tons below the pre-war figure. Allowing for the increase in world population, the gap between supply and demand is too big to permit abandonment of Government controls in either Great Britain or Holland at present; but the control system in Western Europe can be operated so as to improve the terms of trade by more effective combination in the purchase of raw materials and by the removal of subsidies on the finished products.

Mr. Heyworth is emphatically of the opinion that the earliest abolition of the subsidies on food in Britain is essential. Home production in the countries of Western Europe can be increased and production in overseas territories, which were exporters before the War, must be restored to the full, and high priority given to the re-establishment of conditions which make this possible. Additional production must be found by bringing into cultivation unused tracts of land, as typified by the East African Groundnut Scheme, and additional amounts of detergents should be manufactured from materials derived from mineral oil. He even suggested the temporary suspension of the present international limitation on the catching of whales. Finally, he urged better utilization of existing production facilities generally, and the forgoing of expenditure on activities which do not immediately contribute to the alleviation of essential shortages.

Control of Atomic Energy

The Society of Calvinist Lawyers and the Christian Society of Scientists and Physicians in the Netherlands held a meeting at Amersfoort, Netherlands, during November 15–17, 1947, to discuss the problem of atomic energy. Addresses were delivered by Dr. D. J. Lock on "The Military Aspect", Dr. C. C. Jonker on "The Economic Aspect", Dr. Gezina H. J. van der Molen on "The International Aspect", and Dr. R. Schippers on "The Ethical Aspect". The meeting was presided over by the presidents of the two societies, Prof. P. S. Gerbrandy and Prof. G. J. Sizoo. A number of resolutions were adopted, some dealing with spiritual aspects of the problem, and others with the material side. Among the latter, it was noted that the atomic weapon itself does not bring about an essential change in warfare, although the extent of its destructive power is so great that it is not possible to restrict the force of arms to purely military objects. On account of this exceptional character, international control and inspection of the atomic weapon is imperative. Prohibition of the atomic weapon without international control must be rejected as absolutely inefficient in view of former experience with similar prohibitions. Since the application of atomic energy for peaceful purposes leads inevitably to the possibility of preparing for military applications, the production and use of atomic energy for peaceful purposes come within the sphere of international law, and should be put under the supervision and inspection of an international organisation. It was resolved that national sovereignty is not a legal ground for rejecting international control of atomic energy. All nations, it was concluded, should, in view of the far-reaching effects of atomic energy problems, make the utmost effort to find peaceful solutions of international differences.

Horace Wells and Anæsthesia

A century ago, on January 24, 1848, one of the principal actors in the drama of anæsthesia died in prison by his own hand at the age of thirty-three. Born at Hartford, Vermont, on January 21, 1815, Horace Wells studied dentistry at Boston, and practised at Hartford, Connecticut. The idea of inhalation anæsthesia occurred to him on December 10, 1844, during an exhibition of 'laughing gas' by a New York showman, Gardner Quincy Colton, when a young man, Sam Cooley by name, under the influence of the gas severely bruised his leg without apparently feeling any pain. The following day Wells had a troublesome wisdom tooth painlessly removed under nitrous oxide. In January 1845 he went to Boston to demonstrate his discovery at the Harvard Medical School. The experiment went wrong, and the young dentist left the theatre with the words 'charlatan' and 'humbug' ringing in his ears. His physical and mental health now began to decline. The last chapter of his life is steeped in obscurity. On January 24, 1848, in Tombs Prison, New York, he committed suicide under chloroform anæsthesia—slashing his femoral artery with a razor. In 1864 the American Dental Association, and in 1870 the American Medical Association, declared Wells to be the real discoverer of anæsthesia.

Animal and Human Sex Behaviour

ANIMAL and human sex behaviour are the subjects of five papers published in the *Annals of the New York Academy of Sciences* (47, Art. 5, 603–664 ; May 1947). These papers were given at a conference on physiological and psychological factors in sex behaviour held by the Sections of Biology and Psychology of the Academy in March 1946. Prof. S. B. Wortis, in his introduction, says that the conference revealed new material and indicated correlations which emphasize the need to change our attitudes to human sexual behaviour, and he hopes that this material may help to modify the law relating to these matters. He was speaking to Americans, but progressive opinion in Britain has more than once expressed a similar point of view. American and British cultures are not so different that they cannot, in matters like this, be regarded as one. Many of the opinions expressed at this conference will therefore interest British readers of them. There are two papers on animal sex behaviour by W. C. Young, who discusses animal endocrines, and W. E. Galt, whose subject is primate sex behaviour. A. C. Kinsey spoke briefly upon sex behaviour in the human animal, Morris Herman gave a paper on aberrant sex behaviour, and Gregory Bateson gave one on sex and culture.

Historical and Philosophical Society of Jerusalem

IT has often been said that the academic discipline provides a foundation on which international collaboration can be built. The Jerusalem Historical and Philosophical Society, formed in March 1946, with the object of promoting the study of history, philosophy and literature among the Arab, British and Jewish communities of Palestine, is good evidence of such collaboration. The Society meets once a month, when papers are read by members or guest lecturers, and the three subjects, history, philosophy and literature, are taken in rotation, four papers a year being devoted to each subject. Membership is limited and is by invitation only, the sole qualification being an academic interest in one of the three subjects. At present, several of the Arab members belong to the Government Arab College, British members are drawn from the staff of the British Council in Palestine, and Jewish members from the staff of the Hebrew University ; the Department of Education is also represented. So far it has not been possible to print papers in full; but Dr. W. Yourgrau has produced short summaries of seven papers presented during the Society's first year. The president is Sir William FitzGerald, chief justice of Palestine, and the honorary secretary and treasurer is Miss E. Cunnington, Jerusalem, P.O. Box 2.

Calcutta Statistical Association Bulletin

THE publication of *Sankhyā*, one of the leading statistical journals, and the work of Prof. P. C. Mahalanobis, Dr. P. V. Sukhatme and others for national and international statistics, establish India's claim to be considered in the front rank of nations contributing to the theory and application of statistical science. The Calcutta Statistical Association, a new society, has produced a *Bulletin*, the modest aim of which is to publish popular expositions of statistics ; if the journal has the support of the Calcutta school, a high standard should be assured. The first number (No. 1. August 1947. Pp. 1–48. Calcutta, 3*s*.) contains an interesting brief history of crop-sampling in India from the time of Akbar to the present day, a criticism of the recent report of the Indian Central Pay Commission, simple accounts of statistical aspects of public opinion surveying and mental testing, and several shorter notes. The problem of making modern statistical techniques intelligible to readers who lack formal training in the subject has been courageously, though not always successfully, tackled. A more critical approach and increased care in the choice of words should make this *Bulletin* of considerable interest and value outside, as well as inside, India.

Modern Apparatus for Visual Aids

A RECENT publication offers a priced catalogue of representative items in the range of equipment for visual aids in education (Visual Aids : Notes on some Modern Apparatus. By Wilfred J. Garnett. Pp. 36. Manchester : Flatters and Garnett, Ltd., 1947). Each instrument is concisely described, and the pros and cons of each corresponding method of visual presentation are outlined with admirable fairness and objectivity. The most spectacular of the items listed are probably the microprojector and the patent demonstration mirror ; the former as an example of functional efficiency, the latter in view of its comparatively recent development as a visual aid. As a guide to the purchaser of equipment who seeks the best possible results in the way of visual reproduction the author is thoroughly dependable. (The section on "Types of Screen" is particularly helpful, and the actual specimen of 'beaded' screen material does all that is claimed for it.) Technical perfection, however, is not always the last criterion. The technical limitations of film strip sometimes make slides preferable. Yet the growing popularity of film strip among teachers cannot be questioned. The advantages of lightness, compactness and, above all, cheapness are overwhelming. Film strip has come to stay ; can science now produce the non-scratch film ?

Danish Institution of Civil Engineers

IN response to an invitation received from the Danish Institution of Civil Engineers (Dansk Ingeniørforening) Sir Stanley Angwin is representing the presidents of the Institution of Civil Engineers, the Institution of Mechanical Engineers and the Institution of Electrical Engineers in Copenhagen on January 21 and 22 in the celebrations organised by the Danish Institution to mark the opening of their rebuilt headquarters building "Engineering House". The new headquarters replace the Institution's building totally destroyed by the R.A.F. in the spring of 1945, together with the next-door building which the Germans were using as Gestapo headquarters.

International Union of Crystallography

AT the invitation of the American Society for X-ray and Electron Diffraction and of the Crystallographic Society of America, the first General Assembly and International Congress of the Union will be held at Harvard University, Cambridge, Mass., U.S.A., during July 28–August 3, 1948. Delegates to the General Assembly will be nominated by the national academies of countries adhering to the Union; but all crystallographers are cordially invited to attend the International Congress. Those outside the United States expecting to be present are requested to inform the General Secretary (Dr. R. C. Evans, Crystallographic Laboratory, Cavendish Laboratory, Cambridge, England) at a very early date in order that detailed planning may proceed without delay; those willing to contribute papers should at the same time forward details for consideration by the Programme Committee. Crystallographers in the United States will receive separate notification from the American Society for X-ray and Electron Diffraction or the Crystallographic Society of America. It will not be possible for the Union to provide funds to assist delegates in attending the Congress, and crystallographers should therefore make their own arrangements in this matter.

Bristol Symposium on Cosmic Rays

The Colston Research Society, which for many years has made grants in aid of research in the University of Bristol, proposes to support a series of symposia, to be held annually, on selected topics of scientific importance. Papers will be invited from distinguished guests and it is proposed that each year a volume giving an account of the proceedings, including discussions, will be published. The first symposium will be on "Cosmic Radiation", and will be held in the H. H. Wills Physical Laboratory, University of Bristol, during September 20–24, 1948. It will be possible to accommodate a limited number of members of the symposium in Wills Hall, University hall of residence. Further information can be obtained from Dr. C. F. Powell, H. H. Wills Physical Laboratory, Royal Fort, University of Bristol.

Speech Therapy Conference

A Speech Therapy Conference, arranged by the College of Speech Therapists, 68 Queen's Gardens, London, W.2, will be held during September 20–24 at the house of the Royal Society of Medicine. There will be sessions on the following subjects: the aim and scope of speech therapy, the emotional background of stammering, speech disorders arising from head injuries, the speech clinic and the speech-defective child, and the role of emotional problems in producing disorders of speech. Summaries of proposed papers must reach the Secretary not later than March 1. It is hoped to inaugurate during the Conference an International Federation of Speech Therapists. Further information can be obtained from the Conference Secretary, College of Speech Therapists, 68 Queen's Gardens, London, W.2.

Conference on the Family

A conference on "The Family: Whose Responsibility?" is to be held under the auspices of the British Social Hygiene Council and the Town and Country Planning Association in the Conway Hall, Red Lion Square, London, W.C.1, during February 10–11. The chairman of the conference will be Mr. Ivor Thomas, M.P., and chairmen of the various sessions include Dr. Letitia Fairfield, Mr. Walter Raeburn and Sir Anderson Montague-Barlow. Speakers will include Mr. Maurice Reckitt, Dr. Mary Smith, Dr. William Moodie, Miss W. M. Crossman, Mr. B. G. H. Brooke-Taylor, Sir Wilfrid Garrett and Dr. Macalister Brew. Further information can be obtained from the Secretary, British Social Hygiene Council, Tavistock House North, Tavistock Square, London, W.C.2.

Summer School in Micro-Chemical Techniques

In view of the interest shown in the Summer School in Micro-Chemical Techniques held at the Queen's University, Belfast, in 1947, the course will be repeated this year in a somewhat amplified form during June 21–July 3. Lectures will be given together with demonstrations and practical work on standard inorganic microchemical techniques. In addition, limited provision is being made for instruction in selected topics such as physico-chemical measurements on small quantities of material, use of the microscope and micro-electrolytic methods.

Awards for Scientific Journalism

The American Association for the Advancement of Science – George Westinghouse Science Writing Awards for 1947 have been presented to George A. Keaney, feature writer on the *New York World-Telegram*, for his series of five stories on blood, and more especially on the *Rh* factor of blood, which appeared in the *New York World-Telegram*, March 18–22, 1947; and to Steven M. Spencer, associate editor of the *Saturday Evening Post*, for his article, "New Hope for the Anemic" (dealing with folic acid), which appeared in the December 14, 1946, issue of that journal. An honourable mention for the Magazine Writing Award was given Lorus J. and Margery J. Milne, free-lance writers, for their article, "The Life of the Water Film", published in the June 1947 issue of *Natural History*. The two awards, of 1,000 dollars each, are available from funds provided by the Westinghouse Educational Foundation of the Westinghouse Electric Corporation and under the administration of the American Association, and are made in an effort to stimulate and maintain a high standard of science reporting for the lay public through newspapers and general magazines.

Announcements

Under the provisions of Rule II of the Athenæum, which empowers the annual election by the Committee of a certain number of persons of distinguished eminence in science, literature or the arts, or for their public services, the following have been elected members of the Club: Lord Jowitt, Lord Chancellor; Sir Alexander Fleming, professor of bacteriology, University of London; Sir Oliver Franks, provost of Queen's College, Oxford.

Dr. R. L. Smith-Rose, superintendent of the Radio Division of the National Physical Laboratory, has been appointed to the new post of director of radio research in the Department of Scientific and Industrial Research. He will be in charge of the radio research work of the Department, for which a new station will eventually be established. The new station will incorporate the work now being carried out in the Radio Division of the National Physical Laboratory, and the Radio Research Station of the Department of Scientific and Industrial Research at Slough, and also work at present being done for the Department at the Telecommunications Research Establishment at Malvern.

Prof. Frederick R. Miller, professor of physiology in the Faculty of Medicine, University of Western Ontario, has been appointed research professor of neurophysiology in the University.

Dr. R. E. G. Armattoe, director of the Lomeshie Research Centre, Londonderry, has been given a Viking Fund award of about 3,000 dollars to enable him to undertake a field trip to West Africa this year.

Pre-erythrocytic Stage in Mammalian Malaria Parasites

THIS laboratory, in common with many others throughout the world, has for years been working on the life-cycle of malaria parasites in the vertebrate host. The most important details have already been elucidated so far as avian malaria is concerned, but the development of the sporozoites in the prepatent stage in mammalian malaria has remained obscure in spite of the most painstaking and meticulous work in many centres of malaria research.

The latest results obtained by us in this laboratory in the case of monkey malaria, *Plasmodium cynomolgi*, have been striking and, we think, unequivocal. The briefest details of these experiments are as follows.

Anopheles maculipennis, in large numbers, were infected by feeding on a rhesus monkey carrying gametocytes of *Plasmodium cynomolgi*. These mosquitoes, when at the infective stage, with large numbers of sporozoites in the salivary glands, were fed upon a clean rhesus monkey. The total number of anopheles was then ground up in a mortar in heparinized monkey plasma, diluted with normal saline solution, and half the resulting suspension inoculated intra-peritoneally and the other half intramuscularly into the same clean rhesus monkey.

The latter was sacrificed seven days later and various internal organs were taken for examination by smears and in sections. Material was also inoculated into clean monkeys.

This material is now being examined; but the first results obtained are considered worthy of recording here.

In sections of the liver there appeared numerous parasites in the form of plasmodial masses undergoing schizogony. These measure about 25 μ–30 μ in the largest diameter. The masses are clear cut and are scattered through the liver tissue. In sections stained by Giemsa stain, the cytoplasm is a deep blue colour and the discrete particles of chromatin are a magenta colour, both being typical of the usual reaction of protozoal blood parasites with this stain.

Similar results have been obtained in the case of another monkey sacrificed on the sixth day of the incubation period. Further investigation is proceeding.

The importance of these results seems to us to lie in the fact that *P. cynomolgi* is a parasite very closely akin to *P. vivax* of human malaria, and it is reasonable to suppose that the human parasite will show similar developmental changes in the incubation period of an infection.

These results appear to confirm the almost universal belief in the existence of a pre-erythrocytic stage in the mammalian malaria parasites.

Action of Nitrogen Trichloride on Proteins: Production of Toxic Derivative

FOLLOWING Mellanby's discovery[1] that 'Agenized' wheaten flour, when fed to dogs, produces hysteria, it was shown in a first paper[2] from these laboratories that the syndrome is not due to a nutritional deficiency but to the effect of a toxic substance produced by the action of nitrogen trichloride (the main constituent of commercial 'Agene') upon the wheat protein. Furthermore, nitrogen trichloride can react with other proteins such as casein and zein to produce a similar substance. The simplest conception, somewhat similar to that advanced by Dixon and Needham[3] for the action of mustard gas upon tissues, is that a reactive protein contains a number of centres, *C*, probably of several types, all of which react with nitrogen trichloride; but of these centres only one type, *E*, which may occur at several places in the molecule, is essential for the production of the toxic substance. As this can be produced by the complexes of nitrogen trichloride with wheat protein, casein, zein, egg albumin, hæmoglobin, rice protein and probably many other proteins, it is obvious that the *E* centre is common to most proteins. On the other hand, we have prepared two proteins (arachin and kerateine[4,5]) which absorb nitrogen trichloride to form complexes having no significant toxic effect, while gelatin is in much the same category.

The actual chemical interaction between nitrogen trichloride and *E* at the point of attack can involve only small molecular groupings. Nevertheless, it is almost certain that *E* must be part of a larger unit of form —*A*—*E*—*B*— contained within the protein molecule. The simplest form of unit is an individual amino-acid residue, but our failure to produce canine hysteria after treatment with nitrogen trichloride of the mixture of amino-acids obtained on acid hydrolysis of casein suggests that the unit is larger than a single amino-acid. One such unit, strepogenin, has been recognized as common to several proteins[6], but this particular unit cannot be involved in the toxic substance since it is absent in egg albumin.

If the active *E* centre is a portion of a particular amino-acid, it is necessary first to identify the acid and then to ascertain the nature of any environmental specific groupings necessary for the production of the full toxic effect. Our work has been confined chiefly to investigation of the chemical nature of the reactive *E* grouping.

The facile production of hysteria by the zein complex appears to eliminate lysine, tryptophane and glycine both as *E* centres and as necessary concomitant groups. Similarly, the harmless nature of the kerateine complex with its abundance of cysteine (11–12 per cent) and the marked toxicity of the casein complex with its relatively low cysteine content suggests that this amino-acid can also be ruled out, despite the suggestion of other workers[7].

Recent evidence indicates that the feeble toxicity of a mixture of gelatin and maize starch after treatment with nitrogen trichloride is due partly to the small amount of protein, about 0·4 per cent, in this starch. Gelatin is therefore a useful standard, and a comparison of its composition with that of the highly reactive casein and zein suggests that one or more of the following amino-acids are associated with the *E* centre: methionine, glutamic acid, tyrosine, phenyl-alanine, threonine, leucine and *iso*-leucine.

We have given some attention to the conditions under which nitrogen trichloride reacts with proteins and amino-acids and have found that with proteins the extent of the absorption of nitrogen trichloride from the vapour phase can sometimes be greatly increased by reprecipitation of the protein from a suitable solvent, and in the case of some crystalline amino-acids, by dispersing them in a filler such as starch at a suitable moisture content. Methionine mixed with starch at 14 per cent moisture, similar to that of normal flour, is, however, unique in its capacity to react with nitrogen trichloride, of which it takes up about one third of its own weight. Furthermore, the starch–methionine mixture when treated in this manner to half saturation and fed to dogs produces marked paralysis in their legs; the symptoms, however, pass off in a matter of hours. No such effect is observed at full saturation, while we have been unable to produce the symptoms of hysteria at any dosage. Cysteine reacts with nitrogen trichloride if mixed with starch of 25 per cent moisture content, but we have failed to produce any untoward symptoms in the dog by feeding this product.

If methionine contains the active *E* centre, one would expect that for the production of the toxic substance it would be necessary for it to be present in amount above a critical threshold-level. A comparison of the methionine contents of the proteins so far examined shows that arachin, gelatin and kerateine all contain only about 0·5 per cent, whereas casein, zein, gliadin, rice protein and egg albumin contain at least 2 per cent[8]. Our feeding tests have shown that whereas the latter group of proteins is particularly potent in producing hysteria, the former is of low or zero potency. Our source of arachin was defatted peanut meal, which contains not only large amounts of arachin but also a small amount of a very water-soluble protein of appreciable methionine content[9]. This latter, when separated from peanut meal previously heavily treated with nitrogen trichloride, is highly toxic, whereas the arachin fraction from the same meal is practically non-toxic. Hæmoglobin with its non-protein constituents is a special case; but it has intermediate potency and methionine content.

If this hypothesis associating methionine with the *E* centre is correct, the destruction of methionine in an active protein should destroy its capacity to form a toxic complex. It is therefore of interest to note that when zein and casein are oxidized with hydrogen peroxide in appropriate solvents to destroy methionine[10,11], their capacity to form a toxic complex with nitrogen trichloride, which they still absorb generously, is eliminated. It is, of course, known that this chemical treatment inactivates other portions of the molecule, notably tryptophane and in part cysteine; but, nevertheless, the evidence as a whole suggests strongly that the methionine unit contains the *E* centre, probably at the reactive —S.CH$_3$ grouping.

Glutamic acid might also be considered as an *E* centre[12], but as the non-toxin-producing arachin and kerateine contain 15–17 per cent, or about the same as egg albumin, this seems unlikely. Nevertheless, casein, zein and particularly gliadin are rich in this amino-acid, while gelatin, which produces little of the toxic factor, only contains about 5 per cent. It may be, therefore, that glutamic acid is involved not as an *E* centre but as an essential environmental or concomitant grouping. We have as yet no evidence suggesting that any other amino-acid is involved as an *E* centre.

Nitrogen trichloride appears to be unique among the common flour improvers in producing this toxic derivative from a protein. Thus flour treated with other chemical improvers—chlorine, chlorine dioxide, potassium bromate and ammonium persulphate—at twelve times the normal commercial dosage, produced no abnormal symptoms in dogs when fed for a period of twelve weeks. By contrast, nitrogen trichloride at the same dosage will produce hysteria in one to two days.

Full details of the above and related work will be published elsewhere.

Enzymic Conversion of Amylose into Amylopectin

POTATO juice was shown by Hanes[1] to contain a phosphorylase (*P*-enzyme) by the agency of which the long, largely unbranched chains of the amylose component of starch were built up from glucose-1-phosphate. The main component of potato starch is, however, the branched-chain component (amylopectin), and this is not synthesized by *P*-enzyme acting alone on glucose-1-phosphate. An investigation instituted by Haworth, Peat and Bourne[2] of the enzyme system of the potato resulted in the isolation of a second enzyme (*Q*-enzyme) which, in conjunction with *P*-enzyme, effected the synthesis of amylopectin from glucose-1-phosphate[3,4]. The cross-linking enzyme (*Q*-enzyme) possesses a dual function. In addition to its synthetic activity, it also functions as an amylase in effecting the hydrolytic, as opposed to the phosphorolytic, degradation of amylose[4]. The synthesis and degradation of starch by the agency of *P*- and *Q*-enzymes is schematically represented in the paper by Bourne and Peat[3].

The hypothesis thus pictorially presented implied that the completed action of *Q*-enzyme on amylose, in the absence of *P*-enzyme and amylases, should result in the conversion of the long unbranched-chain structure of amylose into the ramified short-chain structure of amylopectin without the concomitant liberation of reducing sugars. The experimental confirmation of this hypothesis has had to wait upon the isolation of a purer *Q*-enzyme than was at first available, and has been delayed because of the labile nature of crude *Q*-enzyme and the difficulties encountered in freeing it completely from the normal amylases with which it is associated in potato juice. These difficulties have now been overcome, and by using a modified technique for its isolation, involving the precipitation of the enzyme as a lead complex, it has been possible to isolate a *Q*-enzyme entirely free from amylase of either the α- or β-type. The action of this amylase-free preparation of *Q*-

enzyme on a natural amylose, separated from potato starch by the thymol method[5], has been quantitatively examined and the product isolated. This polysaccharide product is indubitably an amylopectin, and it is formed in such yield from amylose as completely to establish the truth of the hypothesis previously advanced.

Preliminary quantitative experiments with the purified *Q*-enzyme revealed: (i) that thymol-amylose is rapidly degraded by its agency without the simultaneous liberation of reducing sugars, the diminution in the iodine-staining power (blue value) of the amylose being taken as a measure of the extent of the degradation, and (ii) that *Q*-enzyme is more heat-labile than is *P*-enzyme and is, in fact, largely inactivated at 35° C., the temperature of incubation usually employed. In a larger-scale experiment, thymol-amylose of blue value 1·04 was incubated with lead-precipitated *Q*-enzyme at 20° C. The blue value of the iodine complex diminished progressively, reaching a constant value which was approximately 10 per cent of the original in 24 hours. During the reaction, the maximum development of reducing power was equivalent to less than 5 per cent apparent conversion to maltose.

When first isolated, the product contained a high proportion of inorganic material, but it was calculated that the polysaccharide formed had blue value 0·11 and represented at least 90 per cent by weight of the original amylose. The crude product was purified by dialysis in 'Cellophane' against distilled water. There was some loss of polysaccharide during the dialysis, the passage through the membrane of a substance which stained red with iodine being observed. The bulk of the polysaccharide product, however, did not dialyse and was obtained as a white ash-free powder in a yield equivalent to 74 per cent of the weight of the amylose from which it was derived. It was protein-free, and by acid hydrolysis was converted to glucose to the extent of 97 per cent.

In the accompanying table a comparison is made of the properties of the initial thymol-amylose, the amylopectin formed from it by the agency of *Q*-enzyme, and natural amylopectin separated from potato starch by the thymol method and therefore still retaining a certain proportion of the amylose component.

CONVERSION OF AMYLOSE INTO AMYLOPECTIN

Property	Potato amylose (thymol separation)	Synthetic amylopectin from amylose	Potato amylopectin (thymol separation)
Solubility in hot water	Sparingly soluble	Easily soluble	Easily soluble
Stability of solution	Retrogrades	Stable	Stable
Iodine complex:			
Colour	Blue	Red	Red-purple
Blue value	1·04	0·136	0·198
Wave-length of peak absorption	*c*. 6400 A.	*c*. 5200 A.	*c*. 5550 A.
Limit of hydrolysis by *β*-amylase (% conversion to maltose)	90	55	58

The properties of the synthetic product given in the table conclusively demonstrate its branched-chain structure. In particular, the fact that the action of β-amylase ceases when little more than half the polysaccharide has been converted to maltose definitely classifies it as an amylopectin with about the same degree of branching as is found in thymol-amylopectin. The amylose from which the synthetic amylopectin is derived is, on the other hand, almost completely converted (90 per cent) to maltose by β-amylase.

In this conversion of amylose into amylopectin, *Q*-enzyme displays its dual function, inasmuch as the long amylose chains are broken by hydrolytic scission into shorter chains (pseudo-amylose[3]), which are eventually cross-linked to form the ramified structure of amylopectin:

$$\text{Amylose} \xrightarrow{\text{(degradation)}} \text{Pseudo-amylose} \xrightarrow{\text{(synthesis)}} \text{Amylopectin.}$$

The investigation of pure *Q*-enzyme and its role in the biological transformations of starch is being continued. Full details will be published elsewhere.

We wish to express our indebtedness to Sir Norman Haworth, who has inspired so much of the work in this field.

Adenosinetriphosphate in Glutamine Synthesis

IT was shown by Krebs[1] that the energy required for the synthesis of glutamine from glutamic acid and ammonia which occurs in tissue slices of brain cortex, can be furnished by the oxidation of glucose. In the course of a more general investigation of phosphate-transferring enzymes, evidence has been obtained that adenosinetriphosphate is the immediate energy donor for glutamine synthesis. Since this work was performed, Speck, in a recent publication[2], has reported similar results obtained from work on glutamine synthesis in pigeon liver.

An enzyme system has been extracted from sheep brain which catalyses the formation of glutamine. The extract was freed from adenosinetriphosphatase activity as follows. Acetone-dried grey matter of sheep brain was extracted with ten volumes of water and the solids removed by centrifuging. The crude extract, after cooling to 4°, was mixed with one fifth vol. of 0·1 *M* acetate buffer, *p*H 4·2. The precipitate which formed was centrifuged down and redissolved in water by adjusting the *p*H to 6·7. The purified extract showed negligible adenosinetriphosphatase activity. Glutamine was formed when the extract was incubated in the presence of glutamate, ammonia and adenosinetriphosphate. When the ammonia in this system was replaced by hydroxylamine, a hydroxamic acid was formed which could be estimated by the colorimetric method devised by Lipmann and Tuttle[3] for the estimation of acyl-phosphates.

Incubations were carried out in open centrifuge tubes at 37° for 25 min. The complete system contained acetate buffer *p*H 5·4, 0·25 *M*; magnesium chloride, 0·02 *M*; neutralized hydroxylamine hydrochloride, 0·02 *M*; neutralized cysteine hydrochloride, 0·02 *M*; sodium *l*(+) glutamate, 0·05 *M*; adenosinetriphosphate containing 0·56 mgm. pyrophosphate-P; enzyme solution, 0·5 ml.; final vol., 2 ml.

For experiments showing the formation of amide, the hydroxylamine was replaced by ammonium chloride containing 100 μgm. ammonia-nitrogen. After the period of incubation, the reaction was stopped by the addition of the reagents used for the estimation of the hydroxamic acid[3]. Values of the latter are expressed in terms of a standard prepared from acetyl-phosphate.

TABLE 1

		Details of incubation	Hydrox. acid (μmol.)	Phosphate lib. (μmol.)	Amide formed (μmol.)
Expt.	1	Complete system	2·3	1·86	1·6
,,	2	No glutamate	0·0	0·12	
,,	3	No adenosinetriphosphate	0·0	—	
,,	4	No magnesium salt	0·3	0·2	
,,	5	*M*/100 sodium fluoride present	0·56	0·42	
,,	6	Adenosinetriphosphatase activity	—	0·1	

From Table 1 it can be seen that the formation of amide, or of hydroxamic acid, was paralleled by the liberation of inorganic phosphate from adenosinetriphosphate (expt. 1). The purified extract was almost completely inactive without the addition of magnesium ions (expt. 4) and was inhibited by fluoride (expt. 5). After prolonged dialysis the extract was activated by cysteine. The enzyme is completely specific for the natural isomer of glutamic acid, the *d*(−) form being inactive. Table 2 shows that the formation of hydroxamic acid was dependent on the adenosinetriphosphate added to the system.

TABLE 2

Mgm. adenosinetriphosphate pyrophosphate-P added	0·0	0·056	0·112	0·224	0·56
μmol. hydrox. acid	0·0	0·89	1·45	2·0	2·5

The mechanism by which adenosinetriphosphate enters into the synthesis of glutamine is at present unknown, but one possibility which is being examined is that the first stage in this synthesis might be a transfer of a phosphate group of adenosinetriphosphate to the γ-COOH of glutamic acid, forming glutamyl-phosphate. This could then be expected to react with ammonia or hydroxylamine, to form glutamine or a hydroxamic acid respectively, with the liberation of inorganic phosphate. No accumulation of an acyl-phosphate could be demonstrated when ammonia and hydroxylamine were both absent during the incubation.

Further work on this system will be reported later.

I wish to thank Dr. Malcolm Dixon for the valuable advice he has given during this work and the Medical Research Council for a grant.

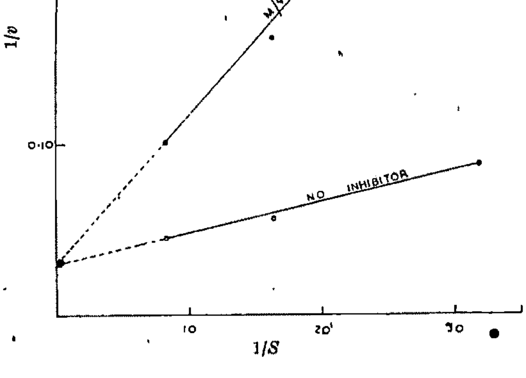
Glutamine-synthesizing System of *Staphylococcus aureus*: its Inhibition by Crystal Violet and Methionine-sulphoxide

IN the course of studies on the assimilation of glutamic acid by Gram-positive cocci, it has been shown that dyes of the triphenylmethane series inhibit some phase of glutamate metabolism within the cells[1]. Other studies of the action of glutamate antimetabolites have shown that methionine-sulphoxide competitively antagonizes glutamic acid in the nutrition of *L. arabinosus*; since it has no inhibitory action in the presence of glutamine, it has been suggested that methionine-sulphoxide inhibits the synthesis of glutamine from glutamic acid[2]. Elliott has described[3] the preparation of an enzyme system from sheep brain which catalyses the formation of glutamine from glutamic acid in the presence of adenosinetriphosphate. A survey of the occurrence of this enzyme in bacteria has now been undertaken.

The formation of a hydroxamic acid in the presence of glutamic acid, adenosinetriphosphate and hydroxylamine was used as a test for the presence of the enzyme system synthesizing glutamine[3]. Thick washed suspensions of *Staph. aureus* showed no activity; but mechanical disintegration of the cells gave an active extract. The organisms were grown for 6 hr. at 37° in a casein-digest medium in Roux bottles, the cells harvested, washed once in distilled water and then made up into a thick suspension of approximately 30 mgm. dry weight of cells per ml. This suspension was disintegrated by shaking with 'glow beads' at 50 vibrations/sec. for 45 min. The solid particles were centrifuged down and the supernatant liquid used as enzyme preparation. It was found convenient, owing to the smaller activity of the crude bacterial enzyme preparation, to modify slightly the conditions of testing used with the brain enzyme[3], as described below. This gave a hydroxamic acid formation large enough to be measured accurately. Incubations were carried out in open tubes at 37° for one hour. The system contained acetate buffer *p*H 5·4, 0·2 *M*; sodium *l*(+) glutamate, 0·06 *M*; magnesium chloride, 0·045 *M*; cysteine, 0·025 *M*; neutralized hydroxylamine hydrochloride, 0·066 *M*; adenosinetriphosphate, 2·46 mgm. pyrophosphate-P; enzyme, 1 ml.; final vol., 4·5 ml. After the incubation period, the colour was developed by adding, in turn, 0·5 ml. each of hydrochloric acid (1 vol. concentrated acid diluted with 1 vol. water), 20 per cent trichloracetic acid, and 10 per cent $FeCl_3.6H_2O$ in 0·2 *N* hydrochloric acid.

The effect of the triphenylmethane dyes was tested on the enzyme. Incubations were carried out in the presence of various concentrations of the dyes,



the latter being extracted with *iso*butanol and finally with ether before estimation of the hydroxamic acid in the photo-electric colorimeter. Crystal violet was completely inhibitory at a concentration of $M/4,000$, although the dye had no effect at $M/40,000$. *p*-Rosaniline at a concentration of $M/2,000$ had no effect.

The enzyme is also inhibited by methionine-sulphoxide, but in this case the inhibition is of the competitive type. In the accompanying graph the reciprocals of the velocity ($1/v$) are plotted against the reciprocals of the glutamate concentration ($1/S$). By extrapolation it can be seen that the maximum velocity (that is, the intercept on the ordinate) is the same whether inhibitor is present or not, showing that the inhibition is competitive[4]. When the concentration of glutamate is 0·033 *M*, $M/90$ methionine-sulphoxide gives an inhibition of 72 per cent; if the glutamate concentration is increased to 0·13 *M*, the same concentration of inhibitor gives 57 per cent inhibition. These findings can be related to the results of Waelsch *et al.*[2], on the effect of methionine-sulphoxide in the nutrition of *L. arabinosus*.

No inhibition of the enzyme system was obtained with sulphathiazole (saturated solution) or penicillin (60 Oxford units per ml.), and the enzyme is formed to the same extent in cells grown in the presence of 4 units penicillin per ml. medium[5].

Use of Solubility Curves at Varying *p*H and Constant Ionic Strength for the Precipitation and Crystallization of Proteins

PROTEIN solubility curves at varying *p*H and constant ionic strength have permitted us to secure important data regarding the fractionation of muscle proteins of the myogen group. This is illustrated by Fig. 1, showing a set of such curves drawn for a rabbit muscle extract of the same kind as that prepared by Baranowski[1] to obtain crystalline myogen A.

The precipitations are carried out at 22° C. on the 0·5 saturated ammonium sulphate bulk extract, by adding solutions of equal ionic strength, containing ammonium sulphate buffered by phosphates. The precipitates are separated by centrifugation. The refractive index increment of the clear supernatant is measured by comparison with a protein-free solution of the same salt concentration. We use a Pulfrich refractometer with double-compartment prism. Protein concentrations can be estimated within 0·5 per cent by this method. The *p*H values are calculated from glass electrode measurements at 22° C.; no corrections were made for diffusion potentials.

The diagram shows eight different solubility minima at the following *p*H values: 5·59, 5·71, 5·83, 5·95, 6·00, 6·07, 6·52 and 6·70.

The salting-out limits of each protein are determined by the ammonium sulphate concentrations at which a given minimum appears and disappears. The curves show evidence of considerable overlapping in the salting-out of the proteins of our extracts.

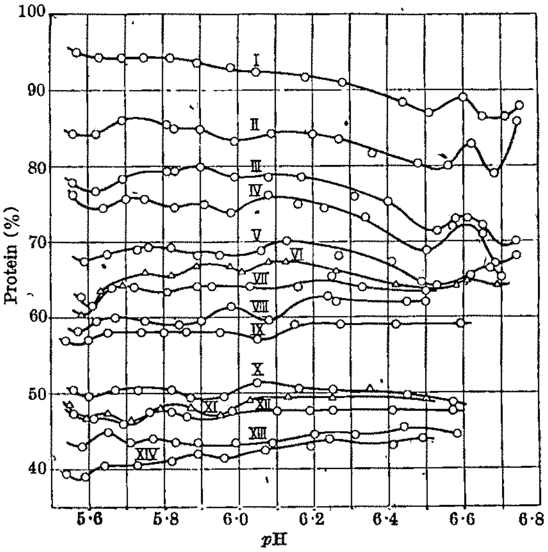

Fig. 1. CONCENTRATIONS OF AMMONIUM SULPHATE IN mol./l.:

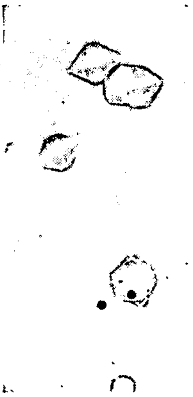
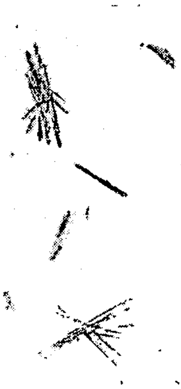
I	2·192	V	2·308	IX	2·401	XII	2·508
II	2·225	VI	2·325	X	2·441	XIII	2·575
III	2·258	VII	2·341	XI	2·475	XIV	2·641
IV	2·275	VIII	2·375				

Salting-out alone could not be used in this case to separate single proteins, but it soon became evident that the diagram indicates the conditions necessary to obtain crystalline proteins: when an isoelectric protein is brought to its saturation point, it has a greater tendency towards crystallizing than any other protein in the mixture.

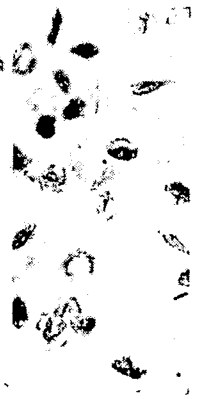
We have succeeded in preparing three different kinds of crystals from the fraction precipitated between 2·008 and 2·341 mol./l. This fraction is separated at 22° C., at the *p*H of the minima 5·59, 5·83, 6·00, 6·52 and 6·70, using the same precipitating solutions as for establishing Curve VII. The precipitates are dissolved in the least amount of water and the solutions are brought to saturation point by adding small amounts of solid ammonium sulphate. After storage at 4° C., three different kinds of crystals separate at *p*H 5·59, 5·83 and 6·00, as shown in the accompanying microphotographs (Figs. 2, 3, 4). The fractions obtained at *p*H 6·52 and 6·70 are very thixotropic and crystallization seems more difficult.



*p*H 6·00
Fig. 2



*p*H 5·83
Fig. 3



*p*H 5·59
Fig. 4

However, bundles of long needles appear at pH 6·70, but only after prolonged storage.

Work is now in progress to define the properties of the different crystals and their state of purity. We also propose to investigate the possibility of obtaining other crystals.

We think that the facts recorded here are sufficient to demonstrate the usefulness of this solubility method. Fractionation schemes, based on it, can be developed on less empirical bases than usual. The tracing of the different substances in the precipitates is done by using a property common to all proteins, the technical work is quite simple and the method shows itself to be sensitive and of great help for crystallizing proteins in bulk extracts.

Reaction between Catalase and Hydrogen Peroxide

IN a recent communication in *Nature*[1], Dr. P. George described manometric experiments which showed a rapid initial decay of the enzyme compared with which the well-known decay due to irreversible destruction was so slow that the rate became almost steady. These experiments were carried out with rather high concentrations of hydrogen peroxide.

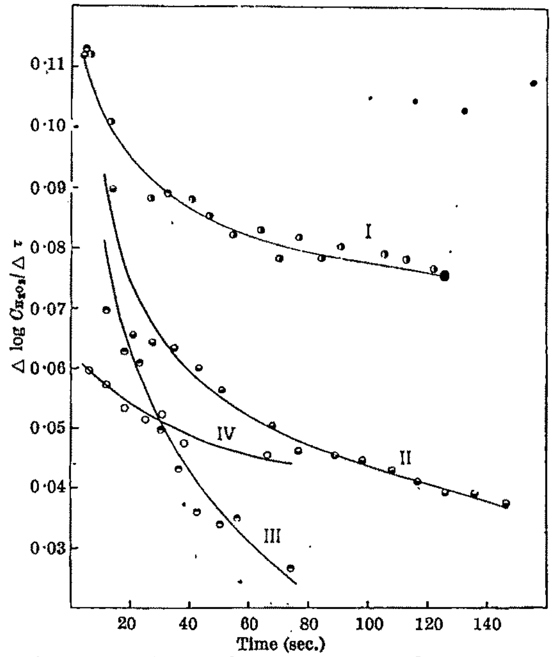
In previous experiments in this laboratory no such initial effect has been observed with the oxydimetric method[2], the reaction following closely the course mathematically deducible from the two equations :

$$-dC_{H_2O_2} = k.EC_{H_2O_2}\,dt \quad \text{and} \quad -dE = k'E.C_{H_2O_2}.dt.$$

With an improved oxydimetric technique allowing exact timing and estimation in intervals of a few seconds, we have now been able to confirm the initial rapid decay. With a hydrogen peroxide concentration of 0·005 M, this technique shows the rapid decay to be limited to the first half to one minute, and the amount of hydrogen peroxide decomposed during it to be small compared with the amount decomposed during the usual three minutes intervals.

In the same article, George described some preliminary experiments on the action of azide and cyanide on the catalytic decomposition of hydrogen peroxide. We have been engaged for some time on a study of azide and cyanide inhibition of catalase with the improved oxydimetric technique. The preliminary results of these studies have been presented in a paper read before the Adelaide Science Congress in August 1946, and are being published in the Congress Reports[3].

The graph shows the variation of the apparent monomolecular reaction constant of hydrogen peroxide decomposition with time. Whereas $1·9 \times 10^{-8}$–$3·9 \times 10^{-6}$ M cyanide causes an immediate inhibition of the enzyme activity and no marked initial rapid decay, $1·1 \times 10^{-7}$ M azide, even if added to the enzyme before hydrogen peroxide, causes no immediate inhibition but a marked rapid decay. There is thus a fundamental difference in the mechanism of inhibition of catalase by azide and by cyanide. These experiments were carried out with horse liver catalase of Kat.-F. 25,000. Identical results were obtained with horse erythrocyte catalase of Kat.-F. 56,000.



ACTIVITY OF $3·5 \times 10^{-10}$ M CATALASE AT 0° C., pH 6·8. I, control ; II, $1·1 \times 10^{-7}$ M sodium azide ; III, $1·1 \times 10^{-7}$ M sodium azide in carbon monoxide ; IV, $3·9 \times 10^{-6}$ M potassium cyanide

According to George, the initial rapid decay is due to the attainment of an equilibrium the kinetics of which agree with the reduction of the hæmatin iron to the ferrous state, as was assumed by Keilin and Hartree[4].

Our experiments support this assumption for the case of catalase in the presence of azide. Carbon monoxide causes an increase in both the rapid decay and the degree of inhibition as measured over longer times. Nevertheless, there are complicating observations. No activation by oxygenation after disappearance of hydrogen peroxide could be obtained. The absorption spectrum of Keilin's azide ferrocatalase[5] was not altered by nitric oxide, whereas carbon monoxide shifted the bands. Moreover, nitric oxide had a specific effect in replacing carbon monoxide and regenerating the spectrum of the original 'azide ferrocatalase'. These observations suggest the overall reaction :

$$N_3^- + Fe^{+++} - \text{catalase} + H_2O_2 \rightarrow NO.Fe^{++} - \text{catalase} + H_2O + N_2.$$

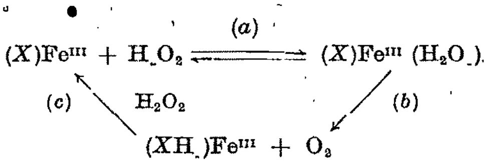
As even in the presence of carbon monoxide we could obtain appreciable inhibition of catalase only by a large molar excess of azide over catalase, the accuracy of the methods available for azide estimation did not allow a direct proof of the oxidation of azide.

Hydroxylamine and hydrogen peroxide yield a spectroscopically undistinguishable compound, and again an oxidation of hydroxylamine to nitric oxide would supply the explanation.

We can confirm the observation that the inhibition of catalase by cysteine is increased by carbon monoxide, and found the same to hold for *BAL* (dimercaptopropanol). No iron is removed from catalase by *BAL*, as has been assumed by Webb and van Heyningen[7] in explanation of the inhibition it causes.

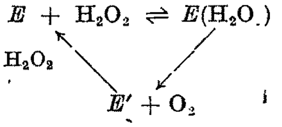
While in the above cases reduction of catalase iron takes place, there is no evidence for such a reaction with uninhibited catalase, or with catalase plus ascorbic acid. Ascorbic acid (neutralized) forms a spectroscopically observable ferric compound with catalase with absorption bands at 565 and 535 mμ; this is not reduced by hydrogen peroxide in an atmosphere of carbon monoxide.

In the paper read at the Adelaide Congress one of us (R. L.) developed a theory of catalytic action which formulates the mechanism as follows:



where X represents a hydrogen acceptor group in the protein.

Catalase is not inhibited by $M/100$ iodoacetic acid; but it is not clear whether it contains essential SH groups[6,8]. While no such reaction of hydrogen peroxide complexes with hydrogen acceptor groups in proteins is known, the specificity of catalase may reside in such a mechanism. The above cycle would correspond to the initial rapid rate. As the 'steady state' of uninhibited catalase is not affected by carbon monoxide, the initial decay is unlikely to be due to slow reduction of the ferric iron by XH_2 after reaction (b). A possible explanation would appear to be a competition for peroxide in step (c) between XH_2 and other hydrogen donor groups in the protein. It is noteworthy that the above cycle corresponds formally with the cycle as postulated by George:



With low hydrogen peroxide and high catalase concentration, catalase acts peroxidatively on alcohols[9]. Under such conditions reaction (c) of the catalytic cycle may be replaced by combination of the iron of the Fe^{III} (XH_2) complex with hydrogen peroxide, followed by oxidation of alcohol bound in the complex. Some observations on the effect of azide and ascorbic acid on the peroxidative action of catalase also support the view of a specific action of the catalase protein.

This work has been supported by grants of the National Health and Medical Research Council of Australia. Full details of the experimental work will be published elsewhere.

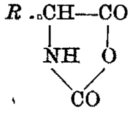
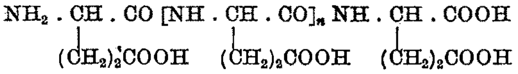
Synthetic Polyglutamic Acid

The recent paper by Woodward[1] records the synthesis of polypeptides of very high molecular weight by the polymerization of N-carbonic anhydrides (I). This reaction is a well-known method of preparing polypeptides[2,3,4], and Go and Tani[5] prepared both a polyglycine of molecular weight about 6,000, and a co-polymer of L-leucine and glycine.

We have been using this method to synthesize a polyglutamic acid (II). This should resemble the capsular substance of *Bacillus anthracis*, which has recently been shown to consist of an α-peptide chain of D-glutamic acid residues joined by γ-peptide chains of D-glutamic acid residues; thus one specimen (H 230 B), molecular weight 21,000, contains about ten γ-peptide links and the α-peptide chains contain 50–100 residues[6]. The infra-red spectra of the silver salt of the synthetic polymer (II) and the silver salt of H 230 B have, in fact, been found by Mr. E. J. Ambrose of this Laboratory to be very similar.



I



$$NH_2 . \underset{(CH_2)_2COOH}{CH} . CO\,[NH . \underset{(CH_2)_2COOH}{CH} . CO]_n\,NH . \underset{(CH_2)_2COOH}{CH} . COOH$$

II

The carbonic anhydride (I: $R = CH_2—CH_2—COOCH_3$) was prepared from γ-methyl L-glutamate; polymerization in cold pyridine gave the methyl ester of polyglutamic acid (II) as a colourless solid soluble only in pyridine. Hydrolysis of this polymer with hydrobromic acid gave partially racemized glutamic acid; since, however, the same specific rotation was observed when L-glutamic acid was heated with hydrobromic acid under the same conditions, partial racemization is ascribed to the hydrolytic procedure. This conclusion is confirmed by the fact that the extent of racemization was independent of the method of polymerization, so that we conclude that no appreciable racemization accompanies the polymerization of this carbonic anhydride.

Hydrolysis of the ester groups in the methyl ester of the polymer (II) was effected by alcoholic, followed by aqueous, alkali. The potassium salt of the polyglutamic acid (II) was purified by dialysis; its molecular weight as determined by Van Slyke amino-nitrogen estimation was about 15,000. Treatment with silver nitrate gave the synthetic silver salt referred to above. The treatment with alkali, however, caused considerable racemization.

A full account of this work will be published later.

Dielectric Relaxation of Molecules Containing Rotating Polar Groups

DEBYE's theory of dielectric relaxation has been extended to molecules consisting of two similar polar groups, which cannot rotate freely relatively to one another about their common rotational axis owing to their mutual potential energy. As a result the mean dipole moment of the molecule in the field $F = F_0 \exp i\omega t$ can be expressed by a sum of terms of Debye's type, namely, $C_n/(1 + i\omega\tau_n)$. The determination of the relaxation times τ_n and of the C_n's leads to the problem of the characteristic values and functions of a differential equation of Hill's type, the explicit form of which is determined by the potential function $V(\varphi)$, where φ is the azimuthal angle between the dipole moments of the groups.

In order to obtain a first orientation, $V(\varphi)$ has been assumed to have the form $(2/\pi^2)E\varphi^2$; then $2E$, the difference between the potential energies in the equal and opposite directions of the moments of the groups, is a measure of the interaction between the groups; in this case the mean moment of the molecule can be obtained relatively easily with any desired accuracy, for all values of the parameter $q = E/kT$. We give here the results for long wave-lengths only, and for symmetrical molecules in which the components of the dipole moments of the groups perpendicular to the rotational axis are equal (μ_1, say) and the sum of their parallel components is zero. Then the mean moment can be written in the form

$$m = \frac{F}{3kT}\mu^2 (1 - i\omega\tau),$$

where μ is the measurable dipole moment of the molecule and τ is the 'relaxation time for long wave-lengths'. In the case of free rotation, one has $\mu^2 = \mu_f^2 = 2\mu_1^2$ and $\frac{1}{\tau} = \frac{1}{\tau_f} = kT\left(\frac{1}{\rho} + \frac{1}{\rho_1}\right)^1$, and for a rigid molecule, that is, when the relative position of the groups is completely fixed in parallel orientation of their moments, then $\mu^2 = \mu_r^2 = (2\mu_1)^2$ and $\frac{1}{\tau} = \frac{1}{\tau_r} = kT\left(\frac{1}{\rho} + \frac{1}{2\rho_1}\right)^2$. Here ρ_1 is the coefficient of friction of one of the groups, ρ that of the molecule as a whole; ρ refers to rotations about axes which are perpendicular to the axis of the groups. Some values of μ^2 and τ, expressed in the units μ_f^2 and τ_f, are given in the accompanying table. The values of τ are calculated for $\rho/\rho_1 = 2$ and 4; the headings *cis* and *trans* in the table correspond to the cases in which the potential function has its minimum at equal or opposite directions of the moments of the groups.

	Cis			*Trans*		
q	μ^2/μ_f^2	τ/τ_f $(\rho/\rho_1=2)$	τ/τ_f $(\rho/\rho_1=4)$	μ^2/μ_f^2	τ/τ_f $(\rho/\rho_1=2)$	τ/τ_f $(\rho/\rho_1=4)$

Experimentally, E. Fischer found[3] that the relaxation time, for long wave-lengths, for *oo'*-dichloro-diphenyl ($\mu = 1·75$) is 1·19 times greater than that for the *mm'*-dichloro-diphenyl ($\mu = 1·68$). When we use for μ_f and τ_f the experimental values of the latter, in which the dipoles of the groups are far enough apart, then the ratios obtained experimentally are $\mu^2/\mu_f^2 = 1·085$ and $\tau/\tau_f = 1·19$, which agree very well with our results for the *cis*-case; the table gives for $q = 0·25$ and $\rho/\rho_1 = 4$ the ratios 1·099 and 1·20, the approximate value 4 for ρ/ρ_1 being obtained on the basis of Perrin's theory. But the results are not in agreement for the *trans*-case. This shows that in the mutual potential energy of the groups, not only the electrostatic interaction of their dipole moments, which favours the *trans*-position, but also other influences are of importance.

The terms used above have the conventional meaning attached to them in the Debye theory. Details of this work will be published elsewhere.

Emission of Enhanced Microwave Solar Radiation

IT is now well known that radiation in the 1-metre wave-length range from the quiescent sun corresponds to that from a black body at about 10^6 °K., but that when large spot groups are present the effective temperature is many times higher, the extra radiation originating in the neighbourhood of the spot group. The million degree radiation has been explained by Martyn[1], who attributes this to thermal emission from the normal corona. Kiepenheuer has suggested[2] that the enhanced emission comes from thermal electrons spiralling around lines of magnetic force. This idea has been attacked by Martyn[3], and both he and Shklovsky[4] have advanced theories for the enhanced emission involving radiation by electrons oscillating at the fundamental frequency of the plasma.

A theory involving a different origin for the energy, but assuming emission of radiation by spiralling electrons, is outlined below. We consider first a mechanism whereby electrons may gain energies much greater than thermal; and, secondly, the resulting intensities of the radiation received at the earth.

A detailed discussion of the induced currents in the sun's atmosphere consequent on sunspot growth is being published elsewhere[5]. It has been shown that the current paths, which must follow lines of magnetic force, may pass partly through the corona, but that any complete circuit must also lie partly below the sun's surface. Plausible assumptions enable us to predict that if the conductivity be 10^{-8} E.M.U., the current density along suitable circuits will be of the order of 10^{-3} E.M.U. for an average rate of growth of a sunspot. The total E.M.F. around such a circuit may be about 10^{15} E.M.U. The fields can be shown sufficient to cause chromospheric flares[6].

The weak-field conductivity of the sun's atmosphere varies as the 3/2 power of the temperature, so that in the corona it is normally 10^{-5} E.M.U. as against 10^{-8} E.M.U. in the chromosphere. The conductivity changes, however, with electric field-strength. In the weak fields, electrons make frequent elastic collisions with ions. But the collision cross-section varies inversely as the fourth power of the electron velocity, and it can be shown that with stronger fields the elastic collision cross-section becomes quite small, so that the conductivity increases[7]. If the electrons have sufficient energy, inelastic collisions can occur, and in the chromosphere these limit electron velocities unless the field is great enough. Both in the chromosphere and corona, electrons travel unimpeded by collisions for sufficiently high fields.

At any one time the current is constant across all sections of any given circuit, so that for small current densities the field in the corona is 10^{-3} of that in the chromosphere. Passing to the other extreme, relativistic limitations on electron velocities prevent the current density from exceeding $n\ e\ c$, where n is the minimum electron concentration in the circuit, that is, the concentration in the corona. Thus the current density cannot exceed $2 \cdot 2 \times 10^{-2}$ E.M.U. if $n = 10^8$ per c.c. (about twenty times the normal current as given above). Thus if the E.M.F. around a circuit is of the order of 10^{16} E.M.U. (10^8 volts) or more, as may well happen near a rapidly changing spot group, an appreciable part of this may be localized somewhere in the upper chromosphere or corona; the distribution of E.M.F. elsewhere in the circuit will be limited to that which suffices to give the same current as can flow in the corona. Thus electrons may obtain energies up to 10^6–10^7 electron volts there.

If electrons the velocities of which are initially directed along lines of magnetic force are now scattered at collisions, they will spiral around the lines of force. The mean free path between such collisions is so long, however, that this process is unlikely. On the other hand, if the lines of force curve through a large angle, as is certainly so in the corona for the case under discussion, the electrons will spiral around the lines of force, and an appreciable part of their kinetic energy will be involved in such motion.

Bailey has shown[8] that in the presence of a steady magnetic field H in an ionized gas with finite electron density there are three fundamental modes of free oscillation of an electromagnetic field. We shall refer here to only one of these, although the others may also be of importance. This particular mode has a frequency which depends on the electron concentration and on the collision frequency; but when these quantities are both small, this natural frequency approximates to the gyrofrequency, $eH/2m$. For conditions such as occur in the inner corona, variations from this frequency are of the order of only a few per cent, and may be neglected. Selecting 100 gauss as a typical value of the magnetic field, we obtain the frequencies for various electron energies as given in the accompanying table.

FREQUENCY OF RADIATION FROM SPIRALLING ELECTRONS OF VARIOUS ENERGIES

Electron velocity (cm./sec.)	Electron energy (volts)	Frequency per 100 gauss (cycles/sec.)
3×10^8	$2 \cdot 5 \times 10$	$2 \cdot 8 \times 10^8$
3×10^9	$2 \cdot 9 \times 10^3$	$2 \cdot 7 \times 10^8$
$1 \cdot 5 \times 10^{10}$	$7 \cdot 5 \times 10^4$	$2 \cdot 4 \times 10^8$
$2 \cdot 1 \times 10^{10}$	$1 \cdot 7 \times 10^5$	$2 \cdot 0 \times 10^8$
$2 \cdot 7 \times 10^{10}$	$4 \cdot 7 \times 10^5$	$1 \cdot 2 \times 10^8$
$2 \cdot 85 \times 10^{10}$	$7 \cdot 4 \times 10^5$	$8 \cdot 7 \times 10^7$
$2 \cdot 97 \times 10^{10}$	$1 \cdot 8 \times 10^6$	$4 \cdot 0 \times 10^7$
$2 \cdot 997 \times 10^{10}$	$5 \cdot 8 \times 10^6$	$1 \cdot 2 \times 10^7$

The intensity of the radiation emitted per unit surface area cannot exceed that from a black body at the same effective temperature (obtained approximately by multiplying the energy in electron volts by 10^4). Computation shows that, in the absence of self-absorption, the energy emitted by the spiralling electrons would be very much greater than this, so that there is little doubt that, in fact, black body intensities are achieved. For a source of projected area 3×10^{14} metre^2 on the sun (1/5,000 of the sun's disk), the radiation received at the earth would be $1 \cdot 65 \times 10^{-29}\ T$ watts/metre^2/c./s. This is $1 \cdot 6 \times 10^{-19}$ W./m.^{2}/c./s. for 10^6 eV. electrons, which is in the range of magnitude of the observed enhanced radiation[9].

The dependence of the emission on high fields leads us to expect that this would be sometimes associated with flares, which are predicted under rather similar conditions. This is in accordance with observation.

The above theory will be presented in greater detail elsewhere. The work described has been carried out as part of the programme of the Commonwealth Council for Scientific and Industrial Research. I am indebted to Dr. J. L. Pawsey for information concerning observed radiation intensities at the earth's surface, and to Prof. V. A. Bailey for his kindness in placing at my disposal his as yet unpublished results on the natural oscillations of an ionized gas in a magnetic field.

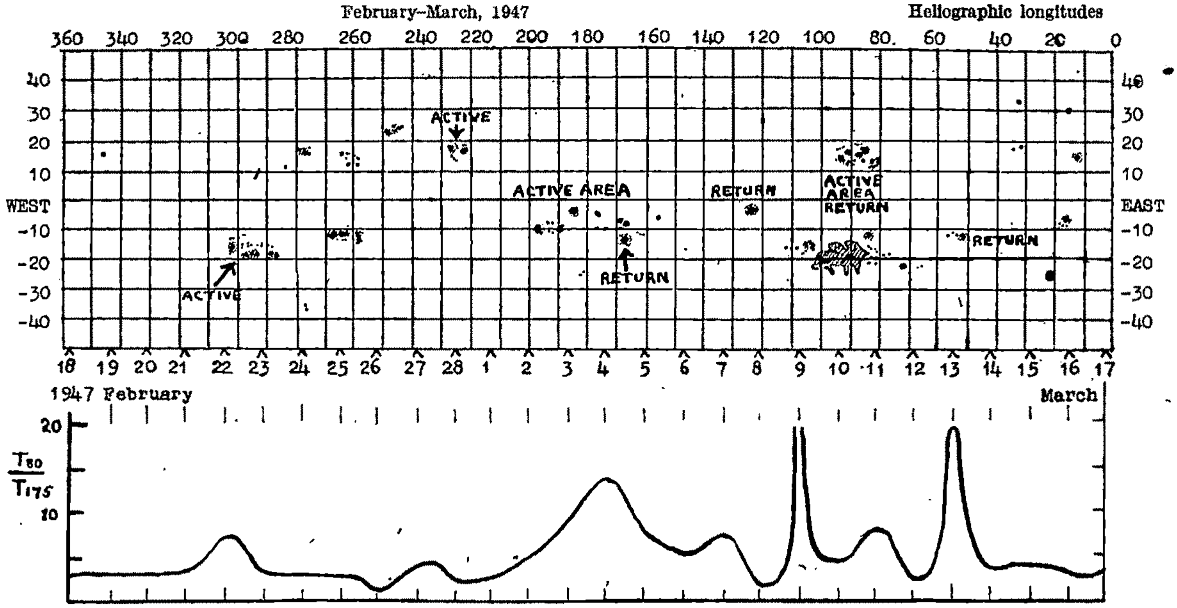
Solar Radio Emissions and Sunspots

THE ratio of the equivalent source temperatures as deduced from observations of solar electromagnetic radiation for frequencies of 80 Mc./s. and 175 Mc./s. (T_{80}/T_{175}) by Ryle and Vonberg[1] would appear to have considerable significance to solar as well as radio physicists.

A comparison of their curve of (T_{80}/T_{175}) for the period December 1946–April 1947 with sunspot records shows a surprising general agreement. It was recognized at a very early stage that the amount of radio-frequency emission from the sun was probably dependent in some way on sunspots[2], and this was confirmed later by several workers[3,4,5] covering short periods generally during the passage of one of the large sunspot groups which have been frequent during the present solar maximum period. The index used by Ryle and Vonberg, however, is of such a nature, and covers a sufficiently long period, that a comparison with sunspot records is possible. From records at this Observatory, it was nearly always



possible to ascribe some significant sunspot group to each of the maxima of the curve, which, at least qualitatively, appears to follow spot activity faithfully.

By following the curve through, the accompanying table shows how the variations agree with sunspot activity. Small pores and insignificant groups have been neglected. The remarkable general agreement is shown in the accompanying diagram for the solar rotation No. 1250 from February 18 to March 17 as an example.

Case No.	Date from curve	C.M. passage sunspot	Helio. lat.	Remarks
1	Dec. 17	Dec. 17	− 8°	Large spot, rapid growth.
2	Dec. 23	Dec. 21·6	+10	Fairly regular spot preceded by moderate group. Remnant of active region.
3	Dec. 27	Dec. 28	+18	Moderate spot.
4	Dec. 31– Jan. 9			No outstanding spots, but curve variations correspond with C.M. passages of small spots.
5	Jan. 12	Jan. 12·5	− 6	Large single spot with following train. Remains of (1). Active region with small outbreaks following.
6	Jan. 20	Jan. 20·5	−12	Moderate group. Great development.
7	Jan. 25	Jan. 26·9	−20	Large group. Rapid development.
8	Jan. 31			Nothing.
9	Feb. 6	Feb. 5	−15	Moderate spot with groups preceding and following. Small southern outbreaks on 3rd and 5th.
10	Feb. 11	Feb. 11	−19	Large leader of active group.
11	Feb. 15	Feb. 16·5	−15	Approx. mean of active area represented by two groups.
12	Feb. 22	Feb. 22·9	−19	Active group. Return of (7).
13	Feb. 28	Feb. 28	+18	Small but active group.
14	Mar. 4	Mar. 4·5	−15	Large spot preceded by several spots. Return of case (9).
15	Mar. 9	Mar. 10	−20	Giant group. Return of (11).
16	Mar. 13	Mar. 13	−12	Small spot and prominence in high N. lat. on C.M.
17	Mar. 22	Mar. 21	−13	Moderate spot, but a considerable outbreak immediately preceding it on March 20 and developing rapidly.
18	Mar. 30	Mar. 29·2	−10	Large spot. New, but in same area as (4).
19	Apr. 7	Apr. 7	−23	Giant group. Return of (15).
20	Apr. 19	Apr. 19	−18	Moderate group.

If the connexion is as real as is suggested, then the emission from the undisturbed sun would appear to give an equivalent temperature varying somewhat less than λ^2 as indicated by Ryle and Vonberg, and more nearly to an exponent of λ between 1 and 2. Also, the suggestions of periodicities of 28, 27 and 26·3 days would appear to have no significance, except perhaps the 27-day period, since such periods in particular cases would be due to the vagaries of sunspot activity itself.

So far as the graph can be read, two other points are confirmed: (*a*) the maximum emission is received somewhere near the time of central meridian passage; (*b*) in general, groups in the early stages of vigorous development, or showing activity by large umbral movements and changes and accompanied by flares, give the greatest emission.

Various factors would make the relationship between times of central meridian passage of sunspots and maximum radio-frequency emission difficult to determine in individual cases. They might be summarized as follows:

(*a*) In the case of a large complicated spot or active area zone, the emission intensity may vary over the area.

(*b*) The axis of the magnetic field may not be perpendicular to the photosphere as is suggested by Martyn[4].

(*c*) A large spot or group takes an appreciable time to cross the central meridian, and just what part should be taken for timing, if (*a*) holds, is debatable.

(*d*) Flares apparently greatly increase the radio emission in the form of short bursts, even when the flare is not exactly on the meridian, and the general emission remains at a fairly high level for some hours following[5,6], due to the remaining bright *Hα* flocculi. This may have an upsetting factor on any radiation index used for correlation.

(*e*) There is slight evidence that increased emission may also occur at the time of central meridian passage of certain types of prominences unassociated with sunspots. This would provide an additional masking effect.

A statistical study of a large number of observations would probably eliminate these factors, for the general case. From observations made in New Zealand on 75 Mc./s., a few cases have been noted in which there has been an increased radio emission without any obvious solar feature with which the phenomenon may be connected. The results, however, are still in the process of reduction, and no definitive statement can be made at the moment.

It is suggested that astronomers with more complete and accurate solar data than is available at this Observatory may be able to make a close analysis of the work considered in this note.

MR. THOMSEN has made an interesting analysis of our results in relation to the positions of sunspot groups. I should, however, like to make two comments.

(*a*) The suggestion (originally made by Appleton and Hey[1]) that the equivalent temperature varies as the square of the wave-length referred only to the high-intensity radiation associated with sunspots. The improved sensitivity of our apparatus makes it possible to detect solar radiation at all times, even on frequencies as low as 80 Mc./s., and the results obtained during the past eleven months show that for frequencies of 80 Mc./s. and 175 Mc./s. the ratio of the minimum equivalent temperatures which have been observed is about 2·2.

Until more information is available on the conditions of escape of radio-frequency radiation from sunspot regions, this method of determining the ratio T_{80}/T_{175} for the undisturbed sun appears more reliable than simultaneous observations on the two frequencies made at times when no disturbed region appears to be near the central meridian.

(*b*) The ratio T_{80}/T_{175} has now been plotted for a period covering twelve solar rotations, and additional confirmation has been obtained of the suggestion (made in our previous communication) of an apparent periodicity of this ratio. During this time the existence of three major 'active regions' is suggested by our results, with mean periodicities of 27·9, 27·0 and 26·3 days. The disturbances can be followed for 5, 7 and 11 solar rotations respectively.

While these results cannot yet be regarded as sufficient proof, they seem to provide good evidence for the existence of long-lived active regions, which at some time in their development give rise to the appearance of visual sunspots.

Structure of Calcium Fluoride Films Evaporated on Polished Glass Surfaces

CONSIDERABLE research has been carried out on the structure of thin films of calcium fluoride deposited by evaporation on polished surfaces[1-5]. But very little, if any, attention has been paid to the temperature of the surface during the period of deposition. In a letter published in 1946[6], it was shown that this temperature plays an important part in the adhesiveness, the water solubility and the optical properties of quarter wave-length anti-reflexion films evaporated on to glass. It has now been found, mainly from X-ray examination, that the structure of a film depends very much on the temperature of the glass surface during the process of evaporation. Initial results of this investigation were included in the letter mentioned above.

In continuing the measurements, the same Seeman-Bohlin type of powder camera was employed. This camera has a radius of 10 cm. and records X-rays scattered through angles up to about 80°. With the iron $K\alpha$ radiation used, it is capable of recording the three strong spectral lines 111, 220 and 311 of calcium fluoride. With films having an optical thickness of $\frac{1}{4}\lambda_{5500}$, it was impossible to obtain sufficiently clear photographs of some of these lines. The line 220 was always present, irrespective of the temperature of the glass surface during coating. It was difficult to determine whether the line 111 was present or not as the angular deviation for this line is 36° only and the background of scattered radiation was comparatively strong. The line 311 was difficult to see one reason being that it was weakened on account of its distance from the irradiated calcium fluoride coated surface. For $\frac{3}{4}\lambda_{5500}$ films some photographs were taken, and it was found that the three lines were present in the case of films on glass surfaces maintained at about 25° C. during deposition, but the line 111 was absent for films on surfaces maintained at 105° C

In order to procure clearer photographs it was decided to work with calcium fluoride films having an optical thickness of $5/4\ \lambda_{5500}$. These films proved sufficiently thick to give good definition with an exposure of 50 milliampere-hours. Results have so far been obtained for crown and flint glasses, the polished surfaces of which were maintained at various temperatures, T, during coating. Below is a summary of the results for crown glass ($n_D = 1{\cdot}52$): (*a*) When T is 25° C. the line 111 is fairly strong, the line 220 i weak and the line 311 is very weak; (*b*) when T i 75° C. the line 111 is fairly weak, the line 220 i rather strong and the line 311 is very weak; (*c*) when T is 105° C. the line 111 is absent, the line 220 i strong and the line 311 is very weak; (*d*) When T has various values between 105° C. and 300° C., the line 111 is absent, the line 220 is strong and the lin 311 is very weak.

Microphotometer measurements of the half-width of the strong 220 lines indicate that there is a growth of the crystallites as T increases from 100° C. to 300° C. This growth would correspond roughly to an increase in mean crystal diameter from 170 to 250 A.

Using crossed nicols and monochromatic light there was very little evidence of the double refraction phenomenon[3] in the case of films for which T wa 25° C. Double refraction was definitely present fo 75° C. films. It appeared to reach a maximum valu for those at about 100° C. and then weakened as T increased to 300° C. When a drop of liquid (chloroform acetone mixture) having a refractive index of abou 1·35 was allowed to spread over the surface of a 100° C. film, say, the double refraction disappeared and returned as the liquid dried away.

Results very similar to those given above wer found when *D.F.* and *E.D.F.* glasses were used.

It may reasonably be concluded from the data that in $5/4\ \lambda_{5500}$ films, for which T is 25° C., the (111) planes of the crystallites are not appreciably orientated. There is considerable orientation o these planes, however, at 75° C. and a random arrangement of the (110) planes. For T equal to 105° C., the orientation of the (111) planes appears to be practically complete. For T equal to 75° C. and greater, the (311) planes give in all cases a line much weaker, in proportion to the line 220, than is to be expected. As there is no evidence, from the positions of the lines in the X-ray photographs, of any change in the crystallites from the cubic system, the double refraction phenomena, mentioned above, indicate that the films are in general of a fibrous construction. The weight of evidence points to the fact that when the (111) planes are orientated they are perpendicular to the axes of the fibres and approximately parallel to the glass surface[3,4]. Consequently, from our results it would seem that there is very little fibre structure in films for which T equals 25° C. and that the structure is not complete in those where T is 75° C. It has already been shown[6] that $\frac{1}{4}\ \lambda_{5500}$ calcium fluoride films increase in density and decrease in thickness as T increases, and from our observations the same seems true for $5/4\ \lambda_{5500}$ films. These changes, for the higher values of T, indicate a crowding together of the fibres and contractions in their lengths. That a maximum double refraction effect appeared for T equal to about 100° C. might easily be expected if the fibres shortened and stood more closely together above this temperature, and if the fibrous arrangement were not complete below this value.

The structure suggested for films of $5/4\ \lambda_{5500}$ optical thickness would seem, from the measurements made so far, to be applicable to $\frac{3}{4}\ \lambda_{5500}$ films, and probably also to $\frac{1}{4}\ \lambda_{5500}$ films. These $\frac{1}{4}\ \lambda_{5500}$ films, as already stated, are very adhesive and water-resistant for large values of T. The reason appears to be that, for such temperatures, the fibres have contracted considerably and have become closely packed.

It is intended later to publish a paper which will include a more complete account of the investigations leading to the results described above.

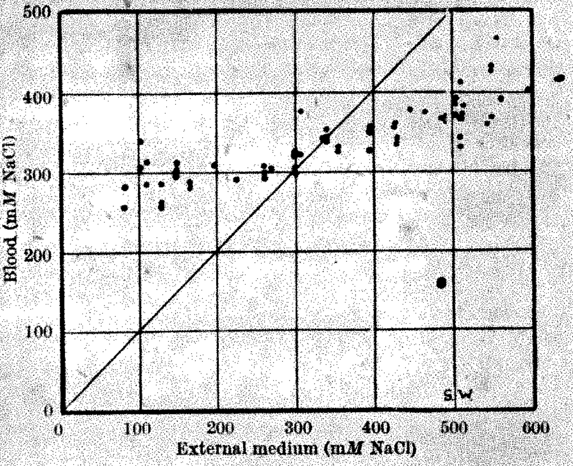
Active Regulation of Chloride in *Metapenæus monoceros* Fabricius

Metapenæus monoceros is a widely distributed Indo-Pacific prawn often met with in shores and estuaries liable to great variations in salinity. At Madras, it is a common inhabitant of the saline part of the Adyar and Cooum Rivers, and sexually mature as well as post-larval prawns have been obtained in brackish water[1]. Dakin[2] has recently reported that the Australian species of *Metapenæus*, which is usually known under the name *M. monoceros* but is believed to be different, breeds in the coastal lakes and estuaries unlike other Penæids. As part of a programme of study on the osmotic regulation in Penæid prawns, we have recently examined the changes in the chloride content of blood in this prawn by employing the micro-modification of the Volhard titration as described by Wigglesworth[3]. The results obtained appear to be of considerable interest since powers of active regulation of chloride are developed to a very high degree in this prawn (see graph).



CHANGES IN THE CHLORIDE CONTENT OF THE BLOOD OF *Metapenæus monoceros* IN DIFFERENT CONCENTRATIONS OF THE EXTERNAL MEDIUM

Diagonal line indicates where points would fall if the chloride concentration for external and internal media were identical. Each point represents mean values obtained for estimations carried out on a single specimen. *S.W.*, range of undiluted sea water

The amount of chloride in blood is in the neighbourhood of 2·2 per cent sodium chloride as against 2·9–3·0 per cent for the external sea water, showing a definite tendency on the part of the animal to resist the uptake of chloride. An average of twelve estimation in animals kept under identical conditions in sea water gives chloride values of 2·16 per cent sodium chloride (370 mM.) for blood as against 2·92 per cent (500 mM.) for the external medium. An external salinity equivalent to 1·9–1·8 per cent sodium chloride (20 per mille) gives approximately similar values for blood and the external medium, but in media of still lower salinities the animal is able to maintain a fairly steady chloride concentration; and even in the lowest salinity of 5–6 parts per mille to which the species has been acclimatized in experimental tanks, there is no fall in chloride concentration below about 250 mM. These values in low dilutions of sea water are very much higher than in many other euryhaline animals on which studies have been made. On the other hand, chloride values for prawns kept in sea water are appreciably lower than for most marine invertebrates[4,5]. A general similarity between this species and the Chinese wool-handed crab (*Eriocheir sinensis*)[6] may, however, be found.

The significance of these results lies in the fact that the Penæid prawns show in their osmotic properties a condition probably similar to that described for the Palæmonid prawns[7], both in their ability to maintain a hypotonic blood in defiance of the external medium and the homoi-osmotic behaviour as judged by the fairly steady values for chloride over a wide range of dilutions of the external medium. From these observations on *Metapenæus* it also seems probable that the hypotonic osmo-regulation in the few instances described[7,8], which is presumably of much wider occurrence than is at present realized, is achieved as a result of the active regulation of the chloride ion by these crustaceans.

Further experiments are in progress and will be fully reported elsewhere.

Development of Cestodes *in vitro* : Production of Fertile Eggs ; Cultivation of Plerocercoid Fragments

Plerocercoid larvæ of *Schistocephalus solidus* and *Ligula intestinalis*, when removed aseptically from their respective fish hosts by means of a special technique, develop into sexually mature tapeworms if cultured *in vitro* in certain nutrient media at 40° C.[1,2]. The eggs, which were produced *in vitro* in large numbers, proved on testing to be infertile. It was tentatively suggested that infertility of such eggs was possibly due to failure of normal copulation to take place within the culture tube, although other factors were also considered.

This and other problems have now been investigated in greater detail in the case of *Ligula*. Plerocercoids were obtained from heavily infected roach (Fig. 1) and cultures prepared by the usual technique[2]. The most significant results were as follows :

(1) The acid (acids ?—unidentified) produced during development proved to be very toxic to larvæ and slowed down development considerably. In order to obtain maturation *in vitro* within a period equivalent to that required in the bird's intestine during the natural life-cycle (that is, about 72 hr.), it was necessary to use 50 c.c. medium per larva and renew it every twenty-four hours. In medium renewed infrequently, 4–8 days incubation was required to induce maturation.

(2) With one larva per tube of 50 c.c. renewed every twenty-four hours, different artificial media were used in an attempt to obtain fertile eggs, but without success. When, however, undiluted horse serum was used, some 6 per cent of eggs produced were found to be fertile, and hatched out normal coracidia. Since these fertile eggs were produced from worms cultured individually in separate culture tubes, it can now be definitely stated that *Ligula* is self-fertilizing, and that copulation between two worms is not essential for the production of fertile eggs.

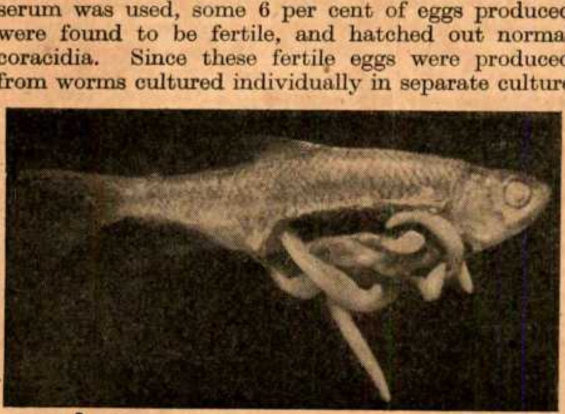

Fig. 1. Roach infected with plerocercoids of *Ligula intestinalis*

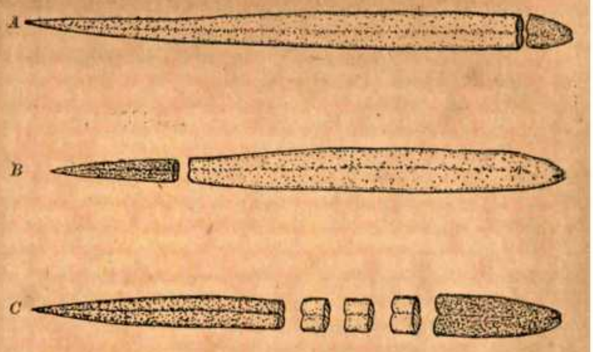

Fig. 2. Cultivation of fragments of *Ligula* plerocercoids. Lightly shaded parts were cultured ; heavily shaded parts were discarded

There are little data to explain the fact that fertile eggs were produced in serum and not in other media ; it can be speculated that possibly serum contains some substances (hormones, vitamins ?) thought to be essential for normal cestode development[3,4,5], or it may be that the physical properties of serum—density, viscosity or osmotic pressure—are more suitable either to the worm itself or to the ejected spermatozoa. Owing to the large quantities required, sera from animals other than horse have not yet been tried as culture media.

(3) The following fragments of larvæ were cultured aseptically at 40° C. in broth : larvæ with scolex removed (Fig. 2*A*) ; larvæ with posterior tip removed (Fig. 2*B*) ; three small pieces about 3 cm. long, cut from the middle region of a large plerocercoid (Fig. 2*C*). All these fragments, although showing reduced activity during cultivation, developed and produced eggs in exactly the same manner as complete larvæ. In all cases, there was no tissue regeneration in either anterior or posterior regions.

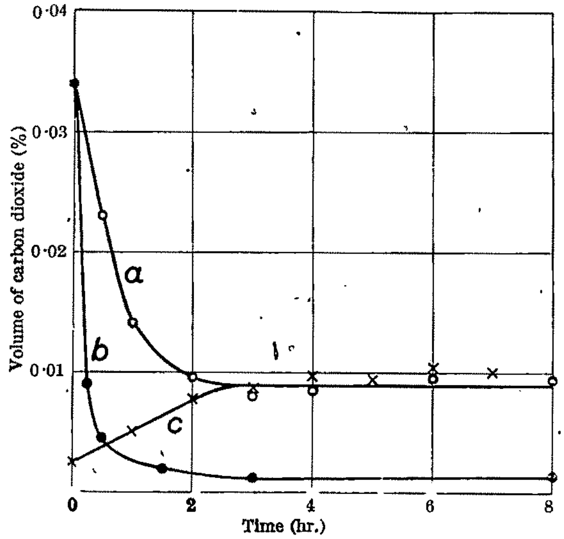
Threshold Value of Carbon Dioxide Concentration in Photosynthesis of Foliage Leaves

How much can the carbon dioxide concentration of the atmosphere be diminished by photosynthesis of green leaves ? Blackman[1], in his researches in vegetable assimilation and respiration, observed that leaves exposed to sunlight took up completely all the carbon dioxide molecules from an enclosed volume of air in a very short time. Reinau[2] did not accept this result which, he thought, was caused by some experimental error. He concluded, entirely on the basis of theoretical considerations, that the carbon dioxide concentration of the atmosphere (mean value 0·030 vol. per cent) could be lowered only very slightly by the photosynthetic activity of leaves. Later, in 1935, the problem was investigated by Miller and Burr[3], who placed potted greenhouse



plants in a chamber inside a closed system through which a vigorous circulation of air was maintained. When the leaves were illuminated with 2,050 foot-candles, they found that the carbon dioxide concentration in no case (thirty-four plants from ten species were employed) could be brought below 0·010 vol. per cent.

However, in Miller and Burr's experiments carbon dioxide was produced inside the apparatus from respiration of roots and stems, and from micro-organisms in the soil. The results, therefore, became expressions of a balance between production and consumption, and did not give correct information about the actual lowest concentration at which photosynthesis can take place.

Aiming at an exact determination of this value, I have, in the summer months of 1947, carried out two series of experiments with leaves of elder (*Sambucus nigra* L.). Stress was laid upon using leaves with fully opened stomata. In the first series (fourteen experiments) leaflets about 30 cm.^{2} in area with the stalk immersed in a little carbon dioxide-free water were placed in a 6,000 ml. separating funnel filled with atmospheric air. After exposure to incandescent light (10,000 lux) from 30 min. to 8 hr., the leaves were taken out through an air trap, and the non-assimilated carbon dioxide shaken out with barium hydroxide. The titration allowed determinations within an accuracy of ± 0·0002 vol. per cent carbon dioxide. The results are shown in the accompanying figure (Curve *a*). In two hours the carbon dioxide concentration was brought down to 0·0090 vol. per cent ± 0·0004 (lowest determination 0·0073), and maintained at this level for at least 8 hr. The temperature of the air around the leaves was 24–28° C. Curve *b* shows the results of control experiments, in which 30 cm.^{2} of filter-paper moistened with 0·8 ml. 10 per cent sodium hydroxide was inserted instead of the leaves.

In the second series (twelve experiments) the leaflets were inserted through the air trap and exposed in air poor in carbon dioxide (mean value 0·0024 vol. per cent). Light and temperature were maintained as in the first series. Under these conditions carbon dioxide was liberated at a steady rate until a level at 0·0089 vol. per cent ± 0·0004 was reached (Curve *c*). The production-rate was calculated from the linear part of the curve and the value found (1·40 mgm. CO_2/dm.^{2} hr.) agreed closely with the rate of carbon dioxide production in respiration of elder leaves in the dark (1·45 ± 0·03).

From these preliminary investigations two facts are clear: (1) There exists a threshold value for carbon dioxide concentration in photosynthesis, which for elder leaves is about 0·0090 vol. per cent. Below this threshold no carbon dioxide assimilation takes place. Thus, it seems that only about two-thirds of the atmospheric carbon dioxide is available for photosynthesis. (2) The rate of carbon dioxide production from respiration is the same in light as in the dark. This finding contradicts the theory of Warburg[4], Miller and Burr[3], and others, according to which an intermediate product of respiration is re-utilized in photosynthesis before any carbon dioxide is liberated.

Extermination of *Aëdes ægypti* in Khartoum

IN the note referring to Lewis's paper on mosquitoes and yellow fever in the Sudan which appeared in *Nature* of August 9, 1947, p. 186, it is stated that the disease has been exterminated from Khartoum as a result of mosquito control measures. This is not entirely correct. Khartoum is some distance north of the northern boundary of the yellow fever endemic area in the Sudan. Yellow fever has never been recorded in Khartoum, and immunity surveys reveal no evidence of the infection having occurred there during the life-time of the present inhabitants. Any suggestion that the disease has ever been identified in Khartoum might greatly increase the confusion of those who are at present devising regulations to prevent the international spread of yellow fever.

The entity which has been virtually exterminated in Khartoum is not yellow fever but *Aëdes ægypti*. This was apparently first accomplished in 1906 by the energetic anti-mosquito campaigns of the late Sir Andrew Balfour. Since then the mosquito situation in Khartoum has been under constant observation. From records extending over forty years it seems probable that at Khartoum, which is in the southern border of a desert tract unfavourable to the species, *A. ægypti* has never been very abundant, and has been eradicated, to reappear on infrequent occasions and be rapidly destroyed. It is very probable that the infrequent reappearances of *A. ægypti* were due to re-importation, since in the early days this mosquito was regularly brought to Khartoum by river steamers. Lewis states that the mosquito control measures at present in force in the Sudan have had the effect, among others, of very greatly reducing the numbers of mosquitoes, particularly those with domestic breeding habits, carried on steamers. *A. ægypti*, in particular, has not now been reported in steamers for several years.

LIMITATION OF BACTERIA BY MICRO-PREDATORS IN SOIL

By Dr. F. J. ANSCOMBE
AND
Dr. B. N. SINGH
Rothamsted Experimental Station, Harpenden, Herts

EIGHTY-SEVEN strains of very varied bacteria, comprising common and rare strains from soil, pigmented and non-pigmented 'miscellaneous' strains, and a number of plant pathogens, were tested on eight micro-predators belonging to four different groups commonly found in soil. The methods used and the results obtained are given by one of us (B. N. S.) in papers dealing with these groups[1-10]. It has been shown that soil micro-predators are very selective in their bacterial food requirements; some bacteria are edible and the others are completely or almost completely inedible. This article deals with the comparative edibility of bacterial strains by these micro-predators, and the probable role of micro-predators in limiting the bacterial numbers in the soil. The following soil micro-predators were used: two unidentified species of amœbæ, a giant amœboid organism (*Leptomyxa reticulata* Goodey), myxamœbæ of two species of *Dictyostelium* (*D. mucoroides* and *D. giganteum*) and three species of Myxococcaceæ (*Myxococcus virescens*, *M. fulvus* and *Chondrococcus exiguus*). The first five organisms are holozoic; the Myxococcaceæ destroy and digest their food by means of secretions[6,10].

TABLE 1

	Large soil amœba		
	Inedible	Edible	Total
Small soil amœba			
Inedible	31	1	32
Edible	7	48	55
Total	38	49	87
	D. giganteum		
	Inedible	Edible	Total
D. mucoroides			
Inedible	28	3	31
Edible	8	48	56
Total	36	51	87
	M. fulvus		
	Not lysed	Lysed	Total
C. exiguus			
Not lysed	37	7	44
Lysed	2	41	43
Total	39	48	87

Of the eight micro-predators tested, it was found that the two soil amœbæ reacted very similarly to their bacterial prey; that is, nearly all bacteria edible to one amœba were edible to the other. Similarly, the myxamœbæ of the two *Dictyostelium* spp. were very similar in their food preferences, as were also two of the myxobacteria, namely, *Myxococcus fulvus* and *Chondrococcus exiguus*. This is shown in detail, in 2 × 2 contingency tables, in Table 1.

Disregarding now one member of each of these three pairs of micro-predators, we consider the following five predators: large soil amœba, a giant amœboid organism (*Leptomyxa reticulata*), myxamœba of *Dictyostelium giganteum* and two myxobacteria (*Myxococcus virescens* and *M. fulvus*). These five are but slightly correlated in their choice of bacterial food. Their relation in pairs is shown in Table 2. It will be seen that there is some tendency, but not very pronounced, for bacteria that are edible to one predator to be edible to any other one. In fact, the number of bacterial strains that are edible or inedible to both of any two predators is of the order of 6 higher than it would be if the two predators made a completely independent selection of bacterial food. There is, however, one exception to this rule, as there appears to be no such correlation between *Myxococcus virescens* and *Leptomyxa reticulata*.

TABLE 3

	Large soil amœba		
	Inedible	Edible	Total
Leptomyxa reticulata			
Inedible	27	21	48
Edible	11	28	39
Total	38	49	87

To make this clear, consider the relation of the large soil amœba and *L. reticulata* (Table 3). If the two predators made independent selections of host bacteria, we should have expected that 48/87 of the 38 bacterial strains inedible to the soil amœba would have been inedible to *L. reticulata* also, that is, about 21, in place of the 27 actually observed. Similarly, we should have expected the number of bacteria edible to both the predators to have been 22 instead of 28, and the two remaining entries to have been each 6 larger, that is, 27 and 17 instead of the 21 and 11.

Considering now the five micro-predators together, we obtain Table 4, showing how many of the 87 bacterial strains tested are edible to 0, 1, 2, 3, 4, 5 of the micro-predators. Thus seven strains are inedible to all predators while thirteen are each attacked by only one predator.

The calculated numbers shown in the last column were obtained assuming that the bacterial strains vary in their intrinsic edibility, some being more

TABLE 2

	Large soil amœba		*Leptomyxa reticulata*		*Dictyostelium giganteum*		*Myxococcus virescens*		*Myxococcus fulvus*		Totals
	Inedible	Edible	Inedible	Edible	Inedible	Edible	Not lysed	Lysed	Not lysed	Lysed	
Leptomyxa reticulata											
Inedible	27	21									
Edible	11	28									
Dictyostelium giganteum											
Inedible	23	13	24	12							
Edible	15	36	24	27							
Myxococcus virescens											
Not lysed	15	9	12	12	13	11					
Lysed	23	40	36	27	23	40					
Myxococcus fulvus											
Not lysed	23	16	27	12	22	17	18	21			
Lysed	15	33	21	27	14	34	6	42			
Gram stain, negative	21	25	26	20	13	33	12	34	14	32	46
,, ,, positive	17	24	22	19	23	18	12	29	25	16	41
Totals	38	49	48	39	36	51	24	63	39	48	87

N.B.—The edible and lysed strains are those which are completely eaten and completely lysed either slowly or readily; inedible and non-lysed strains also include those bacteria which are either very slightly eaten or show very slight lysis.

TABLE 4

Number of predators (out of 5 considered)	Observed number of bacterial strains attacked by the foregoing numbers of predators	Calculated number of bacterial strains
0	7	6·7
1	13	12·1
2	13	16·1
3	17	18·5
4	25	18·6
5	12	15·0
Total	87	87·0

edible to predators than others, but that otherwise it is a matter of chance whether any one strain is edible to any one predator, and there is no tendency for predators to feed complementarily (that is, one generally preferring strains left uneaten by another). The actual mathematical distribution assumed, a type of modified binomial distribution, will shortly be described elsewhere by one of us (F. J. A.). It will be seen that the calculated numbers agree well with the observed.

Thus of the eight micro-predators tested together, five behave in the way just described, showing some tendency, but not a very pronounced one, to feed on the same selection of host bacteria; whereas the remaining three predators are each highly correlated with one of the five already considered, and so not likely to affect appreciably the total number of bacterial strains edible to one or more of the predators. It is interesting to consider, as a matter of speculation, what percentage of the bacterial strains tested would remain inedible by any predator if more predators could be found having the same degree of independence from the five here considered and from one another as these five have from one another. We should expect the percentage of uneaten strains to vary with the total number of predators as shown in Table 5.

TABLE 5

Number of different predators	% of strains uneaten
5	7·7
6	5·9
10	2·6
15	1·3
20	0·8

In Table 2 is also shown the relation of the five micro-predators to the Gram-staining of the bacterial strains. Two of the predators, *Dictyostelium giganteum* and *Myxococcus fulvus*, show a definite negative association, suggesting that they prefer bacterial strains that are Gram-negative. The same will also apply to the similarly behaved *Dictyostelium mucoroides* and *Chondrococcus exiguus*. It should be remembered that many soil organisms such as antibiotic actinomyces and fungi show a strong preference for Gram-positive bacteria. Such organisms will thus tend to be complementary to the above predators in their food preferences.

The remaining predators tested do not show any such association with the Gram-reaction.

RESEARCH AND DEVELOPMENT IN BRITISH COLONIAL TERRITORIES

Colonial Research Committee

THE fourth annual report of the Colonial Research Committee, published under the title "Colonial Research 1946–47"*, together with the fourth annual report of the Colonial Products Research Council, the third annual report of the Colonial Social Science Research Council and the second annual reports of the Colonial Medical Research Committee and of the Committee for Colonial Agricultural, Animal Health and Forestry Research, covers the period April 1, 1946–March 31, 1947, and refers again to the lightening of the task of the Committee by the creation of separate bodies to advise the Secretary of State on special aspects of reseach. Early in 1947, the Colonial Insecticides Committee was created, with Sir Ian Heilbron as chairman, to initiate research, including experimental field work, to examine schemes for research and experiment submitted by Colonial Governments or other appropriate bodies, to advise on problems concerning the use of insecticides, and to make available the latest scientific information to those concerned with the use of insecticides in the Colonies. This Committee has already decided to concern itself primarily with the experimental application of the results of fundamental insecticide research, but will also encourage and reinforce research projects of Colonial Government Departments as well as co-ordinate agricultural, medical and veterinary interests in the use of insecticides. Economic research has now been entrusted to a Colonial Economic Research Committee, with Sir Arnold Plant as chairman, which, working in close association with the Colonial Social Science Research Council, will advise the Secretary of State on economic research and statistics.

While the Colonial Research Committee continues to act as the central advisory body on expenditure schemes initiated by the other bodies, with the exception of the Colonial Products Research Council, its own report becomes essentially a cover note appended to the list of schemes approved for research grants, although the whole report is a most useful reference paper in view of the information it contains concerning membership of the various committees, etc. Referring to Dr. E. B. Worthington's appointment as joint secretary to the Committee, the report states that Dr. Worthington's services have been placed at the disposal of the East African Governor's Conference for a period of two years, to advise on the regional organisation of research in the three East African territories in which the Governor's Conference is interested. The Central African Council, established in 1945 as a consultative body to foster co-operation between Southern Rhodesia, Northern Rhodesia and Nyasaland, also decided to appoint a research secretary to survey existing facilities for research and report upon additional facilities required; but no definite steps were taken to consider the regional organisation of research in West Africa. Five Colonial Research fellowships were awarded during the year, but one was ultimately declined by the applicant.

* Colonial Office. Colonial Research 1946–47. Pp. ii+72. (Cmd. 7151.) (London: H.M. Stationery Office, 1947.) 1s. 3d. net.

Dealing with specific fields of research, censuses were taken during the year in Aden, Ceylon, Cyprus, the Falkland Islands, Fiji and Western Pacific and St. Helena, and the urgent need for complete censuses in all Colonial territories in Africa is stressed. Regional fisheries research institutes are being organised in East, Central and West Africa, and funds are being made available from the Colonial Development and Welfare Research allocation for a Freshwater Research Station at Jinga in Uganda. The shortage of trained staff and equipment, however, are great obstacles to the development of fisheries. Recruitment of trained men has also been a difficulty at the headquarters of the Geodetic and Topographical Survey opened at Bushey Park in March 1946. Only about a quarter of the programme of air photography for West Africa was complete owing to bad photographic weather, but a large programme of air photography covering parts of all the East and Central African Colonies and the High Commissioners' Territories was arranged to start in May 1947. Dr. F. Dixey, appointed as geological adviser and director of Colonial geological surveys from January 1, 1947, has been studying the needs of such surveys in regard to organisation and expansion of staff, but expansion is likely to be hindered by the shortage of geologists. Active control campaigns against the desert locust in the Middle East and the East African and adjacent territories continued during the year, and considerable success was achieved, particularly with 'Gammexane' as poison in baits; a much more toxic spray for locusts from aircraft has been developed. The anticipated progress has not been made in the organisation of a meteorological service. Sixty-seven schemes approved for research grants during the year aggregated £1,085,259; eighteen were for agriculture, veterinary science, forestry or fisheries, twenty-seven for medical and thirteen for social sciences. Actual issues in respect of schemes during the year totalled £164,329.

Colonial Products Research Council

The report of the Colonial Products Research Council refers particularly to the work in Sir Norman Haworth's laboratory at the University of Birmingham on sugar and starch. The study of the chemistry of cane sugar and its immediate transformation products has resulted in the preparation of a sulphonamide derivative which is a promising chemotherapeutic agent, while derivatives of lævulinic acid with marked analgesic properties have been found. Sodium lævulinate appears to be superior in some respects to ethylene glycol as an anti-freeze agent, and the palmityl and stearyl derivatives of dianhydromannitol and dianhydrosorbitol may find application as detergents and emulsifiers. The chief feature of the work on starch is the separation of starch into amylopectin and amylose, and it appears that by first separating starch into these two components its industrial utilization could be greatly extended, amylopectin, for example, being superior to starch as a beater size in paper-making, while amylose acetate is compatible with cellulose acetate in the manufacture of textile fibres and films. It has also been observed that starch glycollate is an ideal indicator in iodometry analysis.

As a result of the work on arrowroot, a process has now been devised which allows the extraction by a grinding mill of special design of practically the whole of the starch from the roots. In the field of citrus products, work at the Imperial College of Science and Technology, London, under Sir Ian Heilbron and Dr. E. R. H. Jones has led to the determination of the nature of the troublesome deposit formed in Tanganyika bitter orange oil during shipment and storage, while work under Prof. T. P. Hilditch at the University of Liverpool suggests that the oil prepared from specially heat-treated seeds of a West African vine (*Tetracarpidium conophorum*) may prove a satisfactory substitute for linseed oil. Other work has been concerned with plants of possible medicinal and insecticidal value, including the exhaustive fractionation of the extract from the flowers of *Brayera anthelmintica* and the separation of the principal carbohydrate fractions of the tissues of *Hydrocotyle asiastica*. Erection of the laboratory of the Colonial Microbiological Research Institute at Trinidad commenced in February 1947, and before leaving for Trinidad, Dr. A. C. Thaysen continued his study of the Actinomyces, developing a new culture medium. Dr. Thaysen is to study the fermentation processes which occur after the harvesting of cocoa beans and on which the flavour of the cocoa is believed largely to depend.

In September 1946, Sir Ian Heilbron and the Director of Research (Dr. J. L. Simonsen) visited Kenya, Tanganyika, Uganda and Zanzibar, discussing the position of both the Industrial Management Board and the East African Industrial Research Board with the managing director and acting-chairman of the Board and with the economic adviser of the Governor's Conference. They were greatly impressed by the possible mineral developments of Tanganyika, and in Uganda discussed the work of the Colonial Insecticide Research Unit and saw the field experiments in mosquito and tsetse control. In their report to the Council, they urged the establishment of a specific Colonial insecticide committee to coordinate research effort in the Colonial field and to bring to the notice of workers the latest information and advice. A list of publications and of patent applications is appended to the report.

Colonial Social Science Research Council

The third annual report of the Colonial Social Science Research Council, pointing out that progress in this field continues to be sporadic and unequal, emphasizes that the chief difficulty remains, that of finding the right man for a project. There has been little alleviation of the shortage of trained personnel, and more adequate provision is required for post-graduate training in the special techniques and skills and in the special background knowledge without which the social science graduate is not equipped for field work among the simpler and less-developed peoples. The Council has given much consideration to such training and records further progress in the preparation of programmes of research needs and priorities. Some twenty projects have been listed for priority in West Africa, and of projects mentioned in earlier reports Miss Phyllis Kaberry's study of the economic and cultural status of women in the British Cameroons, Dr. K. Little's ethnographical study of the Mende in Sierra Leone, Mrs. Meyeronitz's study of the role of gold in the art and culture of the Gold Coast, Mrs. Matson's study of the legal aspects of land tenure in the Gold Coast and Mrs. Ingram's documentary survey of social and economic conditions in the Aden Protectorate have been completed or almost completed, as is Dr. Geoffrey Tooth's study of mental illness and juvenile delinquency in West

Africa so far as it relates to juvenile delinquency in the Gold Coast. New projects launched during the year include a sociological study of the peasant community in Jamaica, an investigation of secondary school science teaching in West Africa and a study of the relations between the extent of education and the after-school occupational life of girls and women in the Gold Coast. A project for a study of the efficiency of labour among the six thousand African employees of the Kenya–Uganda Railway stationed in Nairobi to be undertaken by a team of research workers under Dr. C. H. Northcott was also approved. The project has been planned in conjunction with the Human Nutrition Research Unit, on the recommendation of which there has also been launched a scheme for a survey of nutritional problems in all their aspects in the Gambia.

Colonial Medical Research Committee

The second annual report of the Colonial Medical Research Committee, in addition to reviewing research work completed or in progress, refers to the establishment of sub-committees to deal with nutrition problems, research on helminthiasis, and personnel as well as an East African Medical Survey Sub-Committee, which has already prepared preliminary plans for a medical and sanitary survey as a first stage in a long-term policy of development to establish preventive medicine in East African territories. This was one of the main recommendations of the late Prof. McSwiney as a result of his visit to East Africa in 1946, and his other main recommendation for the establishment of a bureau of health in East Africa is being considered by the Committee in consultation with the East African Governor's Conference. The Colonial Medical Research Service has not yet been brought into being; although the results of most of the field trials of 'Paludrine' arranged in different Colonies are not yet available, the Malaria Sub-Committee considering the relative prophylactic use of 'Paludrine' and quinine has expressed the opinion that 'Paludrine' is a superior drug to quinine for suppressive or prophylactic purposes; in much higher weekly doses than 300 mgm. it has given no toxic manifestations, the latitude between effective and toxic dosage, for therapeutic purposes, being much greater than with quinine. It would be quite safe to sell 'Paludrine' in post offices and similar Government offices in the same way as quinine is now sold.

A research team has been dispatched to British Borneo under a three years scheme to study the transmission of malaria in that Colony, and a Nutrition Field Research Station is being established at Farjara near Bathurst in the Gambia. Following on studies of the microbiology of Kaffir beer and its nutritional value, the effect on the nutritional value for man of maize products obtained by various treatments is being investigated, and the physical and chemical changes in rice during soaking and steaming are being examined with the view of providing a satisfactory basis for parboiling rice. Another link in the co-ordination of Colonial nutrition work is provided by the formation of a Department of Nutrition in the London School of Hygiene and Tropical Medicine and the creation of a chair in nutrition in the University of London, to which the Director of the Human Nutrition Research Unit has been appointed. Research has been carried out on schistosomiasis in the United Kingdom at the London and Liverpool Schools of Tropical Medicine, while work on filariasis has been directed mainly to a search for a chemotherapeutic remedy. Arrangements have been made for work on scrub typhus to be continued at Kuala Lumpur.

Committee for Colonial Agricultural, Animal Health and Forestry Research

The second annual report of the Committee for Colonial Agricultural, Animal Health and Forestry Research refers to the attention given to the terms of service for the Colonial research worker, and a sub-committee under the chairmanship of Sir Edward Salisbury prepared a memorandum on terms of service considered suitable for a Colonial research service for agriculture, animal health and forestry. The sub-committee was primarily concerned to recommend terms that would attract and retain voluntarily in Colonial research a fair proportion of the available research workers in the sciences related to agriculture, and also that there should be no barrier to the free movement of research workers between research institutions in the Colonies and in the United Kingdom and the Dominions. The policy sub-committee was preparing a report on research needs of the Colonies and the organisation of research in Colonial regions. Some progress in the regional organisation of research in East Africa has been made as a result of the visit of Sir Frank Engledow, Prof. J. W. Munro and Sir Harold Tempany in February and March 1946, and the recommendations of a Conference at Nairobi for the replacement of the existing East African Agricultural Research Institute by an East African Agricultural Research Organisation on a more suitable site than Amani, and for the expansion of the East African Veterinary Research Institute at Kabete, Kenya, have now been accepted by the Secretary of State. Attention has also been given to the regional organisation of research in the West Indies, and schemes for research on soils, bananas and cocoa have been recommended by the Committee for assistance under the Colonial Development and Welfare Act.

The Cocoa Research Sub-Committee kept under close review the progress of the West African Cacao Research Institute [see p. 117] and examined in detail the West Indian regional cocoa research scheme as well as considering the control of cocoa virus diseases in Trinidad. A Soils Sub-Committee appointed during the year with Dr. W. G. Ogg as chairman dealt chiefly with Colonial soil classification and nomenclature, West Indian regional soils research and fertilizer experiments. The Stored Products Research Sub-Committee has agreed with the Infestation Division of the Ministry of Food that infestation conditions in the West African territories should first receive attention, and has recommended a survey of these territories, to include the infestation problems of cocoa, ground-nuts, palm kernels and centrally stored foodstuffs for local consumption. Mr. G. S. Cottrell was appointed leader of the survey team in May 1946. A small working party has been appointed under the chairmanship of Prof. J. W. Munro to prepare a memorandum on the control of infestation for the guidance of Colonial governments, while other subjects engaging the attention of this Sub-Committee have been the provision of entomologists and chemists for infestation control work and the use of the new synthetic insecticides in direct contact with stored foodstuffs.

USE OF EQUIVALENT METRIC VALUES IN SCIENTIFIC PAPERS

THE Royal Society Empire Scientific Conference held in June 1946 considered and approved a resolution advocating that where scientific papers or text-books are expressed primarily in British units, provision should be made for the inclusion of metric equivalents or conversion factors.

In July 1947 a letter, signed by the presidents of the Royal Society and of the British Association, the secretary of the Department of Scientific and Industrial Research, the director of the National Physical Laboratory and the chairman of the British Standards Institution Council, was sent to various scientific and technical societies and publishers, directing attention to the resolution and suggesting that, if necessary, a meeting, representative of the various interested organisations, should be held to discuss the implementation of the resolution. Replies to the letter indicated a considerable measure of support for the proposal, and on December 12, 1947, a meeting was held in the rooms of the Royal Society at which methods of implementing the resolution were discussed. This meeting was arranged by the National Physical Laboratory and the director of the Laboratory, Sir Charles Darwin, took the chair.

As an experiment, National Physical Laboratory papers have, since the Conference, so far as possible provided metrical equivalents whenever British units have been used. A paper was therefore prepared at the Laboratory setting out, with examples, ways in which this aim can be achieved; this was circulated to learned societies and institutions and to publishers of scientific text-books and periodicals, to provide a basis of discussion. Thirty-eight societies and thirty-five publishers accepted the invitation and sent representatives to the meeting.

Sir Charles Darwin in opening the meeting emphasized that the matter to be discussed was one of intelligibility only, and had nothing to do with the introduction of the metric system in Britain. By making it possible for the foreigner to convert British units immediately into metric, publishers of scientific papers and books would assist Britain to attain the position of the centre of science in Europe. A little more work would, of course, be entailed on the part of both authors and publishers, but the addition of a few days to the time normally required for the production and publication of a book was not seriously to be weighed against the great loss of time to all the readers if they had each to look up appropriate factors and make the conversion for themselves. He then referred briefly to the experience gained at the National Physical Laboratory since June 1946; this was incorporated in the paper which the meeting had before it for consideration.

Mr. F. A. Gould, a member of the staff of the National Physical Laboratory, in describing the methods of inserting metric equivalents or conversion factors put forward in the paper, said that these incorporated in some way the principle of double entry. For example, where a numerical quantity was cited in the text in English units, the metric equivalent would be given in parenthesis. In some cases such a method would become unwieldy and other devices were suggested. Where the whole text was full of numerical quantities, recourse might be had to a table of conversion factors at the beginning of the paper. Where a numerical table was printed, the conversion factors might be given at its foot, and sometimes to avoid the danger of blunders in the conversion, a single row of the table might also be given in metric form. One of the most effective methods was in diagrams, where it would in most cases be possible to insert additional scales in the metric units.

In the general discussion most speakers expressed a strong dislike of a proposal to give conversion charts in the form of bookmarkers, as these were troublesome to print and were easily mislaid, and suggested as an alternative the use of a 'pull-out'. In order to minimize the additional labour required, there was also a rather natural tendency to favour the method of inserting a list of conversion factors at the beginning of the paper, rather than to give converted figures in the text itself.

The additional paper and extra expense involved in a large amount of double entry, as, for example, in tables, made such a method unpopular with publishers, but it was agreed that in diagrams it would generally be possible to mark ordinates on the left in the British system and on the right in the metric, and that this would make an easy and convenient method of showing the conversion.

The British Medical Association representative outlined the methods which the Association had used without difficulty for some twelve months, and mentioned how much the inclusion of metric values had been appreciated. A recent document produced by the Association without metric equivalents had brought many protests. Some speakers, in mentioning the need for an authorized list of conversion factors, suggested an extension of the list contained in British Standard Specification No. 350.

In summarizing, Sir Charles Darwin said that although there were obvious difficulties to be overcome in dealing with the problems concerned with the insertion of suitable metric information in scientific papers, the representatives at the meeting had shown that there was general support for the policy advocated by the Royal Society Empire Scientific Conference, and he felt that by consulting various organisations an acceptable scheme could be produced. Another general meeting did not seem to be required, and the National Physical Laboratory would produce summarized suggestions for distribution to those interested.

SCIENCE MASTERS' ASSOCIATION

ANNUAL MEETING

THE forty-fifth annual meeting of the Science Masters' Association was held during December 30–January 2 in the University of Sheffield, under the presidency of the Vice-Chancellor of the University, Dr. J. I. O. Masson, when a full programme of lectures, visits, demonstrations and exhibitions was enjoyed by some four hundred members. The meeting opened with a civic reception in the Town Hall, when the Lord Mayor of Sheffield, Alderman W. E. Yorke, welcomed the Association to the City and, afterwards, with the Lady Mayoress, entertained members to tea.

In his presidential address, Dr. Masson made a strong plea for the recognition of the importance and value of first-hand knowledge. The eminent man of science of real life, unlike his counterpart in fiction, is not the mere possessor of a card-index mind, but derives his store of knowledge from personal experience. The wisdom of men such as Ramsay, Arrhenius, W. H. Perkin, William Bragg and Karl Pearson did not derive from knowledge deliberately learned or consciously memorized. The man of science must also resist the very human temptation to take a narrow view of his work and to use it as an instrument for the furtherance of his own worldly reputation. Likewise, he will not allow partisanship for one study to prejudice him against excellence in other fields, of science or the humanities. For both the man of science and the scholar complete intellectual honesty is essential, and the same code covers both. For the scientific worker, the chief danger to be guarded against is the materialistic view that science is to be judged according to the practical inventions that follow in its wake. This is a narrow view and loses sight of ultimates. The virtue of a fine scientific research is similar to that of a fine poem, and each can have a profound effect on human thought, and on the understanding of the universe in which we are set.

On the second evening of the meeting, the Bishop of Birmingham addressed a crowded session of the Science and Religion Group. Defining religion as experience of ultimate reality, Dr. Barnes stated his belief that the minds of mankind make the world as it is known to us; these human minds must be akin to that of God, or science would be impossible. The advice "seek and ye shall find" is as appropriate to the laboratory as to the Church. The pure Christian faith rests on mysticism, strengthened by morality and joined to scientific knowledge; its formulation is not fixed but will change as the generations pass. The failure of traditional forms of religion imposes on all teachers the duty of forging their own religious understanding and passing this on to their pupils.

The third evening was devoted to the Science and Citizenship Lecture, delivered to a public audience by Prof. W. T. Astbury, in the Memorial Hall, Sheffield. Prof. Astbury emphasized the need for a greater appreciation of the work of pure scientists by leaders of industry. Such examples as the production of textile fibres from globular proteins and the release of atomic energy show that pure research finds application in the most unexpected directions. Recent developments in the textile industry show also that the craftsman and the scientific worker can learn much from each other, once the difficulties of mutual understanding are resolved. It is here that the educationist can play his part by ensuring that all members of the public have some appreciation of the spirit and methods of science, and the potentialities for good or evil of its applications. The human race, owing to its discoveries having outrun its moral standards, is in grave danger of descent into the abyss of ruin and destruction. The avoidance of this catastrophe, and the development of the constructive spirit in world affairs, depends in no small degree on the efforts of science teachers.

During the meeting, members heard a number of stimulating and informative lectures by members of the staff of the University of Sheffield. Prof. W. Sucksmith, on "Magnets and Magnetism", gave a lucid exposition of the modern picture of magnetism, with especial reference to the domain concept, and a review of recently developed magnetic materials; Prof. J. H. Andrew, on "Metallurgy as a Profession", outlined many examples of the applications of metallurgy, with a useful discussion of careers open to those with qualifications in this subject; Prof. Harry Moore, on "The Physics and Chemistry of Glass", dealt with the history of glass manufacture, giving many useful data regarding modern glasses, and the results of research into their structures; Prof. L. E. S. Eastham, on "The Evolution of a Developmental Process", illustrated the phenomena of insect metamorphosis on the assumption that the rates of developmental processes are controlled by genes; Dr. T. B. Smith, on "The New versus the Old in the Theory and Practice of Analysis", considered the impact of new ideas of physical chemistry on the teaching of analytical chemistry in 'sixth forms', both from the theoretical and practical aspects; and Dr. V. M. Conway, on "Pollen Analysis", outlined the development of this study and the many uses to which it can be put.

Science masters found much of interest in the excellent experimental demonstrations arranged by the Departments of Botany, Chemistry, Glass Technology, Metallurgy, Physics and Zoology of the University of Sheffield, and the members' exhibition showed its usual high standard of ingenuity. The publishers' and manufacturers' exhibitions were also popular, and the comprehensive visits' programme enabled members of the Association to see many typical local industries.

METEOROLOGY AND THE PROPAGATION OF RADIO WAVES

THE development of radio communication and radar during the War emphasized the fact that the propagation of metre and centimetre waves was greatly influenced by the meteorological conditions in the lower atmosphere. The subject was of such importance that a large-scale investigation of the phenomena involved was organised in Great Britain as a co-operative effort between the staffs of several radio research establishments and of various sections of the Services. The Navy, Army and Air Force, the Ministries of Supply and Aircraft Production, the Meteorological Office and the National Physical Laboratory, and also the Research Laboratories of the General Electric Co., Ltd., each played an important part in this work. The experiments were conducted over both land and sea paths, along which both the radio transmission characteristics and the meteorological conditions were measured simultaneously. The installations at one end of each path comprised a radio-sending station emitting a known amount of radiation towards the receiving station at the other end of the path, where the field strength of the arriving waves was measured and continuously recorded. In the case of one of the oversea paths the meteorological conditions, temperature, pressure and humidity, were measured at various heights along the path by flights of aircraft between the sending and receiving stations. These observations were supplemented by other measurements made from a captive balloon attached to a ship located along the path. In the case of other paths, the meteorological conditions were largely deduced from the normal daily weather charts, supplemented by observations at the terminal points.

This 'field' type of investigation was supplemented by many subsidiary experiments on the properties of the constituents of the atmosphere and the effect which these might have on the propagation of very short radio waves through it. Much theoretical work was also carried out by individual workers on both the meteorological and radio aspects of the whole investigation.

As the various items of all this work reached appropriate stages, reports were prepared and issued as confidential or secret documents under the restrictions of war-time conditions. But the value of the research from the point of view of the scientific world has now been considerably enhanced by the fact that many of the results obtained have been placed on permanent record in the form of published papers. In the first place, the propagation of ultra-short waves formed the subject of one of the sessions of the Radiolocation Convention of the Institution of Electrical Engineers held in March 1946. The resulting papers and lecturettes were published in a special number of the Institution's *Journal* (93, Part IIIA, No. 1, 1946). This Convention was followed in April of the same year by a Joint Conference held by the Physical and the Royal Meteorological Societies, at which the various aspects of the influence of atmospheric conditions on the propagation of radio waves was discussed in considerable detail; and in *Nature* of June 29, 1946 (**157**, 860), Prof. P. A. Sheppard gave a detailed account of this Conference and of the various papers presented at it.

The report of the latter Conference has now been published by the Physical Society as a special volume entitled "Meteorological Factors in Radio-Wave Propagation" (price to non-members 24*s*. including postage). This volume contains the full text of the ten papers read at the meeting, together with eleven other papers describing work on various closely related subjects. Dr. J. A. Saxton gives an account of the experimental determination of the dielectric properties of steam for frequencies between 3,000 and 20,000 Mc./s. (wave-lengths 1·5–10 cm.). The results of such measurements were used to estimate the amount of attenuation to be expected, due to atmospheric water vapour, in the transmission of these waves through the lower atmosphere. The estimated values of such absorption are found to be reasonably consistent with those obtained from theoretical considerations. In four subsequent papers the same author, in one case jointly with J. A. Lane, has studied experimentally and theoretically the anomalous dispersion of water in the centimetre wave-range. The results of this work have provided a detailed knowledge of the refractive index and absorption coefficient of liquid water over a wave-length range from 10 cm. down to a few millimetres, and of the variations of these quantities over the temperature range 0°–40° C.

In a paper entitled "Observations of Unorthodox Radar Vision in the Vicinity of New Zealand and Norfolk Island", Dr. F. E. S. Alexander presents and analyses many observations of anomalous wave propagation obtained by the operators of radar stations on wave-lengths of 10·5 and 150 cm. Another paper, by J. A. Ramsay, describes the results of further observations made at radar stations using wave-lengths of 1·25, 3 and 10 cm. The conditions of propagation were studied at a nominally fixed range, by raising the reflecting target to known heights above the sea by means of a balloon. The results confirmed the prediction, made on theoretical grounds, that anomalous propagation would be experienced on a wave-length of 1·25 cm. to a much greater extent than on 10 cm.

The remaining papers deal with various aspects of the vertical gradient of refractive index in the atmosphere and its effect on the propagation of the very short radio waves under consideration. Dr. G. G. Macfarlane describes a method of deducing the refractive index gradient in a stratified atmosphere from radio observations: while G. A. Bull has provided a note on errors in the measurement of the refractive index consequent upon errors in the meteorological measurements from which the index is deduced. Using information provided by published weather charts, supplemented by some special measurements made in Great Britain, Dr. A. C. Stickland has studied the average condition of the atmosphere as a refracting medium for the propagation of radio waves. From this empirical study, it is shown that the average refractive index of the lower atmosphere varies logarithmically with height, the actual radius of curvature of the path of the waves increasing linearly with height above the earth's surface.

In a field of investigation such as this, where the meteorologist and radio scientist meet on common ground, it is clearly desirable that there shall be some agreement on the definition of what may be termed a 'standard atmosphere', to which both theoretical and experimental investigations may be referred. It is therefore very appropriate that the publication now under review should include a paper by A. C. Best entitled "A Standard Radio Atmosphere for Microwave Propagation". The author discusses three possible definitions of standard atmosphere, one of which is already in use for aeronautical purposes; but he suggests that the final choice of definition for the standard radio atmosphere must be made by the radio investigator rather than by the meteorologist.

All the work described above represents the conclusion of a very satisfactory and highly successful series of investigations initiated and conducted under war-time conditions. It demonstrates the ability of a large body of scientific workers and Service personnel to plan and conduct in an efficient manner a very complicated research programme in the laboratory and in the field. In spite of the varying interests of the many individuals concerned, they worked together as an enthusiastic team and were inspired in the main by two British Government committees. One of these was under the chairmanship of Sir Edward Appleton, who at the end of his introductory paper to the joint Conference mentioned above acknowledges with pleasure the collaboration he received from its members. He also states that his committee, or, to give it the full title, the Ultra-Short Wave Panel of the Ministry of Supply, had the good fortune to work in close collaboration with the U.K. Joint Radio Meteorological Committee, under the chairmanship of Sir Nelson Johnson, and also with the U.S. Wave Propagation Committee under the chairmanship of Dr. C. R. Burrows. R. L. Smith-Rose

---

RELEASE OF INFORMATION ON ATOMIC ENERGY

Two lists of British reports on atomic energy, which had been 'declassified' and made available for purchase through H.M. Stationery Office, P.O. Box 569, Cornwall House, London, S.E.1, were announced last year (*Nature*, March 22, p. 411, September 27, p. 445). The following further twenty-three reports have now been released and should, wherever possible, be ordered by B.D.D.A. number; if this is given, no other identification is needed.

It is hoped that, in the future, reports will be supplied to H.M. Stationery Office as and when they are declassified, and no special announcements will be made; information as to the latest reports available would then be obtained from the regular announcements from H.M. Stationery Office.

B.D.D.A. No.	Report No.	Title and Author(s)	Date	Price
99	Br. 10	Organic derivatives of U. N. Haworth		2*s.* 8*d.*
100	Br. 18	Uranyl fluoride. Miscellaneous notes. Note No. 8. The adsorption of atmospheric moisture by anhydrous UF_4. A. M. Roberts	Feb. 16, 1942	2*s.* 0*d.*
101	Br. 174	Investigation of the Pressure-density relationship for the hexafluoride of U at 49·2° C. C. B. Amphlett and L. F. Thomas	Feb. 28, 1942	2*s.* 0*d.*
102	Br. 27	Uranyl fluoride. Miscellaneous notes. Note No. 18. The true and packing densities of anhydrous UF_4. A. M. Roberts, B. G. Harvey	Mar. 30, 1942	1*s.* 4*d.*
103	Br. 36	The reduction of UF_4 by hydrogen. J. Ferguson	May 14, 1942	4*s.* 0*d.*
104	Br. 182	Pressure density relationship for UF_6 at 50° C.; revised figure for $\left(\frac{\partial e}{\partial p}\right) - 50°$. C. B. Amphlett	June 30, 1942	2*s.* 0*d.*
105	Br. 186	The vapour pressure of UF_6 from 12° to 50° C. C. B. Amphlett	June 30, 1942	2*s.* 0*d.*
106	Br. 187	Determination of the vapour density of UF_6 at room temperature. C. B. Amphlett and L. F. Thomas	June 30, 1942	1*s.* 4*d.*
107	Br. 222	The analysis of gaseous fluorine, Part I. The determination of total and free fluorine. A. F. Williams	Sept. 14, 1942	7*s.* 4*d.*
108	Br. 188	Determination of the ultraviolet absorption of UF_6 vapour. A. E. Martin and C. B. Amphlett	Nov. 30, 1942	2*s.* 0*d.*
109	Br. 166	Gland experiment. H. S. Arms	Jan. 20, 1943	8*s.* 8*d.*
110	Br. 167	Experiments on the pressure dependence of heat conductivity concentration meters. A. F. Brown	Mar. 1, 1943	6*s.* 8*d.*
111	Br. 242	Absolute calibration of a neutron source. O. R. Frisch	June 1943	5*s.* 4*d.*
112	Br. 280A	Remarks on some physical properties of uranium metal. F. E. Simon	Aug. 16, 1943	8*s.* 0*d.*
113	Br. 281	The viscosity of gaseous fluorine. Critical literature survey. Rudge and Southam	Aug. 23, 1943	6*s.* 0*d.*
114	Br. 315	Notes on Br. 44 "On the Correction for Self-Absorption in β-Ray Measurements", Broda, Guer-on and Kowarski, 1942. N. Feather	Aug. 16, 1943	6*s.* 0*d.*
115	Br. 425	Determination of U^{235} content of enriched uranium samples. E. Bretscher and E. B. Martin	Nov. 3, 1943	2*s.* 0*d.*
116	Br. 397A	Memorandum on American tests on fluorocarbon lube oils. J. R. Park	Mar. 16, 1944	1*s.* 4*d.*
117	Br. 516	A hard valve pulse analyser. M. L. Poole	May 7, 1944	12*s.* 0*d.*
118	BI. 37	Stability of solutions of UCl_4 in alcohol, acetone, and water. C. B. Amphlett	May 31, 1944	2*s.* 0*d.*
119	Br. 673A	The analysis of nitrogen – argon mixtures. P. A. I. Tahourdin	Dec. 7, 1945	4*s.* 8*d.*
120	Br. 718A	The tensile properties of uranium at elevated temperatures in the α-range. National Physical Laboratory	Mar. 4, 1946	1*s.* 4*d.*
121	Br. 775	Preliminary creep tests on 99·8% aluminium at 300°, 350° and 400° C. British Non-Ferrous Metals Research Association	July 1947	6*s.* 8*d.*

FORESTRY IN TRINIDAD AND TOBAGO

THE present forest policy for the Colony of Trinidad and Tobago has had several predecessors. The Annual Forest Administration Report for the Year 1946, written by Mr. John Carter, acting conservator of forests, starts with a statement on the present forest policy formulated in 1942 and now formally accepted by the Government and the Secretary of State for the Colonies. Briefly summarized, it is as follows: (*a*) Permanent reservation by the Crown of suitably situated areas of forest of a total acreage sufficient to supply the objects aimed at, both direct and indirect. (*b*) Management of reserved forests on the basis of a sustained yield. (*c*) The fullest utilization of the forest products, based on the correct forest management and the most economic utilization of imported lumber. (*d*) Organised research in all branches of forestry. (*e*) A fully trained staff, both gazetted and subordinate, and the education of all classes of the community to understand the benefits of forestry. (*f*) The encouragement of, and assistance to, private forestry. (*g*) Co-operation between forestry and other land interests with the object of bringing into force a sound land utilization policy.

These are good clauses in a correct forest policy. They have been enunciated on more or less similar lines many times in the past in the British Empire. It would appear from the action being taken both in the Empire and outside it in other parts of the world that Governments generally have become conscious of the serious dangers which are threatening their populations through wasteful utilization of the forest resources, involving possible wood famines in certain regions of the globe, and seriously increasing erosion and degradation of soils and interference with water supplies and rainfall.

The present report describes the steps being taken in carrying out the resolutions on the above heads of policy. The report then continues with details on the actual work carried out during the year. Among other points the question of game preservation and the difficulty of control in the close season is mentioned: and also that negotiations were continued with the Trinidad Field Naturalists Club with a view to the formation of a zoological society which would undertake to establish and maintain a zoological 'garden'. It is interesting to note that a site of about 6 acres in the Royal Botanic Gardens has been made available for the proposed zoo, and the Government has agreed to hand over to a zoological society when it is formed the funds standing to the credit of the Wild Birds Fund, and an annual grant equal to the amount collected for hunting licences.

FORTHCOMING EVENTS

(*Meetings marked with an asterisk * are open to the public*)

Monday, January 26

ROYAL SOCIETY OF ARTS (at John Adam Street, Adelphi, London, W.C.2), at 4.30 p.m.—Dr. C. H. Andrewes, F.R.S.: "The Common Cold" (Cantor Lecture).

UNIVERSITY COLLEGE LONDON (in the Physiology Theatre, Gower Street, London, W.C.1), at 4.45 p.m.—Dr. Ernest Baldwin: "The Comparative Biochemistry of Respiration and Metabolism". (Further Lectures on February 2, 9, 16, 23 and March 1.)*

MANCHESTER LITERARY AND PHILOSOPHICAL SOCIETY (in the Reynolds Hall, College of Technology, Manchester), at 5.30 p.m.—Sir George Thomson, F.R.S.: "Determinism in the Physical World" (Joule Memorial Lecture).*

Institution of the Rubber Industry, Manchester and District Section (joint meeting with the Plastics Institute, at the Engineers' Club, Albert Square, Manchester), at 6.15 p.m.—Mr. N. J. L. Megson and Mr. G. L. Hammond: "Polymer Progress".

Institution of Electronics (at the Royal Society of Arts, John Adam Street, Adelphi, London, W.C.2), at 7 p.m.—Mr. L. E. A. Bourn: "Electronic Organs" (with demonstrations).

Tuesday, January 27

University College London (in the Anatomy Theatre, Gower Street, London, W.C.1), at 1.15 p.m.—Prof. C. B. Fawcett: "Geography and Planning".

Royal Institution (at 21 Albemarle Street, London, W.1), at 5.15 p.m.—Sir Edward Salisbury, F.R.S.: "Reproductive Capacity of Plants". (Further Lecture on February 3.)

Institute of Physics, Electronics Group (at 47 Belgrave Square, London, S.W.1), at 5.30 p.m.—Mr. J. F. Gittins: "Theory and Application of the Coloration of Alkaline Halides".

Society of Instrument Technology (at the Royal Society of Tropical Medicine and Hygiene, Manson House, 26 Portland Place, London, W.1), at 6.30 p.m.—Dr. G. E. Bennett, Dr. J. R. Richards and Mr. E. C. Voss: "Some Electronic Methods of Measurement in Engineering".

Society of Dyers and Colourists, Scottish Section (at St. Enoch Hotel, Glasgow), at 7 p.m.—Mr. J. Boulton: "What Research has Meant to the Practical Dyer and What it will Mean".

Royal Institute of Chemistry, London and South-Eastern Counties Section (at the Technical Institute, Darnley Road, Gravesend), at 7.30 p.m.—Dr. C. W. Herd: "The Chemist in the Flour Mill".

Wednesday, January 28

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 2.30 p.m.—Mr. A. J. Philpot: "Recent Progress in the Making of Precision Instruments".

Royal Microscopical Society, Section of Industrial Microscopy (in the Hastings Hall, B.M.A. House, Tavistock Square, London, W.C.1), at 5.30 p.m.—Dr. C. Seyler: "Microscopy of Coal".

Institute of Welding (at the Institution of Civil Engineers, Great George Street, London, S.W.1), at 6 p.m.—The Sir William J. Larke Medal Paper.

Manchester Metallurgical Society (at the Engineers' Club, Albert Square, Manchester), at 6.30 p.m.—Mr. E. Davis: "Some Metallurgical Aspects of Jointing Non-ferrous Materials".

Society of Chemical Industry, Manchester Section (in the Chemistry Lecture Theatre, The University, Brownlow Hill, Liverpool), at 6.30 p.m.—Annual Joint Meeting of the Manchester and Liverpool Sections; Mr. H. W. Cremer: "Water—a National Asset" (Jubilee Memorial Lecture).

Society of Chemical Industry, Nutrition Panel of the Food Group (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 6 p.m.—"Farm Animals as Converters of Vegetable Food for Human Use".

Thursday, January 29

Society of Public Analysts and other Analytical Chemists (joint meeting of the Physical Methods Group and the Biological Methods Group, in the Barnes Hall, Royal Society of Medicine, 1 Wimpole Street, London, W.1), at 2.30 p.m.—Discussion on "Methods of Penicillin Assay—their Purpose, Scope and Validity" (to be opened by Dr. A. J. Amos and Dr. J. G. A. Griffiths.)

Royal Society (at Burlington House, Piccadilly, London, W.1), at 4.30 p.m.: Mr. M. Ryle and Mr. D. D. Vonberg: "An Investigation of Radio-frequency Radiation from the Sun"; Prof. D. F. Martyn: "Solar Radiation in the Radio Spectrum", Part 1, "Radiation from the Quiet Sun".

Chemical Society, Sheffield Section (joint meeting with the University of Sheffield Chemical Society, in the Chemistry Lecture Theatre, The University, Sheffield), at 5.30 p.m.—Prof. R. P. Linstead, F.R.S.: "Stereochemical Regularities in Catalytic Reactions".

Chemical Society, Manchester Section (joint meeting with the Local Sections of the Royal Institute of Chemistry and the Society of Chemical Industry, at the Engineers' Club, Albert Square, Manchester), at 7 p.m.—Dr. G. M. Bennett, F.R.S.: "Nitration by Mixtures of Nitric and Sulphuric Acids".

Royal Photographic Society, Scientific and Technical Group (at 16 Prince's Gate, London, S.W.7), at 7 p.m.—Dr. D. A. Spencer: "Photographic Visual Aids".

Textile Institute, Lancashire Section (at 16 St. Mary's Parsonage, Manchester), at 7 p.m.—Mr. J. Pollitt: "Geometry of Cloth Structure".

Friday, January 30

Institute for the Study of Animal Behaviour (at the Zoological Society of London, Regent's Park, London, N.W.8), at 3 p.m.—Mr. M. R. A. Chance and Mr. D. C. Yaxley: "Some New Aspects of Post-Convulsive Behaviour in *Peromyscus*"; Prof. George Humphrey: "Some Psychological Factors relating to Convulsive Behaviour in Rats"; Sir Edward Mellanby, F.R.S.: Film on "Canine Hysteria". (Members of the Royal Society of Medicine (Section of Neurology), the League against Epilepsy and the Central Veterinary Society are invited.)

Chemical Society, Birmingham Section (in the Main Chemistry Lecture Theatre, The University, Birmingham), at 4.30 p.m.—Dr. G. B. B. M. Sutherland: "Recent Developments in the Application of Infra-Red Spectroscopy to Chemical Problems".

Chemical Society (joint meeting with the University College of Wales Chemical Society, in the Chemistry Lecture Room, University College of Wales, Aberystwyth), at 5 p.m.—Prof. D. H. Hey: "Some Recent Advances in the Theory of Polymerisation".

Bedson Club (in the Chemistry Lecture Theatre, King's College, Newcastle-upon-Tyne), at 5.30 p.m.—Dr. E. Chain: "The Chemical Structure of Penicillins" (Sixty-eighth Bedson Lecture).

Institution of Electrical Engineers, Measurements Section (joint meeting with the London and Home Counties Branch of the Institute of Physics, at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Discussion on "Practical Considerations in Instrument Design".

Institution of Mechanical Engineers (at Storey's Gate, St. James's Park, London, S.W.1), at 5.30 p.m.—Discussion on "Some Recent Developments in Technique of Radio Valve Manufacture" (to be opened by Mr. J. W. Davies, Mr. H. W. B. Gardiner and Mr. W. H. C. Gomm).

Chemical Society (joint meeting with the Hull Section of the Oil and Colour Chemists' Association and the University College Scientific Society, in the University College, Hull), at 6 p.m.—Prof. R. P. Linstead, F.R.S.: "Phthalocyanines and related Recent Developments in Pigments".

British Institution of Radio Engineers, Midland Section (at the Technical College, The Butts, Coventry), at 6.30 p.m.—Mr. M. P. Johnson: "Some Aspects of Moderate Precision Temperature Control in Communication Engineering".

Manchester Statistical Society, Industrial Group (at the Society of Architects, 16 St. Mary's Parsonage, Manchester), at 6.45 p.m.—Mr. K. A. Brownlee: "The Applications of Statistical Methods in Industrial Chemistry".

Saturday, January 31

British Mycological Society (in the Department of Biology, Chelsea Polytechnic, Manresa Road, London, S.W.3), at 11 a.m.—Papers on "Mycological Education".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Senior Laboratory Technician—The Regional Transfusion Officer, Regional Transfusion Centre, Meanwood Park Colony, Tong Lane, Leeds 6 (January 31).

Lecturer in Chemistry up to B.Sc. standard—The Principal, Chelsea Polytechnic, Manresa Road, London, S.W.3 (January 31).

Vice-Principal of the Farm Institute and Deputy Principal Agricultural Officer to the Education Committee at the Somerset Farm Institute, Cannington—The Chief Education Officer, County Hall, Taunton (February 7).

Assistant Professor or Lecturer in Reinforced Concrete in the Faculty of Engineering, Farouk I University, Alexandria—The Director, Egyptian Education Bureau, 4 Chesterfield Gardens, London, W.1 (February 14).

Senior Lecturer or Lecturer in Mining—The Registrar, The University, Sheffield (February 17).

Senior Principal Scientific Officer (for the development and supervision of research in problems of fluid mechanics applied to mechanical engineering, especially research on hydraulic machinery), and a Senior Principal Scientific Officer (for the development and supervision of research in problems of heat transfer and heat exchange apparatus), at the Mechanical Engineering Research Organisation of the Department of Scientific and Industrial Research—The Secretary, Civil Service Commission, Scientific Branch, 27 Grosvenor Square, London, W.1, quoting No. 2095 (February 28).

Assistant in the Department of Astronomy, United College, St. Andrews—The Secretary, The University, St. Andrews (February 28).

Turner and Newall Research Fellowship in Engineering, Inorganic Chemistry or Physics, or in an allied science—The Registrar, University Office, 46 North Bailey, Durham (February 28).

Leverhulme Studentship in Chemical Engineering—The Registrar, King's College, Strand, London, W.C.2 (February 29).

Gas Research Fellowship, and a British Coke Research Fellowship—The Registrar, The University, Leeds 2 (February 29).

Chair of Mathematics at Birkbeck College—The Academic Registrar, University of London, Senate House, London, W.C.1 (March 2).

Laboratory Assistant (man) at Coopers Hill Emergency Training College, Englefield Green, Surrey, and a Laboratory Assistant (man) at Shoreditch Training College, Pitfield Street, London, N.1—The Education Officer (Estab./2), County Hall, London, S.E.1.

Technician in the Department of Zoology—The Professor of Zoology, King's College, Newcastle-upon-Tyne.

Senior Assistant in Metallurgy—The Clerk to the Governors, National Foundry College, Technical College, Wulfruna Street, Wolverhampton.

Research Engineer, a Research Physicist, an Information Officer, a Chemical Laboratory Assistant, and a Metallurgical Laboratory Assistant—The Director, Motor Industry Research Association, Great West Road, Brentford, Middx.

Chemist, and an Applied Botanist, in the Intelligence Section, and Chemists (2) in the Laboratories, of the Plant and Animal Products Department—The Establishment Officer, Imperial Institute, South Kensington, London, S.W.7.

Laboratory Technician (Grade B) in the Department of Pathology—The Secretary, Welsh National School of Medicine, 10 The Parade, Cardiff.

Senior Laboratory Steward, and a Laboratory Steward, in the Chemistry Department—The Secretary, Woolwich Polytechnic, Woolwich, London, S.E.18.

LAND USE AND SERVICE REQUIREMENTS IN BRITAIN

TO the first of the two critical questions arising out of the Services' requirements for land the promised White Paper on the "Needs of the Armed Forces for Land for Training and Other Purposes" (Cmd. 7278. London: H.M. Stationery Office, 1947. 4*d*. net) gives a reasonably satisfactory answer. A total area of just over a million acres—702,000 for training and 325,000 for other purposes, which include airfields, barracks, defence works, radar installations, and Ministry of Supply purposes other than airfields—represents about one acre in every fifty-six and does not seem an excessive proportion to be set aside for purposes of national defence. Moreover, while the Government recognizes that even this modest total involves asking the nation to make some sacrifice of wealth, recreation and enjoyment, the reasons why more land is required than in pre-war years are set forth clearly and persuasively.

It is important that the new factors in this demand, such as the consequences of the increased turnover of men under training due to the continuance of national service, the larger space required for manœuvre and for the use of modern weapons, and the effect of training various arms in co-operation with live ammunition, should be plainly stated and recognized widely. Any sacrifices which the nation is called upon to make for such reasons must be patently justified and the area of unavoidable encroachment kept as small as possible. The White Paper is, however, much less convincing in its exposition of the reasons why training overseas is impracticable or why more training could not be done in Scotland or Northern Ireland. The very fact that, as the White Paper admits, training of the regular army is actually taking place abroad to some extent and will do so for some time to come, goes to undermine the main contention. Whether the continuance of training abroad would adversely affect recruitment is open to doubt, and does not affect the argument that some training of the regular army could, and probably must, always take place overseas. The White Paper only weakens the case by its emphasis on the redisposition and reorganisation of training establishments which would be required in the event of war if the bulk of such training were carried out overseas. Redisposition and reorganisation in emergency are inescapable, whatever policy is adopted, and here and elsewhere the White Paper betrays a regrettable lack of the wide vision and sense of proportion which are needed to eliminate the suspicions and misunderstandings already engendered by official actions, and to take full advantage of the goodwill and general understanding of the situation which is so widely apparent throughout the country.

Nor is the White Paper happier in its observations upon the unsuitability of Scotland as a training area. The disproportion between the 33,000 acres claimed by the Services in Scotland and the total of 702,000 acres in Great Britain is too pronounced to be brushed aside by such slender arguments. The objections will have to be supported by much more convincing reasons if the public is not to believe that the examination of possible areas in Scotland has not been somewhat superficial, or that the attractiveness of proximity to greater amenities in southern Britain has not considerably influenced the decision.

On the question of the total land requirements, the White Paper is reassuring ; on the choice of training areas within Great Britain, however, it does little to meet the substance of current criticism of piecemeal action. To the question of what land is to be chosen it gives no answer ; and the procedure for examining individual proposals by Service departments gives no indication that the problem will be looked at as a whole and decided from a national, and not a departmental, point of view on any particular issue. It is true that the White Paper provides a comparatively firm basis for argument for or against any specific project ; but the procedure proposed affords no adequate guarantee that decisions will ultimately be determined with reference to the best use of the land of Great Britain as a whole. Nor is it easy to see how such assurance will be forthcoming while the Government persists in its refusal to treat claims for land on the same basis from whatever source they come, and to insist that the Services, and other Government departments, provide fully substantiated reasons for particular proposals at the time when they are advanced, and not afterwards in deference to public protest.

In outlining the proposed procedure, which has already been indicated in some detail by the Parliamentary Secretary to the Ministry of Town and Country Planning in a debate in the House of Commons on November 26, the White Paper gives as one of the main reasons for the time taken in coming to final conclusions about Service land requirements the continuing review of particular proposals with reference to the dependence of the nation upon home agriculture, the vital importance of home-grown timber, the need to maintain unpolluted sources of water, fisheries and the recreational value of the countryside. The Government affirms its desire to make sure that both local authorities and amenity societies have full opportunity to make representations upon the effect of the proposals on the public interest they represent ; and the regional consultations by the Ministry of Town and Country Planning with the local authority and water supply interests, and by the headquarters of that Ministry with amenity and scientific societies having no regional organisation, are intended to ascertain and resolve so far as possible objections advanced against particular proposals. The proposals are then considered by an interdepartmental committee in the light of objections expressed by any Civil department and of representations made in the previous consultations and reports submitted for the consideration of Ministers.

These consultations and consideration of the reports of the inter-departmental committee may lead to a decision, presumably by Ministers, though whether at Cabinet-level is not indicated by the White Paper, that the Service departments proposals must be abandoned. With other proposals there may be no objections, or modification may eliminate all substantial opposition If, however, substantial objections on grounds of the public interest still remain, a public local inquiry will be held, subject to security considerations, to hear and report on objections raised on grounds of public interest, national or local, whether by local authorities, water supply undertakings, amenity societies, or other bodies, and on representations of scientific or archæological societies against curtailment of opportunities for scientific investigation, such as bird-watching, or damage to areas of unique scientific interest. This inquiry will be presided over by a person selected by the Ministry of Town and Country Planning or by the Secretary of State for Scotland on the basis of his experience and standing in public affairs. Thus it would appear that in general there should be reasonable opportunity for objections to be raised on scientific and other grounds to particular proposals before they are too far advanced. Suggestions for the use of specific areas in the same general locality as alternatives to those under inquiry will be admissible, but not general arguments, such as that the requirements should be met in some other part of the country or abroad. Although the intention of the latter restraint is not so much to limit discussion as to prevent repetition tending to prolong the inquiry without benefit, the effect of this restraint may well be, under the existing conditions, to undermine some of the general goodwill and understanding essential to a satisfactory settlement.

On that ground alone it is important that there should be full discussion of the matter in Parliament before the proposed procedure and the general principles indicated are irrevocably adopted. The debate on the second reading of the Requisitioned Land and War Works Bill on December 16 illustrates the value of such discussion. Mr. Glenvil Hall had no difficulty in showing that the Services cannot fairly be blamed for all the delay in working out their permanent requirements, or that there are reasonable grounds for extending the period during which Service departments could exercise their wartime powers on land requisitioned for military purposes. None the less, it was manifest that there is a feeling that the extension of four and a half years requested is excessive, and some instances were cited of unreasonable delays.

Naturally enough, the debate involved some discussion of the White Paper, but the core of the criticism centred around two points : the effect of the Bill and of Services' demands for land on the position of the National Trust and on the proposed national parks. Speaker after speaker testified to the unfortunate effect of the encroachments on National Trust properties; and of the failure of the Services to relinquish such encroachments and to restore them with the utmost dispatch. There may be sound reasons for making some new provision for consideration by an appropriate Government authority, for example, the Minister of Town and Country Planning, of any property offered to the Trust, before it is finally accepted ; but once accepted, that property should be inviolable by the Services or by any other department. The National Trust does not act without full and careful consideration of the real significance to the nation of the properties for which it accepts responsibility; and it should be possible to recognize acceptance by the Trust as a final decision.

A firm declaration by the Government that National Trust properties would in future be inalienable, and that all those properties which are still requisitioned would be released immediately and repaired where necessary, would do much to engender confidence and to dispel the uneasiness and atmosphere of suspicion with which proceedings and discussion on the Services' land requirements have been accompanied. If this undertaking was paralleled by action to implement the recommendations of the National Parks Committee's reports, there should be a profound change in the whole atmosphere and little difficulty in reaching an amicable agreement on particular proposals. While such action is delayed, it is well to remember the observation of the Hobhouse report, which Mr. Turton quoted in the debate: "It would be no exaggeration to say that the appropriation of a number of the particular areas now listed for acquisition of the Service Departments would take the heart out of the proposed National Park areas in which they are sited, and in certain cases render our proposals for the designation of individual National Parks entirely nugatory".

That is one of the main reasons for the alarm which the Services' proposals for training areas occasions and the opposition which they arouse. The recent instance of the rifle range at Thorpe Oland, in Dovedale, shows that the Army is quite able to come to a reasonable compromise if its real needs are recognized; but this example also demonstrates the importance of meeting such proposals with a firm body of representative opinion. Meanwhile, it will be noted that, in concluding the debate, the Solicitor-General avoided any reply to the specific questions put regarding both national parks and National Trust property. The Government will do well to think again here, particularly as public confidence in its good faith received a severe shock in the refusal in the White Paper to honour the pledges given during the War n the Stamford and Purbeck areas that persons required to leave their homes should be allowed to return at the end of the War. To refuse to regard as binding such war-time promises is bad statesmanship, and goes far to undo any good that the White Paper and the recent debates have done. The main considerations should, however, be given urgent attention. Public inquiry into disputed claims on land should be held before, and not after, any proposal comes before the Interdepartmental Committee. The position of the National Trust properties should be made unassailable and the national parks legislation ntroduced. Finally, all Government departments and other public bodies should be obliged to submit heir proposals for the utilization of land to a vigorous, independent and public scrutiny, backed by a competent authority at Cabinet-level, to ensure that national more than sectional and local interests determine the decision.

CHRONICLE AND COMMENTARY

The Intelligent Man's Guide to the Post-War World

By G. D. H. Cole. Pp. 1143. (London: Victor Gollancz, Ltd., 1947.) 21*s*. net.

Farewell to European History

Or the Conquest of Nihilism. By Alfred Weber. Translated from the German by R. F. C. Hull. (International Library of Sociology and Social Reconstruction.) Pp. xx+204. (London: Kegan Paul and Co., Ltd., 1947.) 16*s*.

THE lecturer or tutor who tries to guide his university extension or other students through the mazes of contemporary political and economic issues has long been accustomed to being asked to recommend a book which would cover the ground of his course and serve as a general reference work; and he has not infrequently named one of the books, packed with useful information, which Prof. Cole has found time and energy to produce as the offshoots of his own varied studies. Three major productions of this kind appeared before the War, and the "Guide to Modern Politics" of 1934 is still remembered. But never before has Prof. Cole produced so tightly packed a guide as has now appeared: the information it contains almost overflows as one holds the book, and the table of contents reads like an encyclopædia. There is ample material here for the study of almost every aspect of current problems —population, industrial development, international trade, unemployment, emigration, capitalism and socialism, developments in Britain, in Europe and throughout the world, the United Nations, and the future of democracy. The reader is at a loss whether to admire more Prof. Cole's width of reading or his powers of exposition. The select book-list alone, which runs to something over ten pages, would keep several tutorial classes busy for years, while there is valuable material in the long and well-devised series of tables and charts.

But while one salutes with respect the tremendous labour that has gone to the making of this vast work, only to be compared among recent books, perhaps, with John Gunther's "Inside U.S.A.", at the same time it is necessary to ask what purpose it is intended to serve. The publisher's introduction calls it "a great political self-educator", and if one accepts the view, not unknown among librarians, that the true needs of adult education can be met merely by making books available, then the description is a sound one, though the size and price of the book are somewhat forbidding. Prof. Cole himself is frank in his preface about the task he set himself. Much of the book had to be rewritten several times, he tells us, much of it discarded as centres of interest fluctuated, and in the end he let the printers have it in March 1947 in the hope that the selection of topics made "will give most readers as much of what they want as it is possible to bring between the covers of an exceptionally fat volume".

The disadvantages of this method of work are obvious, and the method itself can only be justified if the resulting book has something new to offer, whether by way of material or by way of interpretation. In the matter of material it may be doubted in this case whether anything new is presented, and it is not too much to expect that the student who would be prepared to sit down to a book of this size would be equally prepared to do the wider reading that is necessary for the study of whatever topic particularly interests him. There is no dearth of useful reading matter, as Prof. Cole's book-list alone shows. It is rather interpretation that is required, and interpretation that could reasonably be expected, from a work that proclaims itself a "Guide". But interpretation in such a work implies the illumination of historical processes. There is much of this, but it is directed less to a clarification of issues than to a statement of Prof. Cole's own views, and even Prof. Cole cannot always speak with the authority of personal investigation. Thus he frankly tells us on p. 845: "I am neither a prophet nor an expert on Indian affairs, and any comment I make can be no more than that of a diligent observer of world politics", but proceeds: "I acutely dislike the idea of a completely separate Pakistan, because it seems to me to stand in the way of effective measures to raise the standards of living among the unfortunate Indian peoples, Hindu and Moslem alike", which illuminates his own views but scarcely those of the people concerned. Again, in discussing English education, he says: "The Education Act of 1944 purports to be a democratic measure; but it will not work out democratically unless a real effort is made to staff and equip, and as soon as possible to build, the new secondary schools up to a standard of real parity with the grammar schools and the so-called 'public schools' ", which is so obviously true as scarcely to need saying but suggests that a "real effort" is not being made; while the attack that follows on "classics" and reactionary headmasters is good electioneering but not very sound as commentary on present developments. On the other hand, there are a number of revealing statements that repay careful thought, such as that "British social history was thus, like British political history, a process of gradual democratisation of what were at the outset essentially aristocratic institutions"; or again, that "there is, in effect, no real school for democracy except the school of action", which might serve as a text on English social development.

But perhaps it is in a remark on p. 288 that Prof. Cole most clearly reveals the limitations of his approach. "England", he says, "for reasons which it would take too long to explain, emerged from absolute monarchy into an aristocratic system in which the aristocracy did not form a closed caste, but mingled with, and recruited itself from, the developing plutocracy of commerce." It is precisely the reasons that are here left unexplained, and others like them, that the student needs to know if he is to make sense of the present confusion. To have the immediate background available is useful, though it can fairly easily be gathered together from a number of reliable sources; but it is in discerning processes at work over a long period that the 'intelligent man' requires guidance. In particular he will ask whether the two wars of this century have played any part in hastening or hindering recognizable historical processes, and a guide to the present discontents might well attempt to estimate the effect of the late struggle on world developments. The impact of the War, for example, on Great Britain, the United States and the U.S.S.R., on Germany, and on the peoples of Asia would repay close attention. These topics are not ignored; but the total effect emerges only indirectly from Prof. Cole's survey. It is as if he were writing only a sequel to the "Guide" of 1934 and noting that some important incidents had occurred since that book appeared; as if little distinction were to be drawn between pre-war and post-war. Without going all the way with the writer of another recent book who sees the war as a "watershed" in modern history, one may legitimately ask for some estimate of its significance, so far as that can be measured at this early stage. Yet it would almost seem that Prof. Cole is more concerned with the dangers of a Third World War than with the consequences of the Second. To say this is not to fall into the common error of blaming an author for writing his book as he saw it rather than as the reviewer would wish it to be. A work that sets out to be a "political self-educator" must seek to anticipate the questions that the intelligent student will ask.

It might be added that the book-list, from the very fact of its length, would benefit by having the guiding principles of selection stated, together with some notes on the books named, while it also needs slight correction in detail—for example, the books by Sir Reginald Coupland and Prof. E. H. Carr are wrongly described on p. 1100.

Dr. Alfred Weber's book, "Farewell to European History", stands in direct contrast to Prof. Cole's, and were it written—or translated—in an easier and less allusive style might be regarded as a valuable supplement to his. For it sets out to do what Prof. Cole has not done, to grasp the nature and spiritual content of the War seen as "an event that would fundamentally affect the further course of history".

Dr. Weber, brother of the better known Max Weber who died in 1920, was deprived of his post by the Nazis and lived in retirement until the end of the War, when, with this searching study in his hands, he turned again, in his eighties, to the task of upholding the traditional standards of German scholarship. The opening paragraph of his introduction: "For anyone endowed with historical perspective it must be clear that the catastrophe we have lived through and are still living through sets us at the end of History as we know it, that is to say, history as moulded by the civilization of the West", inevitably recalls the thesis put forward by Spengler during the First World War. But Weber's concern is with Germany's terrible part in the crimes that have been committed, and he frankly accepts her fearful load of responsibility, recognizing that "she will never again become a sovereign, autonomous, competitive Power State in the earlier sense". The origins of the horrors of recent years he traces in the developments that marked the nineteenth century, and especially in the nihilistic temper, associated in the popular mind with Nietszche, that conquered the older spirit of the West from about 1880 and eventually provided the conditions that made Nazism possible. On this theme Dr. Weber has much that is illuminating to say, and it is of particular interest that it should be said in Germany at this moment by one who represents in himself something of the older spirit that was so tragically engulfed. For the future he sees a revival of traditional Western ideas, based on "national cultures with *intellectually* free sovereignty, but no freely competing nation-states any more". In other words it is the form and not the spirit of the West that is to pass away, a conclusion that is certainly not one of despair.

The publishers are to be congratulated on making this important work available in an English translation.

MAURICE BRUCE

THE LIVING PLANT

Botany of the Living Plant

By Prof. F. O. Bower. Fourth edition. Pp. xii + 700. (London: Macmillan and Co., Ltd., 1947.) 36*s.* net.

THE veteran author of this well-known book must be warmly congratulated on the publication of its fourth edition. He has been fortunate in the selection of those who have aided him, Prof. J. M. F. Drummond and Dr. G. Bond in the third edition, and now Prof. C. W. Wardlaw in the present one. When the book first appeared in 1919, Prof. Bower was one of the few persons competent in Great Britain to write, single-handed, a general treatise on botany at the university level of instruction; but the time is rapidly approaching when the single author must give place to a team of collaborators. This difficulty has been forestalled by Prof. Bower in his admirable choice of assistants, and fortunately the homogeneity of treatment characteristic of the first edition has been maintained.

The general plan of the book remains the same as in the third edition, which was reviewed in *Nature* (144, 400; 1939), but there are considerable alterations in the section on Thallophyta, in which the terminology has been modernized and the treatment of certain groups expanded. In the chapter on the Chlorophyceæ it may be noted that the cause of red snow in high latitudes is *Chlamydomonas nivalis* and not *Sphærella pluvialis*. Attention is rightly directed to the difficulty of drawing a line between the Flagellata and the Algæ; there is an interesting new commentary on alternation of generations in the Algæ, and also a fuller discussion of this in comparison with alternation in the higher plants.

Further information is given about the multifarious spore forms of the Fungi. Included in this section is a comprehensive account of the life-history of *Puccinia graminis* in the light of modern work, though an error still persists concerning the time of nuclear fusion, which occurs during the maturation of the teleutospores and not on germination. It might have been pointed out that this fungus is now something of a rarity in Britain, although other cereal rusts occur frequently: so uncommon is it that many teachers of botany are at a loss for material. A mistake concerning *Phytophthora infestans* should be corrected: it is not true to say that the mycelium spreads through the tissues down the haulms to the tubers.

The stimulus which this book has always given to the study of plant morphology is further enhanced by a new discussion on the nature of the leaves of Dicotyledons and Monocotyledons, by insistence on the sporangia of the higher plants being organs *sui generis*, and by reference to the category of 'telome' introduced by Zimmermann. The chapter on "The Relation of Size and Form in Plants" has been elaborated, and it now contains a most interesting comparison of the apical growth of palms and ferns in relation to the vascular supply and nutritive requirements, which is contrasted with development in the Dicotyledons. This chapter also contains an illuminating statement on adaptation of form in submerged parts.

There are a few new illustrations, notably the frontispiece, which is a modern picture of the giant trees of California, replacing an older representation.

All teachers of botany will offer the heartiest welcome to this new edition, which will give the book a fresh lease of vigorous life. Among other noteworthy features which have been maintained is the unsurpassed exposition of the biological significance of the development of heterospory and the seed habit.

F. T. BROOKS

SAMPLING PRACTICE IN THE UNITED STATES OF AMERICA

Méthodes statistiques modernes des administrations fédérales aux États-Unis

Par Pierre Thionet. (Actualités scientifiques et industrielles, 1011.) Pp. 117. (Paris: Masson et Cie., 1946.) 250 francs.

THIS book reviews recent American developments in the application of sampling to the collection of economic and demographic statistics. It is divided into two parts: the development of the mathematical theory, and the applications which have been made in recent years. On the practical side, chapters are devoted to the sampling methods applied to the 1940 Population Census, the methods adopted in the construction of monthly labour statistics, and the development of sampling methods, including the master sample, in agricultural statistics. On the theoretical side, an endeavour is made to cover the whole of the modern developments of sampling theory.

The book is useful in that it gives under one cover a summary of the very impressive progress that has been made in the United States. Accounts of most of this work have only been published after the outbreak of the Second World War, and are therefore likely to be less available, and less well known, than would otherwise have been the case. The importance of making these developments widely known in Europe, where the application of sampling has lagged behind that in the United States, cannot be too widely stressed.

On the other hand, the book must be regarded as a review of what is going on rather than as a satisfactory text-book from which to learn the new methods. Although half of the book is devoted to the theory of sampling, the presentation leaves much to be desired, and it is clear that the author has not fully digested the more modern developments. Thus, for example, he appears to have no understanding whatsoever of the analysis of variance, although he devotes a section to it, and later reproduces a schema for such an analysis. He also appears to be unaware of the connexion between the analysis of variance and intraclass correlation, a point which he could scarcely have overlooked had he studied Fisher's "Statistical Methods for Research Workers", which introduces the analysis of variance *via* intraclass correlation. Again, what is one to make of the recommendations in the chapter on basic theory that, in the absence of all information on the size of the different strata, the population mean should be estimated from the mean of the strata means, and that an equal number from each stratum should be included in the sample?

Whether the book will be of much value to English-speaking readers, who can easily refer to the original papers (most of which have been published in the *Journal of the American Statistical Association*), is therefore doubtful; but for those who require an introduction to the subject in the French language it will fulfil a useful purpose.

F. YATES

BLINKING: ITS ROLE IN PHYSICAL MEASUREMENTS

By Dr. ROBERT W. LAWSON
Department of Physics, University of Sheffield

Introductory

A BLINK is defined as a temporary closure of both eyes, involving movements of the upper and lower lids. The process of blinking may be carried out voluntarily; but in what follows we are primarily concerned with normal *involuntary* blinking. As a result of a study of the literature on this subject I have become aware of an important consequence of this lid movement which has unexpected repercussions on many phases of human activity, and which does not appear to have been recognized or appreciated hitherto. During part of the duration of each blink we undergo a complete blackout, and this has an important bearing on the accuracy attainable in a variety of physical measurements. That it has not been taken into account in the past is undoubtedly due to the involuntary nature of the act of blinking, for I find that relatively few people are aware of the blackout interval, and those who are rarely have any idea of its duration, believing it to be instantaneous. Moreover, the normal rate of blinking or the converse inter-blink period is not generally known, except in medical and kindred circles. In physics the various subjective errors of measurement have usually been considered to be taken account of adequately by the use of the personal equation. But it is now clear that the blackout factor during blinking must also enter into the personal equation, and it has to be recognized that in certain types of measurement it is, in fact, the dominant part of that equation. Before discussing this feature of the process in greater detail, it will be helpful to summarize the literature on the subject of blinking[1], in so far as it is relevant to this discussion.

Blinking

(*a*) For the normal individual, provided that the experimental conditions remain constant, the average value of the interval between successive blinks (*inter-blink period*) is remarkably constant, though four different types of blinking have been recognized. In the first and predominant '*J*-type', short inter-blink periods are common, the average inter-blink period being *c.* 2·8 sec. for men, and somewhat less than 4 sec. for women. In the second, 'plateau type', the average inter-blink period was found to be *c.* 12 sec., though most of the observations were on women subjects. For the third, 'bimodal type' (uncommon), the average period was 3·6 sec.; and for the fourth, 'symmetrical type' (very uncommon), 5·8 sec. Dryness or humidity of the atmosphere have little effect on the rate of blinking. The value of the inter-blink period in the dark is inappreciably higher than in the light, though a sudden intense light may produce initially a few rapid blinks. The rate of blinking is more rapid when the eyes are converging on a near point than when they are focused on a distant object or moving from point to point. Attempts to stop the lid movements voluntarily lead in a short time to an almost irresistible impulse to blink.

(*b*) "The rate of blinking is closely related to the 'mental tension' of the subject at the time, and in all probability the movements constitute a kind of relief mechanism, whereby nervous energy, otherwise unutilized, passes into a highly facilitated path[1]." When the mind is in a state of relaxation, so that the mental tension is at a low level, there is little need for relief and the rate of blinking is slow, as it is also in the process of solving a mathematical problem, when, although there is intense mental activity, the mental tension is diverted into internal channels. On the other hand, when there is mental tension with no internal or external outlet for its relief, there is an "overflow of nervous energy into facilitated paths", which manifests itself in an increased rate of blinking. As instances of this enhanced rate of blinking or diminished inter-blink period may be cited impotent rage, anxiety with inactivity, suppressed pleasure or excitement, legal cross-examination, animated conversation, and frequent changes in fixation, where blinking tends to eliminate the disturbing blurring of the retinal image during the actual movements of the eyes.

(*c*) The sensory blinking reflex is brought about by an irritative stimulus such as the contact of a foreign body with the lashes, cornea, or conjunctiva, or by an irritation of these parts. The reflex time of the sensory reflex seems to be of the order of 0·04 sec., and the completion of a reflex is followed by a refractory period, lasting 0·25 sec., during which a second stimulus is ineffective. The effect of currents of air is to increase the rate of blinking, and particles of dust in the eyes have the same effect. Smoking a cigarette held between the lips may reduce the inter-blink period to less than one-half the normal value, whereas in pipe-smoking less smoke enters the eyes, and I have found that the inter-blink period in this case is only reduced by 16–40 per cent.

(*d*) The optical blinking reflex is a completely different mechanism from the sensory, being brought about by a bright light, though it is best studied by bringing an object near to the eye without touching it. Here the reflex time is greater, being of the order of 0·1 sec. or slightly more, whereas the refractory period, during which a second stimulus is ineffective, is also longer than for the sensory reflex, amounting to 0·5–1 sec.

(*e*) The aural blinking reflex is initiated by mechanical or thermal stimulation of the ear, and is accompanied by unilateral weeping. Loud noises produce a similar effect.

(*f*) Various estimates have been made photographically of the duration of a full blink, and these lead consistently to values of 0·3–0·4 sec. Ploman, Engel and Knutsson found the duration of a blink (0·4 sec.) to be resolvable into the following intervals: lowering of the upper lid, 0·05 sec.; lids closed, 0·15 sec.; raising of the upper lid, 0·20 sec. (see Duke-Elder, p. 647). From these estimates it seems fairly certain that on the evidence available the time during which the pupils of the eyes are covered by the lids cannot differ appreciably from 0·3 sec., and this value will be used in the sequence. In other words, *during each full blink there is a complete blackout for a period of* 0·3 *sec.*

(*g*) In a publication on eyeball reflex movement associated with blinking, Miles[2] writes: "It was found that synchronously with the lowering of the upper lid there was a very rapid elevation of the eyeball with a much slower reverse movement when the lid was lifted. This movement of the eyeball appears in both reflex and voluntary winking and seems not to depend on the condition of sleepiness. In cases where the lid reflex is small, practically the complete curve for the cornea movement is recorded.

The size of the movement is of the order of 10 to 15 degrees on the arc of vision." "To what extent this shifting of the line of regard modifies the efficiency of vision has not been determined. Under certain lighting conditions one can easily notice the shift in the stimulus, a tailing off downward, at the instant of winking." This last statement is expressed in a somewhat different form by Macleod[3]: "If one notices carefully, one can observe while reading, that just at the beginning of the wink reflex it appears as if the page were suddenly jerked downwards".

In regard to this downward displacement at the moment of blinking, mentioned by Miles and Macleod, I have strong experimental evidence, to be published shortly, that it is due to another cause and not to the upward rotation of the eyeball accompanying the closing of the lids. Moreover, although an opposing motion of the eyeballs undoubtedly does occur during each phase of the act of blinking, experiments that I have conducted over a number of years have convinced me that, in general, the amount of the rotation is much less than the 10°–15° stated by Miles. Thus, in the case of my left eye, there is no perceptible rotation at all, whereas the magnitude of the rotation of my right eye is between $\frac{1}{2}°$ and 1°, and I have recently met with a case in which there appears to be no rotation in either eye associated with the lid movements. Furthermore, I find that as the edge of the upper lid crosses the pupil just before and just after the blackout period, there is *mobile vision*, a variety of autokinetic perception, which lasts about 0·01–0·02 sec. in each case. In contrast, the type of vision that occurs during the inter-blink period may conveniently be termed *static vision*, and it is then that the vision is most efficient. When a single act of blinking has been completed, the eye returns to its original direction of fixation, and in my own case this occupies a time of from 0·2 to 0·25 sec. The blackout period (0·3 sec.) is thus followed by a period of 'mobile vision' of approximate magnitude 0·25 sec.

The Blackout Indices

The above results, taken in conjunction with the value of the inter-blink period, have some important consequences, and it will be found convenient in their discussion to introduce at this stage the terms 'blackout index' and 'modified blackout index'.

(1) The *blackout index*, expressed in per cent, may be defined as one hundred times the ratio between the blackout period (0·3 sec.) and the inter-blink period (2·8 sec. for the prevalent '*J*-type' eye—see (*a*) above). This means that under normal conditions a person with a *J*-type eye is 'blacked out' intermittently for 10·7 or say 11 per cent of the total time of vision.

(2) The *modified blackout index*, expressed in per cent, may be defined as one hundred times the ratio between the sum of the periods of blackout and mobile vision (0·3 sec. + 0·25 sec. = 0·55 sec.) and the inter-blink period. This means that under normal conditions a person with a *J*-type eye has uncertain vision, that is, is blacked out or has mobile vision, intermittently, for 19·6 or say 20 per cent of the total time of vision.

As the periods of blackout and mobile vision undoubtedly show variations from person to person, just as in the case of their inter-blink periods (section *a* above), it is clear that the numerical data for any individual under given conditions should be separately determined in order to be able to evaluate the blackout indices with any precision. All we can do here is to confine ourselves to the data actually available in the literature, or individually determined. In Table 1 are given the data for the main types of subject (see sections *a*, *f* and *g*), for the rapidly blinking subject *X*, whose values I determined during reading and in animated conversation (see section *b*), and for myself in daylight and in the dark (see section *a*).

TABLE 1

Subject	Inter-blink period (sec.)	Black-out period (sec.)	Mobile vision period (sec.)	Black-out index (%)	Modified blackout index (%)
J-type (male)	2·8	0·3	0·25	11	20
,, (female)	*c*.4	0·3	0·25	7·5	14
Plateau type	*c*.12	0·3	0·25	2·5	4·6
Bimodal type	3·6	0·3	0·25	8·3	15
Symmetrical type	5·8	0·3	0·25	5·2	9·5
X (reading)	1·2	0·3	0·25	25	46
X (talking)	0·8	0·3	0·25	38	69
Self (daylight)	13·1	0·1	0·25	0·8	2·7
Self (dark)	13·6	0·1	0·25	0·7	2·6

Note.—For trained observers, the shortest normal inter-blink period so far observed is 0·6 sec., and the longest 18 sec. (woman). The lower limit of the blackout period probably lies near 0·1 sec., whereas the upper limit may readily be as large as 0·5 sec., for some subjects screw their lids together during a blink.

The methods used in determining my own involuntary rate of blinking, blackout period, and mobile vision period will form the subject of a later communication. As no data on the period of mobile vision exist in the literature, the value entered in the appropriate column is that of my own eyes. From the data in the last two columns of the Table it will be seen that very wide individual variations in the blackout indices exist, and it is precisely this fact that is of great importance in physical measurements and in other spheres of human activity.

Classification of Error Types due to Blinking

Certain types of physical measurement must inevitably be in error by at least the amount indicated by the appropriate blackout index. Blackout and mobile vision errors will be present in all types of time observations, though for observers with a long inter-blink period they may be sufficiently small to be negligible, whereas for observers with a rapid rate of blinking the errors may be in excess of 50 per cent and can rarely be neglected.

In considering the subjective errors in physical measurements due to blinking, three main types call for comment, the first of these being by far the most important.

Type A: In subjective counting experiments, where the duration of the events counted is small compared with the blackout period, and especially when the succession of events is random, the results will be in error by at least the percentage indicated by the blackout index. In certain cases the period of mobile vision may still further increase the error. The counting of scintillations in radioactivity provides an excellent illustration of this type of error, for the duration of a scintillation (see Rutherford, ref. 5, p. 545) is of the order of 10^{-4} sec. (blackout period 0·3 sec.), and we shall return to it later.

Type B: When the duration of the events counted or observed is of an order comparable in magnitude with the blackout or modified blackout period, the effect of blinking is an essential part of the personal equation and must be allowed for. Moreover, the error involved will be greater the more rapid the rate of blinking of the observer.

Type C: As the duration of the events observed or the time of observation is progressively increased as compared with the blackout period, the errors due to blinking likewise become progressively less important. In other words, the uncertainty of observation resulting from blinking becomes less important as the time of observation is increased, and the effect of blinking on the personal equation is diminished. This is of importance in pendulum measurements or in observations on the fall of bodies either in the air or in a viscous medium (Stokes' law). It should also be borne in mind that in measurements by the method of coincidences, individual coincidences may easily remain unobserved should they occur during the blackout period of a blink.

In my long teaching experience I have frequently been puzzled by the fact that occasionally otherwise good students seem to be incapable of getting reasonably accurate results in experiments involving the measurement of times of the order of several seconds, and have been loath to put their misfortune down to carelessness. It seems probable that this defect may be connected with the process of blinking, and I can recall individual cases of high rates of blinking in such students. I have also noticed similar discrepancies in the measurement of Young's or Fresnel's (biprism) fringes, and a feasible explanation seems to be that such observers may have a high rate of blinking, so that their vision is blacked out or mobile during a relatively high percentage of the time of their measurements with a lateral traverse micrometer eyepiece, in addition to which occasional fringes may be skipped. In microscopy, too, observers with a high modified blackout index must find it difficult to be certain of the detailed finer structure of the specimen under examination.

In various branches of industry, also, there must be many processes and measurements in which the rate of blinking may be a handicap, and consideration of the process of blinking will surely have an important part to play in matters of vocational guidance. In particular, in mining, the irritation of the eyes produced by dust and the consequent raising of the rate of blinking (see section *c* above) may influence the safety factor, in addition to which miner's nystagmus with its accompanying mobile vision is, I understand, often associated with an enhanced rate of blinking.

Application in Radioactive Measurements

One of the most important constants in radioactivity is Z, the number of α-particles emitted per second by 1 gm. of radium and by 1 Curie of radon. Here the unit 1 Curie is used in its original sense, as the amount of radon in equilibrium with 1 gm. of radium. The value of Z has been determined on many occasions and by a variety of methods. In Table 2 a summary is given of the various methods that have been used in the determination, together with the final result for each[4]. In the words of Rutherford[4]: "Considering the difficulty of accurate measurement by some of the indirect methods, there is a fair accord". "There is no doubt that a direct determination of Z is beset with considerable difficulties, partly connected with the source of α-rays and partly with the efficiency of the electrical and scintillation methods of counting α-particles." "When we consider the care taken in the measurements, it is difficult to account for the divergence between the various values of Z, and particularly the low values in some determinations. One of the main difficulties in these experiments lies in the choice and preparation of a suitable source of α-rays which is free from all uncertainty and can be measured with precision."

TABLE 2

Method	Investigator	Date	Z
1. Electrical counting	(*a*) Rutherford and Geiger	1907	$3\cdot57\times10^{10}$
	(*b*) Hess and Lawson	1918	$3\cdot72\times10^{10}$
	(*c*) Geiger and Werner	1924	$3\cdot5\times10^{10}$
	(*d*) Ward, Williams and Cave	1929	$3\cdot66\times10^{10}$
2. Scintillation	Geiger and Werner	1924	$3\cdot40\times10^{10}$
3. Total charge	(*a*) Jedrzejowski	1927	$3\cdot50\times10^{10}$
	(*b*) Braddick and Cave	1928	$3\cdot68\times10^{10}$
4. Production of helium	(*a*) Boltwood and Rutherford	1911	$3\cdot50\times10^{10}$
	(*b*) Dewar	1910	$3\cdot69\times10^{10}$
5. Life of radium	Gleditsch	1919	$3\cdot55\times10^{10}$
6. Heating effect	(*a*) Rutherford and Robinson	1912	$3\cdot72\times10^{10}$
	(*b*) Watson and Henderson	1928	$3\cdot70\times10^{10}$
7. Volume of radon	Wertenstein	1928	$3\cdot7\times10^{10}$

It is of great interest to examine how the values obtained by the various subjective methods of determining Z may be influenced by the rate of blinking of the observer. Without exception all the methods, directly or indirectly, involve the measurement of time intervals, usually the duration of the experiment, and so the factor of blinking will enter in some small measure into the personal equation (Type *C*). But the error due to the period of blackout is likely to be disturbing only in the subjective measurements of methods 1 and 2. As Rutherford and Geiger used a long-period quadrant electrometer, their blackout error can be disregarded. This also holds for the method 1 (*d*), in which the particles were photographically recorded. We are thus left with methods 1 (*b*), 1 (*c*) and 2 in which the blackout and mobile vision errors may be of importance.

If the string electrometer used by Geiger and Werner in method 1 (*c*) was of the same type as was used by Rutherford and Geiger in their photographic recording of α-particles, its period of deflexion would be *c.* 0·01 and of return 0·02 sec., both of which times are small as compared with the period of blackout during blinking (0·3 sec.), so that the blackout error would be effective (Type *A*). Taking account of the blackout indices in Table 1, this would mean that the results might readily be low by several per cent. A short-period string electrometer thus has distinct disadvantages as compared with a long-period instrument in the subjective counting of particles, a point which has not been realized hitherto.

We may now consider Geiger and Werner's scintillation counting method (method 2). The question of the efficiency of scintillation counts has been the subject of much discussion[5], but the above workers devised an ingenious method which would appear to guarantee one hundred per cent efficiency. In this method the same area of the screen is viewed from opposite sides by the two observers, who record their counts on a drum. If N_1 and N_2 are their respective counts, and if C is the number of coincidences, then the true number of particles was shown to be $N = N_1N_2/C$. But also this method is not free from the error due to blinking, even if both observers have identical inter-blink periods and identical blackout periods, for, as already mentioned, the duration of a scintillation is *c.* 10^{-4} sec. and the period of blackout 0·3 sec. (Type *A*). Certain of their blinks would be sufficiently near to be considered practically simultaneous, especially when we remember that, after a relatively long inter-blink period, it often happens that several blinks follow in quick succession, so that an appreciable number of particles would not be counted by either observer. Without numerical data concerning the acts of blinking of these two workers, no correction can be applied to their estimates of Z, but an error of ten per cent is well within the bounds of possibility, as will be seen by reference to the fifth column of Table 1.

In regard to scintillation counts, an abstract from some work by Chadwick[6] is suggestive: "When the scintillations appear on the screen at convenient intervals, it is possible for the two observers to compare their impressions of the intensity of the scintillations. It sometimes happens, particularly when dealing with the weaker scintillations, that a scintillation which appears bright to one observer is weak to the other." There seems little doubt that the weaker scintillation was seen by one of the observers during one of his periods of mobile vision (*c.* 0·01 and 0·25 sec.). Rutherford's remark (*loc. cit.*) "that the superior efficiency of an experienced observer appears to be due to greater concentration, to control of spontaneous movements of the eye, and to practice in using the ex-central portions of the retina, thereby avoiding the insensitive fovea-centralis" now requires to be supplemented by the statement—"and above all to a low value of the blackout index".

It remains to discuss method 1 (*b*) in Table 2, and here numerical data on the act of blinking are available, at any rate for one of the observers (see Table 1). These workers used a longer period Elster-Geitel string electrometer for their work. The string took just under 0·2 sec. to be deflected, and the entire displaced period[7] was greater than 1 sec. Since these times are appreciably greater than Lawson's blackout period (0·1 sec.), it is certain, even taking account of his period of mobile vision (0·25 sec.), that this observer saw at least two-thirds of a kick which occurred at the moment of a blink, so that the blackout error can be disregarded in his case. In regard to the second observer (Hess), nothing is known of his blackout period, but it is recalled that his inter-blink period was definitely shorter than that of Lawson, so that his blackout indices would be greater. A slight discrepancy in the estimates of Z by these two observers might therefore be expected, and was in fact found[8]. Thus in the final series of observations their mean corrected values of Z were:

Hess (114 determinations): $Z = 3{\cdot}68 \times 10^{10}$,
Lawson (154 determinations): $Z = 3{\cdot}75 \times 10^{10}$.

In all, about 80,000 particles were counted in these final determinations. The accuracy to be expected from this number of particles is thus of the same order as the guaranteed accuracy of secondary radium standards (0·5 per cent), which are used in the measurement of the sources. On the evidence available at the present time, therefore, there seems to be no valid reason for suggesting a change in the accepted value of $Z = 3{\cdot}70 \times 10^{10}$, for its true value is scarcely likely to be greater than $3{\cdot}75 \times 10^{10}$.

Further Applications of the Blackout Indices

It is of interest to note the effect of the act of blinking in other branches of human activity. In the realm of sport it is of great importance. When we consider that a motorist who has a rapid rate of blinking may be blacked out intermittently for about 40 per cent of his driving time, or 40 per cent of the distance travelled, we can surely discern in this a primary cause of proneness to accident. In fast games like tennis or badminton, the ball or the shuttlecock will certainly be lost to sight during the 0·3 sec. of the blackout due to blinking. For people with a high rate of blinking, bowls is a much more suitable form of recreation. In flying, too, the airman does not appear to have been aware hitherto of the effect of blinking on his efficiency, either in bombing a target or in fighter combat, for in the period of his blackout or mobile vision he may have travelled a distance of the order of one hundred yards. The effect will be greater still for the pilot of a jet fighter. The blackout indices are also of great importance in cricket, for if they are high, the batsman or wicket-keeper may lose sight of the ball between the wickets, the fielder may readily miss what seemed a sure catch, and the umpire may give a wrong decision. In boxing, too, a damaged eye stimulates blinking and thus an increase in the blackout index, whereas the time constants involved in the sensory and optical blinking reflexes may be all-important to the boxer. Also in photography it is to be expected that, on the average, a group of people will have approximately normal time constants of blinking, and in consequence, at any moment, a definite percentage of them equal to the normal black-out index (*c.* 10 per cent) will be in the act of blinking. This prediction is confirmed by the examination of group photographs. Thus in two recent topical photographs of groups of 43 and 18 persons respectively, three had closed and three half-closed eyes in the first, and in the second two had closed eyes.

In conclusion, it may be mentioned that all electrical valve counting circuits, by virtue of their time constants, must suffer from the disadvantage of blackout, but as the effects are calculable, they need not necessarily involve serious error in the count. Another electrical analogy is to be found in the time base of the cathode ray oscillograph, in which the fly-back time corresponds to the blackout period in blinking. In this case, also, the error involved can readily be determined.

THE ECOLOGICAL APPROACH TO BOTANY

By Dr. H. GODWIN, F.R.S.
Botany School, Cambridge

THE last forty years have witnessed the growth and establishment of the *idea* of ecology. Twenty years ago it was possible for botanical professors to pronounce that they simply disbelieved in ecology, and it was a word of mystery to the general public. 1911 saw the publication of "Types of British Vegetation" by Prof. A. G. Tansley, and in 1913 the

British Ecological Society was founded, with its periodical *The Journal of Ecology*, to which in 1932 was added *The Journal of Animal Ecology*. In 1939 there appeared the monumental volume, "The British Islands and their Vegetation", by Prof. Tansley, which demonstrated by its advance upon "Types of British Vegetation" the tremendous extension of our ecological knowledge of British vegetation, and in 1942 Sir Edward Salisbury's book, "The Reproductive Capacity of Plants", which showed the progress of autecological investigation.

This expansion of ecology is due to the realization that natural history is not, after all, outside the scope of exact scientific inquiry, and it reflected that the eagerness of the old quest for knowledge of living organisms in the field had been coupled with new techniques and the methods of modern science. The consequence of this expansion is that ecology is now acknowledged by men of science and comprehended by most laymen.

Few, however, comprehend the power of the ecological idea, or how forceful a means it is proving to be in the expansion of knowledge, and in the advance of civilization. We have begun by the recognition that in schools and colleges the mere collection and identification of species and genera must, in educational interests, as well as scientific, give place to studies of the intimate biology of plants and animals, and of the relationships between them and their environment. The complexity and the scientific interest of the situation thus disclosed have affected scientific research in the widest fields: marine biology, with its studies of herring shoals, whale fishing, sealing, and seaweed survey; ornithology, with its intensive and extensive census and migration studies, and starling, rook, wood-pigeon, and sea-bird inquiries; entomology, with its immense fields of applied science, and locust, tsetse, wireworm and aphid investigations; vertebrate ecology of fur-bearing animals and lemming, rat, grey squirrel and coypu; forestry, with its problems of exploiting and equally of maintaining natural forest; all these and many other sciences bear witness to the penetration of the ecological idea into appropriate scientific fields, and of its fruitfulness therein.

It owes its success simply to the timeliness of the reaction against premature simplification of biological interpretation, and premature syntheses from basic generalizations. It is a study demanding constant return to the primary data, which are the observations in the field, and constant emphasis on the reaction of the organism as a whole in its environment.

The value of this approach is apparent in the quality and bulk of the results achieved, and in a demand for trained ecological research workers which far outstrips supply. Wherever biological material is involved, be it rubber, teak, penicillin, slugs, lettuces, lice, cotton, or cat-fish, there comes the need for ecological inquiry, and naturally this is most realized where great natural resources in unexploited lands are being surveyed for their potentialities. Let there be no question: only an ecological approach will now serve us in these regions. Gone are the days of the old German dogma that forests should be grown like crops of potatoes, and rapidly vanishing are the prospects for the heedless garnering of the earth's natural products. The immense destructiveness of modern exploitation has been brought home by the ghastliness of soil erosion phenomena in all parts of the world; but avoidance of such ills inevitably depends upon adequate ecological understanding of the systems of animal and plant life, soil, and climate which are involved.

There was a day when T. H. Huxley wrote and spoke with powerful effect against the neglect of biological teaching, and of biological knowledge, on the substantial ground that man himself is an animal. It needs little effort to extend this thesis, to-day so readily approved, to the understanding that we humans are not distinct from the biome; but that human communities, be they what they may, *all* form an inseparable part of the larger environment. There is no break in kind between the relationships of the great eco-systems of plant and animal communities, and those which include fewer or more human beings: the minor role of the sparse bushmen in their own forest environment grades into our own within a complex mechanical civilization. Since still the human agents remain animal in nature, sustain themselves within communities, and subsist on biological materials, they are no less part of the eco-system than were their ancestors. It is, indeed, appropriate and needful that to the complexity of the world's social problems there should increasingly be brought to bear an ecological and realistic interpretation. This is not to demand here and now the setting up of commissions, institutes or departments of human ecology, but to point out that such problems will be solved only by a generation which has been trained to adopt a sufficiently broad ecological outlook.

It is in our favour that the youth of Great Britain, more than at any time before, receives encouragement to develop such an outlook. Schools (encouraged by syllabuses of progressive examination bodies) devote increasing time to it, and are strongly assisted by the admirable organisation of the Council for the Promotion of Field Studies.

It has never escaped the attention of Prof. Tansley, who for so long has been the inspiration of British ecology, that the standard of school and university teaching in ecology depends upon the quality of the text-books available, and he has added to the debt which the science (and the country) owes him by sponsoring the timely issue of three ecological text-books, which will shape all elementary ecological study in Great Britain for some years to come. These are, first, "An Introduction to Plant Ecology"[1], written by himself, upon the basis of his well-known "Practical Plant Ecology". This keeps the general character of the older book, but also includes chapters on the modern theory of communities, succession, and life-form. The soundly balanced philosophical outlook and the clarity of style which Prof. Tansley commands would alone suffice to justify the book, which, in fact, is indispensable to all taking up the study of ecology, be they teachers or students, and at school or university level.

One of the pioneers to develop school ecological studies was E. Price Evans, who is also known for his work upon the ecology of Cader Idris. He and Prof. Tansley have combined in the writing of "Plant Ecology and the School"[2], a slenderer and more elementary work than that just mentioned, and aimed to make apparent by actual instances exactly how ecology can be practised in schools. This work rightly stresses the *integrative* influence of such ecological studies, and recommends their incorporation in studies of regional geography, and in general science courses. The authors properly observe that plant ecology is not so much a 'subject' as a method of approach to the study of plants, and this holds equally, of course, for all fields of ecology.

The last book of the trio under review, "Practical Plant Ecology", is by Prof. R. C. McLean and Dr. Ivimey Cook[3]: it gives an account of the field methods and field apparatus which have been found useful in the botanical courses of the University of Cardiff. Its matter-of-fact descriptions of apparatus and technique come down to the level of average students, and will give the means to many hitherto uninstructed folk of gratifying their desire to apply precise measurement to botanical field study. The many examples of records made by students indicate the enthusiasm which the authors have engendered in their classes. There is, of course, a danger that students may record data of temperature, light, or *p*H, without any comprehension of applicability to the ecological situation being examined; but this can be guarded against by good teaching, and by conjoint use of the "Introduction to Plant Ecology". It is the commencement of careful record and measurement that is for the moment of prime importance, and this book will go far to ensure it. Messrs. Allen and Unwin are to be congratulated upon providing schools and universities with three excellent books, so satisfactorily supplementing each other; it now remains to meet a similar need in the realm of animal ecology, and to show the way to teach the study of the biome, with its complex integration of both plant and animal life.

SCIENCE AND U.N.E.S.C.O.

MEETING AT MEXICO CITY

IN this article we are concerned mainly with the present results from the successful drive to put the 'S' into 'U.N.E.C.O.'. The presence of some thirty scientific men from the thirty-three countries represented at the second general conference of the United Nations Educational, Scientific and Cultural Organisation, held in Mexico City last November, was an earnest that the 'S' had come to stay; the careful preparations for the programme made by Dr. Joseph Needham and the staff of the Natural Sciences Division and the clear statements made by the representatives of the scientific working party in the plenary sessions account largely for the successful piloting of the various scientific projects past budgetary and other obstacles.

To one accustomed to the atmosphere of international gatherings of scientific men, a first impression of a meeting of the United Nations Educational, Scientific and Cultural Organisation is that, whereas science is truly international in outlook and has learnt to work along international lines, culture is essentially national or racial in outlook and is only just beginning, save on the more mechanical side of museums and libraries, to walk easily along the international path. While the eloquent protest of Sir Sarvepalli Radhakrishnan that the culture of the East is insufficiently represented on the staff of the Organisation was received with sympathy and applause, speeches which sounded as though they might have been delivered at Lake Success were seen to lie clearly outside the sphere of the Organisation's interests and activities. The temper of the meeting clearly indicated a desire for as complete co-operation as possible: political differences were barred, though in some cases national or racial differences were accepted as playing an inevitable part under present conditions.

The programme of many varied schemes for 1948 put forward in advance of the meeting by the Executive Board called for an all-over budget of 8,500,000 dollars. As a first step, this was reduced by the full meeting of delegates by 800,000 dollars, so that when the various sectional working parties met to discuss their programmes in detail, they knew approximately the size of the grant that they were likely to receive and they could modify the proposed plans accordingly. The chairman of the working party of the Natural Sciences Division was Dr. H. J. Bhabha. The programme ultimately adopted by this party and accepted by the plenary session included the following items:

(1) *Grants in Aid to Non-governmental Organisations* (for example, the International Scientific Unions and other bodies of an international character), to meet travelling expenses, publication charges, etc.; a total of 240,000 dollars was approved.

(2) *The Hylean Amazon Scheme.* The Organisation is generously supporting in its initial stages the proposal to found an international scientific institute at Belem to study the problems of the great forest zones and the basins drained by the valley of the Amazon. Physical geography, including soil science, biology, anthropology, agriculture and nutrition all provide special problems to be considered. Brazil, as the country most concerned, backs the scheme strongly. It is being supported by the other countries involved in the area—Bolivia, Colombia, Ecuador, Peru, Venezuela and the British, French and Dutch Guianas—also by the United States and at its own request by India, as a country much interested in tropical problems. The Organisation is making a grant of 100,000 dollars in 1948 for initial surveys. Of this sum, 50,000 dollars comes from the money for the Field Science Co-operation Office for Latin America; Mr. E. J. Corner will be in charge of the initial organisation.

(3) *Field Science Co-operation Office.* In addition to the Office for Latin America, which is to be assigned for the present to the Hylean Amazon, there already exist two field offices which act as links between the main centres of learning and research and countries remote from such centres. One is at Nanking, serving Far East Asia and the Philippines; the other is at Cairo for the Middle East. The officers in charge are Mr. J. Smid, of Czechoslovakia, and Dr. L. T. Thuriaux, of Belgium, respectively. An additional office for India was agreed to by the conference.

(4) *Popularization of Science and of its Social Implications.* Following upon two meetings of experts called together in Paris and in New York during October last, the United Nations Educational, Scientific and Cultural Organisation decided to stimulate research and surveys in this field by fellowships, by co-operation with existing bodies working on the subject and by the preparation and circulation of reports.

The Division of Natural Sciences will also play a part in a number of schemes supported by the Organisation, but having a wide range and affecting other branches of knowledge. These include methods of dealing with rehabilitation in war-devastated countries, exchange of personnel between countries, passage of books across frontiers, documentation, use of mass media for the spread of information, etc.; as in the case of libraries and museums, men of science are directly concerned in these projects, but only as part of a much wider group of interested people. The same applies to certain aspects of education, which provide the main body of the activities of the Organisation, and call for a separate report in itself.

With regard to the future position of science in the United Nations Educational, Scientific and Cultural Organisation, one fact must be borne in mind. The natural sciences were well organised at the start along international lines, while certain other subjects such as the humanities and the social sciences were not. As they fall into line—and the Division for Philosophy and the Humanities has already asked the Organisation to organise a central council along the lines of the International Council of Scientific Unions—they will find useful ways of spending money and will make their appeal to the Organisation for grants. Unless the income of the Organisation rises with its increased opportunities and responsibilities, the grants to science will be maintained at their present level only with difficulty.

In closing this account, tribute must be paid to the Mexican Government for its gracious welcome and generous hospitality; the Lebanese Government has been set a hard task for this year's conference at Beirut. This will be the last conference at which Dr. Julian Huxley will hold office as director-general. Dr. Needham retires from the post of head of the Natural Sciences Division this spring. Both of them have placed the scientific men of the world under a debt of obligation by the way they have initiated the scientific section of an organisation which has great possibilities for the future of the civilized world.

THE EARTH'S SURFACE MAGNETIC FIELD AND ITS SECULAR CHANGE

By Prof. SYDNEY CHAPMAN, F.R.S.

THE Department of Terrestrial Magnetism of the Carnegie Institution of Washington renders a signal service to science by the publication of the important volume entitled "Description of the Earth's Main Magnetic Field and its Secular Change, 1905–1945"[1]. In a sense this represents the attainment (for the time) of one primary objective urged by the first director of the Department, the late L. A. Bauer, upon Andrew Carnegie, in the negotiations which led in 1904 to the institution of the Department. The volume has been prepared almost entirely under the control of the second director, J. A. Fleming, who from early days was Bauer's right-hand man in the development of the Department. The third director is to be congratulated on being able to issue so great a contribution to the science for the furtherance of which his Department was founded.

Bauer set himself with immense zeal to the task of promoting a world magnetic survey more complete than any previously attempted. As most of the earth's surface is water, the chief need was to survey the oceans. Bauer acquired a sailing vessel, the *Galilee*, for his Department, and adapted it (adding auxiliary engines) for magnetic survey work, on which it made three cruises. A non-magnetic vessel, the *Carnegie*, was then specially constructed, which made seven great survey cruises before it was overtaken by the disaster of destruction by fire in the harbour of Apia, Samoa, in 1929. These cruises form the main basis of our knowledge of the earth's surface magnetic field to-day, though supplemented by information provided by the land magnetic surveys undertaken by the principal civilized States in their own or dependent territories, and by the work of many polar and other expeditions.

Since 1929 our knowledge of the earth's magnetism has been slowly worsening. The outbreak of war halted the completion and equipment of the Royal Research Ship *Research*, a non-magnetic vessel built by the British Admiralty to resume the ocean magnetic survey work so well executed by the *Carnegie* during two decades. The fate of the *Research* is at present in doubt, but it may be hoped that the ship will soon begin her work and help to renew our current knowledge of the earth's ever-changing magnetic state.

Although Bauer intended to make a thorough theoretical study of the magnetic data obtained by his survey ships and by the land magnetic expeditions he organised or aided, along with all other available data, he actually made only slight progress in this work. But with generous wisdom he made his data quickly available for use in the construction of magnetic charts by the principal national agencies responsible for producing such charts. In particular, the early work of the *Galilee* and *Carnegie* formed the basis of the Admiralty charts when their preparation was transferred in 1917 to the Royal Observatory, Greenwich.

The supervision of this work by the then Astronomer Royal, the late Sir Frank Dyson, enhanced his interest in geomagnetism and led him, with H. Furner, to make an excellent spherical harmonic analysis of the earth's field for the epoch 1922—the only thorough analysis made during a considerable period extending before and after 1922.

The subsequent further accumulation of magnetic data enhanced the need for further study of the world-wide distribution and secular change of the field. A valuable beginning of this work was made in 1930 by H. W. Fisk (of the Department of Terrestrial Magnetism, Carnegie Institution), by his isoporic charts showing for each magnetic element the lines (isopors) of equal rate of secular change. The Department's plans for a more comprehensive treatment of this century's store of magnetic data first began to mature rapidly when, during the War, the work became the subject of a Government contract under the United States Naval Department. It was entrusted to a team of members of the staff of the Department of Terrestrial Magnetism, under the able leadership of E. H. Vestine, and has been executed thoroughly and successfully. The volume now under notice is the first fruits, and is to be followed by others giving a new spherical harmonic analysis of the field, and other developments.

The main contents of the volume indicate (i) the state of the earth's surface magnetic field for the epoch 1945·0, and (ii) the rate of change of the field at each of the four epochs 1912·5, 1922·5, 1932·5 and 1942·5. The field can be specified at any point by three elements, such as D the magnetic declination, H the horizontal magnetic intensity, and Z the vertical intensity; but other specifications are equally valid, involving one or more of these three elements, together with a choice from the further four elements, X and Y the north and east horizontal components, F the total intensity, and I the magnetic inclination or dip. All these elements are represented in this volume (though not all to an equal extent) by charts, tables and graphs. They are based on more than 100,000 individual observations, relating to nearly 10,000 stations for D and 5,000 stations for the other elements.

There are sixty-three isomagnetic charts for 1945·0, namely, fifteen large-scale sectional diagrams on Mercator's projection, with two polar charts (northern and southern) for the elements D, H and Z, and three charts (one Mercator, covering the middle belt between latitudes 73° S. and 84° N., and two polar charts, north and south) for each of the other four elements.

The isoporic charts number eighty-four, namely, three each (two polar and one for the belt 73° S. to 84° W.) for each of the seven elements for each of the four epochs.

Only the middle-belt isomagnetic charts (for X, Y, F and I) and the middle-belt isoporic charts show the background of geographical outlines.

The unusually large scale of the isomagnetic 1945·0 charts for D, H and Z enables smaller anomalies to be shown than is usual on magnetic maps, at least over the oceans. But Vestine explicitly disavows any claim that the charts represent an accurate description of the field, because there are many regions which have never been magnetically surveyed, across which uncertain interpolations had to be made.

Values for 1945·0 of each of the seven elements, scaled from the charts at 5° intervals of latitude and longitude, and of their rates of secular change at each of the four epochs, scaled from the isoporic charts at 10° intervals of latitude and longitude, are given in tables, part of which are separately published[2].

The volume also includes 214 graphs showing the time variation of each element (separately for D, H and I, and in combination for X, Y, Z and F) for a hundred magnetic observatories, and a sample of eleven repeat stations (out of about two thousand for which such graphs were prepared in the course of the work). The positions of the observatories and of the survey and repeat stations are shown on supplementary charts.

This volume is unique in geomagnetic literature not only for the extent of the underlying data and the fullness of the reduction and representation of the data; it is the first to describe at all adequately the nature of the processes of reduction and representation, with examples of the actual working sheets of computations for a typical observing station. A useful improvement in the work has also been made by rendering the X and Y charts, and the D and H charts (both isomagnetic and isoporic), mutually consistent on the hypothesis of negligible electric currents crossing the earth's surface; and also by the use of simple analytic considerations on the form of the isomagnetic and isoporic lines near dip poles.

The volume is a worthy embodiment and memorial of the first quarter-century of the observing work of the Department of Terrestrial Magnetism; may this work be emulated and surpassed during the remainder of this twentieth century. The development of methods of aerial magnetic survey seems to hold much promise for the future, though meanwhile well-tried methods should not be neglected.

OBITUARY

Prof. Ludwig Becker

PROF. LUDWIG WILHELM EMIL ERNST BECKER, for forty-two years occupant of the regius chair of astronomy in the University of Glasgow, died at Merano in Italy on November 11, 1947. Becker was born at Wesel in Germany in 1860 and educated at the University of Bonn where, in due course, he took his Ph.D. degree. In 1885, after two years as an assistant in the Berlin Observatory, he was recommended to the Earl of Crawford and Balcarres, who owned a large private observatory at Dunecht, near Aberdeen, in professional charge, at the time, of Dr. R. Copeland. In the autumn of 1888 Lord Crawford presented the whole of his magnificent equipment, including his astronomical library of 15,000 volumes, to the Lords Commissioners of the Treasury for a new Royal Observatory. A site on Blackford Hill in Edinburgh was selected in 1889; Becker was included on the staff, with Copeland as Astronomer Royal. Four years later, Becker was appointed to the regius professorship of astronomy at Glasgow, occupying the chair until his retirement in 1935. The University Observatory half a century ago was well equipped for contemporary needs, and in his earlier years he extended considerably its instrumental resources.

Becker was an inspiring teacher. His 'honours-lectures' were mainly on celestial mechanics, of which he was a master. His scientific work covered a wide variety of subjects, of which the following may be mentioned: his investigation on the distribution of blue-violet light in the solar corona at the eclipse of August 30, 1905, in Tunisia; a long and careful investigation on the constant of aberration undertaken with the Glasgow transit circle; a capture-hypothesis relating to binary stars, in which he showed how such a system could capture a third star, losing in the process one of its own components, and how the hypothesis could account for the high eccentricities of binary star orbits (it may be added that this idea of capture has recently been adopted by Lyttleton in his earlier attempts to explain the formation of the planetary system); descriptions of various instrumental improvements such as a motor-micrometer for the transit circle and a new 'artificial horizon' for sextants.

Although Becker had become a naturalized British citizen before his appointment to Glasgow, this fact failed to save him from embarrassment and unmerited suspicion during the First World War; local public opinion forced his temporary retirement to Aviemore in the Highlands, where he lived in seclusion until the end of hostilities. Becker was one of the gentlest of men, modest and retiring in disposition and, whatever the outside world thought, respected and esteemed by his students both for his learning and his kindly qualities. W. M. SMART

NEWS and VIEWS

Scientific Research and Development in Northern Ireland

In accordance with its policy of encouraging the increased application of the results of scientific and industrial research by industry in Northern Ireland, the Ministry of Commerce has formed a Council of Scientific Research and Development. The work of this Council, which will be closely linked with that of the Directorate of Scientific Development of the Ministry of Commerce, will be carried out under the following terms of reference: (1) to advise the Ministry of Commerce on all scientific questions connected with the utilization and development of the natural resources of Northern Ireland; (2) to promote the increased application by industry in Northern Ireland of the latest discoveries and developments in the fields of pure and applied science with the object of improving present industrial methods and processes, creating new industries and expanding existing ones; (3) to arrange, through the Director of Scientific Development, for such investigations and research work as the Council may consider desirable in the best interests of Northern Ireland; (4) to promote the wider dissemination of scientific knowledge throughout Northern Ireland.

The composition of the Council is as follows: Sir David Lindsay Keir, president and vice-chancellor of the Queen's University, Belfast (*chairman*); Mr. D. H. Alexander, Belfast College of Technology; Prof. R. G. Baskett, professor of agricultural chemistry, Queen's University; Mr. O. F. Brown, Department of Scientific and Industrial Research; Mr. H. Bryson (Spence Bryson and Co., Ltd.); Prof. J. K. Charlesworth, professor of geology, Queen's University; Mr. M. Eitel (Stevenson and Son, Ltd.); Prof. K. G. E. Emeléus, professor of experimental physics, Queen's University; Prof. D. C. Harrison, professor of biochemistry, Queen's University; Mr. A. J. Howard, Ministry of Commerce; Prof. K. S. Isles, professor of commerce, Queen's University; Mr. B. M. Cance (Kirkpatrick Bros., Ltd.); Prof. A. H. Naylor, professor of civil engineering, Queen's University; Mr. D. Rebbeck (Harland and Wolff, Ltd.); Dr. A. J. Turner, Linen Industry Research Association; Mr. R. C. Wilson (Newforge, Ltd.); Mr. D. E. Wiseman (Short and Harland, Ltd.); and Prof. A. R. Ubbelohde, professor of chemistry, Queen's University. All inquiries in connexion with the activities of the Council should be addressed to the Director of Scientific Development, Ministry of Commerce, 20 College Gardens, Belfast.

Generation of Electricity from Wind Power

The work of the Section on Rural Electrification of the British Electrical and Allied Industries Research Association has already included research on the small-scale generation of electricity, principally by wind power. Recent shortages of power and fuel have aroused interest in the possibility of utilizing wind power on a large scale for the generation of electricity in Great Britain. Following earlier discussions with the relevant Ministries and other interested parties, the Association has established a new Section on Power Generation with the following terms of reference: "To study the technical and economic problem of large-scale aerodynamic generation in Great Britain; including the collection of all available information and evidence, the principles of the selection of sites and the wind energy derivable therefrom, the co-ordination of wind-driven generators with supply systems, the essential design features of wind-driven generators and the design problems which remain to be solved". The chairman of the new Sectional Committee is to be Mr. T. G. N. Haldane of Messrs. Merz and McLellan. The Committee is expected to comprise representatives from electricity supply, electrical manufacturers, consulting engineers, the Department of Scientific and Industrial Research and the Lord President's Office, the Meteorological Office, the Ministry of Fuel and Power and the Ministry of Supply. Representatives of the aircraft industry will also be invited, as may seem desirable. The research officer for the new Section will be Mr. E. W. Golding, who is in charge of the Association's work on rural electrification and its field station at Shinfield Green, near Reading.

Medical Research in South Africa

The annual report of the South African Institute for Medical Research for 1946 records activities so various that a short note cannot mention them all. Mr. G. H. Beatty, chairman of the Board of Management since 1939, retired in 1946 and was succeeded by Mr. E. H. A. Lawrence. The Institute's close co-operation with the University of the Witwatersrand continues. Increased attention is being given to the problem of the universal donor of blood for transfusion, and studies of the Rhesus factors have been continued. Work on the vole tuberculosis bacillus has included a continuation of immunization experiments previously carried out to include *Cercopithecus* monkeys and rodents. Two species of gerbils have proved equally susceptible to *Mycobacterium tuberculosis* and the vole bacillus, so that they cannot be used for cross-immunization work. Work on leprosy included treatment of lepers with 'Promin', a new sulphone; but blood examinations showed no significant change over a period of four months. Considerable work has been done on diphtheria, dysentery, tetanus, gas gangrene, relapsing fever, typhus fever and other diseases; a plague-like eipizoötic occurring among gerbils in the Johannesburg area was, after investigation, ascribed to *Listeria monocytogenes*, and further study of this organism, which influences the wild rodent population and is also present in domestic rats, gave interesting results which are outlined in this report. Entomologists will be interested in the list of vectors of yellow fever, which records thirty-four species of mosquito new to northern Bechuanaland, also in the work on the physiology of *Cimex lectularius* and the larvæ of *Aedes œgypti*. Standard bed bugs are being reared for the biological assay of insecticides. Work has also been done on nutrition, venoms and antivenenes, and allergy, and a considerable volume of routine work accomplished.

Evolution: An International Journal of Organic Evolution

Workers in various fields such as taxonomy palæontology, cytology, genetics, comparative anatomy, etc., besides the problems inherent in their own fields, often have to take into account and make contribution to the wider field of thought covered by the term 'evolution'. The interest in this major subject has increased noticeably in recent years, and it was with the object of facilitating this modern synthesis that a Society for the Study of Evolution was founded in the United States in March 1946. A grant from the American Philosophical Society has enabled this new society to launch a quarterly publication termed *Evolution: an International Journal of Organic Evolution*, and thus supply a noticeable want. The first number was issued in July 1947 and it is edited by Dr. Ernst Mayr, of the American Museum of Natural History, assisted by associate editors which include representatives of Great Britain, France, and the U.S.S.R. The journal is of convenient size, 25 cm. × 17 cm., well printed on paper that allows the use of half-tone blocks without undue loss in reproduction, and contains 112 pages. In general, contributions are limited to twenty pages, but shorter "Notes and Comments" are also published. They are accepted from any field of biology so long as they have a bearing upon evolution. The contributions in the first number include several papers on *Drosophila*, cytology, Hawaian birds, adaptive evolution in sticklebacks, hybrids in oak-tree populations and evolutionary rates in hypsodonty in horses and beavers. The subscription-rate for the volume is 6.00 dollars, or membership of the Society, which includes the journal, is 5.00 dollars, and the business manager is Mr. K. P. Schmidt, Chicago Natural History Museum, Chicago 5, Ill., U.S.A.

Disposal of Effluents from Harwell

THOROUGH precautions are being taken by the Ministry of Supply to ensure that the Thames water used at the Atomic Energy Research Establishment at Harwell is returned to the river free from risk of harmful radioactivity. These precautions are being adopted after close consultation between Harwell experts and experts of the Ministry of Health, the Metropolitan Water Board and the Thames Conservancy, and on the advice of the Medical Research Council's Research Committee on the Medical and Biological Applications of Nuclear Physics. A certain amount of radioactivity in drinking water can be tolerated by human beings, and the tolerances laid down by the Medical Research Council for the Thames water are such that the medical and biological effects due to the consumption of water during the life-span of human beings would be for all practical purposes negligible. Roughly one million gallons of water a day will be involved. The greater part will be used for the cooling of plant and ordinary domestic requirements at the Establishment. The remainder of the water will be used for research processes, some of them radioactive, and a carefully controlled separate water system will be installed to deal with it. The most highly active portion will be segregated and will not be returned to the river. The remainder will be delivered to storage tanks where it will be tested by medical officers for compliance with the agreed tolerances, treated for chemical impurities and then mixed with the domestic waste water before being discharged into the Thames at Sutton Courtenay.

The system of treatment and examination has been designed so that several operations have to be carried out before the water actually passes into the six-mile long discharge pipe. Moreover, a new weir is being constructed at the point of discharge into the Thames, and the Harwell water will thus be turbulently mixed with much greater quantities of river water immediately it joins the main stream. These safeguards have received the approval of the Ministry of Health. The Thames Conservancy has decided to raise no objection to the proposals, so far as their interests are concerned, in view of the safeguards agreed to be adopted and having regard to the assurances they have received from the Ministries concerned. By arrangement with the Ministry of Supply, the Thames Conservancy will be able to have samples taken at regular intervals for test purposes; the Ministry of Supply is providing facilities for testing such samples at a small riverside laboratory where Ministry of Supply scientific workers will themselves make sample tests and assist the Thames Conservancy.

Grants for Veterinary Education

THE University Grants Committee, the Ministry of Agriculture and Fisheries and the Department of Agriculture for Scotland have appointed an Inter-Departmental Committee to inquire into the financial needs of veterinary education in Great Britain and to make recommendations to the University Grants Committee, in respect of universities, and to the appropriate Agricultural Minister, in respect of other educational institutions, as to the application of any moneys provided by Parliament towards meeting these needs. The Committee is constituted as follows: Dr. A. E. Trueman (*chairman*), deputy chairman of the University Grants Committee; T. Dalling, director of the Veterinary Laboratories of the Ministry of Agriculture and Fisheries; H. W. Dawes, president of the Royal College of Veterinary Surgeons; Sir John Fryer, secretary of the Agricultural Research Council; Dr. Thomas Loveday, chairman of the Joint Advisory Committee on Agricultural Education; Prof. G. W. Pickering, professor of medicine in the University of London; J. N. Ritchie, deputy chief veterinary officer, Ministry of Agriculture and Fisheries; W. L. Weipers, member of the boards of governors of the Royal (Dick) Veterinary College, Edinburgh, and of the Glasgow Veterinary College. The secretary to the Committee is Mr. E. Earnshaw Smith, of the University Grants Committee, 38 Belgrave Square, London, S.W.1. The Ministry of Agriculture and Fisheries and the Department of Agriculture for Scotland will each appoint an assessor to the Committee.

French Conference on Ageing of Population

THE French National Union for Prevention of Depopulation and the French National Demographic Institute are organising a three-day conference on scientific research on ageing in the population of France, to be held in Paris during April 22–24. The programme of the conference is comprehensive: it includes sections of (1) demography, (2) economic and (3) social aspects of the problem, (4) physiology, psychology and pathology of old age, (5) organisation of work and occupation for old people, (6) rejuvenation of population. The conference will not be an international one; all reports will be by French workers, and discussions will be in French. Although only a few foreign specialists in demography, social and economic sciences, and gerontology have been invited, specialists in these subjects can attend the conference without a special invitation and, provided they will speak in French, take part in discussions. The president of the Organisation Committee is M. F. Boverat, 217 rue de Faubourg St. Honoré, Paris, 8e.

International Conference on Large Electric Systems

AN International Conference on Large Electric Systems (C.I.G.R.E.) will be held in Paris during June 24–July 3. Matters relating to the British delegation to the Conference are being dealt with by the British National Committee under the chairmanship of Mr. P. V. Hunter, at the offices of the British Electrical and Allied Industries Research Association. The official languages of the Conference will be English and French. Owing to the difficulties of accommodation, etc., intending delegates are requested to communicate with Mr. R. A. McMahon, Secretary, British National Committee, C.I.G.R.E., "Thorncroft Manor", Dorking Road, Leatherhead, as early as possible.

British Council Conference Grants

The British Council has for some time had a small fund from which grants have been made in exceptional cases to permit foreign men of science (including agriculturists, engineers and medical men) to attend national or international conferences or meetings held in the United Kingdom. The principal grounds upon which such grants have been made are: (*a*) that the application has been received from the body convening the conference or meeting; (*b*) that the Science Committee of the British Council has supported the application; (*c*) that the foreign visitor would be unable to attend without assistance. The grants cover subsistence or part-subsistence in the United Kingdom during the period of the conference or meeting. Fares to and from the United Kingdom are not included. No grants are made in respect of secretarial or other organising expenses, or for entertainment of delegates or hire of premises. Conveners of conferences or meetings to be held in the fiscal year 1948–49 are advised that it is necessary that applications for assistance to foreign visitors should be received not later than a fortnight from the publication of this notice. All applications will be considered together, and conveners will be notified of the results by the end of February. It is improbable that more than a small proportion of applications can be met from the fund. Applications with full particulars (including reasons why financial support is considered necessary) should be addressed to the Administrator, Science Group, British Council, 3 Hanover Street, London, W.1.

Coats Fellowships at Glasgow

Messrs. J. and P. Coats, Ltd., have provided funds for a research fellowship in chemistry or physics (excluding nuclear physics), tenable for two years, of the annual value of £300 and a supplement of £50 to cover research expenses. The Coats Fellowship will normally be awarded to a candidate with at least one year's experience in research work. It will be held in the University of Glasgow, but is open to graduates in science of any British university. The selection board will consist of the professors in the Departments of Chemistry and Natural Philosophy. A Coats Fellowship, similar in general conditions to that instituted at the University of Glasgow, is being offered to the Royal Technical College, Glasgow.

Biography of Sir Joseph Barcroft

Prof. K. J. Franklin, Department of Physiology, Medical College of St. Bartholomew's Hospital, Charterhouse Square, London, E.C.1, has been entrusted by Lady Barcroft and Prof. Henry Barcroft with the preparation of a biography of the late Sir Joseph Barcroft. He accordingly invites the cooperation of Sir Joseph's numerous friends and colleagues; he does not ask, at this stage, for specific information on particular aspects of Sir Joseph's life or work, but for general comments, such as mode o treatment, anecdotes, etc. Full acknowledgment wil be made in any consequent publication, and it is assumed by Prof. Franklin that, should he be prevented from writing the biography, the material may be passed on to an alternative author chosen by Lady Barcroft and her son. Communications should be sent to Prof. Franklin at the address above by April 30 next.

The Night Sky in February

New moon occurs on Feb. 10d. 03h. 02m., U.T. and full moon on Feb. 24d. 17h. 16m. The following conjunctions with the moon take place: Feb 5d. 06h., Jupiter 3° N.; Feb. 11d. 06h., Mercury 8° N.; Feb. 13d. 12h., Venus 3° N.; Feb. 23d. 13h. Saturn 4° S.; Feb. 24d. 02h., Mars 0·6° S. During the first part of the month, Mercury is an evening star, setting at 18h. 20m. and 17h. 58m. on Feb. 1 and 14 respectively, and is in inferior conjunction on Feb. 20. At the end of the month it rises about three-quarters of an hour before the sun but will not be an easy object to observe. Venus, stellar magnitude about – 3·5, is conspicuous in the western sky and sets at 20h., 20h. 40m. and 21h. 30m. at the beginning, middle and end of the month respectively—several hours after sunset. Mars, in the constellation of Leo, rises in the early evening hours and can be seen throughout the night. Jupiter does not rise until the early morning hours—4h. 47m. and 3h. 18m. on Feb. 1 and 29 respectively; but as the planet does not attain an altitude greater than 16° in the latitude of Greenwich, it is not very favourably placed for observation. Saturn, in the constellation of Leo, rises in the early evening hours and can be seen throughout most of the night. The planet is in opposition on Feb. 9. Occultations of stars brighter than magnitude 6 are as follows: Feb. 18d. 18h 37·7m., υ Taur. (*D*); Feb. 18d. 19h. 05.3m., 72 Taur (*D*); Feb. 20d. 00h. 49·9m., 125 Taur. (*D*); Feb 26d. 23h. 02·6m., γ Virg. *m* (*D*); Feb. 26d. 23h 29·7m., γ Virg. *m* (*R*); *D* and *R* refer to disappearance and reappearance, respectively, and the latitude and longitude of Greenwich are assumed. In addition to these occultations of stars, Mars is occulted by the moon on Feb. 24d. 01h. 58·9m., reappearing a 02h. 45·4m.

Announcements

Sir Edward Mellanby will deliver the Sir Frederick Gowland Hopkins Memorial Lecture of the Chemical Society at the Society's rooms on February 19 at 7.30 p.m.

A series of five lectures on aspects of atomic energy has been arranged by the London Branch of the Atomic Scientists' Association. The lectures wil be given in the lecture hall of the Royal Society o Arts, John Adam Street, Adelphi, W.C.2, at 7 p.m on alternate Fridays, beginning February 6. Tickets (2*s*. 6*d*. for one lecture; 10*s*. for the series) can be obtained from Dr. L. E. C. Hughes, 15 Avenue House, Allitsen Road, St. John's Wood, N.W.8.

An exhibition of War Office teaching aids, under the title "The Better Chance", will be open during February 3–11 in the Imperial Institute, South Kensington, London, S.W.7. This is an augmented version of the exhibition held at Eltham Palace on September 15 (*Nature*, 160, 411; 1947). It is open to the public.

LETTERS TO THE EDITORS

The Editors do not hold themselves responsible for opinions expressed by their correspondents. No notice is taken of anonymous communications

Structure of Cyclo-octatetraene

We have been engaged in an investigation of the structure of cyclo-octatetraene by X-ray methods. In a previous communication[1], we gave the preliminary crystallographic data. Cyclo-octatetraene crystallizes in the orthorhombic system with four molecules per unit cell. The cell dimensions are $a = 7\cdot76$ A., $b = 7\cdot80$ A. and $c = 10\cdot66$ A. The space group is *Aba*.

The work has now been carried further to the point where the essentials of the structure are known, and accounts of the structure have been presented at several scientific conferences[2,3,4].

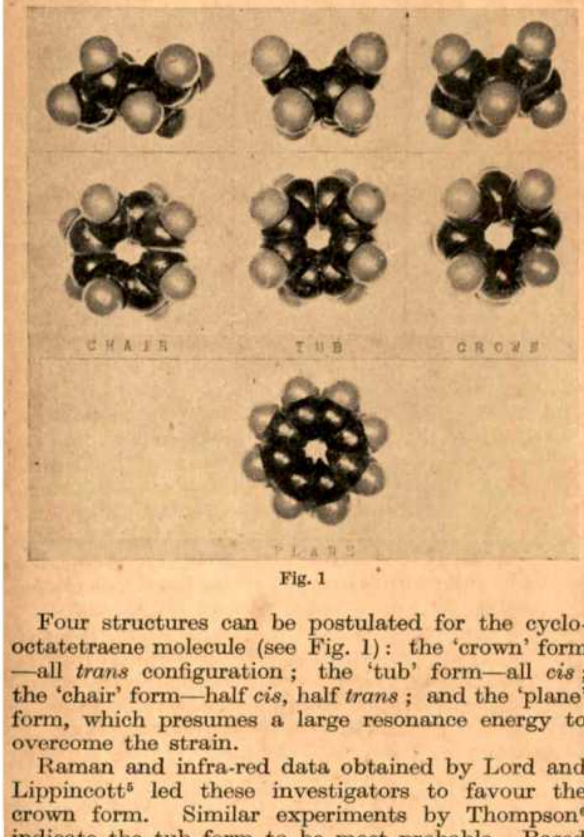

Fig. 1

Four structures can be postulated for the cyclo-octatetraene molecule (see Fig. 1): the 'crown' form—all *trans* configuration; the 'tub' form—all *cis*; the 'chair' form—half *cis*, half *trans*; and the 'plane' form, which presumes a large resonance energy to overcome the strain.

Raman and infra-red data obtained by Lord and Lippincott[5] led these investigators to favour the crown form. Similar experiments by Thompson[6] indicate the tub form to be most probable. Based on their recent electron diffraction study, Hassel[7] and co-workers conclude that the structure is the crown form with bond-lengths approximately those of benzene, suggesting a high degree of resonance.

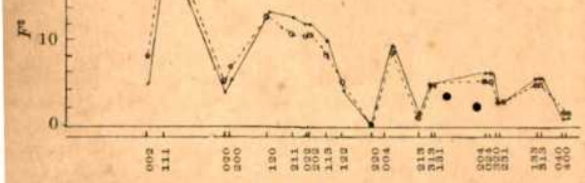

Fig. 2. COMPARISON OF OBSERVED (FULL LINE) AND CALCULATED (BROKEN LINE) F^2 VALUES

Bragg–Lipson[8] structure factor charts proved very useful in our work. It was found that only the tub form with alternating single- and double-bonds gave a good fit with the experimental data (Fig. 2). The two-fold axis required by the space group must pass through the single bonds, and the bond-lengths are typically aliphatic: double-bond length, 1·34 A.; single-bond length, 1·54 A.; and C=C – C bond angle 125°. These values indicate little or no resonance energy in the cyclo-octatetraene molecule, which is in accord with the latest thermochemical data of Rossini[9] and co-workers.

Infra-Red Absorption Spectra of Crystals

Spectroscopic investigations on the scattering of light in crystals show very plainly that their vibration spectra have a discrete structure manifesting itself as a set of lines with sharply defined frequency shifts. That a similar discrete structure is also to be seen in the infra-red absorption spectra of crystals when examined under appropriate conditions is shown by a remarkable investigation by Barnes and Brattain[1]. These authors examined the case of magnesium oxide, which is a crystal of the cubic class with a structure similar to that of rock-salt. Plates obtained by cleavage from flawless transparent single crystals of large size were employed, and the absorption spectra of a whole series of such plates from the very thinnest obtainable to the thickest were investigated. The rock-salt spectrometer used in the study covered the wave-length range 1–15·6 μ, and the galvanometer deflexions were amplified 150 times by a photo-electric relay system. The resulting data showed the presence of some forty absorption lines in the wave-length range 6–15·5 μ. In the absorption curves reproduced with their paper, these lines are so sharply defined that their positions can be measured with high precision.

The theory of the vibration spectra of crystals worked out by me[2] leads to the result that crystals having the rock-salt structure have nine fundamental eigen-frequencies. These frequencies have now been evaluated theoretically, and their values for the case of magnesium oxide expressed as infra-red wavelengths come out as 14·2, 14·7, 15·35, 17·1, 19·0, 21·1, 23·4, 38·5 and 54·5 μ respectively. All except the first three lie outside the range of a rock-salt spectrometer. Hence, except for the first three fundamentals, the absorption spectra recorded by Barnes and Brattain represent a superposition of the spectra of various orders higher than the first, in other words, of the overtones and summations of the nine fundamental frequencies of vibration of the structure.

The changing aspect of the absorption curves with increasing thickness of the plate is readily understood on this basis. In the region of wave-lengths less than 7·1 μ, we are only concerned with the third-order absorption spectrum. This is necessarily weak and is, therefore, most marked when thick plates are used. Moreover, since the third-order frequencies are numerous and very close to each other, they are only imperfectly resolved. It is not surprising that, in these circumstances, the absorption by the thicker plates in the short wave-length region is registered as a smooth curve showing only minor fluctuations of intensity. In the region of longer wave-lengths, on the other hand, the confusion arising from the superposition of the third-order absorptions is less important. Since the infra-red activity is also much greater at such wave-lengths, thinner plates are necessary to avoid complete absorption and to enable the individual lines to be distinguished. An examination of the published curves, indeed, reveals the presence of the first three fundamentals, as also of the octaves of the first seven fundamentals with notable intensities in the theoretically predicted positions. Some twenty of the other observed absorption lines have also been identified as the summations of the fundamental frequencies taken two at a time.

Further details will appear shortly in the *Proceedings of the Indian Academy of Sciences*.

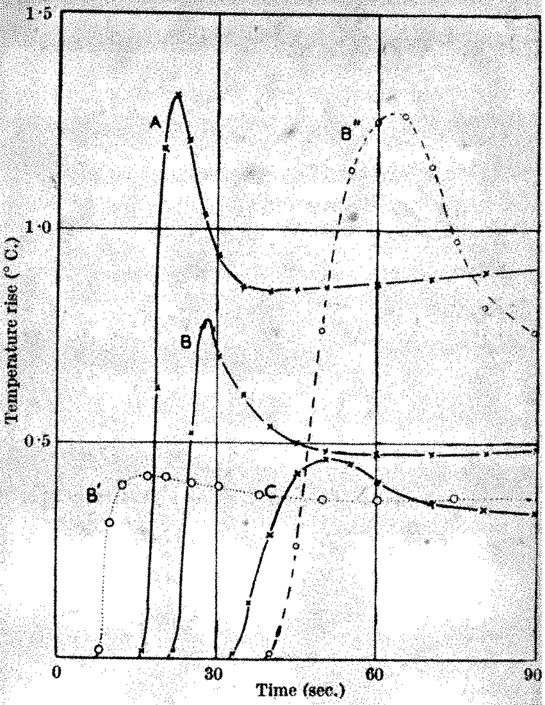
Thermal Mutual Inductance

WHEN heat is dissipated from a hot body immersed in a fluid, the flow of heat is accompanied by a mechanical circulation of the fluid in the system of natural convection currents. The stored kinetic energy bestows on the heat current a property which has been termed 'thermal inductance', and curves I have obtained[1] for the thermal transients consequent on the sudden heating of a cylindrical body, or wire, immersed in a fluid, clearly show the influence of this inductive element. Experiments of this nature may, however, readily be extended to show the influence of a property which may be referred to as 'thermal mutual inductance'. If we take two parallel wires, one vertically above the other so that the same system of convection currents link both, then any change in the heat flow from one might be expected to influence the heat flow from the other. There are two such changes possible, a transient and a permanent one. A steady change in the heat flow from the upper wire consequent on a change in the heat flow from the lower simply represents the case of a hot-wire anemometer used to explore natural convection currents. If, however, our system is to exhibit a property of thermal mutual inductance, then we expect a transient change in the heat flow (or associated temperature difference) from the upper wire to accompany any change in the heat flow from the lower.

In a system of two parallel wires, the lower constituting the thermal primary and the upper the secondary, the primary input may be computed from the current flowing in the lower wire, and the secon ary thermomotive force in terms of the temperatu difference between the upper wire and the bulk the fluid. This temperature difference can be measure by means of a fine thermocouple attached to t upper wire or by using the wire itself as a resistan thermometer. The former type of instrument may somewhat suspect in work of this nature, as t instrument essentially measures the temperatu difference between the wire and *some particular poi* in the fluid, and any asymmetry in the heated co vection current will clearly give rise to spurio thermal transients. As a matter of interest, t nature of the apparent thermal transients obtaine with such a pair of thermocouple hot wires has bee observed to vary somewhat with the size and sha of the containing vessel as well as with the natu and temperature of the fluid.



Resistance thermometer measurements are fr from any suspicion that the transient observed is du to the rising heated column reaching different part of the measuring instrument at different times, bu are complicated by the fact that the steady rise i temperature of the whole fluid will also be recorde by the measuring device. Transients obtained fro a pair of parallel nickel wires, 0·1 mm. diamete 3·0 cm. long and 1·2 cm. apart, are shown in th accompanying figure. Concentrated solutions o sucrose were used on account of the low convectiv moduli associated with these solutions[2]. The curve represent the temperature rise of the upper wi plotted against the time elapsed since switching o the primary (thermal) current. Curves *A*, *B* and refer to a 63 per cent (by weight) solution of sucros in water at 23° C.; *A* with a primary heat flow o 5·0 watts, *B* 2·0 watts and *C* 0·95 watts. The curve *B'* and *B''*, shown dotted and broken respectively also refer to results from a primary thermal curren of 2·0 watts, *B'* in distilled water, a fluid of highe convective modulus than 63 per cent sucrose solution and *B''* in 68 per cent sucrose solution, a fluid o lower convective modulus, both again at 23° C.

All curves shown on the figure are of the same form. There is no immediate change in the secondary temperature following a switching on of the primary current. When, however, the heated column of liquid reaches the upper wire, there is a rapid rise in the temperature, which attains a maximum and then falls again. A subsequent slow rise in temperature is probably due to gradual heating of the whole bulk of fluid, as this last feature was not observed when using thermocouple type hot-wire instruments. From the curves shown it appears that the time taken for the thermal secondary to respond to a change in the primary is the longer the lower the primary current and the lower the convective modulus of the fluid.

There are several features of interest in this work. The time taken for the secondary to respond to a change in the primary is clearly a measure of the speed of the convection current, which is connected with the kinetic energy stored in the natural convection current and is thus related to the magnitude of the (self) induction associated with the flow of heat in fluids. Apart from the time-lag, the change in the primary current produces both transient and steady-state changes in the secondary, so that the pair of coupled hot wires constitutes a leaky thermal mutual inductance. The transient rise in temperature when the top of the convection column first reaches a temperature-recording instrument apparently means that the top of the column is at a higher temperature than the rest. Such a state of affairs is, however, only to be expected from the phenomena of thermal (self) inductance already observed. The delay in setting up a system of convection currents around a body the temperature of which is suddenly increased means that the initial part of the convection column has remained longer in contact with the hot body and is accordingly heated to a higher temperature than subsequent sections of the same column.

Solar Noise

DURING a television outside broadcast from Brands Hatch, in Kent, during the afternoon of August 31, 1947, there appeared on the screens and from the loudspeakers of two television receivers situated in Ealing, London, and Claygate, Surrey, a sudden and intense increase of fluctuation noise. The visual effect was that of a violent snowstorm of the type well known to televiewers due to motor-car ignition interference, but at a very much more intense level than seen heretofore by either of the observers. The spots of noise upon the viewing screen were of slightly greater size than a line-width and in number something like 70–100 per scanning line. The intensity of the fluctuation noise interference was of such value that both receivers lost their line synchronization, though frame synchronization still held. The sound effect emerging from the loudspeakers was in no way distinguishable from a considerable increase in the fluctuation noise level. The phenomenon lasted about forty-five seconds at an intense level and then faded slowly away during a period of about fifteen seconds, the entire effect lasting about one minute. The fact that the interference appeared to be completely random in nature and also that it faded slowly away seemed to preclude any fault on the television transmission system.

Since observing this phenomenon, one of us visited Mr. J. S. Hey, of Operations Research Group, Ministry of Supply, West Byfleet, Surrey, who very kindly showed us his charts of recorded solar noise for the time of occurrence of the interference (August 31, 1947, between 3.30 p.m. and 4.0 p.m. British Summer Time). These charts showed considerable activity from the solar noise point of view in frequency-bands around 25 Mc./s., 73 Mc./s. and higher frequencies as well. As the charts were not capable of recording solar noise greater than about 10 μV./m. for the band-width of the receivers used for the recording, it is not possible to get an exact correspondence between the actual level of measured solar noise and the degree of interference in the television receivers. However, the charts did show, on several occasions during the half-hour period mentioned, a noise-level above the 10 μV./m. limit on them. The possible extent of interference from solar noise, though this may well be rarely encountered, can be surmised from the fact that the field-strength of television signals in the Ealing area is of the order of 3 mV./m. and in Claygate of the order of 1½ mV./m.

It would seem beyond reasonable doubt that the interference observed was, in fact, solar noise, particularly when the ratio of television band-width (5,000 kc./s.) to recording receiver band-width (about 20 kc./s.) is taken into account. A complete fade-out on many circuits was recorded by Cable and Wireless, Ltd., and the B.B.C. receiving station at Tatsfield at about the same time as the interference was observed.

Use of High-frequency Current in Surgery

IT has been remarked[1] that extended injury was caused to the brain of monkeys beyond the point of a needle electrode when using high-frequency current for surgical purposes. If the needle were of a ferrous material, such as steel, or a ferrous alloy, this may be expected, and is in accordance with our research experience over many years in experimental work on instruments for electrosurgical techniques, which involve the use of high-frequency currents, particularly for ophthalmic surgery using the Safar technique.

The main reason for the extended injury to tissues when using a ferrous wire, or needle, is due to the heating of the wire by eddy currents, and the increased resistance of the material which carries high-frequency current. As is well known, the D.C. resistance of a conducting material is given as

$$R_{\mathrm{DC}} = l\rho/A,$$

where A is the cross-sectional area, l is the length and ρ is the specific resistance. The high-frequency resistance is given by:

$$R_{\mathrm{HF}} = R_{\mathrm{DC}} \times [1 + F(z)], \qquad (1)$$

where

$$z = \sqrt{8.\pi^2.r^2.\mu.f/\rho}. \qquad (2)$$

If $z > 3$,

$$F(z) = \tfrac{1}{4}\,(z\sqrt{2} - 3). \qquad (3)$$

If, by way of example, we consider a steel wire of 0·0126 cm., radius (r); specific resistance ρ of $11{\cdot}8 \times 10^3$ in C.G.S. units; permeability μ of 375; working frequency of $2{\cdot}0 \times 10^6$ c.p.s. and length l of 5·0 cm., then

$R_{\rm HF} \doteq R_{\rm DC} \times 10{\cdot}261$, and $R_{\rm DC} = 0{\cdot}1174$. Hence $R_{\rm HF}/R_{\rm DC} = 10{\cdot}261$.

This ratio is the important consideration in assessing the difference in temperature of the needle electrode when carrying high-frequency instead of direct current.

It is well known that the heat H generated in a conductor of resistance R, carrying a current I, is proportional to I^2Rt, and since the influence of high-frequency current is to increase the resistance, as indicated, this would appear to explain the statement in the report (*loc. cit.*) that when D.C. current was used the difficulties were mostly overcome. Ferrous metal becomes hot when carrying high-frequency current, and when hot metal contacts a biological substance it sticks and often causes injury by burning.

The ideal physical condition for operating electrodes carrying high-frequency current for surgical techniques is that they should remain practically at the temperature of the operating theatre, since they are only directors of the current to the site of operation. The surgical effect depends on the thermogenic property of the high-frequency arc at the point of the electrode.

In the case of wire electrodes this is accomplished by the use of 20 per cent iridium platinum alloy. For general purposes a diameter of about 0·025 cm. or slightly less appears to be most suitable. This alloy also offers the advantage that, with the use of 'Easi-flo' solder, a perfect joint can be formed with a German silver shank when the solder is melted in a hydrogen jet to prevent oxidation and ensure chemical wetting. Such a perfect joint is devoid of cracks and crevices, and thus prevents the ingress and trapping of germs.

Intracellular Determination of Protein by X-Ray Microspectrography

In a recently published paper[1], the possibility of making a determination of intracellular protein *in situ* was suggested. The analytical procedure was to be based on the binding of phosphotungstic acid by the protein and subsequent determination of the tungsten by X-ray microspectrography[2,3].

In a model experiment the amount of phosphotungstic acid which was combined with varying concentrations of protein has been determined. Protamine solutions of known concentration were precipitated with 5 per cent phosphotungstic acid, centrifuged and washed several times with distilled water. The precipitates were dissolved in alkali and the absorption of X-rays by the solutions was measured. 30,000-volt X-rays (minimal wave-length *c.* 0·4 A.) were used. The solution was placed in a cuvette with parallel walls of thin glass, and the thickness of solution was approximately 0·5 cm. The same cuvette was used for all measurements. The results are shown in Fig. 1, in which extinction coefficient is plotted against the amount of protein. (Extinction coefficient $E = \log I_0/I$, where I_0 is the intensity of the incident X-rays and I is the intensity of the transmitted X-rays.) As can be seen from the figure, there is a straight-line proportionality between the amount of protein and the extinction coefficient, which is proportional to the amount of tungsten bound to the protein. The extinction for zero concentration of protein was measured with the cuvette containing alkali of the same concentration as that used for dissolving the precipitates.

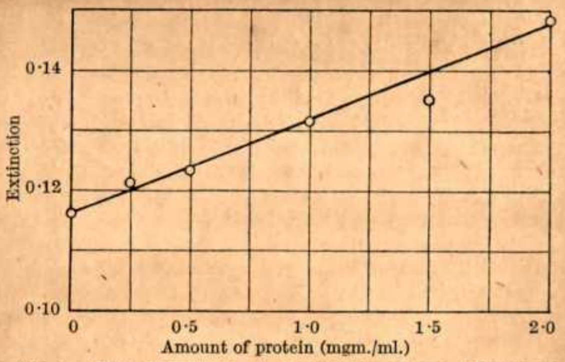

Fig. 1. THE EXTINCTION AS A FUNCTION OF THE AMOUNT OF TUNGSTEN BOUND TO PROTAMINE

Microtome sections 10 μ thick of tissues of *Helix pomatia* and *Lophius piscatorius* (tissues fixed by freeze-drying) were treated with a solution of 2 per cent phosphotungstic acid (pH 2–2·5) for one minute, washed, dried and photographed with soft X-rays on fine-grained films. 3,250-volt X-rays were used, which correspond to a minimal wave-length in the continuous X-ray spectrum of *c.* 3·8 A. In these photographs the tungsten stands out in sharp contrast to the unstained tissue. Two photographs of ganglion cells from *Helix* are shown in Fig. 2; *a* was taken on Ilford High Resolution plate, and *b* on Eastman Spectroscopic plate 649. From these photographs it can be seen that the cytoplasm binds more phosphotungstic acid, under these conditions, than does the nucleus (the light areas in the photographs represent areas in the tissue which absorb X-rays strongly). Smaller structural elements appear in the nucleus. The relative amounts of tungsten bound by the protein within the cell may be obtained by measuring the absorption in different parts of the cell. If no phosphotungstic acid were bound by the protein, the extinction coefficient for a section of the

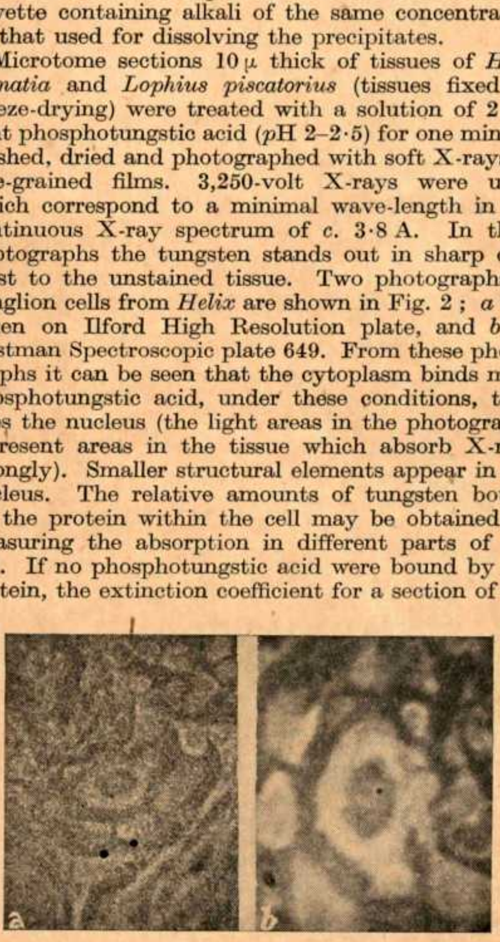

Fig. 2. MICRORADIOGRAMS OF GANGLION CELLS FROM *Helix* TREATED WITH PHOSPHOTUNGSTIC ACID. (*a*) × 130; (*b*) × 260

tissue 10 μ thick and for the X-rays used would fall in the range 0–0·04, and the contrast would be very low.

It must be emphasized that many precautions must be taken before data so obtained may be translated into concentrations of intracellular protein. Further experiments are in progress to overcome some of the difficulties involved.

Micro Estimation of Amino-Nitrogen and its Application to Paper Partition Chromatography

The present interest in the quantitative estimation of amino-acids in protein and peptide hydrolysates has prompted an early description of a method which it is felt may make some contribution to this problem.

The method described by Pope and Stevens[1] using copper phosphate for determining amino- and peptide-nitrogen has been successfully adapted to the determination of micro amounts (1–25 μgm.) of α-amino-nitrogen. The essential points of the method are that after the amino-acid has been allowed to react with copper phosphate, the soluble copper complex in the filtrate is decomposed by means of sodium diethyl-dithio-carbamate, the resultant characteristic golden yellow colour is extracted into amyl alcohol and the amount of copper determined absorptiometrically. The theoretical value of 0·44 for the ratio of α-amino-nitrogen to copper in the complex A_2Cu is not obtained under the experimental conditions in use, and it is essential to construct a standard curve for each individual amino-acid. Such curves are reproducible, and over their linear portion (10–25 μgm. α-amino-nitrogen) the amino-acids methionine, hydroxyproline, aspartic acid, leucine, *iso*leucine, histidine, phenylalanine, valine, glutamic acid, tryptophane and tyrosine give ratios lying between 0·50 and 0·55; alanine, glycine, threonine, serine, cystine and cysteine ratios between 0·55 and 0·80; and lysine, arginine and glucosamine ratios between 1·25 and 1·60.

The application of the method to the paper chromatograms of Consden, Gordon and Martin[2] has enabled quantitative recoveries of the component amino-acids of simple mixtures to be obtained. The technique employed is to localize the amino-acid on the chromatogram by use of a trial strip, as suggested by Dent[3], then cut out the square of paper containing the amino-acid. The square is folded, dropped into a test tube and the amino-acid treated with a suitable amount of copper phosphate sludge. The excess copper phosphate is filtered off, the copper in the filtrate determined by means of sodium diethyl-dithio-carbamate and its equivalent in α-amino-nitrogen obtained by reference to a standard curve for the amino-acid under investigation. Using this technique, a single-dimensional chromatogram of a valine/glycine mixture using *n*-butanol/water as the solvents gave recoveries of 94 per cent for glycine and 97 per cent for valine.

It has been found possible for ninhydrin to react with glycine and valine under conditions where almost no destruction of amino-nitrogen occurs, although enough colour is obtained to determine the position of the amino-acid on the chromatogram. Such development of colour did not affect appreciably the subsequent quantitative determination of α-amino-nitrogen. With single-dimensional chromatograms of a glycine/valine mixture, recoveries of 91 per cent for glycine and 93 per cent for valine have been obtained after reacting with ninhydrin. If the principle is found capable of extension to other amino-acids, it may be possible to avoid the use of trial chromatograms altogether, and this would be a great advantage in two-dimensional chromatography.

At the present time the errors of the estimation are such as to be well within the limits required for establishing the ratios of the amino-acid components of peptides.

A fuller report of this work will be published elsewhere.

Solvation of Hydrogen Ion in Oxygen-containing Solvents

The nature of non-aqueous solutions of the so-called 'strong' acids has received a good deal of attention; but although much information is now available regarding a number of individual solvent systems, comparatively little progress has been made in establishing quantitative scales of comparison of properties such as proton-availability in different solvents. A quantity suitable for this purpose is the acidity function first introduced by Hammett[1] to deal with concentrated aqueous solutions. The acidity function is a measure of the tendency of the medium to donate a proton to a neutral base and may be defined by

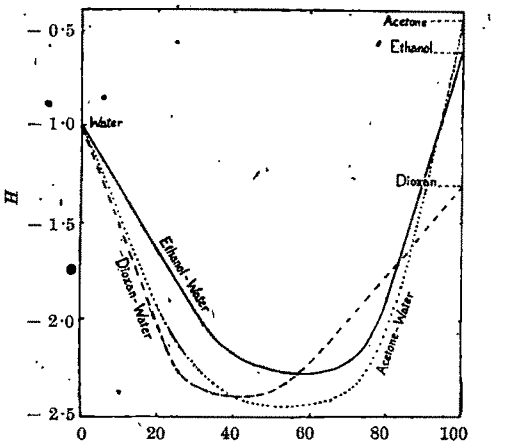
$$H = \log[BH^+]/[B] - \log K_B^{H_2O}, \quad . \quad (1)$$

where B is the proton-acceptor and BH^+ its conjugate acid, and where $K_B^{H_2O}$ is the equilibrium constant of the reaction

$$B + SH^+ \rightleftharpoons BH^+ + S \quad . \quad . \quad . \quad (2)$$

in water, SH^+ representing the solvated proton. It can be readily shown that $H = \log\,(\alpha c_A K_B^S/K_B^{H_2O})$, where c_A and α are the concentration and degree of dissociation of the acid, and K_B^S the equilibrium constant of reaction (2). The ratio $K_B^{H_2O}/K_B^S$ will be a measure of the proton-affinity of the solvent relative to water and can be calculated from H if α is known.

Using *m*- and *p*-nitranilines as proton-acceptors, H has been determined spectrometrically for solutions of hydrogen chloride in water, dioxan, ethanol and acetone, and their binary mixtures. The values of H for the four single solvents vary in the order dioxan < water < ethanol < acetone. These differences cannot be accounted for by differences in α, which can be estimated from conductivity measurements. The deduced values of $K_B^{H_2O}/K_B^S$ vary in the



ACIDITY FUNCTIONS FOR 0·1 M SOLUTIONS OF HYDROGEN CHLORIDE IN WATER – ORGANIC SOLVENT MIXTURES

order water (1·0) > dioxan (0·45) > ethanol (0·29) > acetone (0·10), which is the sequence to be expected from simple considerations of electron availability at the oxygen atom in the series ether > alcohol > water > ketone, except that the position of water is anomalous.

In water-organic solvent mixtures, H shows non-linear variations with solvent composition, passing through a minimum in the region of equal molar proportion of the two components (see diagram). This is in sharp contrast to ethanol-acetone and ethanol-dioxan mixtures, where no such minima are observed. The anomalous behaviour of the partly aqueous solutions may be explained in terms of the abnormally high proton-affinity and exceptional intermolecular structure[2] of water. In aqueous solution the protons are accommodated in the interstices of the quasi-crystalline tetrahedral lattice and simultaneously bound to four surrounding oxygen atoms. On the addition of the organic solvent, the tetrahedral structure will be gradually broken down by the interposition of organic solvent molecules, and hydrogen-bonding between neighbouring water molecules will be replaced by much weaker hydrogen-bonding with organic solvent molecules. The density of packing will increase, and the protons will be preferentially surrounded by the smaller water molecules. As a result of the decreased extent of intermolecular hydrogen bonding and the closer packing, the effective proton-affinity of the water molecules will increase, and $K_B{}^S$ and H will fall. The breakdown of the tetrahedral structure will be more rapid the larger the organic solvent molecules and, in agreement with this picture, the slopes of the left-hand parts of the acidity function – solvent composition curves (see diagram) increase in the order ethanol < acetone < dioxan. When the concentration of organic solvent is increased beyond 50 mol. per cent, organic solvent molecules begin to predominate in the medium and eventually replace the aqueous solvation shell. Since intermolecular structure and hydrogen-bonding is much less pronounced in ethanol than in water[3], and presumably almost entirely absent in dioxan and acetone, the organic solvents will only exert 'normal' proton affinities derived from the interaction of protons and discrete solvent molecules. On the right-hand parts of the acidity function – solvent composition curves, H therefore increases with decreasing water content to its value in the anhydrous solvent.

The conclusion that water has an abnormally high proton-affinity is in agreement with other evidence[4]. The variations in acidity function with solvent composition are paralleled by corresponding variations in other properties such as electrical conductivity[5], heats of transfer[6] and catalytic constants[7], which may all be similarly explained in terms of the changes in the state of solvation of the hydrogen ions.

A detailed account of this work will be published elsewhere.

Critical Temperature and Molecular Weight of *n*-Paraffins

INVESTIGATIONS on the viscosity of liquids and gases showed that the viscosity at the critical point, η_c, should be given by

$$\eta_c = K \frac{\rho_c{}^{2/3}}{M^{1/6}} T_c{}^{1/2}, \qquad (1)$$

where K is a universal constant, ρ_c is the critical density, T_c is the absolute critical temperature, and M is the molecular weight.

A correlation of the viscosity of n-paraffins under saturation pressure with the ratio T/T_B (T is the

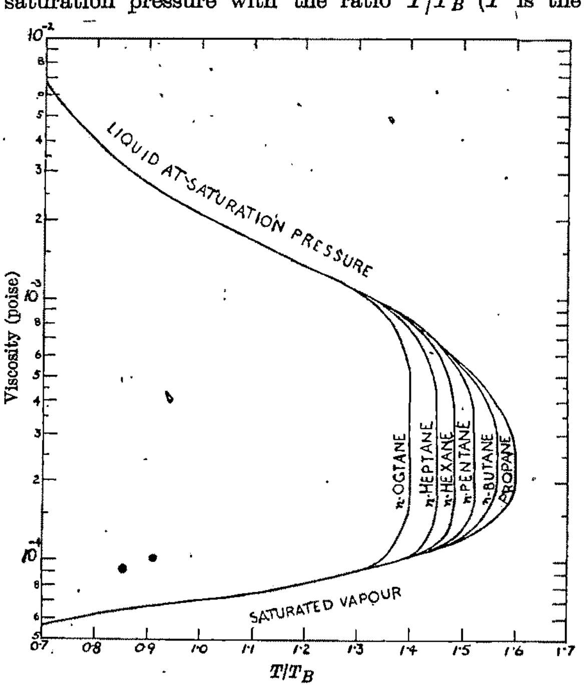

Fig. 1

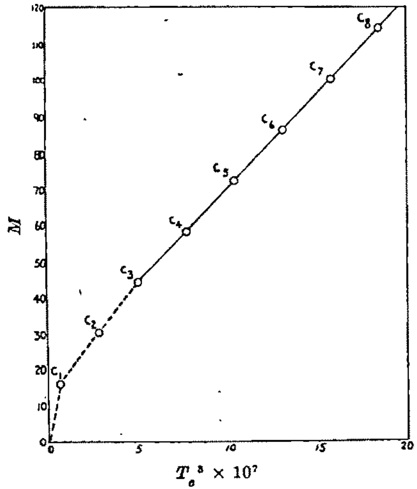

Fig. 2

absolute temperature; T_B is the absolute atmospheric boiling temperature) yielded the chart shown in Fig. 1. From the figure it seems that η_c has very nearly the same value for all the n-paraffins between C_3 and C_8. It will further be found that for these substances ρ_c has the same value of approximately 0·23 gm./c.c. From equation (1) it can be deduced that, if η_c and ρ_c are nearly the same for the n-paraffins, then $T_c^{1/2}$ should be proportional to $M^{1/6}$ or

$$T_c^3 \propto M.$$

The linear relationship between T_c^3 and M for the n-paraffins above C_3 is illustrated in Fig. 2.

Now since M is generally an additive property, T_c^3 should also be an additive property for the n-paraffins above C_3. The increment of T_c^3 equivalent to $-CH_2-$ is about 2·7 × 10^7.

It is interesting to note the position of the points for methane and ethane in Fig. 2. The increment for $-CH_2-$ between methane and ethane and between ethane and propane is 2·1 and 2·2 × 10^7 respectively, while the value of T_c^3 for methane is only 0·69 × 10^7. Thus it seems that the value of T_c^3 reflects the 'flexibility' of the hydrocarbon chain, namely, the number of internal degrees of freedom. This number is small for methane, and increases with the chain-length. For the n-paraffins higher than propane, the increase is proportional to the number of $-CH_2-$ groups present in the molecule.

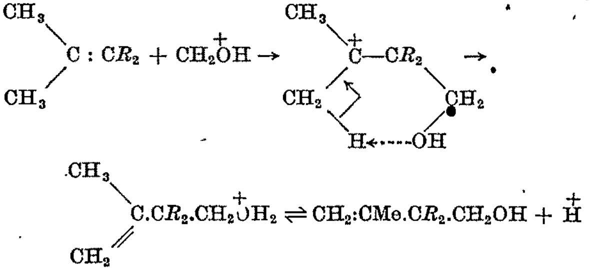
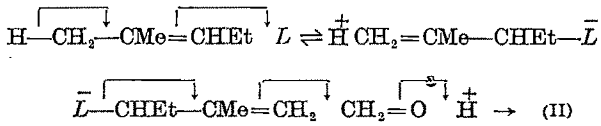
Olefine Reactions Catalysed by Lewis Acids

In a recent monograph[1], C. C. Price refers to a publication by me[2] in which reference was made to the formation of unsaturated alcohols of the general type $CR_2 : CR.CH_2.CH_2OH$ by the catalysed reaction[3] of formaldehyde with the olefines $CR_2 : CR.CH_3$. Price states, "The reaction . . . has been interpreted as involving attack at the 'active' α-position of the double bond; but it is very difficult to account for the catalytic effect of acids by such a mechanism. It seems much more likely that all the reactions involve a similar intermediate." This common intermediate is $>\overset{+}{C}-\underset{|}{CH}-CH_2OH$, formed by the addition of the formaldehyde cation $CH_2\overset{+}{O}H$ to the olefinic bond. The formation of 3-methyl-Δ^3-buten-1-ol from *iso*butylene is then formulated thus:



(I, $R_2 = H_2$)

Quite apart from the fact that such a mechanism still involves an 'active' α-methylenic hydrogen atom, there are specific objections to such a view. First, this mechanism only gives the correct structure for the reaction product when the olefine is of the type $CH_3.CR : CH_2$, because, in such cases, it is impossible to differentiate structurally between a $=CH_2$ group formed from the initial CH_3 group and the $=CH_2$ group of the parent olefine. The British patent[3] states that the reaction is valid for *all* olefines of the type $CRR' : CR''.CH_3$. Thus, 2-methyl-Δ^2-pentene should, by Price's mechanism, afford 2-ethyl-3-methyl-Δ^3-buten-1-ol (I, R_2=H, Et). The product obtained is stated to be 3-methyl-Δ^3-hexen-1-ol, $CHEt : CMe.CH_2.CH_2OH$ (II), the expected product from a mechanism

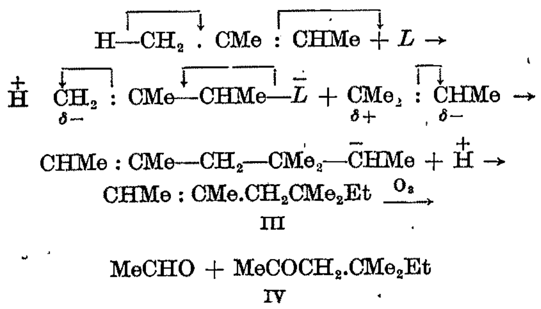


$$H-CH_2-CMe=CHEt\ L \rightleftharpoons \overset{+}{H}\ CH_2=CMe-CHEt-\bar{L}$$

$$\bar{L}-CHEt-CMe=CH_2\quad CH_2=O\quad \overset{+}{H} \rightarrow \quad (II)$$

Secondly, the British patent states specifically that "the catalyst is non-acidic", meaning by this that no *hydrogen* acid is present. The reaction is effected in aprotic solvents and the effective catalysts are molecules like stannic chloride, etc., which are strong acids in the Lewis sense[4].

The validity of this argument has been challenged[5] on the grounds (i) that no evidence for the structure of the unsaturated alcohol (II) is given in the British patent, and (ii) that minute traces of the proton-donator, water, might well be present under the experimental conditions employed. The essential feature of the mechanism which is challenged by Price is that addition of a Lewis acid to an olefine can cause direct separation of a proton from the olefine in the presence of a proton-accepting reagent[6]. In the reaction between phenyl *iso*cyanate and trimethylethylene in the presence of stannic chloride under conditions which were proved to be rigorously anhydrous[6], considerable stannic chloride-catalysed polymerization of the olefine also occurs. The dimeride fraction of this polymeride, on ozonolysis, affords *only* acetaldehyde (: CHMe end-group) and a mixture of two isomeric methyl hexyl ketones, separated by fractional crystallization of their semicarbazones into two pure products, m.p. 174° and 154°, respectively. The ketone giving the semicarbazone, m.p. 174°, has now been proved, by direct comparison with a synthetic specimen, to possess the structure (IV), derived from the dimeride (III), in which one molecule of trimethylethylene has added on as the fragments $\overset{+}{H}$ and $\overset{-}{C}H_2.CMe:CMe_2$ to a second molecule, polarized in the normal direction. It is difficult to explain the formation of a dimeride of structure (III) except by a mechanism which involves the direct separation of an α-methylenic proton from the olefine, already activated by hyperconjugation[7], under the influence of the Lewis acid ($L = SnCl_4$), thus:



$$H—CH_2 . CMe : CHMe + L \rightarrow$$

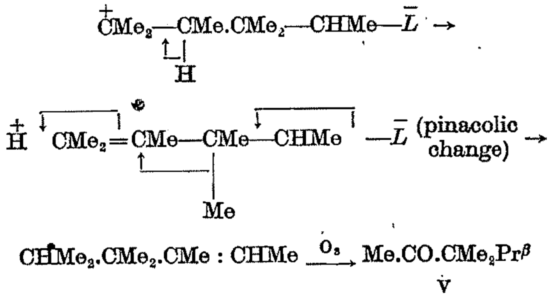
$$\overset{+}{H}\ \underset{\delta-}{CH_2} : CMe—CHMe—\overset{-}{L} + \underset{\delta+}{CMe_2} : \underset{\delta-}{CHMe} \rightarrow$$

$$CHMe : CMe—CH_2—CMe_2—\overset{-}{C}HMe + \overset{+}{H} \rightarrow$$

$$\underset{\text{III}}{CHMe : CMe.CH_2CMe_2Et} \xrightarrow{O_3}$$

$$\underset{\text{IV}}{MeCHO + MeCOCH_2.CMe_2Et}$$

If, as required by Price's mechanism, the sole function of the Lewis acid catalyst were to produce a carbonium cation $\overset{+}{C}Me_2—CHMe—\overset{-}{L}$, the initial dimerization should occur to give the intermediate $\overset{+}{C}Me_2.CHMe.CMe_2.CHMe_2—\overset{-}{L}$, which could not give the structure (III) by any acceptable proton migration. The most probable rearrangement of such an intermediate would be



$$\overset{+}{C}Me_2—CMe.CMe_2—CHMe—\overset{-}{L} \rightarrow$$

$$\overset{+}{H}\ CMe_2{=}CMe—CMe—CHMe\ —\overset{-}{L}\ \text{(pinacolic change)} \rightarrow$$

$$CHMe_2.CMe_2.CMe : CHMe \xrightarrow{O_3} \underset{\text{V}}{Me.CO.CMe_2Pr^{\beta}}$$

Although the structure of the second ketone (semicarbazone, m.p. 154°) has not yet been established, it has been proved by direct comparison with a synthetic specimen that it is *not* identical with the ketone (V), which, incidentally, gives a semicarbazone, m.p. 153°, depressed to m.p. 139–140° by admixture with that of the ozonolysis ketone.

A fuller account of this work will be published elsewhere when the structure of the second methyl hexyl ketone has been established.

Formation of Hydroxy Peroxides

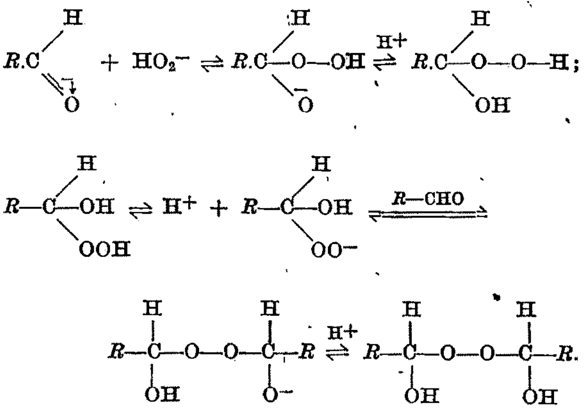
The reactions of hydrogen peroxide, and alkyl hydrogen peroxides, with organic compounds are usually regarded as homolytic processes. This note outlines evidence which suggests that the peroxidations of aldehydes are almost certainly of a heterolytic character. In such reactions, hydrogen peroxide behaves as a nucleophilic reagent, attacking through its anion HO_2^-, just as hydrogen cyanide attacks[1] through its anion CN^-.

As evidence in favour of this mode of attack, we find, using a spectroscopic method, that the formation of hydroxy alkyl peroxides from aldehydes with hydroperoxides is catalysed by bases such as pyridine, and by acids, and proceeds more rapidly in organic solvents such as ether than in the gas-phase; the reaction is insensitive to illumination by daylight. Various workers[2] have shown that, with reservations regarding formaldehyde, these reactions are reversible.

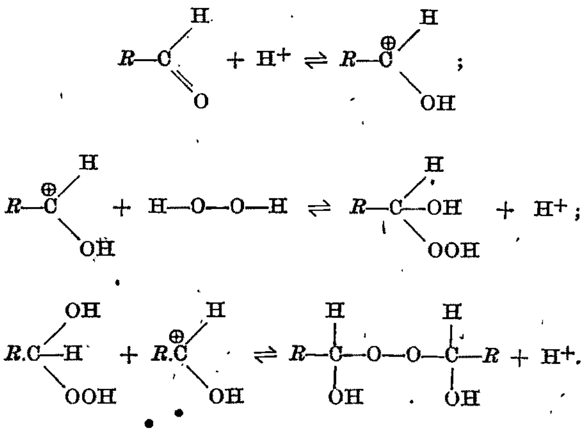
We formulate the reactions thus:

In basic or neutral solutions:

$$H_2O_2 \rightleftharpoons HO_2^- + H^+ ;$$



In acid media:



Further investigations of these and other nucleophilic reactions of hydroperoxides are in progress.

It has come to our notice, immediately before this letter was submitted, that Dr. Style and his co-workers at King's College, London, are investigating the reactions between hydrogen peroxide and aldehydes in water.

Reaction between Manganous Ion and Manganese Dioxide

The decrease of manganous ion concentration which occurs when a manganous salt is shaken with manganese dioxide has been known for a long time. Being most marked with freshly precipitated oxides, it is not surprising it should first have been considered an adsorption. For some time this observation has found practical application in the removal of soluble manganese in water supplies[1], while recently it has been shown of significance in the chemistry of the dry cell depolarizer[2], and also in the oxidation-reduction cycle of manganese in the soil[3,4].

In all instances the primary reaction is probably

$$MnO_2 + Mn^{++} + 4H^{+} = 2\,Mn^{+++} + 2H_2O.$$

Except in the presence of concentrated acid, the equilibrium is such that the amount of Mn^{+++} is very small. In the presence of pyrophosphoric acid, which forms a stable complex anion with trivalent manganese[5], the reaction may proceed far to the right[4]. In the absence of complex-forming substances and in neutral and slightly alkaline solutions, a new solid phase appears, the reaction again proceeding to the right. One solid phase which has been observed at *p*H values as low as 4·5 has been identified as manganite[2]. Its formation may be shown by rewriting the above equation so as to assume hydrolysis of the manganic ion, thus

$$MnO_2 + Mn^{++} + 2H_2O = 2MnOOH + 2H^{+}.$$

Dion and Mann[3] state the reaction proceeds only in the reverse direction. This is contrary to the above findings[2] and to our own. In seeking a cause for potential drift with a manganese dioxide electrode[7], we have found that some such reaction proceeds even when the dioxide has the dense heat-stable pyrolusite structure; that it leads to the production of a lower oxide even at *p*H values as low as 1; and that this oxide has a structure not previously described.

Half-gram portions of dioxide obtained by heating pure manganous nitrate were allowed to stand for two days at room temperature with 50 ml. of the solutions shown in the accompanying table. The solid residues after washing and drying at room temperature *in vacuo* were examined by one of us (J. M. C.) by both the X-ray and electron diffraction methods. In each instance the X-ray powder pattern showed only the lines of pyrolusite. However, the electron diffraction pattern from the sample treated with hydrochloric acid and manganous chloride had rings distinctly different from those of pyrolusite. The other treated samples gave a pyrolusite pattern, but in addition showed weakly the stronger rings of the new pattern. When manganese dioxide is dissolved in concentrated hydrochloric acid and the manganese tetrachloride hydrolysed, this new pattern is not obtained, but rather the pattern of γMnO_2 or of pyrolusite[6].

Reactants	X-ray diffraction pattern	Electron diffraction pattern
Original MnO_2	pyrolusite	pyrolusite
MnO_2, $MnCl_2$ 0·1 *M*, HCl 0·1 *M*	pyrolusite	pyrolusite and new oxide (strong)
MnO_2, HCl 0·1 *M*	pyrolusite	pyrolusite and new oxide (weak)
MnO_2, $Mn(ClO_4)_2$ 0·1 *M*, $HClO_4$ 0·1 *M*	pyrolusite	pyrolusite and new oxide (weak)

The rings of the new pattern given by the sample treated with hydrochloric acid and manganous chloride show arcing when the specimen is tilted, most of the arcs lying along one diameter. This indicates that the substance is in the form of thin flakes, of the order of 100 A. or less in thickness, lying flat on the supporting film of collodion. It seems probable that these flakes were formed by the breaking-off of an altered surface layer from the particles during the process of grinding the sample under secondary butyl alcohol. Lattice spacings and ring intensities are given below.

D	Int.	*D*	Int.
5·1	W	1·74	M
4·39	S	1·62	M
4·12	S	1·58	MW
3·34	W	1·50	W
2·46	S	1·30	W
2·35	M	1·27	MW
2·06	MW		

This pattern is similar to that of goethite, $\alpha FeOOH$, and there is good agreement between the observed spacings and those calculated for an orthorhombic cell with dimensions $a = 4{\cdot}42$, $b = 10{\cdot}4$, $c = 2{\cdot}83$ A., which are close to the dimensions of the goethite cell. However, interpreted on this basis, some reflexions are present which are not permitted by the space group of goethite, and some reflexions given by goethite are absent. Hence the substance cannot be considered as truly isomorphous with goethite. The data are not sufficient to allow a more definite determination of structure. Recently Gruner[8] has briefly described a new mineral (groutite) found in Minnesota which has the cell dimensions $a = 4{\cdot}56$, $b = 10{\cdot}70$, $c = 2{\cdot}85$ A. It is considered, however, that these dimensions differ significantly from those of the oxide described here. No manganese analogue of goethite is reported by Dana, who lists the groups:

goethite ($\alpha FeOOH$), diaspore ($\alpha AlOOH$),
lepidocrocite ($\gamma FeOOH$), boehmite ($\gamma AlOOH$),
manganite ($\gamma MnOOH$).

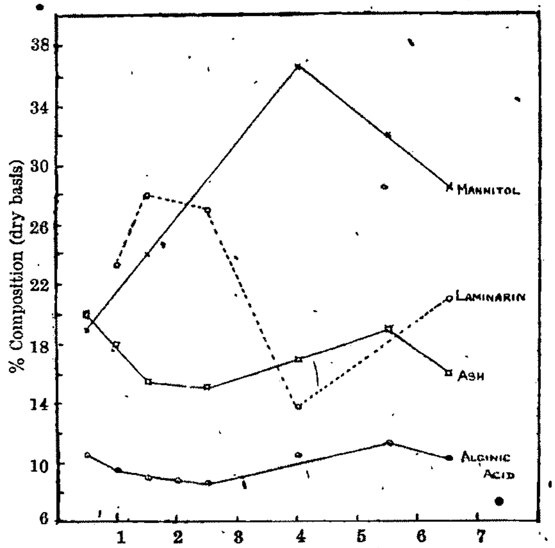
Seasonal Variation in Chemical Constitution of some Common British Laminariales

It is well known that seaweed, vast quantities of which grow around the coast of Scotland, undergoes wide seasonal variation in chemical constitution. Very little use has been made of these seaweed resources, which may be due to the fact that in Britain they have never been studied intensively from a chemical point of view, and no simple analytical methods have been available for the estimation of the various constituents. The future of any seaweed industry now depends on a thorough knowledge of the organic constituents, which are mainly polysaccharide in nature, and it is the latter which are subject to such wide seasonal variation. It is important, therefore, that the variation of the chemical constituents throughout the year be known, so that the seaweed may be harvested at the appropriate period in order that the constituent required will be at its maximum.

During the past three years, the Scottish Seaweed Research Association has each month been collecting, off the west coast of Scotland and in the Orkneys, samples of the principal British Laminariales. Before drying and preparing the plants for analysis, they are separated into fronds and stipes and analysed individually. Previous workers[1] have apparently analysed the whole plant, and they give no details of the methods of sampling, drying, etc., which are of great importance in plant analysis. During our investigations, every effort has been made to collect the plants from the same habitat and to dry and prepare the samples for analysis under controlled conditions.

Our results have shown that the wide seasonal variations in constitution previously recorded are due almost entirely to variations in the composition of the fronds, which are annual, whereas the stipe is perennial, and it is in the frond where most of, if not all, the photosynthesis occurs. In the spring of each year the frond is renewed, when its composition is approximately the same as that of the stipe; that is, high in mineral matter, proteins and alginic acid; low in mannitol, and containing no laminarin. As photosynthesis proceeds, the mannitol accumulates in the frond and reaches a maximum about midsummer, while laminarin reaches a maximum in the late autumn when the mineral matter is at a minimum and the dry-weight content at a maximum.



Variation in composition of *L. Cloustoni* fronds from Orkney with depth of immersion (August, 1946)

It is interesting to note that, in all the samples analysed, very little or no laminarin was found in the stipes; and it is quite probable that it is entirely absent.

Variation in chemical composition, however, depends on another important factor, the depth of immersion of the seaweed. The relationship between the depth of immersion of Algæ and their metabolism, as expressed by their chemical composition, has previously been noted by Haas and Hill[2] and Barbara Russel-Wells[3], who found a direct increase of fats and fat-like substances with degree of emergence and an increase in the unsaponifiable residue with depth of immersion. No other work appears to have been carried out on this important aspect.

In August 1946, samples of *L. Cloustoni* were taken from the Orkney waters at depths of ½–6½ fathoms (dead low water ordinary spring tides), and the analysis of the fronds, given in the accompanying graph, show remarkable variations.

The mannitol content (36·7 per cent), even when expressed on the whole plant, is considerably greater than any figure previously recorded. In addition, the iodine content increases with depth of immersion and reaches the remarkable figure of 1·25 per cent (on the anhydrous basis) at 7½ fathoms.

Further samples of the *Laminaria Cloustoni*, *Laminaria digitata* and *Laminaria saccharina* have been taken in Orkney in May and July of this year, and the results so far obtained support the previous findings.

This work is being continued and a more detailed report will be published later.

Aerobic Mesophilic Bacteria in Composts

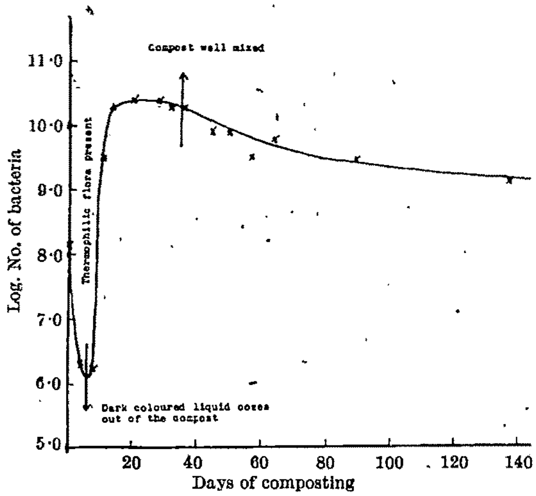
In a previous communication[1], an account was given of the activity of the thermophilic flora which develops in composts made from grass cuttings (lawn mowings). This thermophilic flora can be seen as a white coating on the cuttings, particularly in the upper layers during the high-temperature phase. From it true and facultative thermophilic bacteria were isolated. Recently, in addition, evidence of the presence of a thermophilic actinomycete has been obtained (cf. Waksman *et al.*[2]).

The object of this communication is to give a general account of the behaviour of the aerobic mesophilic bacterial flora of this type of compost. The accompanying table gives the results of bacterial counts using the dilution plate technique (plates incubated at 25° C. for seven to nine days) obtained from samples taken from the centre of composts at different times during the composting period. The moisture content remained practically constant throughout this period.

No. of days of composting	Internal temp. of compost	Bacterial numbers (millions per gm. fresh material)
0 (fresh cuttings)	20° C.	155×10^6; 117×10^6; 87×10^6; 35×10^6
2	65° C.	$2{\cdot}2\times10^6$; $2{\cdot}16\times10^6$; $3{\cdot}7\times10^6$
4	54·4° C.	$17{\cdot}48\times10^6$; $3{\cdot}68\times10^6$; $3{\cdot}84\times10^6$
11	30° C.	$3{,}275\times10^6$
28	15° C.*	$13{,}000\times10^6$; $12{,}100\times10^6$; $5{,}750\times10^6$
64	15° C.*	$10{,}385\times10^6$; $11{,}815\times10^6$; $11{,}500\times10^6$

* Reached outside temperature

It will be seen that there is a reduction of the mesophilic bacterial flora present on the fresh material at the high-temperature phase (65–55° C.). When the temperature of the heap falls below this, there is a very striking development of the mesophilic flora. The general picture of the bacteriology of this type of composting can best be shown by plotting the logarithm of the bacterial numbers against the days of composting.



CHANGES IN THE AEROBIC BACTERIAL FLORA (DEVELOPING ON NUTRIENT AGAR) DURING THE COMPOSTING OF GRASS CUTTINGS. CURVE REFERS TO MESOPHILIC BACTERIA

A similar course of events has been found with the mesophilic flora of a straw compost prepared following the principles of Hutchinson and Richards[3]. In the case of straw, however, no liquid appears during the composting (at least under our conditions), and the development of a thermophilic bacterial flora is not so obvious.

Pre-erythrocytic Stage in Mammalian Malaria Parasites

Shortt and Garnham have announced [*Nature*, January 24, p. 126] the discovery of plasmodial masses in the livers of two monkeys six and seven days respectively after inoculation with sporozoites of *Plasmodium cynomolgi*. These plasmodial masses apparently form the long-sought pre-erythrocytic stage of mammalian malaria parasites, and it is to be expected that human malaria parasites will show similar developmental changes in the incubation period of an infection. Prof. Shortt has very kindly shown me his preparations, and I write to confirm his discovery by the finding of similar parasites in my own laboratory.

For several years we have studied the life-cycle of avian and simian malaria parasites, and biological information has been collected about development of *P. cynomolgi*. After the injection of sporozoites into the skin of monkeys, sporozoites have been demonstrated microscopically at the site of injection for 4½ hours but not longer; these sporozoites lie extracellularly and probably represent forms which fail to develop further. By subinoculation, sporozoites have been demonstrated in the blood of a limb (in which circulation had been arrested by a tourniquet) as late as two hours after intradermal injection. Following this initial period (as is well known) the blood ceases to be infective on subinoculation for approximately eight days. The time at which infectivity returns is sharply defined. Monkeys inoculated with blood taken at 7 days 21 hours, at 7 days 15 hours, and at many shorter periods never became infected; monkeys inoculated with blood taken at 7 days 23 hours, 8 days 4 hours, or longer periods did become infected. Meticulous examination of blood films between the eighth and thirteenth day of the infection showed that the entry of parasites into the blood stream was not synchronous but that it was a continuous process spreading over several days. Subinoculation of tissues (including liver) from monkeys during the inoculation period was done repeatedly; but no transmission was ever achieved with tissue removed less than 7 days 23 hours after the injection of sporozoites. The tissue forms were not transmissible by this means.

Our attempts to locate and identify the tissue forms were unsuccessful until Prof. Shortt's kind demonstration of this preparation. On re-examination of our sections, forms similar to those he has described have been found in the livers of three monkeys. In one experiment, a three months old rhesus monkey was inoculated intravenously and parenterally with the glands from 120 infected mosquitoes. It was killed 7 days 23 hours later. The blood, liver, lung and spleen respectively were infective to other monkeys, but other organs did not produce infection. Large plasmodial masses (average diameter about 28 μ) have been found in the liver; this monkey had been bred in the laboratory, so there could be no question of some other natural infection acquired in India. Similar forms have been found in the liver of a monkey killed 7 days 15 hours after the intravenous injection of the ground-up thoraces of 1,000 infected mosquitoes; the blood and organs were not infective for other monkeys. A third monkey was inoculated intravenously with a suspension of 40 infected mosquitoes (ground up), and it was killed exactly five days later. The blood, liver and other organs did not infect monkeys into which they were sub-inoculated, but parasites (average of longest diameter 14 μ) have been found in the parenchymatous cells of the liver.

In all these cases, parasites are much more scanty and difficult to find in smears than in sections. Further investigation is proceeding.

Variations in Spermatogenesis of Oligospermic Men

In two cases of barren marriage due to severe oligospermia of the husbands, pregnancy occurred notwithstanding spermatic counts of 5,200,000 and 10,000,000 per c.c. Owing to the fact that both couples were extremely religious Jews, extra-conjugal relations could be excluded. Since fertilization with such low spermatic counts seemed improbable, it occurred to us that variations in the spermatogenetic function occur in certain cases of oligospermia. Thus, fertilization might take place at a time when higher spermatic levels are reached.

We have, therefore, examined a group of twenty-one men selected on the basis of a very low spermatic count on first semen examination (less than 10 million per c.c. in twelve cases, less than 20 million per c.c. in five cases and less than 30 million per c.c. in four cases). The total number of spermatozoa in the ejaculate was less than 90 million per c.c. in each. In all these cases the wives were excluded as responsible for barrenness. In order, to study the spermatogenic function, five to seven semen analyses were performed in each case. Each specimen was taken after a period of abstinence of five days.

These semen analyses revealed two types of spermatogenesis in this series. In the first type (thirteen cases) the spermatozoal count was fairly constant, and the differences between any two spermatic counts did not exceed 12 million per c.c. The other seminal characteristics associated with spermatogenesis (sperm motility and percentage of normal spermatozoa) were also quite constant. In the second type (eight cases), extreme variations in the spermatozoal count were observed on repeated examinations. These variations in the spermatic density were as much as 43·5 million per c.c. in the same patient, at different examinations. In five of these cases values as high as 60 million per c.c. were reached. The other spermatic characteristics (motility and morphologically normal spermatozoa) also showed significant variations, although not so striking as the spermatic density.

During the period of observation (4–23 months) conception occurred in two of these barren marriages. In both cases the husbands belonged to this second type of oligospermia.

These observations lead us to distinguish between two types of oligospermia: (1) constant oligospermia, characterized by constancy of a poor spermatogenetic function; and (2) periodic oligospermia, characterized by periodic variations in spermatogenic characteristics; so that in one or more of a series of semen analyses normal values may be reached. Fertilization in this type of oligospermia may well occur.

The value of any therapeutic agent in the treatment of oligospermia should be studied only in cases of constant oligospermia. In view of the above reported observations, many therapeutic reports in cases of oligospermia might be considered as doubtful.

A detailed report of this study will be published elsewhere.

Honeydew on Lime Trees

The dry summer of 1947 led to the accumulation of large amounts of honeydew secreted by the aphis *Therioaphis tiliæ* (L.) on the leaves of European lime trees. Sufficient often dripped to the earth to give a hard coating to the surface.

Portions of leaves (40 gm. dry weight) were gathered by tearing off the edges bearing the honeydew, which had sometimes dried to form a white solid. The leaves were steeped in cold water for 30 min. and the extract (440 ml.) filtered, giving a clear, slightly green liquid. Soil (230 gm.) was scraped from beneath a lime tree and extracted with 200 ml. water. After being heated on the water bath for 45 min. the extract was centrifuged and filtered, yielding a clear, green-brown solution.

Total fructose was estimated in these extracts by the method of Corcoran and Page[1], and reducing sugars were determined, before and after 15 min. hydrolysis at 100° C. in $N/2$ hydrochloric acid, by the method of Somogyi[2]. It was assumed that the hydrolysable non-reducing sugar was sucrose, and that reducing non-fructose sugar before and after hydrolysis was glucose.

Sugars excreted by aphis on European lime tree

	Gm. sugar/100 gm. leaf or soil			
	Sucrose	Glucose	Fructose	Total sugars
Leaves	12·3	8·3	9·2	29·8
Soil	4·7	1·5	1·4	7·6

The results given in the accompanying table show that the amount of sugars secreted by the aphis on to the leaves of lime trees is surprisingly large, and must amount to several kilograms for an average-sized tree. About half the total solids of both extracts consisted of sugars.

My thanks are due to Prof. C. H. O'Donoghue for his interest in this work.

Structure of Cyclopropane

Although I am pleased to note that Dr. A. D. Walsh has made a final contribution to this discussion, it may nevertheless be possible to correct a mis-statement. He says[1] that I take the usual formula to represent only the position in space of the atoms involved. What I actually wrote was[2]: ". . . to the usual formulæ. These represent nothing more than the mode of linking of the atoms in the molecule, combined with an indication of the degree of symmetry of the statistical distribution of electrons". Or again[3]: "The formula represents only the mean position in space of the atoms (kernels) and the mode of binding (that is, the structure disclosed by analysis, synthesis, X-ray crystal evidence, etc.)".

COMPLEXITY OF FRESH *HEVEA* LATEX

By Miss L. N. S. HOMANS, J. W. van DALFSEN

AND

G. E. van GILS

Netherlands Indies Rubber Research Institute,
Buitenzorg, Java

ALTHOUGH under difficult conditions, the work at the Netherlands Indies Rubber Research Institute at Buitenzorg (Java) was continued during the Japanese occupation. Since it will be a long time before the accumulated results of the years 1942–45 can be published in detail, some points of general interest are reported here.

It is common knowledge that upon addition of small amounts of salts of bi- or poly-valent cations to fresh latex, a partial coagulation follows. The yellow-coloured coagulum generally contains 10–30 per cent of the rubber and gives after drying a yellow rubber, rich in proteins and having a high acetone extract. The high acetone extract and the colour are produced by the yellow particles, first observed by Frey-Wyssling, which although generally called 'resin particles', contain mainly lipoids. What, however, is the reason of the high protein content?

In 1941 it was observed by one of us (L. N. S. H.) that when fresh latex is centrifuged in tubes, a separation occurs into a heavy yellow fraction, taking up a tenth to a third of the total volume, and a lighter white fraction. The yellow fraction is more viscous and often in itself consists of various layers, bright yellow, grey yellow, orange or even green coloured. Much information was obtained by studying separately the chemical composition, colloid-chemical and enzymological properties of these fractions.

The difference in composition is evident from the following example:

	Original latex	White fraction	Yellow fraction
Ratio of weight	100	76·3	23·7
Specific gravity	0·977	0·966	?
Viscosity (centipoises)	11·7	9·2	?
Dry rubber content (%)	34·8	43·7	9·0
Total solids (%)	37·4	45·8	14·3
Nitrogen content (%)	0·24	0·22	0·33
Ash content (%)	0·60	0·47	1·11
pH (fresh)	6·3	6·9	5·7
Crepes prepared from the sample had:			
Nitrogen content (%)	0·37	0·34	0·73
Ash content (%)	0·15	0·13	0·50
Acetone extract (%)	2·42	2·10	6·99

It is clear that a large part of the non-rubber constituents of the latex assembles in the yellow fraction, whereas the white fraction is a purer rubber dispersion than the original latex. In spite of its higher rubber content, the white fraction is less viscous, even after ammoniation, and consequently it has better creaming properties.

Another important difference is in their behaviour on standing. Whereas the original latex coagulates spontaneously after about twelve hours, the white fraction may stay fluid for days. The yellow fraction, on the other hand, coagulates within a few hours. This probably is a consequence of the fact that all enzymatic reactions in the yellow fraction are much more pronounced than in the white fraction, giving rise to accelerated splitting of large-molecule complexes and the formation of free fatty acids which, in their turn, in the presence of magnesium ions, effect spontaneous coagulation[1]. The addition of a freshly made pancreas lipase extract accelerates the spontaneous coagulation of the yellow fraction considerably, is less active in the original latex and has scarcely any influence on the white fraction.

A clear demonstration of the greater activity of enzymes in the yellow fraction is given by the dark discoloration on the surface, which is caused by oxidizing enzymes. On standing exposed to air, latex sometimes becomes discoloured on the surface, turning grey or greyish-purple. The white fraction never becomes discoloured; but the yellow fraction always becomes dark grey or purplish-black, often very quickly. Gas formation occurs in the yellow fraction earlier and to a much greater extent than in the white fraction.

Microscopic observations. The complexity of fresh latex, caused by the existence of the yellow fraction, is even observable under the microscope provided the latex is examined in a thin layer and with a small magnification (60–200) and that it is not diluted. The rubber dispersion then is visible as a highly absorbent mass; the rubber particles are not visible separately; but the whole mass is constantly glittering and twinkling in consequence of Brownian movement. The yellow fraction, on the other hand, appears as irregular shaped transparent 'islands' with an irregular structure. The great difference in viscosity is evident. By pressing on the cover glass, streaming of the rubber dispersion is easily effected; but the bright 'islands' are viscous and change their shape only slowly and with difficulty. The phenomenon is especially clearly observable in latex from twigs and from young trees, since in such lattices the yellow fraction takes up a large, even the larger, part of the volume.

Stability. In old ammoniated latex the yellow fraction is no longer present. Resin particles may be observed, but not the viscous matter just described. This is easily understood by observing under the microscope the picture which appears when alkali diffuses into fresh latex: the transparent viscous islands dissolve. Sometimes, however, the viscous matter is more resistant and in exceptional cases it was still present in ammoniated latex several weeks old. Not only the amount but also the properties are dependent on all kinds of biological factors, such as age and strain of the tree, place and frequency of tapping; possibly the season, the weather, even the soil may be of influence.

Very much in contrast to the influence of alkali is the action of distilled water. Now the viscous matter may be observed to stiffen and flocculate under the microscope. From this observation puzzling effects such as the rise in viscosity upon dilution of fresh latex with water, and the forming of clots upon dialysing, now become clear. The behaviour of the yellow fraction of *Hevea* latex upon addition of water is analogous to that of *Cryptostegia* latex[2], since coagulation results.

Dilution of the yellow fraction without a change in the consistency of the viscous matter is possible with a salt solution containing a monovalent cation of about 0·1 normality. With such a solution it becomes possible to wash the yellow fraction by repeated centrifuging, decanting and diluting. Moreover, under suitable conditions as to pH and the concentration of the monovalent cation, it is possible to separate the yellow fraction without centrifuging but simply by gravity. The fact that the addition of salt reduces the viscosity of the fresh latex very considerably is one of the reasons for this.

The true nature of the viscous matter in fresh latex is not yet known, but the properties resemble those of coacervates[3] very much; thus it seems probable that fresh latex contains a micro-coacervate which by centrifuging or under favourable conditions as to the viscosity goes over in a macro-coacervate.

The progress of our research work has been slowed down, first by the War and later it was interrupted by the unhappy conditions in Java; it is expected, however, that work at our Institute will be resumed in the near future.

STUDIES IN STOMATAL ACTION

Adequacy of the Porometer in the Investigation of Stomatal Aperture

IN the usual form of porometer a small cup is permanently attached to the leaf surface, air is drawn through the leaf into the cup under reduced pressure and either the rate of air flow is measured[1,2] or, in the 'resistance porometer'[3,4], the fall in pressure across the leaf and also that across a standard capillary resistance in series is found; from these pressure gradients the resistance to flow through the leaf is calculated. The rate of flow or the resistance to flow are functions, though very complex ones, of stomatal aperture. In earlier work porometers were used for the purely qualitative purpose of showing whether the stomata were opening or closing. Interest in the dynamics of stomatal movement[5,6] and in the relation between stomatal movement and carbon assimilation[7,8], however, made it desirable to attempt to estimate from porometer readings the resistance to viscous flow of the stomata alone, thus eliminating the confusing effects of the irrelevant internal resistances in the leaf. Hence, ultimately, making use of the less convenient 'diffusion porometer'[9] to calibrate the 'resistance porometer', the resistance to diffusion through the stomata might be estimated. With this end in view a mathematical theory of porometers was elaborated[10,4] and used to estimate stomatal resistances in *Pelargonium*[4].

During a recent investigation of shock-induced stomatal movements[11], it was found that with stomata open in the light, strips of epidermis taken by Lloyd's[12] method within the cup area showed very much wider apertures than those taken just outside the cup. This was at first attributed to the lack of shock sensitivity of the stomata within the cup[11]. The possibility existed, however, that the stomata outside the cup were not showing 'shock closure' on stripping of the epidermis, but actually had smaller apertures on the intact leaf than those within the cup. This, if true, would have an important bearing on the quantitative use of porometers, for the theory mentioned above demands the assumption that the stomatal apertures are the same inside and outside the cup.

A considerable number of experiments, carried out separately after consultation between us, has left no doubt that illuminated leaves, both of *Pelargonium zonale* and *Triticum vulgare*, have, in fact, much wider stomatal apertures where the surface is enclosed in a cup than elsewhere. This has been shown by a modification of Molisch's[13] injection technique using gentian violet in absolute alcohol (*Pelargonium* and *Triticum*) as well as by Lloyd's method and direct microscopical observation (*Pelargonium*). If part of the lamina of a *Pelargonium* or wheat leaf is merely placed between two glass strips and then, after two or three hours illumination, flooded with alcohol, heavy injection indicating wide open stomata is found where the leaf has been enclosed, and little or none elsewhere. Darkened portions show no injection either within or outside the enclosed area. Similar results are obtained using small chambers resembling porometer cups.

The conditions within a porometer cup differ from those outside in the following respects: (1) The air inside the cup is of restricted volume and at rest between readings (if the porometer is disconnected); it thus rapidly becomes saturated with water vapour, a process which is hastened by the drawing of air from the intercellular space system of the leaf into the cup during readings. In the case of *Pelargonium*, the concentration of ethereal oils must also be higher within the cup; with any species other gaseous substances may diffuse out of the leaf, and the oxygen and carbon dioxide tensions in the cup will also be affected. (2) The upper surface of the leaf above the cup is (normally) touching a glass plate. (3) The temperature within the cup may be slightly higher. (4) The leaf in the cup area is (usually) illuminated from above only, the cup shading the lower surface from any *direct* light.

The possible effects of these differences may now be considered.

(1) Experiments, each with a pair of porometer cups on the same leaf, one cup containing a desiccating agent (silica gel or calcium chloride) and the other empty or with moist broken porous tile, show similar wide stomatal opening in both cups, whether judged by porometer readings or Lloyd's method. These results seem to dispose of high humidity as the factor causing the wide opening within the cup. The ethereal oils of *Pelargonium* also seem unlikely to be important in this respect, for similar effects are found with wheat. The question of other variations in the composition of the air in the cup is discussed elsewhere[14].

(2) It is found that similar wide stomatal opening occurs when *Pelargonium* or wheat plants are enclosed in a bell jar, in a saturated atmosphere, with the leaves not in contact with the glass. Thus pressure of the glass plate on the leaf is not concerned. Similar plants outside the bell jar show little opening except where the leaves are enclosed between glass plates, as above.

(3) In the bell jar experiments just cited the difference in temperature inside and outside does not exceed $1\frac{1}{2}$° C. Thus the differences in aperture can arise in the absence of appreciable temperature differences.

(4) These experiments have been carried out with moderate light intensities—a 100-W. or 150-W. lamp, with running water screen, at 3–7 in. distance. It seems improbable that *reducing* the illumination of the lower surface of the leaf would cause wider stomatal opening. In all cases the usual closing response to darkening the upper surface has been found.

Whatever the cause of the wider opening within the cup, and this is the subject of a further communication from one of us[14], it is essential to overcome it if the porometer is to be used other than to show in a purely qualitative manner whether the stomata are opening or closing. The ideal to aim at is obviously to make the conditions within the cup the same as those outside. This has been to a large extent achieved by a simple modification of the form of resistance porometer used by Heath[4]. Air of the same composition and humidity as that surrounding the leaf is supplied to the porometer at a constant *increased* pressure by a simple aspirator working on the 'gasometer' principle. To avoid alteration of the humidity, medicinal paraffin is used in the aspirator and a light grade of the same in the manometers. As compared with the normal type of resistance porometer the pressure gradients are all reversed, but the manometer readings are used in the usual way, only the signs being changed. A hole in the glass or 'Perspex' plate pressing the leaf against the cup washer leaves all the upper leaf surface above the cup area open to the air. Between readings the cup is swept with a stream of the same air that surrounds the rest of the leaf, and during readings such air is being forced from the cup into the leaf through the stomata. There is therefore no tendency for water vapour or other gaseous substances from the leaf to accumulate in the cup. Using this modification of the porometer, preliminary tests with *Pelargonium* have indicated that the stomal apertures inside and outside the cup, as shown by Lloyd's method, are of similar magnitude. A preferable alternative to sweeping air through the cup would be the use of a detachable cup. Maskell[7], using the smooth-leafed cherry laurel, was able to use a cup with a gelatine washer which was simply pushed against the leaf and could be completely removed between readings. For hairy leaves such as *Pelargonium*, however, it is necessary to use a special design of detachable cup which leaves the washer in position on the leaf between readings. Such cups have been used previously for *Pelargonium* in the Research Institute of Plant Physiology, and the method is at present in use in experiments with wheat. A similar cup will now be tried with *Pelargonium*, which is easier than wheat to examine by Lloyd's method, to see whether it gives similar apertures within and outside the cup area.

It is likely that with readings of short duration a normal (reduced pressure) resistance porometer might safely be used; but the modification described above reduces the risk and does not appear to have any disadvantages. The 'gasometer' type of aspirator, which can, of course, be used for either increased or reduced pressures, has the important advantage over the usual type that there is no bubbling of the air through a liquid and hence the menisci in the manometers are absolutely steady and readings can be made instantaneously.

It should be emphasized that data obtained with the more usual type of porometer and a permanently fixed unswept cup are valid for the enclosed stomata so far as qualitative indication of opening or closure in response to light or darkness is concerned. The stomata within the cup do respond to light, and open much wider than those outside. It may be noted also that when used with double 'leaf chambers'[8], in which a considerable area outside the porometer cup is maintained under identical conditions, the normal type of porometer yields data which as an approximation at least may be treated quantitatively in the manner indicated elsewhere[4].

This work is continuing and will be published in detail in due course.

Control of Stomatal Movement by a Reduction in the Normal Carbon Dioxide Content of the Air

To account for the much wider stomatal apertures found within a porometer cup than elsewhere on an illuminated leaf[1], the hypothesis was examined that some volatile substance produced by the leaf itself caused opening of the stomata in light when in high concentration. On testing this hypothesis a considerable amount of experimental evidence was obtained in its favour. Thus detached leaves in water of *Pelargonium* or wheat, enclosed together with entire plants in a saturated atmosphere under a bell jar and illuminated for a few hours, showed wide stomatal opening when tested by the injection technique of Williams[1]; single leaves similarly enclosed by themselves, also in a saturated atmosphere and illuminated, showed little or no injection. On the other hand, similar single leaves of wheat each enclosed in a *small* volume of saturated air in a glass tube showed very heavy injection, as in the leaves from the crowded bell jars. When such tubes were swept continuously with a slow stream of humid air, little or no injection of the leaves was found.

The following statistically significant effects were thus obtained: (1) Heavier injection (wider stomatal opening) with many than with few or single leaves in the same large volume of humid still air; (2) heavier injection with single leaves in a small than in a large volume of humid still air; (3) heavier injection with single leaves in a small volume of humid still air than in humid moving air. Porometer experiments with *Pelargonium* showed that sweeping the cup with moving air, whether dry or humid, caused considerable stomatal closure as compared with still air. Similar results have been obtained with wheat, using dry air, by Mr. Milthorpe in this Institute. Darwin's[2] finding that removal of plants from a (presumably crowded) greenhouse to the laboratory caused stomatal closure, but that enclosure of the plants in bell jars caused the stomata to remain open or re-open, also seemed to support the hypothesis, although he himself attributed these effects to humidity changes.

There existed, however, the seemingly remote possibilities that all these effects were due either to the removal of carbon dioxide or the increase of oxygen concentration brought about by photosynthesis. The crucial experiments were therefore performed of sweeping porometer cups, attached to illuminated leaves of *Pelargonium* and wheat, with either carbon dioxide-free or ordinary air, both dry and humid conditions being investigated. It was at once found that moving carbon dioxide-free air, whether humid or dry, caused stomatal opening, sometimes even where the full opening in still air had been reached. This last implies sensitivity to extremely low carbon dioxide concentrations. Ordinary air at the same rate of flow caused very considerable closure. Rate of sweeping had virtually no effect between one and eight litres per hour (*Pelargonium*), and four litres per hour was adopted as standard. The effects of carbon dioxide-free and ordinary moving air in the dark were also investigated (*Pelargonium*). It was found that although carbon dioxide-free air would *prevent* complete closure in darkness and would also cause partial further opening of stomata which were not completely shut, if the stomata had been completely closed (resistance approx. infinity) by ordinary air they would not reopen in carbon dioxide-free air. This would seem to show that the effect of carbon dioxide is due to its concentration in the sub-stomatal cavities and not at the outer surface of the guard cells. In all these porometer experiments the modified resistance porometer[1] was used; the stomata were allowed to attain their equilibrium opening for each set of conditions before the conditions were altered, except in a few cases with saturated air, in which equilibrium was attained much more slowly than with dry air.

Supporting evidence for the 'carbon dioxide' hypothesis has been obtained from experiments in which single detached leaves of *Pelargonium* or wheat have been enclosed under bell jars, with or without a dish of $2N$ caustic soda solution, and illuminated for a few hours. Significantly heavier injection has been found for both species in the leaves from the bell jars with caustic soda, the effect being particularly striking with *Pelargonium*.

The porometer experiments not only dispose of the 'volatile substance' hypothesis, for such a substance should be equally swept away by either carbon dioxide-free or ordinary air; they similarly dispose of the 'oxygen' hypothesis. The only remaining possibility, apart from a carbon dioxide effect, seems to be that closure is caused by some other substance present in the air supply. Such a substance would have to be absorbed by caustic soda or soda lime but not by silica gel, phosphorus pentoxide or calcium chloride; nor by a solution of sodium thiosulphate, which was used to remove chlorine from humid air supplied by a water pump. Furthermore, such a substance must be of wide occurrence, for similar partial closure of stomata freely exposed to the air has been found at Bedford College[1,3] and in two laboratories in the Research Institute[1]. In the latter there was no gas supply nor tobacco smoke. On the present evidence, therefore, the 'carbon-dioxide' hypothesis seems by far the most plausible.

The effects of carbon dioxide on stomata have been investigated in a sporadic manner for more than fifty years, but the comparison has almost always been made between carbon dioxide-free or ordinary air and very high concentrations or even pure carbon dioxide. Darwin[2], using his 'horn hygroscope', found that the stomata in light "remain open in an atmosphere free from carbon dioxide". In pure carbon dioxide they were found to close slowly. He criticized Schellenberger's[4] finding, that in carbon dioxide-free air the stomata closed slowly, as being due to the use of relatively dry air; but the present work renders this explanation improbable, and many other factors, such as a diurnal rhythm of stomatal movement[5,6], may have been involved. Lloyd's[7] data for *Verbena ciliata* rather suggest that the stomata do not close readily in darkness in carbon dioxide-free air, but if already shut will remain closed; in light they open in carbon dioxide-free air. These results resemble some of the present findings but Lloyd does not direct attention to them. Linsbauer[8] investigated the effects of carbon dioxide-free air both in light and darkness, and found that in all experiments the removal of carbon dioxide favoured the opening of stomata in the dark. The effect in the light was stated to be the same but less pronounced owing to the stomata being already partly open. These entirely correct results have seemed suspect owing to the very crude technique by which they were obtained, for leaf fragments were held against a moist filter paper over solid caustic potash or a strong solution, and Linsbauer himself noted that the tendency of the leaf fragments to dry gave much trouble. High carbon dioxide concentrations were found to cause closure or failure to open in both light and darkness. Stahl[9] also found that high carbon dioxide concentration caused closure. Scarth[10] investigated the effects of high concentrations of carbon dioxide (10–50 per cent) and found in darkness closure followed after many hours by opening. In the light, opening was prevented. Carbon dioxide-free air was apparently not investigated.

The importance of the findings here reported would seem to lie in the discovery of the extreme sensitivity of the stomata to very small variation in carbon dioxide concentration (between *c.* 0·03 per cent and zero). This is found to furnish a plausible explanation of a number of hitherto obscure phenomena observed in the course of many years research on stomata in this Institute. Such a mechanism may well have the biological advantage for the plant that the stomata tend to close in wind and thus reduce the risk of desiccation due to excessive transpiration. That such stomatal control of transpiration in wind can occur is shown by moving air experiments at present in progress in this Institute, and is strongly suggested by the work of Wrenger[11].

The present work again raises the possibility that the light response of the stomata may be entirely due to the removal of carbon dioxide by photosynthesis, and the dark response to its accumulation inside the leaf, as has been suggested by Stahl[9], Sayre[12], Scarth[13] and others. Clearly, however, not only the carbon dioxide of respiration but the external supply also is of great importance, especially in the light, and much further work is needed.

The mechanism by which the carbon dioxide concentration controls movement of the guard cells also calls for much further investigation. The opening force in the stoma has been shown to be supplied ultimately by the turgor of the guard cells[14], but the intermediate steps between this and the carbon dioxide concentration in the substomatal cavity are quite uncertain. The evidence for the usual starch $\rightleftarrows$ sugar hypothesis, whether controlled through pH change or in any other way, is not convincing so far as the dark – light response is concerned[15].

This work will be continued and detailed publication will follow in due course.

SOCIAL AND SCIENTIFIC DEVELOPMENT OF THE WEST INDIES

THE considerable report by Sir John Macpherson, recently issued*, contains much valuable information relating to the work of the Development and Welfare Organisation in the West Indies. The report at once conveys an impression of how much is being done (or is under consideration) and how much there is yet to do. The contemporary situation in the West Indian Colonies, whether agricultural, economic, social or political, is complex. It has been long in the making, and wise foresight, good management, patience, industry and optimism will be needed before matters are put right. It is probably true to say that, in this region, there is now a general demand for conditions which will enable the local populations to enjoy a fuller and better life. In practice this means that improvements must be effected in almost every walk of life and in every branch of official activity.

The report opens with an informative general survey of West Indian affairs. Particular attention is given to such topics as agriculture, forestry, fisheries, education, public health, housing, town planning, labour conditions, social welfare, public works, etc. A special Welfare Fund, granted by the Exchequer of the United Kingdom, is available for promoting schemes for the general improvement of education, health services, land settlement, and the hundred-and-one projects which collectively will make for better conditions and opportunities for the native population of the West Indies.

Space does not admit of an adequate review of the contents of this report. But as an example of the treatment accorded to one major theme, agriculture may be selected. Here, as elsewhere, Sir John is direct and to the point. It is most sincerely to be hoped that his words will be heeded throughout the length and breadth of our Caribbean Colonies. The ideas are not new, but it is good to hear them forcibly restated at this time :

"The greatest need of the British West Indies to-day is the most intensive use of the land according to methods of good husbandry, both for export crops and local food crops. In no other way can a growing population be supported or the demands for higher standards of living be met. The intensive and balanced use of the land calls for far-reaching reforms in the basic methods now employed, and for improved education facilities and efficient advisory services. The reforms require special measures, some of which cannot be successfully applied until new knowledge acquired through scientific investigation has been made widely available. The work of the Development and Welfare organisation has been constantly guided by these fundamental facts."

It is heartening to read that the need for soil conservation is being more widely understood, that grass is being introduced as a rotational crop, and that there is an increasing disposition to realize that land, water and forest resources are "the foundation upon which better standards of life can be established".

As improvement in agriculture will necessarily depend on an advance in agricultural education, measures to achieve this end are in hand. Measures to assist peasant agriculture, to promote mixed farming adapted to West Indian conditions, to test communal and co-operative farming, and to improve livestock, etc., each has its place in the new agricultural outlook. The essential place of a wide system of researches, duly co-ordinated, is recognized. This matter has been given much attention, and a number of schemes have already been approved. Some of these, including problems of sugar technology, soil science, the improvement of cacao, genetics of tropical crops, including bananas, etc., will be centred at the Imperial College of Tropical Agriculture in Trinidad, while related investigations will be carried out in some of the other islands because of their special suitability for the work.

These notes give but a small sample of the contents of this document as they relate to agriculture. Attention is also given, in due measure, to the several other major topics mentioned above. The text, clearly but closely written, contains much interesting and valuable detail and should be carefully read by all who follow with interest and sympathy the new movement that is undoubtedly afoot in the Colonies.

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, February 2

FARMERS' CLUB (at the Royal Empire Society, Craven Street, London, W.C.2), at 2.30 p.m.—Dr. W. G. Ogg : "Soil and the Farmer".

ROYAL SOCIETY OF ARTS (at John Adam Street, Adelphi, London, W.C.2), at 4.30 p.m.—Prof. A. C. Frazer : "The Metabolism of Fats" (Cantor Lecture).

INSTITUTION OF POST OFFICE ELECTRICAL ENGINEERS (at the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London, W.C.2), at 5 p.m.—Dr. D. G. Tucker and Mr. F. Scowen : "Modern Approach to Transmission Networks".

SOCIETY OF ENGINEERS (at the Geological Society, Burlington House, Piccadilly, London, W.1), at 5.30 p.m.—Mr. E. E. Turner : Presidential Address.

Tuesday, February 3

UNIVERSITY COLLEGE LONDON (in the Anatomy Theatre, Gower Street, London, W.C.1), at 1.15 p.m.—Prof. L. S. Penrose : "Human Genetics".*

BRITISH SOCIETY FOR INTERNATIONAL BIBLIOGRAPHY (at the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London, W.C.2), at 2.30 p.m.—Papers.

ROYAL ANTHROPOLOGICAL INSTITUTE (at 21 Bedford Square, London, W.C.1), at 5 p.m.—Rev. Prof. E. O. James : "The Social Function of Anthropology".

ROYAL STATISTICAL SOCIETY, RESEARCH SECTION (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W.C.1) at 5.15 p.m.—Mr. W. L. Stevens : "Control by Gauging".

CONWAY DISCUSSION CIRCLE (at Conway Hall, Red Lion Square, London, W.C.1), at 7 p.m.—Dr. J. A. C. Brown : "Group Psychology in Industry".*

Wednesday, February 4

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 2.30 p.m.—Lieut.-Colonel L. Urwick: "Education for Management".

Institution of Electrical Engineers, Radio Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. J. H. H. Merriman and Mr. R. W. White: "The Application of Frequency Modulation to V. H. F. Multi-Channel Radio-telephony".

Royal Statistical Society, Birmingham Group of the Industrial Applications Section (in the Chamber of Commerce, 95 New Street, Birmingham), at 6.30 p.m.—Mr. K. Brownlee: "The Design of Experiments with Special Reference to the Chemical Industry".

Society of Public Analysts and other Analytical Chemists (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 7 p.m.—Messrs. D. W. Kent-Jones, A. J. Amos, P. S. Elias, R. C. A. Bradshaw and G. B. Thackray: "The Micro-analytical Test for Purity in Food, with special reference to Cereals".

Thursday, February 5

Royal Society of Arts, India and Burma Section (at John Adam Street, Adelphi, London, W.C.2), at 2.30 p.m.—Colonel D. J. Atkinson: "The Forests and Forests Resources of Burma".

Royal Society (at Burlington House, Piccadilly, London, W.1), at 4.30 p.m.—Dr. C. H. Kellaway, F.R.S.: "The Wellcome Research Institution".

Chemical Society (at Burlington House, Piccadilly, London, W.1), at 7.30 p.m.—Scientific Papers.

Friday, February 6

Institution of Chemical Engineers, North-Western Branch (at the College of Technology, Manchester), at 3 p.m.—Annual General Meeting; Dr. D. T. A. Townend: "Coal Utilisation".

Physical Society (in the Physics Department, Imperial College of Science, Imperial Institute Road, London, S.W.7), at 5 p.m.—Mr. M. Blackman and Mr. J. L. Michiels: "Efficiency of Counting Systems"; Mr. N. F. Astbury: "The Moving-Coil Galvanometer as a Circuit Element".

Institute of Navigation (at the Royal Geographical Society, Kensington Gore, London, S.W.7), at 5.30 p.m.—Dr. G. N. Harvey: "A New System of Compass Correction".

King's College (Strand, London, W.C.2), at 5.30 p.m.—Prof. I. L. Kandel: "American Universities and their Place in American Life".*

Geologists' Association (at the Geological Society of London, Burlington House, Piccadilly, London, W.1), at 6 p.m.—Mr. W. N. Croft: "A Year in Graham Land".

Royal Statistical Society, London Group of the Industrial Applications Section (at the E.L.M.A. Lighting Service Bureau, 2 Savoy Hill, London, W.C.2), at 6 p.m.—Dr. Geiss: "Quality Control in Europe".

Society of Chemical Industry, Manchester Section (at the Engineers' Club, 17 Albert Square, Manchester), at 6 p.m.—Dr. Herbert Levinstein: "Raw Materials for Rayon".

Society of Instrument Technology, Midland Section (at the Chamber of Commerce Buildings, New Street, Birmingham), at 7 p.m.—Mr. D. E. Edmundson: "Magnetic Materials as Applied to Instruments".

Society for Visiting Scientists (at 5 Old Burlington Street, London, W.1), at 7.30 p.m.—Prof. S. Loria and Mr. J. G. Crowther: "Science in Poland".

Society of Chemical Industry, Chemical Engineering Group (joint meeting with the Glasgow Section of the S.C.I., at Glasgow).—Mr. A. G. White: "The Manufacture of Explosive Substances".

Saturday, February 7

London County Council (at the Horniman Museum, London Road, Forest Hill, London, S.E.23), at 3.30 p.m.—Prof. H. J. Fleure, F.R.S.: "Ploughs and Soils—a Study of some Foundations for European Life".*

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Senior Lecturer in Aerodynamics, a Senior Lecturer in Mathematics, a Responsible Lecturer in Physics, a Lecturer in Mechanical Engineering, a Lecturer in Production Engineering, and a Responsible Lecturer in Electrical Engineering—The Principal, Royal Aircraft Establishment Technical College, Farnborough, Hants (February 7).

Principal of the School of Electronics, Malvern—The Chief Superintendent, Telecommunications Research Establishment, Great Malvern, Worcs, quoting 5/138/JFA (February 7).

Senior Lecturer in Physics and Electronic Engineering at the School of Electronics, Malvern—The Chief Superintendent, Telecommunications Research Establishment, Great Malvern, Worcs quoting 5/188/JFA (February 9).

Lecturers (2) in Mathematics—The Clerk to the Governing Body, Battersea Polytechnic, Battersea, London, S.W.11 (February 14).

Experimental Officer (graduate with knowledge of field plot technique and statistical analysis of experimental results), Horticultural Advisers (2, with recognized qualifications in horticulture), and Instructresses in Dairying and Poultrykeeping (2, with recognized qualifications in these subjects)—The Secretary, Edinburgh and East of Scotland College of Agriculture, 13 George Square, Edinburgh (February 14).

Research Assistant in the Department of Pharmacology and Therapeutics—The Registrar, The University, Sheffield (February 21).

Physicist in the Department of Meteorology—The Secretary, Imperial College of Science and Technology, South Kensington, London, S.W.7 (February 21).

Lecturers in Mathematics and Science (including physics, mechanical or electrical engineering, chemistry, or biology)—The Director of Studies, Royal Military Academy, Sandhurst, Camberley, Surrey (February 21).

Senior Research Officer in the Tobacco Branch of the Division of Agriculture and Lands, Southern Rhodesia—The Secretary, Office of the High Commissioner for Southern Rhodesia, 429 Strand, London, W.C.2 (February 27).

Assistant Technical Officers (2) in the Royal Mint—The Secretary, Civil Service Commission, Scientific Branch, 27 Grosvenor Square, London, W.1, quoting No. 2091 (February 28).

Lecturer in Statistics in University College, Dundee, and in the Conjoint Medical School, Dundee—The Secretary, The University, St. Andrews (February 28).

Chair of Genetics—The Secretary, The University, Edmund Street, Birmingham 3 (March 8).

Readership in Physics at Birkbeck College—The Academic Registrar, University of London, Senate House, London, W.C.1 (March 9).

Professor and Head of Metallurgy Department, Indian Institute of Science, Bangalore—The High Commissioner for India, India House, Aldwych, London, W.C.2 (Bangalore, March 10).

Lecturer in Economic Statistics in the Faculty of Economics, University of Sydney—The Secretary, Universities Bureau of the British Empire, 8 Park Street, London, W.1 (Sydney, March 31).

Scientific Officer (University graduate with 1st or 2nd class honours in Chemistry) in the Spectrographic Department—The Secretary, Macaulay Institute for Soil Research, Craigiebuckler, Aberdeen.

Chemist in connexion with the study of problems of fruit and vegetable preservation—The Director, University of Bristol Research Station, Campden, Glos.

Research Chemist—The Director of Research, Research Association of British Flour-Millers, Cereals Research Station, St. Albans, Herts.

Senior Research Chemist, a Senior Technological Chemist, Junior Research Chemists, and a Junior Research Physicist—The Director of Research, British Leather Manufacturers' Research Association, 1–6 Nelson Square, London, S.E.1.

Divisional Analyst, and Scientific Technologists (or Grade III Scientists), in the Coke Oven Laboratories—The Divisional Chief Scientist, National Coal Board (South-Western Division), Ystrad Mynach, Hengoed, Glamorgan.

Chemists and Physicists—The Director, Research Association of British Paint, Colour and Varnish Manufacturers, Paint Research Station, Waldegrave Road, Teddington, Middx.

Agricultural Zoologist in the Malayan Union—The Director of Recruitment (Colonial Service), Colonial Office, 15 Victoria Street, London, S.W.1.

REGIONAL DEVELOPMENT ORGANISATIONS IN BRITAIN

THE able study of local and regional development organisations in Great Britain made by Mr. M. P. Fogarty and published last year under the slightly misleading title, "Plan Your Own Industries" (Oxford : B. Blackwell, 1947. Pp. viii+320. 25*s.*), is of interest to the scientific worker from several points of view. His appreciation of the contribution which such bodies can make in bringing local initiative, enterprise and interest into regional planning, whether it be of industry, water-supply, housing, or any other social service, is valuable in the debate on local government reform and the decisions of the Boundary Commission, as well as in discussing the position of the development areas and of the utilization of land in Britain. Certain bodies of this type, notably the West Midland Group on Post-War Reconstruction and Planning, have made important contributions in this field, and Lord Rennell has already powerfully urged that the Boundary Commission should take adequate account of the scientific study of Herefordshire, for which the West Midland Group was responsible.

It seems clear from Mr. Fogarty's study that such bodies can materially assist in making the industrial development of a town or county a matter for genuine local discussion and decision, whatever changes in the organisation of local government may be instituted or regional organisations established. Any new system will require time to build up the essential local and regional advisory bodies ; and in the meantime the existing development organisations should have a most important part to play in preventing friction or misunderstanding as the Board of Trade panels considering the distribution of industry and the new Town and Country Planning Act come into full operation. In facilitating the Government approach and dealing with local plans and projects, and in making known, locally and regionally, the purpose of Government proposals and the reasons for them, development organisations could do much to facilitate the understanding, approval and co-operation which are the essence of genuine democracy at the local as at the regional level.

It would be too much to expect the development associations to make major contributions to the larger national problem, which, as Mr. George Gibson pointed out to the Manchester Statistical Society last autumn, is no longer that of bringing the work to the workers in the development areas, but increasingly of bringing the workers to the essential jobs where those jobs are now located. That contention is supported by the whole trend of the report on the Northern Region —Northumberland, Durham and the North Riding— which the North-East Development Association issued in May 1946. But some of the development organisations have also been responsible for pursuing exactly the kind of research advocated by the Barlow Commission on the geographical distribution of population and industry, and although the Government has not seen fit to implement the main recommendation of that Commission's report for the establishment of a central authority to control industrial location, the recommendations on the need for unified research appear to have been accepted implicitly, although action has not proceeded further than the appointment by the Board of Trade of a joint committee with the universities to deal with questions of research.

In the meantime, the study of land classification in the West Midland region issued last year by the West Midland Group shows how far such bodies have already gone in the prosecution of the required type of research. The West Midland Group has succeeded in bringing geographers and agricultural scientists together in a conference where agreement was reached on a system of classification based on the physical properties of soil and site. An expert committee then spent three years reconnoitring the land resources of the region; and the resultant study is a valuable contribution to the general problem of classifying land so as to distinguish the areas best suited for new settlement and industrial development from those best reserved for various agricultural purposes or for recreation and enjoyment.

Clearly such voluntary work has an interest and an importance far beyond the area in which it is being prosecuted, and it is well that an attempt should be made to assess both its extent and quality, and the relation of such efforts supported by private sources —like the Bournville Village Trust in the West Midland Group—to existing or projected national or regional efforts. For example, Sir Edward Appleton and others have strongly advocated the formation of joint research councils on the lines of that established two years ago in Manchester. There is at least some risk that, without co-ordination and consultation, effort may be duplicated in different regions or even in the same region by the different organisations.

It is accordingly important that an effort should be made to assess the value of the research work carried out by the development organisations and its place in the national organisation of research. Such an appreciation is essential to determine the proper apportionment of our resources of man-power in research and to avoid waste of both material resources and trained man-power. This is the aspect of these organisations which is of most interest to the man of science.

Examining the research activities of development organisations, Mr. Fogarty distinguishes three types of service which they render to industry and to their region. First, there is what may be described as general economic and social research—the study of social and economic facts and potentialities in a region against their wider national or even international background. Second comes the solution of technical or scientific problems arising in development, production problems, the study of new processes or inventions and the investigation of natural resources. Both these factors may clearly be described as research; but the third type of service would not usually be included under that head. This is the function of collecting and supplying factual information about, or to, an area on industrial or tourist facilities, openings for trade, the effect of new laws and regulations, local industrial organisation and the trend of public opinion in the area.

Although there are some exceptions—and Mr. Fogarty instances the second Industrial Survey of South Wales as a conspicuous example—the social and economic research conducted by development organisations has not been of high standard. Mr. Fogarty's review of their results and resources leads him to believe that at best the results of research conducted by such organisations are likely to be of limited value on account of the lack of staff and inadequate financial resources. For example, the University of Bristol Reconstruction Research Group has an annual income of about £3,000; but the total resources of the Bristol Development Board, which is not a conspicuously poorly endowed organisation as development organisations go, amount to little more than that sum.

The angle of approach is another factor to be considered, and this may be too narrow. Mr. Fogarty's considered opinion is that the smaller agencies will best serve research by promoting and encouraging the supply of detailed information and by efforts to improve its utilization. Reports from recent 'working parties' of the Board of Trade have pointed significantly to the need for improvement in this respect, and the gap between the discovery of new knowledge and its utilization in industry is already a matter of concern to the Department of Scientific and Industrial Research.

Here then is a point at which the development organisations may be able to offer an important and continuing service to the research effort of the country. Even the larger development organisations, in Mr. Fogarty's opinion, should not be expected to undertake general economic or social research on their own. The main responsibility for this should be carried by Government departments, the universities and regional authorities; the unique position and constitution of the West Midland Group should preclude it being quoted as typical of the type of organisation desired Much more research is required in this field from the universities and Government departments, as well as from regional authorities, which have scarcely commenced to discharge this responsibility even where they exist.

In regard to the second type of research considered by Mr. Fogarty, the larger development organisations such as the Welsh Reconstruction Advisory Council the Scottish and Welsh Development Councils, the National Industrial Development Council of Wale and Monmouthshire, and the Cumberland Development Council, have a good record for scientific and technical research. Despite their achievements in coal utilization, mineral survey, and the development of producer gas vehicles, it must remain a matter of opinion whether the development organisations do not here intrude on a field which is best left to industry and the research associations. They could undoubtedly help in some fields to discover and fill in the gaps in research effort; but from the national point of view it seems likely that their best contribution is mad by assisting to close the gap between research and commercial development, and supporting the work of the joint research councils.

In the field of research, development organisations, Mr. Fogarty concludes, are generally interlopers and at best stop-gaps. They are primarily executive bodies and unsuited, except in emergency, to conduct research. They can stimulate research, and have a valuable part to play in improving the utilization of research and in ensuring that results of economic and social investigations are turned to practical account.

These conclusions are not without significance for the research association movement in Britain. They emphasize the importance of adequate endowment of a research association to enable research to be prosecuted effectively: there are minimum standards below which it is waste of resources and of man-power to look for results. Mr. Fogarty's comment in regard to social and economic research, that by doing such research badly development organisations may make it impossible for better qualified agencies to do it at all, is relevant in considering the development of new, or the expansion of existing, research associations, as against the establishment of other co-operative agencies of the type of the Mellon Institute in the United States or the Fulmer Institute in Britain.

The point is of interest because there was nothing in Mr. Herbert Morrison's speech at Letchworth on January 14 (see p. 214) to indicate that the Advisory Council on Scientific Policy or the Committee on Industrial Productivity is considering this question of the type of research structure which will best serve our needs and make the most effective use of the available scientific man-power. The Lord President of the Council said that the Government had decided that the new town at Stevenage should be given preference in considering the sites of new scientific establishments in the London region, and although he could not state what actual research would be located at Stevenage or when it would come, he indicated that a number of research stations had outgrown their present sites and would have to move. He visualized Stevenage as becoming one of the most important scientific centres of Britain.

The Lord President was clearly alive to the importance of scientific research being well distributed over the country, and referred to the location in Scotland of the largest of the new scientific stations, that for mechanical engineering research. At the same time, he recognized that many of the research establishments must of necessity be in the London region. What was lacking in his speech was any clue to the reasons which had led to the choice of Stevenage as a scientific centre; the occasion may not have been appropriate, but men of science at least would find it reassuring if some indication was given of the considerations on which this decision is based.

The matter is important because criticism of the research association movement in Britain has centred around a tendency to locate the associations in the neighbourhood of London, where many are distant from the centre of industry they serve. Whatever substance there may be in such criticism —and the success of the Institute of Paper Chemistry at Appleton, Wisconsin, is frankly attributed to the location of the Institute in the midst of paper mills as well as to its close association with Lawrence College—the location of research institutions is a matter which might be well worth inquiry by, for example, the joint research councils and like regional bodies, if not by national organisations such as the Department of Scientific and Industrial Research. Considerations of man-power at least are likely to force it on the attention of the Advisory Council on Scientific Policy, if it has not already done so.

In his final conclusion, Mr. Fogarty comes back to a crucial factor which impels a review of the whole structure and location of the research effort in Britain at the present time, namely, that of staff. The success of the development organisations depends upon the quality of the staff they employ, and the initial problem is how to deploy to the best advantage in the national interest those limited resources of trained man-power which we possess. If encouragement of development organisations to continue and to expand their research activities means dissipation of the nation's research effort, waste of man-power and duplication, at a time when severe limitations have been imposed by the Government itself on capital expenditure, it may still be a wise measure to use the interval to turn to the task of promoting the utilization by industry of existing knowledge. That is a matter to be considered by the development councils as well as by higher authorities.

GREEK FISHES

A Glossary of Greek Fishes

By Sir D'Arcy Wentworth Thompson. Pp. vi + 302. (London: Oxford University Press, 1947.) 21*s*. net.

MORE than fifty years ago appeared "A Glossary of Greek Birds", which has been a treasure and a joy to two generations of scholars and naturalists. To the same learned and versatile writer, and the same 'blameless drudgery of lexicography', we owe now this companion volume, "A Glossary of Greek Fishes"—"a work of love and predilection all along". Doubtless with longer labour the "Glossary" might have been clothed in introduction and appendixes for the varied general problems and inquiries which it suggests; but the author has done well to ensure the publication of what is, after all, the essential compendium of facts; and some of the more difficult or more important items run to three or more pages, and the tunny has eleven.

Greeks knew much about fishes, as a maritime and insular people should, and revelled in names for them, and in legends, folk-lore, and acute observations; they were—and are—also connoisseurs of fish as food, and talked about what they ate and enjoyed. Even the almost fish-less "Epic" has its fishing similes and glimpses of marine life; how much it had forgotten or by-passed, we know from Minoan art. Herodotus had a quick eye for exotic fishes. Alexander disclosed a new ocean of tropical wonders, as well as the Nile with vocabulary and fishing-stories of its own. The western colonies transmitted Greek fish-lore, and added to it. Italian sailors brought their own names into Greek waters, without displacing the old vocabulary; and many modern fish-names are still Greek. Our own 'trout' may be a Greek name misapplied (p. 271). A dozen or more of names in this "Glossary" are printed in roman characters, being only preserved in Latin authors, though certainly known to the Greeks. It is interesting to note how many names defy derivation, and may well be pre-Hellenic; others seem to be borrowed from Egyptian. Almost none are from Phœnician, and the same applies to Greek shipping vocabulary; a devastating commentary on the old myth of Phœnician influence on Greek culture.

How fully the author has covered the field is evident from his 'addenda' (p. 297)—only three items. He has inevitably included much besides 'fishes' in the strict sense; for many molluscs and other *frutta di mare* shared the same names, or were otherwise connected with fisheries; lobsters, crabs, octopus and squid, oysters and 'purple-shells' are examples. There were also observations of fossil fishes and molluscs, and geological inferences, undeterred by Archbishop Usher. The picturesque accounts of fishes' characters and mode of life are not so fanciful as they seem; some are confirmed by modern observers. The female *scarus* may not insert its tail in a fish trap to enable its mate to escape; but the writer of these lines has seen the decoy fish in its bucket ready to be paraded along the rocky refuge of the *scarus*-shoal. Many fishes, too, make noises; if not calls, and perform extraordinary feats of agility, and of endurance on land. In this mass of minute detail there are almost no misprints: p. 191, *aestate* for *aetate*; p. 205, πήγανον for ῥήγανον; p. 239, *weel* perhaps for *creel*.

The picture of the tunny-seller on a Campanian vase (frontispiece) exactly confirms the dissection of the tunny described on p. 88. There are many line drawings, from Yarrell and other standard works, and from Egyptian frescoes.

May the author long enjoy the grateful appreciation of fish-lovers and etymologists. J. L. Myres

THE RACE FOR OIL

American Oil Operations Abroad

By Leonard M. Fanning. Pp. ix+270+93 plates. (New York and London: McGraw-Hill Book Co., Inc., 1947.) 20*s*.

"IT is even probable that the supremacy of nations may be determined by the possession of available petroleum and its products." This quotation, from President Coolidge, appeared on the title-page of a book by Ludwell Denny published in the United States in 1928 under the challenge "We Fight for Oil". This caused a sensation at the time, largely because it developed in no uncertain, often hostile, terms the theme of Anglo-American rivalry ('oil war' that author called it) in a race to secure the world's major oil resources outside the United States. Much has happened since this supposed 'menace' to world peace was so bitterly proclaimed, and those who remember the stir caused at the time by this strongly anti-British thesis will read with considerable interest another American's survey of how that fight has been carried on since the end of the First World War up to the present time.

"American Oil Operations Abroad" again has for its purpose the "most vital issue before the world and the American nation to-day—the international oil situation"; but the story is told, on the whole, with more carefully balanced facts and less Anglophobia than pervaded the earlier volume mentioned.

To appreciate fully the purpose of this book, one must try to read it wholly through American eyes. The atmosphere created by the author, probably intentionally, is one of 'look what we have done in the teeth of unmitigated opposition'. Implicit in this is the underlying theme that 'nobody else could have done anything like so much and so well'. Accept this for the moment as the reviewer's over-statement and see where it leads. The record is impressive.

The United States must look abroad for oil, partly in fear of declining home resources, mainly to expand foreign business and to acquire political, military and defensive advantages as widely spread over the world as possible. But oil only occurs in restricted regions, many of these in countries where wide open spaces prevail and standards of civilization are, to say the least, scarcely those of the western hemisphere. Once foreign oil invasion starts, political risks are taken by all nationals concerned. Even expropriation and seizure of oil properties by governments within the domain of which foreign operations are in full swing must be faced. Economic risks revolve mainly around the time-lag between prospecting operations and actual oil production: millions of dollars are involved in this phase alone. Struggle for a share of the world's oil centres mainly in the Caribbean countries and Middle East: it still goes on. Participation in foreign oil markets is part of an international trading treaty worked out by the United States and Great Britain, but so far not ratified. Aside from these aspects, however, are enormous economic, social and educational advantages to foreign nationals when successful enterprise opens up their countries' storehouses of oil. These are the main considerations of this book. Its perusal leaves one with confirmed feeling that the international oil war is indeed on, with yet one more protagonist in the field than Denny counted upon.

In much the author writes, there will be wide understanding by British petroleum technologists and economists. But perhaps the real picture of the situation will remain blurred until someone writes a counterpart volume on what British oil interests have done abroad, over a longer period of time than American interests, with at least all the same hazards faced and overcome, and with far less experience of an indigenous oil industry to work on than our more fortunately placed friends overseas.

H. B. Milner

"WHEN THE PIE WAS OPENED"

Mathematische Werke

Von Johann Heinrich Lambert. Band 1: Arithmetik, Algebra und Analysis, 1. Herausgegeben von Andreas Speiser. Pp. xxxi+358. (Zürich: Orell Füssli, 1946.) 25 Swiss francs.

VERSATILITY is the most delusive of the fairy gifts; the men of genius on whom it was bestowed otherwise than in subtle malevolence can be counted on the fingers. In the age of Euler himself, Johann Heinrich Lambert shone by his own light, not as a reflexion of the great luminary, and had he consented to be only a mathematician, the course of mathematical history would have been different. But condemned by the humiliations of his early life to demand intellectual submission from everyone he met, Lambert could not bear the thought that there were branches of learning of which he was not a master, or stimuli to which his mind did not respond. Asked by the King of Prussia, "What do you know?" he answered, "Everything, sire"; and to the further question, "How did you learn ?", the reply was, "I taught myself". His contemporaries were duly impressed by the range of his knowledge, and if the solipsistic manner of which we are told suggests that he often knew that he was relying on a bluff which might easily be called, his portrait, which we can study for ourselves, suggests that he thoroughly enjoyed the sensation of carrying off the bluff.

An edition of Lambert's writings has now been planned on a generous scale; pure mathematics is to be followed by applied mathematics, geometrical drawing, astronomy, physics, philosophy, and logic, and the finest workmanship in Switzerland is being employed on the production. The first volume is a delight to handle and to read. It contains Fermey's *Éloge*, and papers on elementary trigonometry, on continued fractions, on the solution of equations, on rectification and quadrature, and on interpolation, introduced by Prof. Speiser in a brilliant critical commentary. The celebrated series for the power of a root of the equation $x^m + px = q$, which moved Euler to enthusiasm, is in the first paper. Lambert's first paper on the quadrature of the circle, which is well known from Rudio's reprint of 1892, is here, with its fallacies neatly exposed by the editor; the paper in which Lambert did establish the irrationality of π is to come in the next volume.

One complaint must be made. With one exception, the papers are reprinted from the collection prepared by Lambert himself (Berlin, 3 vols., 1765–72), and the references are to this edition, with no indication of the date of composition or first publication; the omission deprives us of any time-scale for the development of Lambert's ideas, and will be even more serious when we come to correlate his work in pure mathematics with his other investigations.

In conclusion, the directorate of the Schnyder von Wartensee Foundation and Dr. R. G. Bindschedler are to be applauded for meeting the costs of this undertaking. The time has perhaps gone when a wealthy patron could usefully build a telescope, or a charitable institution could found a chair, for if telescope or professorship is wanted a modern community is not slow to provide it from public funds. There are worse ways of buying a claim to be remembered in the republic of letters than the endowment of a worthy definitive edition; a bid in the grand manner has been made on behalf of the Schnyder von Wartensee Foundation, and we commend the example to puzzled decimillionaires.

E. H. Neville

OSCILLATORY TIME-SERIES

Contributions to the Study of Oscillatory Time-Series

By Maurice G. Kendall. (National Institute of Economic and Social Research Occasional Papers, No. 9.) Pp. viii + 76. (Cambridge: At the University Press, 1946.) 7*s*. 6*d*. net.

The classical approach to time-series was a search for hidden periodicities, observational error being considered the only obstacle to accurate prediction, and there is no doubt that it was the striking success of the associated methods in astronomy and tidal theory which led to the confident belief that they might be equally relevant to the study of social phenomena. Now, however, in this and many other fields one prefers to work with a quite different model, in which the time-series is generated by a linear operator supplied with a random input. (A pleasing example is the music made by a sea shell.) The resulting series, though in general oscillatory, will not be periodic, and the possibility of prediction will be severely limited by the continued occurrence of random changes in phase and amplitude.

Mr. Kendall's monograph discusses all existing methods of time-series analysis in relation to one of the simplest of these models, Yule's autoregressive scheme defined by

$$u_t + au_{t-1} + bu_{t-2} = \varepsilon_t.$$

Here u_t describes the time-series and ε_t the random input; a and b are constants and the linear operator can be found by solving the difference equation. The book contains much useful computational advice together with a new set of tables for harmonic analysis. The correlogram and periodogram analyses of four artificial series of great length supply the first empirical evidence about the relative value of these two methods, and this part of the work is sure to stimulate much further research. The labour involved in the work must have been very great, and the debt already owed to its author by the statistical world has been correspondingly increased.

Mr. Kendall's chief conclusion is that the periodogram analysis of autoregressive series is misleading and not worth the labour involved, but his case seems to me to be overstated. The greater share of condemnation really belongs not to the periodogram itself but to the classical (here inapplicable) method of interpretation. Recent work by the late Prof. P. J. Daniell[1] suggests that a *smoothed* periodogram might be of much diagnostic value, and one would like to see Mr. Kendall's sample periodograms compared with their expectation forms. Daniell also showed[1] that the *sample* periodogram and correlogram are algebraically equivalent, so that each contains exactly the same information; a very interesting consequence of his identity is that the smoothed periodogram depends mainly on the first few sample autocorrelations. Mr. Kendall's observations should also be compared with recent work by Prof. M. S. Bartlett[1] on sampling properties of the correlogram, which explains the failure to damp according to expectation when the series is of finite length.

The present debate about the best definition for the 'period' of an autoregressive series seems to me of doubtful value. What we need in practice is not a period of recurrence so much as an estimate of the time from the present boom to the next slump (and conversely). This might well be measured by the location of the principal negative minimum in the correlogram, and the ordinate there would indicate the degree to which the series was oscillatory. (Bartlett[2] has already pointed out the need for distinguishing between *oscillatory* series and those which are merely *fluctuating*—Kendall's series 2 is an example of the latter type.)

I am puzzled by equation (6·8) for the "m.d. (peaks)", because the latter expression has several possible meani[illegible] number of peaks per unit length of se[illegible]be the quantity actually determined, [illegible] course, equal to the reciprocal [illegible]sion.

[illegible]avid G. Kendall

Advanced Calculus

By Prof. David V. Widder. (Prentice-Hall Mathematics Series.) Pp. xvi + 432. (New York: Prentice-Hall, Inc.; London: Constable and Co., Ltd., 1947.) 36*s.* net.

THE subject-matter contained in this volume is, broadly speaking, that encountered by a student taking an honours course in pure mathematics, and within some four hundred pages the author has succeeded in discussing a wealth of valuable material. Considerable care has been taken with the mode of exposition, particularly as regards the framing of the definitions and the arrangement of the theorems, in each of which the hypothesis, proof and conclusion are elegantly presented.

In addition to the usual topics which feature in books of this kind (such as partial differentiation, infinite series, limiting forms and the various types of classical integral), there are chapters dealing with vector methods, applications of the calculus to differential geometry, Stieltjes integrals, Fourier series, and the Laplace transform. The notation employed, being that now current in the United States, differs quite substantially in many places from that used in Great Britain as do, to a less extent, some of the methods of proof. No serious disadvantage, however, need result from these causes, as any student for whom this book was designed would inevitably possess considerable skill in elementary manipulation and should, in consequence, experience no difficulty in following Prof. Widder's lucid and concise arguments.

Although present-day austerity precludes the use of paper of a quality worthy of such a work, the printing is of a very high standard. A large collection of valuable examples, many of which are worked as illustrations in the text, is also provided.

J. H. PEARCE

Good Health to the Garden

How to Combat the Pests, Diseases and Weeds of Vegetables. Pp. 48. (Yalding: Plant Protection, Ltd., 1946.) 3*s.* 6*d.* net.

THIS is an attractive book, well printed, and beautifully illustrated from water colours by Dorothy Fitchew. It deals with the commoner pests, diseases and weeds likely to be encountered among vegetables in the home and allotment garden. The brevity of its text should also appeal to amateur horticulturists, who are often overpowered by a compendious treatment of garden difficulties alone. Eleven pests and the same number of diseases are described, with control methods based on general treatment and 'Plant Protection' products. One short section deals with friends of the garden, while general pests such as wireworms, millepedes, cutworms and leather jackets are also discussed and figured in colour. This is one of several such books projected by Messrs. Plant Protection, Ltd.

Wild Flowers of the Chalk

By John Gilmour. (King Penguin Books, K.37.) Pp. 31 + 16 plates. (Harmondsworth and New York: Penguin Books, Ltd [illegible]) 2*s.* 6*d.*

THIS is another of [illegible]ng Penguin series depicting wil[illegible]ng to their habitat. J. S. L. Gilm[illegible]s formerly assistant director at [illegible]c Gardens, Kew, and is now di[illegible]rticultural Society's Gardens[illegible]ches have been mainly ecological, so it can be taken for granted that the text is authoritative and up to date.

Gilmour discusses the origin of the chalk flora, both 'characteristic' and 'non-characteristic', then considers in more detail such chalk habitats as downs, dykes and earthworks, grassy knolls, cliffs and chalk pits, beechwoods, roadsides and hedgerows. Though a few species are comparatively rare, the reader should have little difficulty in finding most of the flowers in their season. It is impossible to rate too highly the sixteen-colour plates prepared by Irene Hawkins. No one could fail to identify a plant thus illustrated; but apart from this, each plate is a work of art. This book, small though it is, is one which every field naturalist should possess.

A Handbook of Sociology

By Prof. William F. Ogburn and Prof. Meyer F. Nimkoff. (International Library of Sociology and Social Reconstruction.) Pp. xi+644. (London: Kegan Paul and Co., Ltd., 1947.) 25*s.* net.

PROFS. OGBURN and Nimkoff's contribution to the well-known International Library of Sociology and Reconstruction maintains the high standard which one has learned to expect from this series and, in many respects, may be rated as the most useful source-book in sociology yet produced. Looking at social life as the interaction of four factors: the biological organism, geographical environment, group processes and cultural heritage, the authors first discuss the principal conclusions of biology, psychology, geography and other disciplines in their relations to sociology, and then proceed to the fundamental facts, basic concepts and theories which form the body of sociology proper. In the latter section the book touches its highest level and, in the chapters on the family and religious institutions, the rational approach to subjects which are usually clothed with emotion and sentiment deserves careful study by all who are seeking to unravel the complexities of the behaviour of individuals in groups.

T. H. HAWKINS

Mammals of Eastern Asia

By G. H. H. Tate. (Pacific World Series.) Pp. xv + 366. (New York: The Macmillan Company; London: Macmillan and Co., Ltd., 1947.) 20*s.* net.

THE ill wind has blown its proverbial good. Until now there has been no general work on mammals of eastern Asia, and it took the War to produce one: Dr. Tate wrote this book for the benefit of soldiers interested in natural history. The scope of the book is the mammal fauna found from north-eastern Siberia to Singapore, and from the Gobi Desert and Lake Baikal to the western shores of the Pacific. The mammals of the Japanese islands are also included, but not those of the East Indies, which have already been dealt with in a companion volume, "Mammals of the Pacific World", 1944, by Dr. Tate in conjunction with T. D. Carter and the late J. E. Hill.

"Mammals of Eastern Asia" is really an illustrated, descriptive checklist, and with its help the amateur naturalist should be able to identify most mammals occurring in the area. This book, though it sets out to cater for the amateur, will be found invaluable by the professional zoologist, since it contains much information which is only to be found otherwise in scattered papers.

T. C. S. M.-S.

RECENT MOSQUITO ERADICATION CAMPAIGNS

By Dr. J. R. BUSVINE
London School of Hygiene and Tropical Medicine

UNFORTUNATELY, it is exceedingly difficult to exterminate insect pests over a large area (not to mention the whole world), because of their enormous numbers, small size, and powers of proliferation. Therefore, we have come to be satisfied with 'control' as an objective; and so far as mosquitoes are concerned, control measures are considered satisfactory if they reduce the mosquito population below the 'critical density' necessary for the propagation of disease.

In recent years, however, the feasibility of eradication of mosquitoes from large areas has been demonstrated by the remarkable work directed by Drs. F. L. Soper and D. Bruce Wilson in Brazil. Their two original campaigns seem to have been entirely successful in achieving their objectives; by a few years of intensive work it has been possible to replace widespread and continuous control measures by a relatively small and inexpensive 'quarantine' service.

It will be recalled that the two insects attacked were *Aëdes ægypti*, the yellow fever mosquito, and *Anopheles gambiæ*, the dangerous African malaria vector. Both these mosquitoes are comparatively restricted in their choice of breeding sites to places in, or close to, the haunts of man. Furthermore, *An. gambiæ* was not indigenous in South America (though it appeared to thrive in Brazil). For these reasons the problems were simpler than they might have been. This should not be taken to belittle the many difficulties of organisation, which were overcome so successfully as to provide a model for subsequent eradication schemes.

General Organisation of an Eradication Campaign

The first essential is a survey of the territory by an entomologist with experience of anti-malarial work. This survey is particularly important when the object of eradication is a mosquito not normally present, and where the area invaded must be defined. On the basis of the preliminary survey, and with the aid of large-scale maps, estimates must be made of the staff, equipment and supplies necessary.

The main attack is made against the larval stage of the mosquito. Every suitable breeding site in the entire eradication area must be treated periodically, to prevent breeding for a sufficient period to ensure extermination of the species concerned. Success depends upon the continued thoroughness of a large number of workmen recruited locally (and, possibly, of doubtful reliability). These men can seldom be directly supervised for more than a small fraction of their working time, owing to the vast scale of the operations. The only workable solution is to make each larviciding team (possibly consisting of only one man) responsible for a defined zone, and to have an independent checking service to assess the progress of the work in each zone. The zones are grouped together in sections, and these again into divisions in the charge of a small hierarchy of officers. The lower grades can be recruited locally and trained, whereas the higher ones should be experienced malariologists or at least biologists, medical men, or engineers. All officers must be able to speak the local language.

A highly important part of the organisation (which absorbs about 25–30 per cent of the expenses) is the checking staff, whose duties consist in continually searching for larvæ or adult mosquitoes. Those 'scouts' seeking larvæ systematically check the work of the larviciders; the scouts seeking adults visit suitable 'catching stations' such as human or animal houses likely to be frequented by mosquitoes. The reports of the searching staff provide a means of independently checking the efficiency of the larviciders and assessing the progress of the campaign; negative reports are, of course, as important as positive ones, but require more careful verification. Arrangements are made for specimens of larvæ or adult mosquitoes to be preserved and sent to an entomological laboratory at headquarters for identification.

In order to systematize methods and records, a considerable series of printed instructions and recording forms is necessary. Regional chiefs are required to know exactly what all their subordinates should be doing on any day, so that their activities can be checked by random visits from headquarters. The headquarters staff inevitably become largely occupied with ordering and distribution of equipment and supplies, the engagement and promotion of staff and the solving of difficulties which arise in the work. Once the methods have been decided upon, eradication becomes an exercise in administration rather than an exclusively scientific or technical occupation.

It may now be of interest briefly to describe and compare three recent eradication undertakings, which display some evolution towards more ambitious objectives. I was privileged to witness the latest one (in Sardinia) in its comparatively early stages.

Anopheles gambiae in Upper Egypt

In 1942 there was a severe epidemic of malaria in upper Egypt, followed by another in 1943. Conservative estimates place the number of cases at 200,000, with a death-rate around 10 per cent. The vector was found to be *An. gambiæ*, which does not normally occur in this region, though it is found in the Sudan. There is a possibility that the northern range of this mosquito fluctuates from time to time, and it may thus penetrate into Egypt. The invasion prior to the 1942 outbreak was very considerable, for the mosquito was found to be breeding along a strip of the upper Nile 850 km. (530 miles) long, and varying from 1 to 30 km. (20 miles) wide. The mosquito had some difficulty in maintaining itself in this area; the winter (December to March) is too cold, and the summer (April to August) is too dry. However, the autumn is warm and moist, and there is great proliferation during September to November. *An. gambiæ* certainly survived from 1942 until 1945 in upper Egypt.

To combat the mosquito, the Gambiæ Eradication Service was formed with funds supplied by the Egyptian Government, administered by Dr. S. Madwah, the eradication programme being directed by Dr. J. A. Kerr, of the Rockefeller Foundation. In addition, there we[illegible]t various times thirty to fifty medical men or [illegible]rs supervising the work, the senior ones i[illegible] of the ten main divisions. Smaller are[illegible]r the control of inspectors (senior sa[illegible]) and foremen. The earlier treat[illegible]hanged to Paris Greening, wh[illegible]ler in the circumstances. S[illegible]lied the insecticide, each m[illegible] cover, in which all [illegible]y. The area of the zones varied from 0·2 to 9·2 sq. km. The eradication campaign depended basically on the anti-larval attack, but, in addition, there was some house-spraying with pyrethrum against adults in malarious areas, and also spraying of vehicles to prevent insect transport. The progress of the work was watched from the reports of an army of 'larval scouts' and 'adult searchers'.

The Paris Green treatments began in August 1944, and reached a peak in October; the last specimen of *An. gambiæ* was found in February 1945. Treatments were continued for six more months, and then stopped in the most favourable mosquito season. A careful search was continued for three months, but no more *An. gambiæ* were discovered. It is important to note that whereas the invading *gambiæ* was eradicated, other mosquitoes native to the region gradually reappeared. They are evidently more difficult to exterminate.

Anopheline Eradication in Cyprus

The mosquito eradication campaign in Cyprus, organised by Mr. Mehmed Azis, is novel in two respects: it aims at extermination of all *indigenous* mosquitoes from the island, and it was begun without the impetus of a disastrous malaria epidemic. The programme was undertaken as a measure of permanent improvement of the state of the colony; since, in spite of its arid appearance in summer, Cyprus is highly malarial. The chief vectors are *An. superpictus*, which breeds in very small shallow pools, often difficult to find; *An. sacharovi*, a marsh breeder; and *An. bifurcatus*, which breeds in wells. The last-mentioned species presents a special problem, for the local people often resent the application of larvicide to their only source of water.

The eradication programme in Cyprus was different from the other operations discussed in that it was planned to cover the island in three sections, one in each year, with an overlapping protection fringe to prevent reinfestation of the zone under treatment. As a consequence, a smaller staff was required. The eradication was based on anti-larval measures, and *D.D.T.* solution was used for the first time in an eradication project. Treatments were applied weekly in the plains and fortnightly to sites above 2,000 ft. The areas covered by each larvicider were 25–80 sq. km. (10–30 sq. miles); these were divided into sections for treatment on the various days of the week. Only one or two litres of spray were required for each day's work, and the small amounts required were applied by hand atomizers. In addition to the larvicidal work, a limited amount of drainage work was done to eliminate marsh-breeding forms. There was an attempt to prevent transport of mosquitoes in vehicles by spraying them regularly at certain points on the main roads. The progress of the work was assessed, as usual, by an independent checking staff. In the first year (1946) the work was confined to the long narrow Karpas peninsula, which constitutes a seventh of the total area of the island. This relatively easy task was chose[illegible]r the first year to accustom the workers to th[illegible]k. The Karpas peninsular was apparently c[illegible] mosquitoes in the first season and, at the ti[illegible] about half the remainder of the island [illegible]ith in the second season.

Mosquito Era[illegible]

Moderately serious [illegible], about 10 per cent of [illegible]; this is worse than anywhere in Sicily or Italy. The only important vector is *An. labranchiæ*, which is found at greater altitudes than on the mainland. In 1946 it was decided to use certain funds acquired from the United Nations Relief and Rehabilitation Administration, and controlled by a commission of the Italian Government, to create a mosquito eradication organisation. This project was directed by Dr. J. A. Kerr* of the Rockefeller Foundation, International Health Division, with a British, American, and Italian headquarters staff. The island was surveyed in 1946 and eradication work begun in 1947. As before, the chief reliance was placed on anti-larval work which, as in Cyprus, is being done with 5 per cent *D.D.T.* solution applied from hand atomizers. The average-sized zone for treatment by one man is 10 sq. km., and this is divided into six sections, to be visited on successive weekdays. In contrast to earlier campaigns, an extensive *D.D.T.* house-spraying programme has been employed. About 90 per cent of all dwellings on the island have been spray-painted with a *D.D.T.* emulsion to give a residual insecticidal film. This will be repeated again in the early spring of 1948 and, possibly, in 1949.

The anti-larval work of the first year was confined to an area in the south-west, comprising about a fifth of the area of the island. This is for the training of operators and to test the organisation. In the following year it is proposed to cover the entire island and treat all breeding sites weekly throughout a thirty-six-week breeding season. The progress of the work will be judged from the reports of the usual checking staff, and in the third year of the planned programme, after the cessation of the anti-larval spraying, they will continue to search for mosquitoes to verify the eradication.

Discussion

The success of the earlier campaigns and the experience gained in them has led to the more ambitious objectives of the two latest projects. These involve three new difficulties: (1) the mosquitoes attacked are indigenous; (2) the mosquitoes attacked breed in sites remote from human habitations, and are quite ready to feed on mammals other than man; (3) in both areas there are considerable tracts of rough country, far from roads, to be treated.

To balance these formidable difficulties, there is the introduction of the powerful new synthetic insecticides and the fact that both areas are islands. The value of *D.D.T.* in the larviciding work is very great, for it substantially reduces the amount of equipment which may have to be carried all day over difficult country. The only insecticidal impedimenta required for a day's work is a hand atomizing gun and a litre or so of 5 per cent *D.D.T.* solution. *D.D.T.* has also been used for residual treatment of houses throughout the experimental area; but it appears to me to be of somewhat doubtful value in eradication, when the vectors can be found breeding in large numbers in sites remote from houses. The disadvantage consists in the fact that all treated buildings are lost as catching stations; and, in eradication, the whereabouts of the last surviving mosquitoes is important. House treatment with *D.D.T.* is, admittedly, clearly of value in malaria control and it also has the advantage of killing other insect pests; the latter fact sometimes ensures the co-operation of the inhabitants.

---

* I understand that Dr. Kerr has retired for reasons of health and that Dr. J. A. Logan has taken his place.

APPROXIMATE OVERALL STATISTICS CONCERNING ANOPHELINE ERADICATION PROJECTS

Zone	Anopheline species	Area involved	No. of men employed	Total time	Cost £1,000's*
Brazil	*gambiæ*	?	2000	3½ yr.	530
Upper Egypt	*gambiæ*	4,100 sq. km. 1,500 sq. miles	4000	2 ,,	800
Cyprus	*superpictus*, *sacharovi*, etc.	9,300 sq. km. 3,600 sq. miles	100	3 ,,	15 (7 months)
Sardinia	*labranchiæ*	23,000 sq. km. 9,000 sq. miles	6000†	3† ,,	more than 500† a year

* On the basis £1 = 4 dollars = 2,000 lira.

† Estimates.

Some overall statistics of the anopheline eradication campaigns are given in the accompanying table. It should, however, be pointed out that such operations are very difficult to compare by the use of such overall figures, or by examining small-scale maps. For example, the area which can be covered by a single larvicider will depend not only on the number of breeding sites present and the ease of travelling, but also on accessibility from sleeping quarters. Some labourers may be unwilling to leave their homes and enter a temporary unusual occupation, especially if they have relatively lucrative local employment. For such reasons as these, there may be manifold differences in the difficulties encountered in such operations in different areas; nevertheless, it cannot fail to be noticed that the Cyprus venture appears to be very much less expensive than the other ones.

It is too early to give an estimate of the chances of ultimate success of the campaigns now in progress. My visit to Sardinia strongly impressed me with the difficulties of adequately supervising work over such a large and inaccessible area. These latest eradication schemes demand all the faith and energy, as well as the technical and administrative skill, which are being devoted to them.

SCIENTIFIC RESEARCH IN THE BRITISH ZONE OF GERMANY

By PROF. F. A. PANETH, F.R.S.
University of Durham

FOR the second time within a period of thirty years, science in Germany is struggling for its existence; but the problems of to-day are different from those of 1918, and so are the ways and means by which a solution is being attempted.

When, after the First World War, Germany had collapsed, the greatest menace to the maintenance of its scientific standing was, besides the financial weakness of the country, the severing of all international relations. German men of science had done more than their colleagues in other countries to help their Government, and especially the systematic study of the possibilities of poison gas as a method of warfare was deeply resented by the Allies. It took a long time before Germans were permitted to participate again in international meetings, the delay being largely dependent on the share taken in war-work; German astronomers were admitted years before German chemists. In these circumstances, only a national effort could save the position of German science; but the complete exhaustion of all the usual financial resources seemed to present an insurmountable obstacle. It was mainly the foresight, energy and organising genius of one man, Fritz Haber, to which the preservation of the high level of German science was due: while traditionally only the 'Länder' were the supporters of university activities, he convinced the authorities of the 'Reich' that in this emergency they had to provide ample funds for scientific work of every kind. Under his influence the Notgemeinschaft der Deutschen Wissenschaft came into being, and science in Germany continued to flourish.

To-day the material position of the scientific institutions in Germany is infinitely worse than it was after the First World War; but, on the credit side, it can be stated that there is little sign of any moral discrimination between men of science inside and outside Germany. This is no doubt due to the fact that this time support of the Governments was certainly more whole-hearted in the Allied field, right up to the perfection of the most powerful weapon of aggression. Immediately after the armistice, contacts were made between the scientific workers of the Allied countries and their German colleagues. The first object was to obtain all possible information for the benefit of the Allies; but these discussions could not fail to result in the awakening of the old spirit of international solidarity so sadly interrupted during the War, and to-day it is very pleasant to see the efforts made by the occupying Powers to reactivate scientific life and research in Germany. There are differences between the four zones of occupation, and in some regions the endeavour went mainly in the direction of uprooting and transplanting scientific installations and workers, instead of giving them a fresh opportunity in Germany. Moreover, it seems that even members of the universities who had been dismissed as a consequence of the unfavourable verdict of a denazification tribunal were often tempted by offers of employment in other countries, previous enthusiastic support of the Nazi war machine now being no obstacle. Much more evident, however, at least in the British Zone, is the understanding help given by the Allies to all attempts at reviving the scientific activities inside Germany.

As a consequence of the country's unconditional surrender it was entirely for the Allies to decide how much scientific research should be permitted in Germany. The rules were laid down in the Allied Control Council Law No. 25, the object of which is "to prohibit for military purposes scientific research and its practical application, to control them in other fields in which they may create a war potential and to direct them along peaceful lines". A number of subjects are specifically mentioned as prohibited: for example, applied nuclear physics; applied aerodynamics; ship construction; the detection of objects by electromagnetic radiation. Work on other problems requires prior permission, as, for example, research on broadcasting and television, electronic valves, ball bearings, and radioactivity other than for medical purposes. Detailed regulations have been issued for the procedure according to which applications for permission, and periodical reports on the work done, have to be submitted to the Control Council.

It is clear that the effect of Law 25 on German science will depend on the spirit in which it is interpreted; and that spirit, in the British Zone, is very favourable. Göttingen, one of the few university towns in Germany where war damage has been negligible, has been chosen as scientific headquarters. Here the office of the Research Branch of the Economic Subcommission of the Control Commission has been set up; its scientific adviser is Dr. R. G. J. Fraser. Plans are under way to create in Göttingen a substitute for the former research centre of Berlin-Dahlem, where a great number of the famous institutes of the Kaiser Wilhelm Gesellschaft were situated, and which no longer exists. The Allgemeine Versuchs-Anstalt (AVA) in Göttingen is not only using existing buildings but also planning to erect new ones to house institutes for physics, fluid flow, brain research, instrument design, and particularly medical research, to which special assistance will be granted.

The support given by the Research Branch and its officials to German science is by no means confined to the Göttingen complex. A new institute for the standardization of physical quantities, in the tradition of the former Physikalisch-Technische Reichsanstalt, is in course of formation in Volkenrode (near Brunswick). Another sphere of the Research Branch's activities is in the newly created learned societies; because of their official Nazi affiliations the German Physical Society, the German Chemical Society, and many similar ones were disbanded; but a new German Physical Society in the British Zone held its second conference in Göttingen at the beginning of last September (see *Nature*, November 22, 1947, p. 723), to be followed a month later by a meeting in Bonn of the Society of German Chemists in the British Zone. Both meetings were attended by a number of foreign scientific workers.

It is well known that in certain branches of chemical documentation Germany had been leading for many decades; no reference work on organic chemistry can compare with "Beilstein", none on inorganic chemistry with the eighth edition of "Gmelin", both of which are publications of the German Chemical Society. Both are still incomplete, and it is very gratifying to learn that, after a period of uncertainty following Germany's collapse, provision has now been made for their continuation. "Beilstein" will be re-organised in the American Zone, but some difficulties may be expected owing to the loss of a few of the senior members of the original editorial staff; "Gmelin", on the other hand, is fortunate in that practically the entire staff is now re-assembled in the British Zone, as the Gmelin Institute for Inorganic Chemistry and Related Subjects. Its new organisation presents some interesting features, so a few more words may not be amiss.

In Clausthal, near Göttingen, buildings of a munition factory had been scheduled to be blown up by the army; thanks to the intervention of the Research Branch, the administrative block was spared, in which at the moment the chief editor of "Gmelin", Prof. E. Pietsch, and about fifty of his old helpers have not only their offices but also living quarters for themselves and their families. The great hardships of life in present Germany are thus mitigated; the housing problem is solved, and the purchase of fuel and food is a community affair. The beneficial influence on the scientific productivity of the "Gmelin" staff is very obvious; and as, fortunately, a photographic copy of the 900,000 odd reference cards which the staff had prepared in the course of twenty years has been saved (although the originals were destroyed by fire), the editor's hope of completing the new edition of "Gmelin" in ten years may well come true.

There is probably no scientific worker in Germany who would not appreciate the help given by the Allies in the revival of the various scientific activities, though some seem to think that the possible control of their work by international committees is no unmitigated blessing. It would certainly be regrettable if control, or even advice, should go so far as to make work appear international which is, in fact, due to the efforts of German specialists. In this connexion we should like to refer again to the very different situation which existed in Germany after the First World War, when the necessity of keeping science in Germany alive by its own exertion, against international detachment or even hostility, proved to be in itself a potent force in its recovery. One can understand that to-day there is in some quarters a slight resentment against too much patronizing from outside; but what seems to some justified national pride may easily be denounced by others as a remnant of Nazism. All the steps taken by the British Control Commission with respect to scientific activities in Germany have to be viewed against a very complex psychological background; considering that such difficulties are added to those due to the hard material conditions, everyone will gladly acknowledge that, thanks to the Research Branch of the Control Commission, a great deal has already been achieved, and that one can cherish very good hopes for the future.

WATER MOVEMENTS AND EARTH CURRENTS: ELECTRICAL AND MAGNETIC EFFECTS*

It is a consequence of Faraday's law of electromagnetic induction that when a large body of water moves in the presence of the earth's magnetic field, an electromotive force is set up across the direction of motion. Faraday himself said that the tidal streams in the English Channel would generate electric currents across the channel, through the sea, and returning through the land beneath the water. Twenty years later (1851) he was satisfied that fluctuations observed by Charlton Wollaston on the first submarine cable between England and France were due to this effect. Other early observations tended to confirm the connexion of the tides with earth currents in submarine cables and in coastal regions.

No serious study of the subject was made at the time, but a great step forward was made in 1918 when Young, Gerrard and Jevons made a series of experiments with electrodes in the sea at Dartmouth, and Decheverens demonstrated the dependence of the fluctuating earth-current on the tides in one of the Channel Islands. Another striking contribution was made by Cherry and Stovold, who observed fluctuation of tidal periods between the English and French coasts when Post Office cables were being renewed after the Second World War, the largest differences being as much as 0·8 volt. Several Admiralty departments have also observed submarine fluctuations of tidal period, and the subject is being studied at the Admiralty Research Laboratory. A possible application is that once a suitable calibration has been made, the potentials, in sea or land, may serve as a routine method of measuring tidal streams or other water flow.

---

* Substance of papers by N. Barber and M. S. Longuet-Higgins, Admiralty Research Laboratory, read at a Geophysical Discussion on "The Electrical and Magnetic Effects of Marine Currents" held at the Royal Astronomical Society on November 27.

The gradients are detected by a high-resistance galvanometer the terminals of which are connected to non-polarizing electrodes placed a mile or so apart on the sea bottom, or down wells near the coast. The potential gradients are of the order of 10 millivolts per kilometre. Evidence that the tidal potential gradients and the electric current associated with them are due to the motion of the tidal streams through the earth's magnetic field is provided by the following observations : (1) The potential gradient in the sea is directed approximately at right angles to the direction of water flow. (2) The times of maximum potential gradient coincide with the times of maximum velocity of the tidal stream. (3) The English coast is positive with respect to the French coast when the tidal stream is flowing east. (4) The potential gradient in the land is directed in the opposite sense to the potential gradient in the sea : when the potential of the English coast is positive, the point of highest potential is on the coast and the potential is less at points farther inland or out to sea.

If the moving water in the Channel acts as a tidal dynamo, the electromotive force to be expected can be estimated from the known velocity of the tidal streams and the vertical intensity of the earth's magnetic field. The estimated electromotive force between the English and French coasts at the time of maximum stream is 3 volts, which is about four times as much as the observed potential difference. The reduction can be attributed to the flow of electric current : when the English coast is at a positive potential the current flows northwards through the water, and after spreading outwards and downwards into the land returns in a southward flow below the sea bed, so that the tidal dynamo is short-circuited. In the water the electric current density is estimated to be about 10^{-8} amp. per square centimetre when the tidal streams have their maximum velocity ; but in the land, and below the sea bed, the current density is presumably very much less.

If the magnetic field produced by this presumed flow of electric current could be measured, it would give further valuable evidence of the phenomenon ; but since the flow of current is solenoidal it can be expected to produce little or no magnetic field on the earth's surface. On the sea bed in the English Channel at a depth of 100 metres, the flow of electric current may produce a tidal variation amounting to ± 10 gamma in the east–west component of magnetic field ; but in the land near the coast at a depth of 1,000 metres the variation of magnetic field may amount to less than 1 gamma, since the current density in the land is so much smaller. No observations of this nature have yet been made.

The observation of tidal potential gradients is usually complicated by more rapid and irregular variation of potential gradient due to earth currents associated with magnetic storms. These earth currents are observed in the sea as well as on land, and they tend to be concentrated in estuaries and channels, presumably because these provide preferential paths of low resistivity.

The magnetic fields of these concentrations make important contributions to the vertical magnetic intensity in the neighbouring coastal regions. This possibility was recognized by Van Bemmelen, who made a survey of the character of the sudden commencement of magnetic storms at a large number of observatories, and showed that the sudden changes of vertical intensity are usually of opposite signs at the Greenwich and Paris Observatories, although the two observatories are only 200 miles apart. He suggested that the difference in sign might be due to earth currents induced by the magnetic storm being concentrated in the English Channel between the two observatories.

An example taken from measurements of the east–west potential gradient in the sea off Plymouth for a minor magnetic storm with a sudden commencement at 2240 hr. on August 30, 1946, when the horizontal intensity changed by 65 gamma in an interval of about three minutes, shows that the east–west potential gradient in the sea increased by 60 millivolts per kilometre at the same time. Assuming that such a potential gradient was present in the whole of the English Channel, it can be inferred that a current of about 3,000 amp. was flowing at the time. Such a current flowing fifty miles from the Observatory at Abinger would produce there a vertical magnetic field of 7 gamma, an appreciable part of the 12 gamma which was actually measured.

Although there is some indication that earth currents localized in the English Channel may produce appreciable magnetic changes at Abinger when the period of the change is as long as an hour, the effect of earth currents should be more important in variations of shorter period. Experiments in the narrow channel between Cumbrae and Bute in the Clyde estuary suggest that earth currents in this and neighbouring channels are the main source of fluctuation of magnetic field as far as periods less than 10 min. are concerned ; but for longer periods (greater than 30 min.), the direct magnetic effect of the overhead electric currents becomes of increasing importance relative to that of the earth currents. The study of short-period variations in the earth's magnetic field must, therefore, take account of possible secondary effects due to earth currents concentrated in a channel or arm of the sea.

OBITUARIES

Prof. David Enskog

We learn only now, with much regret, of the death on June 1, 1947, of David Enskog, professor of mathematics and mechanics at the Kungliga Tekniska Högskolan, Stockholm, since 1930.

Born in 1887, Enskog was a student at Uppsala from 1906 until 1911, in which year he obtained his licentiate, partly for experimental work on gas diffusion. In the same year he published a short paper on the kinetic theory of gases, which contains a brief mention (the first so far as I know) of the phenomenon which since 1916 has been called thermal diffusion. In 1912 he published another paper dealing with a gas composed of electrons and molecules ; H. A. Lorentz had shown that the mean free-path phenomena for such a gas could be accurately calculated ; for this case Enskog made the first accurate calculation of the thermal diffusion coefficient.

Enskog sought without success to obtain a travelling studentship to enable him to continue his studies and research ; instead he became a schoolmaster, first at Stockholm, and later at Skövde and Gävle. He married in 1913. During the First World War he was exempted from military service on medical grounds. His years of school teaching continued until 1930, with an interlude of nine months in 1922, during which he held a travelling scholarship of the Swedish Academy of Sciences at Göttingen and Munich. During these seventeen years of school teaching, he produced a long series of papers, mainly on gas theory, but also on integral equations, nuclear structure, and radioactivity. His transfer to a university chair seemed rather to bring him new duties than increased leisure, and this, with renewed ill-health, reduced his productivity in his later years, though he continued to think and write on gas theory; one of his last papers was concerned with the absorption of sound in gases and liquids, owing to viscosity and thermal conduction.

Enskog's most distinguished work was done on the kinetic theory of gases; in his 1917 dissertation, and in a more detailed paper of 1921, he extended Boltzmann's work on entropy and the mean free-path phenomena, solving Boltzmann's integro-differential equation for any moderately rare gas constituted of spherically symmetrical molecules. His exposition was not easy, but his work had great mathematical elegance. The results were substantially the same as those that I had published in 1915 and 1916, following Maxwell's line of approach. In a subject so complicated it was advantageous to have the two independent treatments, the close agreement of which helped others to have confidence in the results. This work forms the main subject of "The Mathematical Theory of Non-Uniform Gases", by Prof. T. G. Cowling and myself, in which we expounded the theory on his lines rather than on those I had followed; the book was, therefore, appropriately dedicated to Enskog.

Enskog also did important work, yielding valuable results, on the kinetic theory of dense gases and liquids; his interest in this difficult subject was shown over many years. It seems likely, however, that the line of future progress lies along another path, recently opened up by Prof. Max Born and Dr. H. S. Green.

In 1946 the Royal Swedish Academy of Science bestowed on him its Svante Arrhenius Medal, in well-deserved recognition of the distinction of his contributions to gas theory.

Enskog was a friendly man of engaging simplicity and great modesty. His home life was very happy. He is survived by his wife and children (a son and two daughters) and grandchildren.

S. CHAPMAN

Mr. W. H. Pick

WITH the death of William Henry Pick, a principal scientific officer in the Meteorological Office, which occurred on December 26, 1947, the Meteorological Office and the Royal Air Force lose one who combined to an exceptional degree meteorological and educational ability.

Pick was born in 1891 and after graduating in science at the University of London became a teacher. He showed his interest in meteorology first by maintaining with his pupils at Queen Mary's School, Basingstoke, a climatological station sending returns to the Meteorological Office. He joined the Meteorological Section, Royal Engineers, in 1917, and after serving in France was placed in charge of the meteorological detachment with the North Russian forces in 1919; then in 1920 he joined the Meteorological Office. For the next eight years he was meteorological officer at the Royal Air Force College, Cranwell. He wrote for the cadets his book "A Short Course in Meteorology", which soon found appreciation in a much wider circle, edition after edition being called for.

After nearly four years as a senior forecaster at Meteorological Office headquarters, he was meteorological officer at Andover during 1932–38, and in the earlier part of that period was closely and fruitfully associated with twelve special investigations carried out by the R.A.F. into cloud flying with its risks of ice accretion. Advisory duties at H.Q. Bomber Command during 1938–40 were followed, after a short interlude in the Air Ministry, by duties in connexion with the meteorological aspects of smoke screening, first with the Ministry of Home Security and then with H.Q. Anti-Aircraft Command. From early 1945 until a very few days before his untimely end, he was in charge of the meteorological station at South Cerney meeting the requirements of several R.A.F. stations.

Pick wrote numerous papers published by the Meteorological Office or in the *Quarterly Journal of the Royal Meteorological Society* on visibility as affecting aviation, on the forecasting of night minimum temperatures and the persistence of types of pressure distribution. The thesis "The Teaching of Meteorology in Secondary Schools" for which, with his "Short Course", he was awarded the fellowship of the College of Preceptors particularly exemplifies his two main interests. He served on the council of the Royal Meteorological Society during 1931–36.

Pick will be missed by many members of the Royal Air Force, especially his old Cranwell pupils, to whom he had been a wise teacher and friend, and by his colleagues in meteorological circles. He was married in 1944 and leaves a widow.

Mr. John Lister

MR. JOHN LISTER, formerly head of the Mathematical Department, Chelsea Polytechnic, died at Gawsworth, Cheshire, on December 5. Born at Stockport in 1876, he went to the Royal College of Science, London, in 1895, and took his associateship in 1898 with first-class honours in mathematics, physics and chemistry as his main subjects. After two years teaching at West Ham Technical Institute, he was appointed lecturer at Chelsea Polytechnic, where he spent the rest of his teaching career, being eventually head of the Mathematical Department, until his retirement in 1927.

His wide knowledge of cognate subjects gave colour and interest to his teaching of mathematics, and the admirable lucidity of his expositions will be remembered by many generations of Chelsea students.

WE regret to announce the following deaths:

Prof. T. D. A. Cockerell, emeritus professor of zoology, University of Colorado, on January 26, aged eighty-one.

Dr. H. A. Deslandres, For.Mem.R.S., formerly director of the Observatory of Meudon, on January 15, aged ninety-four.

Mr. Orville Wright, a pioneer with his brother, Wilbur Wright, of the aeroplane, on January 30, aged seventy-six.

NEWS and VIEWS

Scientific Civil Service: Promotion of Individual Research Workers

In *Nature* of April 5, 1947 (p. 464), some details were given of a number of members of the Scientific Civil Service who, as individual research workers of exceptional quality, had been appointed to special posts created under provisions included in the Government White Paper on the Scientific Civil Service (Cmd. 6679) published in 1945. It has now been announced that, on a further review, the undermentioned members of the Scientific Civil Service have similarly been promoted to the grade of senior principal scientific officer (inclusive salary scale £1,320–£1,520) with effect from January 1, 1948.

H. Barrell (Department of Scientific and Industrial Research), the authority in Great Britain on the determination of standards of length in terms of wave-lengths of light; he has carried out much work in interferometry and its application to the measurement of accurate gauges; W. Binks (Department of Scientific and Industrial Research), who has made important contributions on the measurement of the intensity of the ionizing radiations produced by X-rays and radioactive substances; he was largely responsible for work which led to the internationally accepted recommendations for the protection of workers in this field; H. Carmichael (Ministry of Supply), who has carried out important investigations into cosmic rays and is at present engaged on instrumentation for atomic energy research; Dr. C. M. Cawley (Department of Scientific and Industrial Research), a chemist who has carried out outstanding work during the last eighteen years on the mechanism of hydrogenation of tar, oils, and pure compounds; on the production of toluene from cresol; on the development of gelled-fuels for flame throwers; and on the extraction of benzol from coal gas, and on wax from British peats and lignites; I. Fagelston (Admiralty), a chemist who has made outstanding contributions on propulsion problems in relation to torpedoes and surface and underwater craft; A. Forster (Ministry of Supply), an organic chemist and engineer with outstanding knowledge of high explosives and propellants, and of their manufacture; J. K. Hardy (Ministry of Supply), an engineering physicist who has made important contributions to the study of de-icing and to many other subjects; A. W. Hothersall (Ministry of Supply), who is a leading authority on electro-deposition of metals, with particular reference to resistance to wear and erosion; B. Pontecorvo (Ministry of Supply), who was responsible for pile development in Canada and is now conducting fundamental atomic energy research in nuclear physics; Dr. R. H. Purcell (Admiralty), a physical chemist who has been concerned with the practical application of physics and chemistry to a very wide field of engineering problems; H. A. Sloman (Department of Scientific and Industrial Research), who has carried out pioneer work on the production and properties of pure beryllium, and, recently, on the analysis of gaseous impurities in metals, especially in steel and by the development of the now widely used vacuum-fusion method; A. G. Tarrant (Department of Scientific and Industrial Research), a physicist who has contributed outstandingly to the solution of research problems in road construction, specializing particularly in the development of equipment for studying the deterioration of road surfaces; during the War he developed novel types of accelerometer for examining the movement of gun mechanisms and the flight of bombs and underwater projectiles.

British Somaliland and its Development

The report on the general survey of British Somaliland, 1945 (Burao: General Survey. 3*s*. 6*d*.), prepared following the approved scheme under the Colonial Development and Welfare Act, indicates that considerable areas of the country are almost completely unknown. 1945 was a good average year as regards rainfall and grazing, and in the geological exploration of the Onkhar area an oil seepage was found, of which 800 square miles were mapped. This area is well watered and there are valuable belts of Damas trees in the coastal lowlands. A potential motor track from Dur Elan to Onkhar was discovered. The original purpose of the survey was the collection, co-ordination and distribution of data from existing knowledge, and also the continued collection of further data, especially as regards topography, meteorology, geology, botany, zoology and tribes and their stock, so as to fill in the gaps in the structure of a composite research scheme and eventually to compile a full account of the general geography of British Somaliland on which wise development could be based. Detail is included in this report as an example of the sort of information which general survey officers are expected to collect, and some notes on the methods of work are also included for the use of colleagues in Somaliland, including native assistant surveyors.

A Gazetteer of British Somali Place Names (Burao: General Survey. 1*s*.), covering British Somaliland and Grazing Areas, September 1943–February 1945–December 1945, has been prepared by the Survey Department of the Protectorate Government and published separately, to facilitate the location of place-names which may or may not be recorded on existing maps, and to provide an authoritative foundation for fixing as closely as possible the spelling of these names according to the recommendations of the Royal Geographical Society.

Scientific Expedition to Arnhem Land

The National Geographic Society, Smithsonian Institution and the Commonwealth of Australia jointly are sending a scientific expedition to Arnhem Land at the close of the rainy season in March. The expedition will study the aborigines and the plant and animal life, including marine life, throughout the dry season, which normally ends late in October. Arnhem Land, which is an aboriginal reserve, has no charted trails suitable for motor transport; the expedition's approach will be by small schooner to coastal stations on Van Diemen Gulf, the Arafura Sea, and the Gulf of Carpentaria. Natives will be enlisted as porters for journeys inland. Of five bases selected for the expedition's use, one especially suited for study of marine life is on Groote Eylandt just off the east coast in the Gulf of Carpentaria. Other bases are at the heads of navigation of mainland streams, where Christian missions established early in the century have been allowed to remain. The leader of the expedition will be Charles Pearcy Mountford, ethnologist of the South Australia Museum, Adelaide. Mr. Mountford, who has taken part in various anthropological and ethnological expeditions in Australia, is an authority on aboriginal art, customs and culture. Other members of the party are Frank M. Setzler, head curator, Department of Anthropology; Dr. David H. Johnson, associate curator, Division of Mammals; Herbert G. Deignan, associate curator, Division of Birds; and Dr. Robert R. Miller, associate curator, Division of Fishes, all of the Smithsonian Institution; and Harrison Howell Walker, National Geographic staff writer-photographer with several years of Australian experience. A similar group of Australian scientific workers will take part in the expedition.

Fuel Systems for the Aero-Gas Turbine

Dr. E. A. Watson and his colleagues were associated with Air Commodore Whittle in the early development of the aero-gas turbine. A paper presented before the Institution of Mechanical Engineers on December 5 gives an account of the results of their researches into fuel systems for such turbines. In the first part of the paper, Dr. Watson deals with the methods used for ensuring that the correct quantity of fuel is supplied to the engine under all conditions of thrust and altitude. The desirable characteristics of fuel systems from this point of view are deduced in a logical way, commencing with a typical heat input–engine speed curve at given inlet pressure and temperature, which is then modified to take into account variation of inlet conditions. It is then shown that neither an approximately isochronous governor nor a constant-stroke fuel pump driven directly by the engine possesses the required characteristics. The remaining alternative is to define the fuel flow directly by the pilot's control, with a compensating device for attitude variation. The remainder of this part of the paper is devoted to a discussion of the methods employed to achieve this, illustrated by descriptions of the various devices which have been used.

In the second part of the paper, the author turns his attention to the atomization of the fuel in the burners, and gives an account of some very ingenious methods which have been developed by various investigators to determine particle size and distribution. Illustrations are given of some atomizers which have been used. The paper should be of general interest to all who have followed the development of the gas turbine from its early stages, and the second part of particular interest to those concerned with the combustion of liquid fuels.

The Electronic Organ

So far as can be ascertained, there is only one type of electronic organ, that is one operating from purely electric means (see *Nature*, **145**, 170 (1940)) and so obviating pipes, being developed and manufactured in Great Britain, namely, the Electrone of the John Compton Organ Co., Ltd. The fact that it is produced by a long-established pipe-organ company means that it is properly 'voiced' by experienced craftsmen, without which it might be feared that traditional organ-tone might be lost. The model now available has two manuals and pedals, and a good array of stops and couplers. It was described by its inventor and designer, Mr. L. E. A. Bourne, and fully demonstrated by Mr. J. I. Taylor at a meeting of the Institution of Electronics held at the Royal Society of Arts on January 26. The post-war model is a great improvement over that produced in small quantities before the War, and can now easily take a place with regular pipe-organs of three times the price and greatly diminished maintenance. The improvement is largely due to a re-design of the electrostatic runners, using formants in many of the tracks instead of the previous all-sine-wave tracks, and more carefully selected loudspeakers. There are twelve unit-generators, all equal but driven by one belt, coupling pulleys of diameters inversely proportional to the equal-tempered ratios. Harmonics up to the thirtieth are used at present, but experiments are being made to go much higher when larger instruments are constructed, that is, larger in the sense of diversity of registration and effects, not volume, since this merely means using more amplifiers and suitably disposed loudspeakers.

Intensive Vegetable Cultivation

The increased demand for fresh vegetables has stimulated the grower's interest in new or improved methods of intensive cultivation. There remains, however, the difficulty of providing him with the latest information in an accessible form, and three illustrated bulletins issued by the Ministry of Agriculture (London: H.M. Stationery Office) on different aspects of the subject will do much to meet this need. "Irrigation" (Bull. No. 138. 1*s*. 6*d*. net) is entirely new. In it natural water supplies of all types are discussed, and the various methods of augmenting them by means of spray or soil irrigation described. Such artificial systems inevitably entail heavy expenditure, but it is considered that in some circumstances the results may fully justify it. "Crop Production in Frames and Cloches" (Bull. No. 65. 2*s*. 6*d*. net) has been completely rewritten. It provides a wealth of practical information, though stressing the fact that a thorough understanding of soils, varieties, ventilation, etc., is needed before success in this specialized line can be expected. "Practical Soil Sterilization" (Bull. No. 22. 1*s*. 3*d*. net) appears in a revised form. Large-scale methods employing both steam and chemicals are described for use in glasshouses, but instructions for dealing with small quantities of soil needed for propagation purposes or growing plants in pots are also included.

Annular Eclipse of the Sun on May 8-9

The National Research Council of Japan has arranged a programme of observations of the ionosphere during the annular eclipse of May 9 next, the central line of which passes across a small island north-west of Hokkaido. One of the objects of the programme is to obtain further evidence on the speed of particles proceeding from the sun to the earth. The exact times of contacts are to be recorded in connexion with a large-scale programme of geophysical observations.

National Foundation for Scientific Research, Brussels

The nineteenth annual report of the National Foundation for Scientific Research, Brussels, covering the year 1945–46, includes the reports of the ten scientific commissions together with details of grants made, of distinctions obtained during the academic year, and particulars of researches in progress during 1946–47. A list of publications during the year is appended under authors, together with a classified list of authors according to the scientific commission with which their work is associated. The Commission for Mathematics and Astronomy reports on a study of irregular algebraic surfaces and on correspondences between two algebraic surfaces. Prof. M. A. Picard reports on behalf of the Commission for Physical Chemistry, Electro-chemistry and Radioactivity on research on new radioactive substances, while on behalf of the Commission for Morphological Medical Sciences, Prof. M. G. Leplat refers to a study of senescence. The Scientific Commission for Pathology of Transmissible Diseases, Colonial Pathology and Hygiene has studied the extension of bilharziasis and its control, rickettsiosis and filariasis, while the Commission for Clinical Sciences has been investigating the problems of antibiotics and the mode of action of sulphonamides. The Commission for Applied Chemistry has investigated the constitution and chemical properties of mineral oils, and a new Scientific Commission has been set up for the study of problems of nuclear energy.

National Institute of Sciences of India: Elections

At the annual general meeting of the National Institute of Sciences of India, held at Patna on January 1, the following new fellows were elected: Dr. B. S. Bhimachar, fisheries officer with the Government of Mysore, Bangalore; Pratap Chandra Bose, chief engineer, Corporation of Calcutta; Dr. Satya Charan Chatterjee, head of the Department of Geography, Patna College, Bankipur, Patna; Jehangir Fardunji Dastur, head of the Division of Mycology, Indian Agricultural Research Institute, New Delhi; Dr. Arun Kumar Dutta, reader in physics, Dacca University; Dr. Rukmini Kishore Dutta Roy, Geological Survey of India, Calcutta; Dr. Robert E. Heilig, chief physician, Jaipur; Dr. Kolar Ramakrishna Krishnawami, director of industries, Bihar, Patna; R. A. MacGregor, formerly chief metallurgist to the Government of India, Calcutta; Ganesh Chandra Mitter, chief assayer, His Majesty's Mint, Bombay, and honorary professor of industrial chemistry, Royal Institute of Science, Bombay; Dr. Mahadeo Atmaram Moghe, professor of zoology, College of Science, Nagpur, and head of the Department of Zoology and dean of the Faculty of Science, Nagpur University; Dr. S. P. Raju, director of the Engineering Research Department, H.E.H. Nizam's Government, Hyderabad, Deccan; Dr. Srinivasa Ramanujam, Central Potato Research Institute, New Delhi; Dr. Subbarao Ramachandra Rao, professor of physics, Central College, Bangalore; Dr. Jyotis Chandra Ray, director, Indian Institute for Medical Research, Calcutta.

Physiology and Pathology of Animal Reproduction

The First International Congress on the Physiology and Pathology of Animal Reproduction and on Artificial Insemination will be held during June 23–30 at Milan. On June 21 a preliminary conference will take place, under the auspices of the United Nations Educational, Scientific and Cultural Organisation, at which a limited number of Italian and foreign specialists will discuss "Interacting Substances of Ova and Sperm, and Parthenogenesis". The Scientific Commission of the Congress will arrange the papers sent to the Congress in sections according to subject; full sessions will discuss certain themes of general interest. The subjects the Congress is to deal with are: (*a*) biological problems of animal reproduction; (*b*) breeding problems of animal reproduction; (*c*) pathological problems of animal reproduction; (*d*) methodological and practical problems of artificial insemination of animals; (*e*) legislative and organisational problems of artificial insemination and of animal reproduction. An exhibition of related material and books, and also visits to breeding stations and scientific institutions, are being arranged. Papers for the Congress must be received by March 31. Detailed information can be obtained from Prof. T. Bonadonna, secretary-general of the Congress (via Bronzetti 17, Milan). The subscriptions are: for members actually taking part in the Congress, 8 dollars or £2; for others, 4 dollars or £1.

International Symposium on Noise

An international symposium on noise is to be held by the Acoustics Group of the Physical Society in association with the Royal Institute of British Architects during July 14–16, in the hall of the Institute at Portland Place, London, W.1. The draft programme provides for four sections: (1) noise measurement; (2) field and laboratory studies; (3) reduction of noise, air-borne and structure-borne; (4) building practice, as applied in houses and flats, factories, theatres, concert halls, etc. Contributions to the symposium are invited, and those who intend to read papers or submit written contributions are asked to inform the recorder, Dr. A. J. King, not later than March 31. Anyone wishing to have accommodation reserved should apply as soon as possible to the Accommodation Officer. The address for him and the Recorder of the Symposium is: Acoustics Group, Physical Society, 1 Lowther Gardens, Prince Consort Road, London, S.W.7.

Royal Meteorological Society

The following have been elected officers of the Royal Meteorological Society: *President*, Dr. G. M. B. Dobson; *Vice-Presidents*, Capt. L. G. Garbett, E. Gold, G. Manley, J. F. Shipley, A. Thomson (for Canada) and J. Paton (for Scotland); *Treasurer*, W. N. Witchell; *Secretaries*, E. L. Hawke and Wing-Comdr. R. M. Poulter; *Scottish Secretary*, A. J. Drummond; *Foreign Secretary*, L. C. W. Bonacina; *Councillors*, A. C. Best, A. W. Brewer, J. S. Forrest, Major H. C. Gunton, W. G. Kendrew, I. T. D. Kirkpatrick, Dr. A. R. Meetham, Dr. F. J. Scrase, Prof. P. A. Sheppard, A. E. Slater, Lieut.-Comdr. P. C. Spink and Dr. T. W. Wormell.

Ethics and Science Conference

The Ethics and Science Conference arranged by the British Social Hygiene Council will be held on Friday, March 19, at the Livingstone Hall, London, S.W.1. The main theme of the Conference will be "Society and the Individual", each of the two sessions being devoted to a different aspect of this problem; the speakers at the morning session considering "The Value Society Sets upon the Individual", and at the afternoon session "The Values the Individual Sets before Himself". The chair will be taken by Mr. L. J. F. Brimble and Dr. E. B. Strauss, and the speakers will include Mr. F. Ian G. Rawlins, Canon Marcus Knight, Mr. Kenneth Walker, Dr. E. H. Larkin, Mr. John Mackay-Mure, Mrs. Joan B. Thompson, Father Leycester King, Dr. Mary Smith, and others. Time will be allowed for discussion at both the morning and afternoon sessions and at an open meeting in the evening. It is hoped that, as a result, fresh light will be thrown upon the problems arising from the apparent conflict between the scientific and spiritual interpretations of life. Further information and tickets (members of the Council, 2*s*. 6*d*.; others, 3*s*. 6*d*.) may be obtained from the British Social Hygiene Council, Dept. S.J.1, Tavistock House North, Tavistock Square, London, W.C.1.

LETTERS TO THE EDITORS

Formation of Siphons in Lamellibranchia

THE mantle edge in the Lamellibranchia consists, as is well known, of three lobes. Of these the one adjacent to the shell (Fig. 1, 1) is concerned with the secretion of this, while the bounding periostracum is secreted as a thread from the base of the groove (*PG*) between this and the next lobe. This middle lobe (2) has sensory functions, bearing tentacles and in certain cases, for example, *Pecten* and *Spondylus*, eyes. The innermost lobe (3) is characteristically muscular. It contains radial muscles attached to the shell along the pallial line and, between upper and lower strands of these, other muscle running longitudinally. Action of these muscles, in conjunction with distension caused by pressure of blood, is responsible for the movements of this lobe, usually known as the velum or, better, the pallial curtain. By this means the entrance of water into the mantle cavity is controlled, for example, in *Ostrea*[1]. In extreme cases, such as *Pecten* and *Lima*, it also controls the direction in which water is expelled during the swimming movements[2].

In other words, the inner, secretory lobe retains the primitive function of the mantle edge in the Mollusca, while the sensory and muscular lobes have come into being with the evolution of the Lamellibranchia. The sensory functions of the head have been taken over by the enclosing mantle, the margins of which alone are now in contact with the environment. The greatly increased water current caused by the lateral cilia on the ctenidia which have been enlarged in connexion with feeding is controlled by the muscular lobe.

While in the more primitive Lamellibranchia the original freedom of the mantle edges is retained, as in the genera mentioned above, in the majority these are fused to a greater or less extent. Openings are retained for the extrusion of the foot and for intake and expulsion of water, with occasionally a fourth aperture. What does not appear to have been recognized is that the degree of fusion involved in the formation of the inhalant and exhalant apertures or siphons may take one of four forms, involving fusion of one, two or, in part or entirely, all three lobes of the mantle edge. These are shown diagrammatically in Fig. 2, *A–D*.

In the first of these, (*A*), only the inner, muscular lobe is involved. The simple exhalant opening (not a true siphon) of *Mytilus* is so formed. The inhalant and exhalant openings, one or other of which may be prolonged into a short siphon, in the Leptonacea[3], best exemplified by *Kellia*, and which are widely separated with the inhalant opening anterior, are similarly formed. The same is true of the Tridacnidæ[4] where, owing to the twisting round of the visceral mass in relation to the shell, the exhalant opening has migrated to the topographically upper surface. There are at least three groups in which posteriorly directed siphons are formed in this manner, namely, in the Nuculanidæ among the Protobranchia and in the Tellinacea (including, as pointed out by Graham[5], the Solecurtidæ) and Anatinacea among the Eulamellibranchia. In all these the middle and outer lobes of the mantle edge are continuous around the posterior margin of the shell; but the muscular lobes of the two sides unite to form the siphons. Those of the Nuculanidæ show an interesting series of stages in the conversion of ciliary into tissue junctions in the formation of the siphonal tubes[6]. In this group also the exhalant and inhalant siphons are united to one another; but not in the other two, where they are free throughout. Those of the Tellinacea are conspicuous for their length and mobility in connexion with the deposit-feeding habits of this group (now being studied); those of the Anatinacea are shorter but, at any rate in *Thracia*[7], are capable of temporary extension during the formation of mucus-lined passages from the posterior end of the animal through the substratum to the surface. In all, the siphonal openings are lobed or bear a single row of short tentacles.

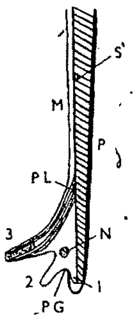

Fig. 1. SECTION THROUGH MANTLE EDGE OF A LAMELLIBRANCH. *M*, MANTLE; *N*, NERVE; *P*, PERIOSTRACUM; *PG*, PERIOSTRACAL GROOVE; *PL*, PALLIAL MUSCLES; *S*, SHELL; 1, 2, 3, OUTER (SECRETORY), MIDDLE (SENSORY), INNER (MUSCULAR) LOBES

The second type of siphon, in which the inner and middle lobes are concerned, (*B*), is the most common. It occurs in such widely distributed genera as *Cardium*, *Venus*, *Venerupis* (*Paphia*) and *Ensis*. The united siphons are usually relatively short and are fringed by a common row (or rows) of tentacles from the middle lobe (2). The inner lobe (3) is represented around the inhalant opening by an inner row of larger, more mobile and usually inwardly arching tentacles which serve as strainers. In the exhalant siphon it forms a membrane which confines and directs the water current.

In the third type, (*C*), the siphons are also invariably fused and similarly fringed with tentacles and with a membrane round the exhalant opening, for example, in *Aloidis*[8]. But here the inner margin of the outer lobe which secretes the periostracum is also involved, so that this protective covering is continued almost

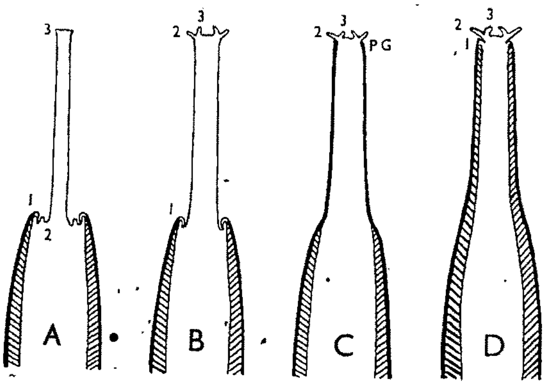

Fig. 2. DIAGRAMMATIC LONGITUDINAL SECTIONS SHOWING FORMATION OF SIPHONS: (*A*) WHERE INNER MANTLE LOBES ALONE FUSED; (*B*) WHERE MIDDLE LOBES ALSO FUSED; (*C*) WHERE SIPHONS COVERED WITH PERIOSTRACUM DUE TO FUSION OF GROOVES SECRETING THIS; (*D*) WHERE ALL LOBES COMPLETELY FUSED

to the tip, just short of the common ring of tentacles. This condition is found in the Mactridæ, the Lutrariidæ (*Lutraria*, as will be shown in a forthcoming paper, is really a *Spisula* or *Mactra* specialized for deep burrowing), the Myidæ (including *Aloidis*) and the Hiatellidæ. By providing protection for the siphons, this condition might be thought to have arisen in direct connexion with deep burrowing, as in *Lutraria, Mya* and *Panomya* (*Panope*). But genera allied to the three of these, namely, *Spisula, Aloidis* (*Corbula*) and *Hiatella* (*Saxicava*) respectively, have only short, or relatively short, siphons which are similarly protected. It would, therefore, appear that acquisition of this type of siphon is a necessary preliminary to that of the other modifications associated with deep burrowing. As will be shown in detail later, the general similarity between *Lutraria, Mya* and *Panomya* must be attributed to convergence.

The final stage in siphonal formation, (*D*), is represented in the Cuspidariidæ (Septibranchia)[9], where the siphons lie within a posterior tubular extension of the shell due to the complete fusion of the outer mantle lobes.

Aspects of the Locomotion of Whales

IN an article in *Nature* of January 10, p. 44, Mr. R. W. L. Gawn, superintendent of the Admiralty Experimental Works, Haslar, has directed attention to the possibility that an investigation of the propulsive mechanism of large whales might result in the design of faster submarines. In this connexion the results of work carried out in this Department may be of interest.

(1) In order to drive a large whale at its maximum observed speed against a resistance equal to that of a rigid model when towed at the same speed, the output of power from each pound of muscle need not —as pointed out by Mr. Gawn—be greater than that characteristic of other types of mammalian muscle. On the other hand, a dolphin travelling at well-authenticated speeds would, if its resistance is equal to that of a rigid model, require an output of power at least six or seven times that attributed to the muscles of a well-trained athlete or dog[1]. The difference between the whale and the dolphin is largely, if not solely, due to the fact that the amount of available muscle increases with the cube of the body-length, whereas the surface resistance increases only with the square. If the maximum output of useful work per pound of muscle of a 60-ft. whale and a 6-ft. dolphin is the same, and if the whale's maximum speed is 20 m.p.h., then the dolphin's speed should not exceed 9 m.p.h.—a figure far below that actually observed. As a submarine, the dolphin, rather than the whale, forms a more obvious and perhaps easier subject for investigation.

(2) There seems no reason to believe that the form or surface of an inert whale, dolphin or fish endows the body with a resistance substantially different from that of a well-streamlined object of comparable size and speed; the observations of Kempf and New[2] and of Richardson[3] establish this fact for dead specimens of pike, herring and mackerel, and quite recently I have found that a similar drag coefficient applies to a living fish by observing the rate of decrease of its speed during the passive glide which frequently follows a burst of active swimming. By following the course of the glide and knowing the speed at which it starts, it is possible to calculate the initial output of energy. For a 20-cm. trout, this was found to be approximately 0·4 gm./metres/sec./gm. of body-weight. The significance of this figure lies in the fact that it is almost identical with that obtained by Houssay[4] for considerably larger trout the maximum output of power of which was assessed by their ability to raise relatively large weights at low speeds. There is, therefore, no difficulty in accounting for the performance of small fish, at least so far as their behaviour in the laboratory is concerned.

(3) When we compare the performance of a 20-cm. trout with that of a salmon, we are in the same dilemma as when we compare the behaviour of a large whale with that of a dolphin. If we endow each gram of the muscles of the salmon with the same output of power as that of the trout, and assume that its resistance—like that of the trout—is equal to that of a rigid model of comparable size and speed, the maximum speed of the salmon should not exceed 7 or 8 m.p.h. If, as many anglers believe, salmon can travel at 15–20 m.p.h., they must, like the dolphin, either have remarkably powerful muscles, or have a very low surface resistance.

The data at present available can only be harmonized by one of three assumptions: (*a*) the speeds often attributed to large fish have been very greatly exaggerated; (*b*) the output of power from the muscles has been greatly under-estimated; (*c*) the resistance of an actively swimming fish is substantially lower than that which operates when the animal is gliding passively through the water. Before it is possible to determine the significance of the first of these factors, we require much more reliable data concerning the maximum speeds of fish of known size. Anglers tend to exaggerate the speed at which a line is running out from a small reel, just as they over-estimate the tension in the line. On the other hand, in the laboratory we may be working with fish which are not in a particularly good state of athletic fitness; we may also be making a mistake in assuming that the output of power from mammalian muscle cannot be substantially greater than 0·01 h.p. per lb.—a point recently stressed by Dr. D. A. Parry.

(4) A detailed study of the propulsive mechanism of any aquatic animal obviously presents very difficult hydrodynamical problems, and it is perhaps impertinent for a biologist to suggest any particular line of approach. Nevertheless, it seems legitimate to stress the fact that the surface of an actively moving fish differs from that of a rigid model in two fundamental respects: (*a*) the tail and caudal fin are oscillating from side to side; (*b*) the aspect which the fin presents to the water is partly determined by mechanical forces. Until the flow past such surfaces has been considered in detail, it seems dangerous to assume that the resistance of a swimming fish is the same as that of a rigid model. Observation of appropriate models indicates that the flow of water

past the surface of an active fish is totally different from that of a rigid surface; the water flows smoothly past the undulating surfaces and is subjected to well-defined acceleration. It would be significant if a flow of this type tended to reduce turbulence. Similarly, it would be of great value to know more about the propulsive effect, considered by Garrick[5], of an actively oscillating surface hinged to the hinder edge of an aerofoil. If the flow past the body of an actively swimming salmon proves to be laminar, we can accept Houssay's estimate of muscle-power without asking anglers to believe that the fish cannot travel at 20 m.p.h.

The object of these comments is not, in any way, to detract from the value of further information concerning the propulsive powers of large whales or the hydrodynamical properties of rigid surfaces, but to emphasize the peculiar importance of studying forms, such as the dolphin, where the ratio of body surface to muscle weight seems to render them much more impressive models of submarine design. At the same time, the situation seems likely to remain obscure until we know a great deal more about the hydrodynamical properties of oscillating surfaces, and have been able to measure the forces operating against the body of a living or model fish in a water channel. The whole problem seems to present an admirable opportunity for co-operative effort. The results of such an inquiry might or might not lead to the construction of faster or more efficient submarines; but in so far as they enabled us to measure the propulsive thrust of a fish's tail, they would have a very direct bearing on the design of efficient fish passes for salmon.

J. GRAY

Zoological Laboratory,
Cambridge.
Jan. 20.

[2] Kempf, G., and New, W., *Z. wiss. Zool.*, 17c, 353 (1932).

[3] Richardson, E. G., *J. Exp. Biol.*, 13, 63 (1936).

[4] Houssay, F., "Forme, Puissance et Stabilité des Poissons" (Paris, 1912).

[5] Garrick, T. E., Nat. Adv. Com. Aero. Report 567 (1936).

MR. GAWN has revived interest in Gray's[1] demonstration that the drag of a fast-moving small whale, treated as a rigid body, seems to demand far more power than its muscles could supply, even if the propulsive efficiency were 100 per cent. Clearly, the assumptions underlying the evaluation of the equation

$$\text{muscle power} = \frac{\text{drag} \times \text{speed}}{\text{propulsive efficiency}}$$

need reconsidering. We have recently published some work[2] which considers two of the factors: muscle power and propulsive efficiency.

(1) *Muscle Power.* Mr. Gawn follows Gray in using 0·01 h.p./lb. as the maximum mechanical power output of muscle—a figure based on the external work done during a 15-min. maximum effort by a rowing crew. But muscle-power cannot be expressed as a simple function of size, without taking into account the conditions under which the muscle is working, and in particular the rate of fatigue and muscular efficiency. Thus a man working a bicycle ergometer at maximum muscle efficiency can develop more than 0·02 h.p./lb. (from data given by Dickinson[3]) until the accumulating oxygen-debt ends the activity; while greater power still can be developed during a single flexion of the arm against a suitabl load. This suggests that an animal capable of higher rate of oxygen intake than man might develo greater power for a given time, or a given power fo a greater time. We have suggested that the respiratory adaptations which enable whales to discharg their oxygen-debt quickly after long dives may als enable them to maintain an unusually high oxyge intake, and therefore power-output, when they ar swimming near the surface and can blow frequently This idea is supported by Scholander's[4] observatio on a porpoise that both the vital capacity (relativ to man) and the absorption constant were greate than in man. As for muscle efficiency, it is quit possible that the efficiencies achieved by man wit the help of well-designed machines may occur i whales during normal locomotion, because the loading of their muscles will be high and the rate of contraction low.

(2) *Propulsive Efficiency.* We have shown that th swimming movement consists of a vertical oscillatio of the tail (that is, region posterior to the dorsal fin and a continuous adjustment of the angle of attac of the flukes to give a forward thrust throughou the tail cycle. The dynamics of such a system hav been worked out assuming the flow around th flukes to be stable; but the efficiency then obtaine is improbably low and indicates the need for furthe work, observational (particularly on the relatio between forward speed and oscillation frequency and experimental. The comments of a marin engineer on this method of under-water propulsio would be of great interest.

We believe that the other problem raised by M Gawn—heat loss—is much less difficult. Blubber i fundamentally similar to a terrestrial mammal's skin and blood vessels run through the thick fat laye (hypodermis) to form a plexus and capillary loop a few millimetres from the surface. Control of th flow of blood through these vessels would provid for a considerable range of heat loss. Indeed, th problem is how to keep warm rather than how t lose excess heat, for we have shown that heat los by conduction through the blubber alone is such tha a 14-cm. layer would be needed to reduce bas metabolism to the level characteristic of mos mammals. Perhaps most whales need to kee swimming in order to keep warm.

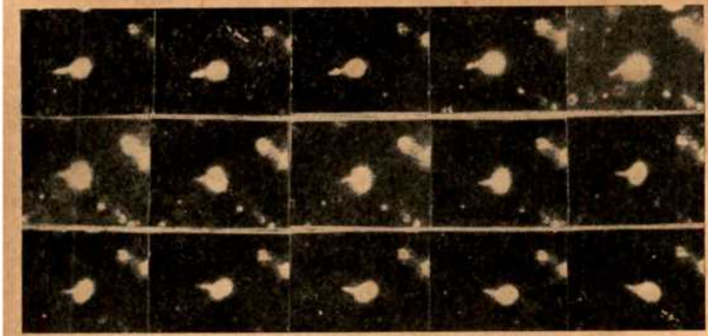
Bacterial Flagella and Motility

IN dark-ground microscopy with the sun a light-source, motile bacteria, when swimming fas show a tail, as in the top left-hand photograp reproduced. This tail is occasionally seen to untwis into a number of wavy threads which appear t remain attached to the periphery of the bacteri body for a while and then float away[1,2,3]. Whe such preparations are dried, the wavy threads ca be stained with so-called flagellar stains, and hithert they have been regarded as 'flagella' or motor-organ Motility of bacteria is thought to be due to activit



of these threads, either by themselves or twisted into a tail. Sunlight dark-ground studies of several kinds of motile bacteria under various conditions have convinced me that motile bacteria are not rods, but that they are spiral-shaped, and that they propel themselves by a gyrating, undulating movement of their bodies. Flagella or motor-organs, therefore, appear superfluous[3,4].

This suggested that the wavy threads, constituting the tail, might not be flagella. The undulating, gyrating movement of the body may spin the outer slime covering of bacteria into a tail, which is dragged along by the body. There always is a good deal of to-and-fro movement as well. Aided by micellar structure of the mucus, this continuous spinning will result in a tail consisting of a number of wavy slime threads. If these conceptions are correct, the tail must behave passively, whatever happens to the bacterial body.

The gyrating, undulating motion of bacteria can suddenly go into reverse. If this is done at high speed, the momentum of the body will drive it on in the direction in which it was going ; but the bacterium may then perform a semi-somersault and the rear end will suddenly become the front end. Such a semi-somersault will leave a *passive* tail more or less where it was, in space, the body performing its semi-somersault independently. This is just what happens.

The accompanying reproduction shows fifteen enlarged consecutive pictures of a 16-mm. film made to illustrate bacterial movement[3]. They show, from upper left to bottom right, a typhoid bacterium performing a semi-somersault. Its body goes through a clockwise half-turn, the front end becoming the rear end. (It could not be kept in perfect focus, the whole movement taking less than a second.) The short body radiated too much light (this was necessary to bring out the faint tail) and so there is no spiral shape visible. It is clear that the bacterial body first moves forward with a straight tail, that the forward movement comes practically to a stop while the semi-somersault is performed, and that the tail remains practically where it is and does not take part in the semi-somersault. As soon as the semi-somersault is ended, forward movement is resumed, and the tail is dragged on again.

My interpretation is that during the semi-somersault the wavy threads, which constitute the mucous covering and the tail, perform a sliding movement past one another, thus giving the bacterial body sufficient freedom to perform its semi-somersault without interfering with the appearance of the tail.

If the tail consisted of flagella or motor-organs, attached all over the body, twisted into an active tail at the end, and yet governing the motion of the body, it becomes difficult, if not impossible, to imagine how such organs could bring about the phenomenon illustrated.

The film mentioned above contains several instances of such semi-somersaults with identical behaviour of the tail. The one reproduced here had the special virtue of going through its stages at a relatively low speed. These observations provide a strong argument in favour of my view that what are traditionally regarded as active bacterial flagella really are passive mucous twirls, and that motile bacteria move by means of gyrating, undulating movements of their bodies.

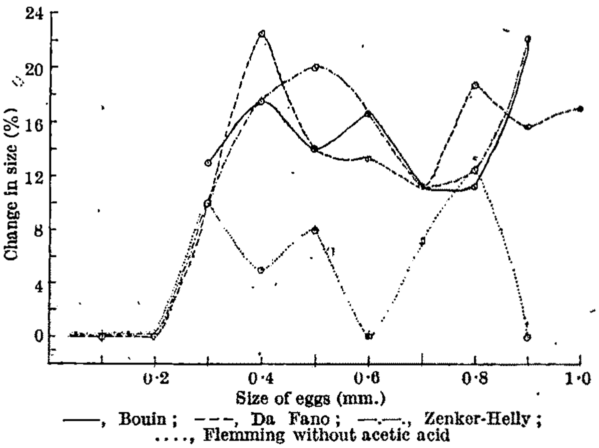
Elminius modestus: Another Imported Pest of East Coast Oyster Beds

THE barnacle *Elminius modestus* Darwin was known only from the southern hemisphere until, less than a year ago, Bishop reported its presence at Chichester and probably at Harwich[1]. Further details of its present known distribution are given by Crisp and Chipperfield[2]. It is now abundant in the estuaries of the Crouch, Roach and Blackwater, and at Whitstable. The multiplication of the American pests, *Crepidula fornicata*[3] and *Urosalpinx cinerea*[4], had already affected these famous oyster-producing grounds, before the greater part of the stocks there were wiped out in the severe winter a year ago. The presence of *Elminius* in very great numbers will tend to retard recovery.

Dense populations of large individuals occur at landing stages, such as the ex-Admiralty pier at Burnham-on-Crouch and the Seasalter Oyster Company's quay at Whitstable. On most shores the equally dense communities consist of small individuals derived from this year's settlement. The present distribution of *Elminius* therefore suggests that it is a comparatively recent introduction from ships' fouling, and shows clearly that it multiplied enormously last summer. In this area it is now more widespread than any British species of barnacle, and it occurs in some places, such as the beach at Maldon, where native barnacles appear to be absent. Between tide-marks on most shores it is the dominant barnacle, and it extends from the sub-littoral zone almost to high-water mark of neap tides. Its upper limit roughly coincides with that of *Balanus balanoides*. In the lower part of the tidal zone and below tide-marks it meets with severe competition from *B. improvisus*. Surfaces which were already thickly populated by *B. improvisus* escaped settlement by *Elminius* last summer, but most bare surfaces did not. Last year *Elminius* settled abundantly on periwinkles and on Whitstable mussels, forming encrustations which will be still heavier this year when the barnacles have grown. It has even settled



The frequency distribution diagrams on log sectional paper show that the samples taken were not abnormal. Diagrams showing the average shrinkage indicate that shrinkage increases with the size of the egg. The smallest eggs showed almost negligible shrinkage, while in the larger ones it was considerable. The eggs of moderate size also showed a fair amount of change in their dimensions. An interesting point was that in Flemming without acetic acid the eggs swelled up and their diameters increased, although the swelling was less than the shrinkage caused by the other fixatives. Curves of percentage change in dimensions show that of all the four fixatives Flemming without acetic acid seems to be the least harmful; for the highest point on its curve is near the lowest point of other curves.

The Iron Alum Acetocarmine Method for Algæ

THE chromosomes of many Algæ have been found difficult to stain by the ordinary acetocarmine method. Where staining takes place, it is seldom deep enough in colour. The addition of ferric acetate or other ferric salts to the carmine solution, or rubbing together of steel needles in it, brings about only slight improvement, if any, as observed by Baker[1].

However, the use of iron alum as a mordant on previously fixed material, preceding the acetocarmine treatment, brings about a totally different effect. It has been shown[2] that chromosomes strongly absorb iron from an iron alum solution. They absorb more than other parts of the cell. This, it is thought, must be of importance. With many Algæ, a few minutes or less in a weak solution of iron alum, followed by rapid washing in water, is sufficient for the formation, on addition of acetocarmine, of a dense blue-black colour, presumably ferric carmine lake. This is rapidly dissolved on heating the preparation when covered with a coverglass, but remains longest in the chromosomes, nucleoli and 'chromocentres'. Thus differentiation is brought about. The lake gives a beautifully precise dark red to purple-black stain, and if the degree of mordanting is well adjusted other parts of the cell are only faint pink or scarcely stained. Such preparations are readily made into permanent mounts in 'Euparal' or Canada balsam in the usual way. If the coverglass is floated off in 95 per cent alcohol there is no loss of stain. Preparations which have been kept for two years show no fading.

That the ferric carmine lake can be formed in this way is contrary to the statement of Baker (ref. 1, p. 155), "the lake cannot actually be formed in strongly acid solution". The strength of the acetic acid solution in which the lake appears by the method described above is something less than 45 per cent, due to dilution of the carmine by the small amount of water placed on the slide with the washed algal material: nevertheless this dilution cannot be great. Unless the material has received only a rapid dip in dilute alum solution, there is always an excess of lake to be dissolved away, and it may be necessary to add acetic acid to complete the differentiation.

The contrast with ferric hæmatoxylin lake is marked when aceto-hæmatoxylin is used instead of carmine, after mordanting. On heating, a beautifully differentiated hæmatoxylin stain results, but this is quite transitory. When the permanent balsam mount is made, even after repeated blueing, the colour generally fades within 12 hours.

Other metallic salts, including copper, lead and aluminium, have been tried as mordants. Even other ferric and ferrous salts are, however, apparently less satisfactory than iron alum.

The advantages of the method when used with Algæ are several. It is rapid, a permanent mount being possible within 30 min., starting from fresh material. It can be used following any fixative. Obstacles to the view of the nucleus are readily removed; for example, chlorophyll by fixation with 2 parts of glacial acetic acid to 1 part of 95 per cent alcohol, starch by heating. Not least is the absence of shrinkage, another consequence of heating under a coverglass. Collapse of the cells in xylol is a familiar nuisance when mounting filamentous forms. It is suitable for class-work, when a permanent mount is often unnecessary, for example, for demonstrating the number of nuclei in algal cells. It is equally good for archegonia and antheridia of fern prothalli and has been successfully used on fungi. A disadvantage from the research worker's point of view is its frequent failure after wax embedding.

A detailed schedule of treatment will be included in a forthcoming paper on the nucleolus and nucleolar organisers in *Spirogyra*.

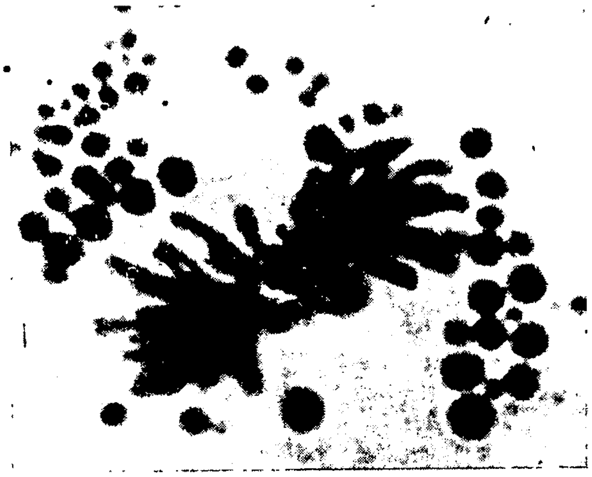
Amphibian Tissue Cultures for Biophysical Research

CULTURES of embryonic chick tissue have been successfully used for many types of cytological research and have proved admirable material for biophysical [illegible]tions into the mechanism of mitotic cell [illegible] fortunately, however, chick fibroblasts [illegible]t very suitable for detailed observatio[illegible]omosomes owing to the small size [illegible]rge number of chromosomes in t[illegible]

Previou[illegible]icated that amphibian cells mig[illegible]uitable material for such stu[illegible]ary experiments, a



METAPHASE GROUP IN NEWT FIBROBLAST. THE LONGITUDINAL SPLIT IN CHROMOSOMES IS CLEAR AT THIS STAGE. × 640

convenient method has been developed for cultivating various tissues and organs of adult frog (*Rana temporaria*), newt (*Triturus vulgaris*) and tadpoles of *Xenopus lævis* in hanging-drop preparations. Explants of *Rana* testis produce a broad outgrowth of fibroblasts which divide readily and survive without subcultivation for a period of two weeks, and longer if the tissue is transferred to a fresh medium. The cells are 40–50 μ in length and the chromosomes about 20 μ ($2n = 26$).

The limb and kidney of *Xenopus lævis* tadpoles give a good growth of fibroblasts after subcultivation. These cells have remarkable powers of flattening on the coverslip, and the cytoplasm is free of granules. This condition makes them very suitable for optical studies. The cells are of the same size as those of *Rana temporaria* and $2n = 36$. Fibroblasts from liver cultures of adult newt *Triturus vulgaris* are 80 μ in length and the chromosomes 20–30 μ in length ($2n = 26$).

In collaboration with Dr. A. F. W. Hughes, a cinematographic analysis of the mitotic process is being made in cultures of *Rana temporaria* by means of phase-contrast illumination. In the films the chromosomes are very clear from early prophase to late telophase. The separation of daughter chromosomes is also visible at magnifications greater than 500, and reconstitution of the nuclear membrane shows some new features. A full account of the results will be published elsewhere. It is also proposed to use this material for studies with the ultra-violet and electron microscopes.

I wish to express my appreciation of the help and advice given to me by Dr. H. B. Fell, director of the Strangeways Laboratory, where with the generous provision of facilities the work has been carried out. I am also indebted to Prof. J. T. Randall, who suggested this investigation, and to the Department of Scientific and Industrial Research for a maintenance grant.

Submicroscopic Structure of the Red Cell

IN a recent paper, Dervichian, Fournet and Guinier describe experiments on the low-angle scattering of X-rays from red blood cells[1]. They show that the scattering curve can be explained as being due to the superposition of two intensity distribution curves: one showing a regular decrease from the centre outwards and the other a distinct maximum at $2\theta = 0{\cdot}025$ radians, corresponding to a Bragg spacing of 62 A. The authors conclude from the latter that the hæmoglobin molecules in the red cell are not distributed at random, but that a certain mean distance between neighbouring molecules is frequently realized. These results are the more interesting, since the scattering effects observed can be predicted from the molecular dimensions of hæmoglobin and its concentration in the red cell, as will be shown below.

The normal red cell is not birefringent. Individual hæmoglobin molecules, on the other hand, are strongly anisotropic, and it seems probable, therefore, that the hæmoglobin molecules in the red cell have complete freedom of rotation. We know from single-crystal X-ray analysis that hæmoglobin molecules (of horse) can be regarded as circular cylinders of 57 A. diameter and 34 A. height[2]. The cylinders are known to be enclosed in a monomolecular envelope of 'bound water' 3 A. thick, which brings the corresponding dimensions of the hydrated cylinders to 63 A. and 40 A. respectively. If the hæmoglobin molecules have complete freedom of rotation, their effective shape will correspond to that of the smallest sphere into which the hydrated cylinders can be inscribed. The diameter of this sphere is $\sqrt{63^2 + 40^2} = 74{\cdot}5$ A.

Considering the large size of the molecule, the concentration of hæmoglobin in the red cell is astonishingly high (34 per cent), which suggests that the molecules may be arranged in some form of close-packing. A 34 per cent solution contains $3{\cdot}35 \times 10^{18}$ molecules per ml., giving a volume per molecule $V_m = 298{,}000$ A.^{3}. Assuming close-packing, the average distance between the molecules will be $\sqrt[3]{4V_m/\sqrt{2}} = 75$ A. Alternatively, the inter-particle distance found from the position of the diffraction maximum observed by Dervichian, Fournet and Guinier by using the expression for a close-packed liquid[5] is $d' = \dfrac{\lambda\sqrt{3/2}}{2\sin\theta} = 75$ A.; this value agrees closely with both the calculated inter-molecular distance and the effective molecular diameter derived above. Thus, provided we assume the hæmoglobin molecules in the red cell to be close-packed, the inter-molecular distance calculated purely from the molecular weight of hæmoglobin and its concentration in the red cell agrees with the distance calculated from the observed diffraction ring; and, moreover, this distance is the same as the effective diameter of the freely rotating molecules, derived from X-ray analysis of crystalline hæmoglobin.

This close agreement lends strong support to the picture of freely rotating molecules arranged in a close-packed lattice. On the other hand, the apparently diffuse nature of the first diffraction ring, together with the absence of higher orders, indicate that three-dimensional regularity within the corpuscles cannot extend over more than a very small number of unit cells at the most; and Dervichian, Fournet and Guinier's description of the arrangement as intermediate between the order in a solid crystal and complete disorder in dilute solution therefore seems very appropriate.

The degree of regularity may perhaps be compared to that in a liquid metal, where each metal ion is surrounded on the average by twelve nearest neighbours arranged in close packing, but where the probability of finding any metal ion at the 'close-packed' distance from any other is high only in the case of nearest neighbours and becomes negligibly small when third or fourth nearest neighbours are considered. Thus we may conclude that despite the existence of short-range order, the hæmoglobin molecules in the red cell are suspended in true solution. This view is supported by the recent finding that the kinetics of the reaction $CO + O_2Hb \rightleftharpoons COHb + O_2$ are the same in the red cell and in cell-free solution[3].

The arguments presented above have some interesting biological implications. Clearly, from the point of view of its functional efficiency as an oxygen carrier, the red cell should combine maximum oxygen capacity with high speed of reaction and diffusion of oxygen through the cell. The greatest possible oxygen capacity would be provided by hæmoglobin crystals, which are known to have a hæmoglobin concentration of 55 per cent[4] and through which oxygen can actually diffuse. On the other hand, the speed of reaction would probably be low in an arrangement where both the position and the orientation of the molecules are fixed, and the rate of diffusion might be hampered by the narrowness of the channels between the molecules in the crystal lattice. It seems likely, therefore, that freedom of rotation of the hæmoglobin molecules and the absence of a three-dimensionally continuous lattice are needed to ensure high rates of reaction and diffusion. In that case 34 per cent is the highest concentration which is compatible with these conditions, since it leads to an average distance of approach between freely rotating molecules which is equal to their effective diameter. Any further increase in concentration would lead to mutual hindrance in the rotation of the molecules, and would be likely to affect the reaction rates.

Our calculations show that close-packing of the molecules is, in fact, an inevitable consequence of the high hæmoglobin concentration. If the molecules were arranged at random, their mean distances would have to be greater than 75 A., with the result that a hæmoglobin concentration of 34 per cent could not be achieved.

Weight of the Rat Thymus

RECENT work involved accurate weighing of the thymus glands of young (6–12 weeks old) hooded Lister rats of both sexes. It became evident that great care was essential in dissecting out the thymus because of the risk of including one or more lymph nodes in the tissue taken for weighing. In rats of this age, mediastinal lymph nodes are occasionally difficult to distinguish from part of the thymus. One or more of these nodes is usually found on each side of the thymus and is visible from the front on opening the thorax. Identification is simple when the nodes lie apart from the thymus; but when they are welded by connective tissue to the thymus, and the symmetry of the sides of this organ is not altered, confusion may arise.

Close inspection by naked eye or hand lens may be required to distinguish a node from the thymus. Typically, the surface of the node is slightly granular, being marked by the tiny bulges of many follicles. This is in contrast to the smooth, homogeneous surface of the thymus. A line of cleavage can usually be made between a node and the thymus by blunt dissection. Further, a node pressed between the blades of a pair of forceps feels harder and more 'rubbery' than the thymus. The presence of follicles, however, invariably indicates a node, and the pressure test, which would distort the tissues and interfere with subsequent microscopical examination, is not required in practice. Histological examination reveals the interloper, but only after it is too late to assess the true weight of the thymus.

The nodes can be strikingly demarcated from the thymus by vital staining. Intraperitoneal injection of 1 ml. of 0·5 per cent trypan blue (Gurr's) in distilled water every alternate day for eight days (that is, total of four injections) causes an intense staining of the nodes, whereas the thymus takes up the dye poorly. Macroscopically, the submaxillary lymph nodes are not stained so intensely as these mediastinal nodes, and the follicles of Peyer's patches of the small intestine do not appear to concentrate the dye at all. Further work is in progress on these points and on the detailed histology of the lymph nodes. In earlier work from this Institute[1] the procedure followed for stripping the thymus removed the relatively small mediastinal nodes from the weanling rats used for these experiments. But in my older rats examination of specimens of vitally stained lymph nodes adherent to the thymus indicates that the nodes could account for an error up to 30 per cent of the thymus weight if not removed.

The thymus weight of rats is often recorded in experiments besides those concerned with nutrition, and this note is published to direct attention to the possibility that such observations may be seriously complicated if great care is not taken to free the thymus from the closely related mediastinal lymph nodes.

The above work was done during the tenure of a full-time Agricultural Research Council scholarship.

Brain Lactate in Emotion

THERE are many indications that emotional excitement is associated with increased functional activity of the central nervous system. This is shown by the increased autonomic and motor activity in emotion, as also by the shock and exhaustion which may follow intense emotion. Histologists have described changes in the staining properties of the nerv[illegible]ells in emotional fatigue; but there is littl[illegible]ion as to the nature of the underlying [illegible] changes.

Lactic ac[illegible]ions were carried out on the brains of y[illegible]he animals were killed by dropping them into liquid air, which, in addition to killing them instantaneously, produced a rapid fixation of the biochemical changes in the brain. It was found that the brain lactate in rats which had been frightened for four minutes by repeatedly removing their support gave consistently higher values (mean for six rats, 40 mgm./100 gm. tissue) than in normal resting litter-mate controls (mean, 18·7 mgm./100 gm. tissue). Stone[1] has previously reported that the brain lactate in mice may be raised after muscular exercise. In the present investigation the rise in brain lactate in emotional excitement was still observed in rats in which muscular activity had been almost abolished by giving tubocurarine: it was therefore unlikely that the effect was due to concomitant muscular exercise. The blood content of the brain is too small to account for the lactate found in the tissue, and in any event blood lactate estimations in the experiments with tubocurarine gave comparatively low blood lactate values. It would appear that the observed rise in brain lactate is due to the increased functional activity of the brain in emotional excitement.

Starches of the Wrinkled and the Smooth Pea

We wish to report some observations concerning the chemical constitution of pea starch which may influence current views on the part played by this polysaccharide in plant metabolism. The form of the starch grain is often characteristic of the plant or plant organ in which the starch is found, but in most of the common starch-bearing plants this difference in grain-form is not reflected in the chemical composition of the starch. By composition is meant, in this context, the relative proportions of the amylose (unbranched chain) and amylopectin (branched chain) components of the starch. Most of the cereal and root starches are composed of 20–30 per cent amylose and 70–80 per cent amylopectin. Until recently, the only exceptional starches which had been examined were those of the waxy (or glutinous) variety of cereals. Thus, waxy maize starch, which has a low gelatinization temperature and is stained reddish-purple with iodine (B.V. 0·10), owes these properties to the fact that it contains little, if any, amylose, being composed almost entirely of the branched-chain component.

Attention was directed to the unusual properties of the starch of the wrinkled pea by Hilbert and MacMasters[1], who showed that it contained a higher percentage of amylose (60–70) than did any starch hitherto examined. We have confirmed this finding and have shown, moreover, that the starch of at least one variety of wrinkled pea (Steadfast) contains less than 2 per cent of amylopectin.

The starch prepared from the defatted flour of Steadfast wrinkled pea by separation with cold water contains much protein which a[illegible]rs to be an integral part of the grain. The pro[illegible]starch, which stains blue with iodine (B.[illegible]ontains only 54 per cent of acid-hyd[illegible]ysaccharide. Although practically ins[illegible]g water, it can be dispersed in hot caustic soda solution, and by a graded acidification of the alkaline solution it is possible to obtain the starch free from protein. A more generally applicable method, however, consists in the exhaustive extraction of the protein-starch complex with hot 30 per cent chloral hydrate solution (pH 3), the extraction being continued until the insoluble residue no longer contains acid-hydrolysable polysaccharide.

The main protein-free fraction obtained by chloral hydrate extraction was a typical amylose, inasmuch as it did not gelatinize appreciably in boiling water, was hydrolysed to an equal degree (98 per cent) by $1 \cdot 5\,N$ sulphuric acid and by β-amylase, and its complex with iodine showed a blue value and a visible light absorption curve substantially the same as those of the amylose separated from potato starch by the thymol method[2]. A quantitative analysis of all the fractions obtained by extraction with chloral hydrate revealed the presence of not more than 2 per cent of the branched-chain component. The estimation was based upon the relative extent of hydrolysis effected by mineral acid on one hand and by β-amylase on the other.

Although the wrinkled pea is now regarded by botanists as the type (*Pisum sativa*) and the smooth pea as the variation (*P. arvense* L.), it is probable that the reverse is true and that the wrinkled pea is the product of artificial breeding[3]. It is of interest to find, therefore, that the starches of the two varieties are chemically different. We have shown that the protein-free starches derived from two types of smooth pea, Early Bird and Pilot, contain 66 per cent of amylopectin and only 30 per cent of amylose. The salient differences between the starches of *P. sativa* and *P. arvense* L. are shown in the accompanying table.

STARCHES FROM THE WRINKLED AND THE SMOOTH PEA

Variety of pea	Protein-free starch				
	B.V.	Amylose		Amylopectin	
		%	B.V.	%	B.V.
Wrinkled (Steadfast)	1·10 (av.)	98	1·10	2	—
Smooth (Early Bird)	0·535	29·4	1·25	65·8	0·200
Smooth (Pilot)	0·560	30·2	1·30	66·1	0·265

Blue Value (B.V.) is defined in ref. 4.

The starch of the smooth variety of pea appears not to exist in combination with protein in the grain, for it is possible to obtain protein-free starch from the pea flour by the usual treatment with cold water, that is, without disruption of the grain.

Wrinkled pea starch, being an amylose, is precipitated almost quantitatively by thymol from an aqueous dispersion, and it shows, in a more marked degree, the properties associated with the unbranched component of cereal starches. It may be dispersed by treatment with warm alkali, but subsequent neutralization is followed by rapid and spontaneous precipitation of the starch from solution (retrogradation). It does not swell in pyridine and can be acetylated by acetic anhydride and pyridine only if it is freshly precipitated by the addition of acetone to a chloral hydrate solution. The acetate so obtained is fibrous in form. In these respects the protein-free starch of *Pisum sativa* more nearly resembles cellulose in physical characteristics than does any of the seed or root starches hitherto investigated.

It may well be that the composition of pea starch is conditioned by the degree of maturity of the seed, and a determination of the amylose-amylopectin ratio at different stages of growth should give some insight into the biogenesis and biological function of starch in this plant.

We wish to thank Sir Norman Haworth for his interest in this work, and the Colonial Products Research Council for financial assistance. We wish also to acknowledge our indebtedness to Dr. T. J. Schoch for a sample of starch isolated from Laxton's Progress variety of wrinkled peas.

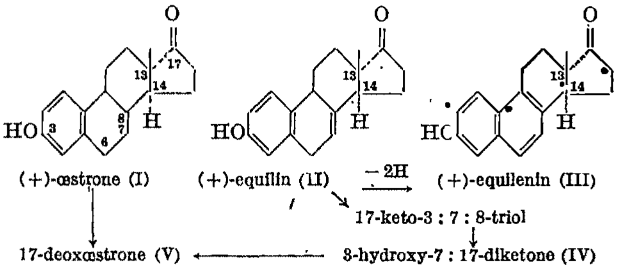
Nature of the C/D-ring Union in the Œstrogenic Hormones

In a recent discussion[1] of the nature of the *C*/*D*-ring union in the natural œstrogenic hormones (+)-œstrone and (+)-equilenin, I suggested that the stereochemical correspondence of these compounds was not beyond all doubt. It has since come to my notice that satisfactory evidence of such correspondence does, in fact, already exist in the literature. Because this evidence appears generally to have escaped recognition, it seems desirable to direct attention to it, and it is briefly summarized hereunder.

(*A*) When (+)-equilin (II) is shaken with palladium black in ethanol at 80° in an atmosphere of nitrogen, dehydrogenation occurs to give (+)-equilenin (III)[2,3]; in view of the very mild conditions employed, it seems certain that (+)-equilin and (+)-equilenin correspond stereochemically at C_{13} and C_{14}. (+)-Equilin is hydroxylated by treatment with osmium tetroxide to yield a 17-keto-3 : 7 : 8-triol[4], which by distillation in a high vacuum loses 1 mol. of water to afford a 3-hydroxy-7 : 17-diketone (IV)[5], which by Wolff–Kishner reduction of its disemicarbazone gives 17-deoxœstrone (V)[5], obtained previously by the same method from the semicarbazone of (+)-œstrone (I)[6]. Although carried out at 205–210°, it seems improbable that pinacolic dehydration of the 3 : 7 : 8-triol, involving migration of a hydrogen atom from C_7 to C_8, could lead to inversion of configuration at C_{14}; similarly, Wolff–Kishner reduction of many steroid ketones has been carried out, but in no case has inversion at C_{14} been observed; for example, androstane-3 : 17-dione gives androstane[7] and ætiocholane-3 : 17-dione furnishes a high yield of ætiocholane[8]. These reactions therefore link (+)-œstrone (I) with (+)-equilenin (III) and indicate that these hormones, as also (+)-equilin (II), correspond stereochemically at C_{13} and C_{14}.



(*B*) When the 3-hydroxy-7 : 17-diketone (IV) is acetylated, there is obtained an enol-diacetate, in which the position of the new double-bond between C_6 and C_7 is established by the absorption spectrum[5]; this by hydrogenation with palladium black in acetic acid and subsequent alkaline hydrolysis gives a 17-keto-3 : 7-diol[5], converted by treatment as the 3-monobenzoate with phosphorus pentachloride (1 mol.) in the presence of calcium carbonate into a 7-chloride[9]. Elimination of hydrogen chloride from this by use of sodium iodide in pyridine furnishes, after removal of the benzoyl group by alkaline hydrolysis, Δ^6-œstrone, since the position of the new double-bond is established by the absorption spectrum and hydrogenation with palladium black in ethanol at 20° gives (+)-œstrone as the sole product[9]. This sequence of reactions avoids the high-temperature Wolff–Kishner reduction, and again links (+)-œstrone (I) with (+)-equilenin (III) in respect of configuration at C_{13} and C_{14}.

$$\begin{tikzcd}
\text{(+)-œstrone (I)} & \text{(+)-equilin (II)} \arrow[r] \arrow[dr] & \text{(+)-equilenin (III)} \\
\Delta^6\text{-œstrone} \arrow[u] & & \text{3-hydroxy-7 : 17-diketone (IV)} \arrow[d] \\
\text{17-keto-3-benzoyloxy-7-chloride} \arrow[u] & \text{17-keto-3 : 7-diol} \arrow[l] & \Delta^6\text{-17-keto-3 : 7-diacetate} \arrow[l]
\end{tikzcd}$$

(*C*) Quite recently[10], transformations analogous to the foregoing have been carried out on "α"-dihydroequilin, which as the 3 : 17 "α"-diacetate is hydroxylated by treatment with osmium tetroxide to a 3 : 7 : 8 : 17 "α"-tetrol, also obtained by reduction with sodium and ethanol of the 17-keto-3 : 7 : 8-triol mentioned in section (*A*); this tetrol, either by distillation at 200° in a high vacuum or by treatment with hot 8 per cent sulphuric acid, undergoes pinacolic dehydration to give a good yield of a 7-keto-3 : 17 "α"-diol, which by Wolff–Kishner reduction or by removal of the 7-carbonyl group by the procedure described in section (*B*) furnishes "α"-œstradiol, a reduction product[11] of (+)-œstrone.

Once again these reactions link (+)-œstrone (I) with (+)-equilenin (III), and appear to prove that these hormones possess the same type of *C*/*D*-ring union, at present assumed by convention to be a *trans*-fusion.

p-Hydroxybenzil

By oxidizing *p*-hydroxydeoxybenzoin with chromic anhydride in acetic acid, Weisl[1] obtained a substance, m.p. 175°, which he claimed to be *p*-hydroxybenzil. He described it as an amorphous powder, crystallizable with difficulty from aqueous ethanol in the form of orange needles; in alcoholic solution, it gave a deep red colour with potassium hydroxide.

Recent work in these Laboratories has shown that *p*-methoxybenzil[2], when demethylated with hydrobromic acid, gives a *p*-hydroxybenzil, m.p. 129–130° (found: C, 74·1; H, 4·7. $C_{14}H_{10}O_3$ requires C, 74·3; H, 4·5 per cent) (acetyl derivative, m.p. 67°), which crystallizes readily from benzene or aqueous ethanol in pale yellow needles; with potassium hydroxide its alcoholic solution assumes a deep golden-yellow colour, evidently due to heightened resonance effects in the anionic form of the molecule. The same compound has been obtained almost quantitatively by the oxidation of *p*-hydroxydeoxybenzoin with selenium dioxide and in a small yield by the application of Weisl's method to *p*-acetoxydeoxybenzoin with subsequent deacetylation of the product. It seems very probable, therefore, that Weisl, through omitting to protect the hydroxyl group during his oxidation, obtained some product of more complex nature which he wrongly assumed to be *p*-hydroxybenzil.

The reaction of *p*-hydroxybenzil, m.p. 129–130°, towards urea and sodium ethoxide in ethanol proceeds in the normal manner to give a mixture of the hydantoin and the glycoluril. 5-Phenyl-5(*p*-hydroxyphenyl) hydantoin, recently mentioned but not characterized by Melton and Henze[3], has m.p. 311° (decomp.) (found: C, 66·7; H, 4·9. $C_{15}H_{12}O_3N_2$ requires C, 67·2; H, 4·5 per cent); this compound is also produced by the demethylation of 5-phenyl-5(*p*-methoxyphenyl) hydantoin, m.p. 224–225°, obtained from *p*-methoxybenzil and urea by the standard method. All melting points are corrected.

Further details of this work will be incorporated in a later publication.

Auroral Activity in Southern Norway from the Middle of August to the Middle of October, 1947

Corresponding to the very high solar activity last autumn, an unusual number of auroras have occurred in southern Norway; I have never before seen so many auroras in so short a time. Thanks to fine weather conditions, all my aurora stations have been in action and a great number of pictures have been obtained for the determination of height and position of the auroras.

Auroras were observed between the following dates and the next one: August 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 24, 25, 28; September 3, 7, 11, 13, 14, 15, 17, 18, 24, 25; Octo[illegible] 2, 3, 5, 7, 8, 10, 11, 12, 13, 14, 17, 18. On Au[illegible] September 3, 7 and 24, auroras forme[illegible] On several occasions red rays and re[illegible]re seen.

Photographs were taken from my stations on August *13*, *15*, 16, *18*, 19, 21, *22*, 25, 28, September *3*, 7, 11, *15*, *17*, *18*, *24*, *25* and October *2*, *7*, *13*, 17, 18. On the dates printed in italic type, pictures were taken from two, three, four or five stations simultaneously. In all, 1,920 photographs could be used, among which 398 sets were suitable for height determination.

Of special interest were the photographs taken on August 15–16. During that night Lovell, Clegg and Ellyett obtained for the first time radar echoes from the aurora[1], a fact which, if verified, may have the greatest importance for future auroral research. 125 successful pictures were taken that night from my stations, Oslo, Dombås, Holmestrand, Askim and Kongsberg, which gave twenty-eight sets of simultaneous pictures. Of these, eight sets have been measured, giving, among other things, heights of summits of sunlit auroral rays equal to 539, 774, 520, 541, 452, 425, 573, 590, 730 and 657 km., which is of the same order as the heights found by radar.

Lorentz-like Transformations

The analogy between Dingle's relativistic theory of temperature radiation[1] and the special theory of relativity may be given precise mathematical form by the introduction of a transformation of which those due to Lorentz and Dingle are special cases. This may assist in the further development of the thermal theory.

Consider quantities a and t which transform according to

$$\left.\begin{aligned} da' &= g(b_1)\ (da - b_1 dt), \\ dt' &= g(b_1)\ h(b_1\,, b)\ dt, \\ b' &= (b - b_1)/h\ (b_1\,, b), \end{aligned}\right\} \qquad (1)$$

g and h being continuous functions of their arguments. The quantity b is defined as da/dt and b_1 is a particular value of b which acts as a parameter of the transformation. With

$$g(0) = 1 \equiv h(0,b) \qquad (2)$$

the transformation goes over into the identity as $b_1 \to 0$.

As invariant metrics of the transformation (1) the special forms (i) $da^2 - dt^3$, (ii) $dt(dt - da/k)^3$ are of interest, k being a constant. In case (i) the two-dimensional Lorentz transformation is obtained from (1) in the form

$$\left.\begin{aligned} da' &= \frac{da - b_1 dt}{(1 - b_1{}^2)^{1/2}}, \\ dt' &= \frac{dt - b_1 da}{(1 - b_1{}^3)^{1/2}}, \end{aligned}\right\} \qquad (3)$$

whereas case (ii) yields Dingle's transformation:

$$\left.\begin{aligned} da' &= \frac{da - b_1 dt}{(1 - b_1/k)^{1/4}}, \\ dt' &= (1 - b_1/k)^{3/4}\, dt. \end{aligned}\right\} \qquad (4)$$

The physical interpretation of the symbols and a comparison with Dingle's notation are given in the accompanying table.

TABLE OF SYMBOLS USED

Symbols used		Interpretation	
Present notation for cases (i) and (ii)	Dingle's notation for case (ii)	Case (i)	Case (ii)
a	η	Distance covered	Measure of entropy radiated
t	t	Vel. of light × time	,, ,, time
b	τ	Vel. ÷ vel. of light	,, ,, temperature
w_1	Not used	$+1$	Measure of an infinitely high temperature
w_2	$-\zeta$	-1	Constant depending on an experimental arrangement and corresponding to the absolute zero of temperature
$g(b_1)$		$(1 - b_1^2)^{-1/2}$	$(1 - b_1/w_2)^{-1/4}$
$h(b_1, b)$		$1 - b_1 b$	$1 - b_1/w_2$

These properties suggest a study of the general transformations (1). They form a group provided

$$\left.\begin{aligned} g(b'_2) &= \frac{g(b_2)\,h(b_1\,,\,b_2)}{g(b_1)\,h(b_1\,,\,b_1)}, \\ h(b'_2\,,\,b') &= \frac{h(b_2\,,\,b)\,h(b_1\,,\,b_1)}{h(b_1\,,\,b)\,h(b_1\,,\,b_2)}. \end{aligned}\right\} \qquad (5)$$

Furthermore, particular values, w_n ($n = 1, 2, \ldots$) of b such that $w'_n = w_n$ (values of b which are invariant under (1)), must satisfy

$$h(b_1\,,\,w_n) = 1 - b_1/w_n \qquad (6)$$

by (1). Hence

$$b_1 \neq w_n \quad (n = 1, 2, \ldots), \qquad (7)$$

since, with $b_1 = w_n$, (6) shows that $h(w_n, w_n) = 0$, so that the transformations (1) would become meaningless in this case. If these transformations form a continuous group, it follows from (7) that there can be no value w_n of b within the range which the parameter b_1 can cover. Such values of b can thus occur only at the end-point(s) of the range of values of b_1 within which the transformations (1) are effective. In fact, with the convention $w_1 > w_2$,

in case (i) $w_1 = 1$, $w_2 = -1$, $1 > b_1 > -1$,
in case (ii) $w_1 = \infty$, $w_2 = k$, $\infty > b_1 > k$.

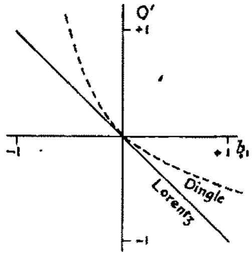
It is interesting to note that these conclusions are already inherent in the transformation (1). They represent a generalization of the property of Einstein's special relativity that, if v be an arbitrary velocity, c the velocity of light, the relations

$$v = -c, \quad -c < v < +c, \quad v = +c,$$

are each invariant under a Lorentz transformation. In Dingle's case they enable us to interpret the constant k (which occurred in the second metric) as an invariant temperature which, with the usual measures, corresponds to the absolute zero of temperature. k must be negative, since the group property of the transformation requires that the value $b_1 = 0$ be possible.

In the relativity case, b_1 is the velocity of a system of reference S' relative to another system S. Expressing this relationship symbolically, we write

$$b_1 : S \rightarrow S', \text{ and introduce } b_2' : S' \rightarrow S''. \qquad (8)$$



RELATIONS BETWEEN o' AND b_1, TAKING $w_2 = -1$ IN BOTH CASES

Hence $b_2 : S \rightarrow S''$ and, in particular,

$$\text{if } S'' \equiv S, \text{ then } b_2 = 0, \text{ and } b_2' = o' = -\frac{b_1}{h(b_1,o)} \qquad (9)$$

by (1). Hence for case (9) the relations (8) yield the reciprocal transformations

$$b_1 : S \rightarrow S', \quad -b_1/h(b_1,o) \;:\; S' \rightarrow S.$$

The relation between these two transformations for the two special cases is illustrated in the figure. Thus, on transforming from S' to S the last equation (1) is replaced by

$$b = \frac{b' - o'}{h(o',b')} = \frac{(b - b_1)h(b_1,o) + b_1 h(b_1,b)}{h(b_1,b_1)} \qquad (10)$$

by (1), (2), (5) and (9). Using (10) to eliminate $h(b_1,b)$ from (1), our transformation is seen to be a linear transformation with matrix

$$g(b_1)\begin{pmatrix} 1 & -b_1 \\ \dfrac{h(b_1,b_1) - h(b_1,o)}{b_1} & h(b_1,o) \end{pmatrix}. \qquad (11)$$

Though we are not here concerned with the physics of the theories leading either to case (i) or to case (ii), their unification in the above way may be of interest.

P. T. LANDSBERG

[1] Dingle, H., *Phil. Mag.*, 35, 499 (1944); 37, 47 (1946); *Nature*, 157, 515, 556, 737 (1946).

MR. LANDSBERG'S letter, in that it derives a general transformation of which the Lorentz transformation is a special case, is doubtless of importance mathematically. It seems to me to have considerable physical interest for two reasons. First, it should help to elucidate the difference between the 'one-way' character of the laws of radiation and the 'two-way' character of the laws of motion, since it shows that both sets of laws, expressed in relativistic form, are special cases of a more general relation. Secondly, the detailed correspondence obtained between the Lorentz transformation and the transformation operative in thermal relativity should help by analogy in the further development of the latter. It might help, for example, in deriving a rigorous relation between specific heat and temperature (expressed, of course, not in those terms but in terms of the thermal relativity measurements) by analogy with the mechanical relation between mass and velocity.

HERBERT DINGLE

DOSAGE/RESPONSE RELATIONSHIPS IN MOULD INHIBITION

By J. N. PHILLIPS and J. M. VINCENT
School of Agriculture, University of Sydney

WHILE in the inhibition of several moulds by alkyl *p*-hydroxybenzoates, the expression :

$$y = a\,x^b, \qquad (1)$$

where y is proportionate reduction in rate of increase in colony diameter (inhibition), x is concentration of inhibitor, a and b are constants ($b < 1$), provides a fair statement of results and permits a reasonable comparison of substances[1], considerations raised by Hinshelwood in connexion with antibacterial action[2] have suggested the desirability of re-examining data for agreement with the form of the Langmuir adsorption isotherm.

The experimental points for the inhibition of *Aspergillus niger* by the alkyl *p*-hydroxy- and *p*-aminobenzoates is fitted rather better by the logarithmic (equation 1) than by the simple adsorption relationship. For these cases the former remains the better statement of results, although it throws no light on possible mechanism of inhibitor action. There is, however, little to choose between the two curves over a fair part of the inhibitory range, and even with this organism the adsorption form might serve as a first approximation. The alkyl *p*-aminobenzoate inhibition of two other organisms (*Penicillium roqueforti* and *Byssochlamys fulva*) fits the adsorption equation as well as, or rather better than, the logarithmic form. The detail of these investigations will be reported elsewhere, but certain implications of the equation based on the adsorption phenomenon seem to merit attention.

From the adsorption isotherm :

$$k_1x(1-A\theta) = k_2A\theta, \qquad (2)$$

where k_1 and k_2 are constants of adsorption and desorption respectively, θ is number of molecules adsorbed per unit area, A is effective area occupied by each molecule adsorbed at the surface, x is molar concentration of substance being adsorbed, it follows that :

$$A\theta = B.x/(1 + Bx), \qquad (3)$$

where $B = k_1/k_2$.

We can now look at two ways in which inhibition may be related to adsorption per unit area :

(i) as proportional to the *area* occupied by the adsorbed molecules, when

$$y = K_1A\theta, \qquad (4)$$

where y is inhibition, K_1 is a constant expressing the relative effectiveness per unit area occupied by adsorbed molecules ;

(ii) as proportional to the *number* of molecules adsorbed, when

$$y = K_2\theta, \qquad (5)$$

where K_2 is a constant expressing the relative inhibitory effectiveness per molecule adsorbed.

Regarding the first possibility and combining (3) and (4),

$$y = K_1B.x/(1 + Bx). \qquad (6)$$

The corresponding equation for the second postulate would be :

$$y = K_2B.x/A(1 + Bx). \qquad (7)$$

Equations (6) and (7) can then be written in the linear forms :

$$x/y = 1/K_1B + x/K_1. \qquad (6a)$$

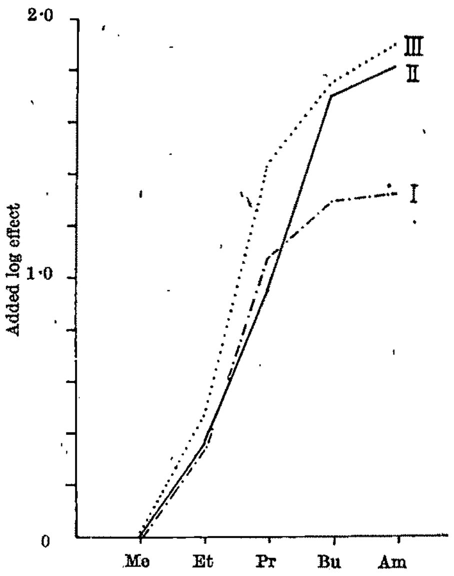
$$x/y = A/K_2B + Ax/K_2. \qquad (7a)$$

If then the experimental data be plotted as x/y against x, the slope of the line (generalized as $1/K$) represents $1/K_1$ or A/K_2 according to the supposition being examined.

Whatever the detailed factors represented by the slope, B can be determined by substitution in equations (6*a*) and (7*a*). This constant would then, by definition, provide a measure of relative adsorbability at a biological surface.

It is possible by these means to examine dosage/response data in order to analyse inhibitory action in terms of: 'biological' adsorbability (B) and relative effectiveness per unit area occupied by adsorbed molecules (K_1 or K_2/A). The technique seems likely to have a use in the more critical study of toxic substances and has obvious similarities to the Lineweaver and Burk manipulation of the Michaelis–Menten equation[3].

The application of the method is illustrated in the case of the relative inhibitory action of successive alkyl *p*-aminobenzoates on *B. fulva* (see graph).



INCREASED EFFECT WITH INCREASING CHAIN-LENGTH OF ALKYL *p*-AMINOBENZOATES

Curve I : Logarithm of concentration causing 50 per cent inhibition of *B. fulva*. Methyl = −0·43.

Curve II : Logarithm of lowering of surface tension (data of Adams, Rideal *et al.*[4]). Methyl = 0·28.

Curve III : Logarithm of 'biological adsorption' (B) as defined in text. Methyl = −1·0.

Curve I shows the increase with chain-length of overall inhibitory effectiveness as gauged by − log (concentration giving 50 per cent inhibition). This should be compared with surface activity data (Curve II)[4] from Adams, Rideal *et al.* Up to propyl, there is good agreement between this biological effect and the simple physical property of lowering surface tension at an air–water interface. Beyond propyl, the biological effect falls markedly below the surface tension data. If, however, K and B are dissected out from the biological data, there are two interesting consequences. The slope of the line increases, that is, K decreases, with chain-length :

Ester	K
Methyl	20·4
Ethyl	18·5
Propyl	12·4
Butyl	11·4
Amyl	9·8

At the same time, the logarithmic increase in 'biological' adsorption (B), plotted against chain-length (Curve III), agrees very much better with the simple physical determination (Curve II).

Since inhibition seems likely to be more closely related to the number of molecules adsorbed than to the area they occupy, it would seem profitable to examine the slope values regarded as A/K_2 (equation 7a). Without losing sight of the possibility of decreased K_2/A being due to a decrease in effectiveness per molecule (K_2), a more reasonable proposition for such a homologous series would be that it results from increasing A due to extra molecular bulk or a different disposition relative to the adsorbed surface.

It needs to be observed at this point, however, that other inhibitor/organism relationships need not be so straightforward as that quoted above. At least two reasons can contribute to this: (i) the accurate determination of the constants is often difficult; (ii) the dosage/response relationship is, to a varying degree, only approximated by the simple adsorption form, and it might be necessary to restrict the determination of constants to a relatively small portion of the curve such that permits valid comparison between substances. With these reasonable provisos, data for *P. roqueforti* and *A. niger* seem to show at least the same trends as those seen clearly in *B. fulva*. Their detailed examination will be dealt with elsewhere in collaboration with Mr. G. W. K. Cavill.

In conclusion, we should like to express our indebtedness to Prof. C. N. Hinshelwood for his critical comment on an earlier draft of the ideas set out in the present communication. Needless to say, although the present form has been influenced by such comments, Prof. Hinshelwood cannot be held responsible for any of its residual imperfections.

NITROGENOUS CONSTITUENTS OF THE POTATO

By Dr. E. B. SLACK

Biochemical Laboratory, Cambridge

OSBORNE and Campbell[1] isolated a globulin from the expressed sap of minced potatoes. By extracting the crushed potato residue with 10 per cent sodium chloride, they were able to obtain an additional amount of protein which they considered was identical with the globulin contained in the press juice. When a solution of this protein in 10 per cent sodium chloride was gradually heated, a flocculent coagulum was formed at about 60° C., and further precipitates were obtained at higher temperatures up to 80° C. At this temperature coagulation of all the protein was complete, although a minute amount of proteose material appeared to remain in solution. The authors concluded that the only true protein present in potato was a globulin, with rather indeterminate heat-coagulation properties, for which they proposed the name of 'tuberin'. Neuberger and Sanger[2] extended this work and found that the potato residue, after removal of the press juice, contained a small amount of nitrogen (about 8 per cent of the total potato-nitrogen) which was insoluble in all the usual protein solvents. In more recent studies on tuberin, Groot, Janssen, Kentie, Oosterhius and Trap[3] have shown that it can be separated electrophoretically into two components.

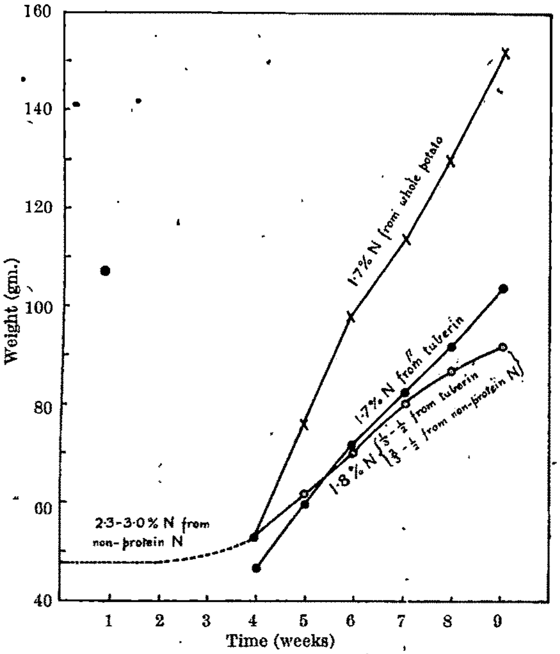
Determinations of the amino-acid content of tuberin were carried out by Sjollema and Rinkes[4] and by Groot[5]. The results of the earlier workers are probably not very reliable owing to the inadequacy of methods at that time. It is noteworthy, however, that Groot's recent figure for the lysine content of tuberin is of the same low order, 3·6 per cent, as that obtained by the earlier workers.

Using Gale's decarboxylase method[6], I have found that a sample of tuberin, prepared from King Edward potatoes by heat coagulation of the press juice at 80° and pH 4·5, had a lysine content of 7·7 per cent, a value that is more consistent with the high nutritive value of tuberin reported by Kon[7] and by Chick and Cutting[8]. Estimations of the other essential amino-acids of tuberin were made by the methods of Tristram[9] for valine, leucines, tyrosine and phenylalanine, of Macpherson[10] for arginine and histidine, of Lugg[11] for cystine and methionine, of Hess and Sullivan[12] for tryptophan, and of Rees[13] for threonine. The results show that the only amino-acid present in inadequate amount is methionine (see accompanying table). In addition to tuberin, the potato contains a variety of other nitrogenous substances present in considerable amount, the actual ratio of protein to non-protein nitrogen varying appreciably with different samples. In the case of the King Edward potatoes used in the present work, about half to two-thirds of the total nitrogen was non-protein.

AMINO-ACID COMPOSITION OF TUBERIN AND OF WHOLE POTATO

Amino-acid	Amino-acids (gm.) per 16 gm. nitrogen in Whole potato	Tuberin
Phenylalanine	5·4	6·6
Leucines	11·3	17·5
Valine	4·8	6·1
Tryptophan	0·8	1·6
Threonine	3·7	5·9
Arginine	4·4	6·0
Histidine	1·7	2·2
Lysine	5·0	7·7
Cystine	1·7	2·1
Methionine	1·6	2·3

Neuberger and Sanger[2] and Chick and Cutting[8] examined the non-protein fraction and found that about 50 per cent of the nitrogen was present in the form of amides (glutamine and asparagine), and about 30 per cent in the form of nitrogenous bases precipitable by phosphotungstic acid. Only about 10–20 per cent of the non-protein nitrogen was found to be present in the form of α-amino-acids. In the present work, this α-amino fraction has been separated by the procedure of Vickery[14] and analysed for the essential amino-acids by the methods specified for tuberin above. By combining the values obtained for the amino-acid content of the non-protein fraction with those found for tuberin, and assuming that all the protein present in potato has the same composition as tuberin, it is possible to calculate the amino-acid composition of the 'crude-protein' (N × 6) of the whole potato. The result is given in the table, and shows that the latter is poorer in its content of all the essential amino-acids than tuberin, from which it might be predicted that its nutritive value would also be inferior to that of tuberin.



THE AVERAGE GROWTH-RATES OF YOUNG LITTER-MATE RATS RECEIVING DIETS COMPLETE WITH RESPECT TO ALL ESSENTIAL NUTRIENTS EXCEPT PROTEIN, SHOWING THE RELATIVE NUTRITIVE VALUE OF VARIOUS NITROGENOUS CONSTITUENTS OF THE POTATO[15]

Chick and Cutting[8] and Chick and Slack[15] have shown, however, that although the non-protein fraction is alone incapable of supporting growth, yet the mixture of protein and non-protein nitrogen in the whole tuber possesses a nutritive value, as measured by its growth-supporting capacity for young rats, at least equal to that of the isolated tuberin. The obvious explanation of this result is not possible, since no supplementation between tuberin and the non-protein nitrogen could be demonstrated when the two fractions were isolated and fed in various proportions. In the accompanying growth charts, obtained in one such experiment, the broken line represents the average weight-change of a group of six litter-mate weanling rats receiving a diet complete with respect to all essential nutrients except nitrogen. The latter was derived entirely from protein-free potato juice and fed at a level of 2·3 per cent nitrogen on the dry weight for three weeks and at a level of 3·0 per cent nitrogen for a further week. There was little change in weight on these diets. At the end of a month, three of the six rats were given a diet containing 1·7 per cent nitrogen derived from whole potato, and the other three a diet containing 1·8 per cent nitrogen derived from a mixture of tuberin and non-protein nitrogen in the proportions in which they occur in the whole potato. The average growth-curve of a group of three rats receiving a diet in which all the nitrogen is supplied at a level of 1·7 per cent nitrogen derived entirely from tuberin is included from another experiment.

It is difficult to account in terms of amino-acid content for the superiority of the whole potato over tuberin as a source of dietary nitrogen. The small amount of unidentified nitrogen which cannot be extracted from potato residue (about 8 per cent of the total potato nitrogen and almost certainly protein) may be exerting an effect, or the potato may contain minute amounts of material similar to streptogenin, which Woolley[16] has shown to be a peptide-like factor stimulating the growth of *L. Casei* and obtained b tryptic digest of certain proteins of which it is a integral part. Otherwise it would appear that th potato contains further substances which, thoug neither proteins nor amino-acids, are capable replacing or supplementing these in the diet.

I wish to thank Dr. Harriette Chick for permittin me to include the results of the experiments shown i the graph, and should also like to record my appre ciation of the helpful advice and encouragement have received from Sir Charles Martin and Pro A. C. Chibnall.

NEW CHEMICAL AND PHYSICAL LABORATORY AT THE ROYAL AIRCRAFT ESTABLISHMENT, FARNBOROUGH, HANTS

CHEMICAL research in the Royal Aircraft Estab lishment commenced under Dr. J. E. Ramsbottor in the early years of the First World War, but unt very recently the accommodation for chemical an physical research was by no means adequate fo present-day needs. However, a new laboratory ha recently been completed and was formally opene on October 29 by Mr. G. R. Strauss, Minister c Supply. In his introductory address, the director c the Royal Aircraft Establishment, Mr. W. G. A Perring, outlined the growth of chemistry at th Establishment and summarized the outstandin contributions of the Chemistry Department to aerc nautical research. A specification for a new labora tory was originally drawn up by Dr. Ramsbottor and his staff before the Second World War, and i his capacity of war-time head of the Chemistr Department, Prof. W. F. K. Wynne-Jones was re sponsible for the detailed layout of the laboratory an for pressing forward the extended scheme. Muc valuable advice was received from Sir Ian Heilbron c the Imperial College of Science and Technolog London, and throughout the planning and cor structional period Mr. R. B. Twiss, a member of th Chemistry Department staff, has been the genere adviser on all research requirements to the architec Mr. Oliver Law, the consulting engineers, Messr A. H. Barker and Partners, and the contractor Messrs. Trollope and Colls.

The new laboratory was designed in 1944 and cor structed during the period 1945–47. Its genere layout represents an attempt to provide up-to-dat facilities for both basic research in the chemical an

NEW CHEMICAL AND PHYSICAL LABORATORY AT THE ROYAL AIRCRAFT ESTABLISHMENT, FARNBOROUGH

physical fields and more applied studies of aviation problems of a chemical and physical nature. Well-sited, easily accessible by new roads in front and rear, the laboratory comprises a single block, in plan dumb-bell-shaped and almost symmetrical, the long centre section terminating in two transverse wings. The overall length is about 220 ft., the width of the centre part 44 ft., and of the wings 65 ft., the total floor area being of the order of 40,000 sq. ft. Excavation of the whole centre section provides considerable basement area for spectrographic laboratories, service control rooms, air-conditioning equipment, refrigerators, a liquid-air plant and bulk store. The wings are not excavated and their solid floors permit heavier plant installation than suspended floors.

The main building rises three floors above the basement, and has a flat roof surmounted by a small central laboratory, lift room, and the fume-extraction plant, the latter comprising four large fan chambers and their associated acid-resisting ductwork. Most of the floor area is available for experimental work, all services being carried up into the central laboratory.

The building construction is robust; the reinforced concrete framing (columns, beams and floors) was cast *in situ*. The external walls are filled with 13½-in. solid brickwork above ground-floor level; basement retaining walls are of reinforced concrete, brick-faced. The foundations are adequate for structural weight plus a uniform loading of 200 lb. per sq. ft. for all suspended floors.

Along the centre section of the building, columns are regularly spaced at 10 ft. 7 in. centres, with spacing in wings appropriate to the greater spans. The central corridors on each floor, including the basement, extend from wing to wing and are 7 ft. wide, so that along the length of the block subdivision by transverse brickwork partitioning provides rooms which are multiples of the unit bay size (internally 10 ft. 3 in. by 16 ft. 9 in.). The wings, 62 ft. by 20 ft. internally, can be used as single rooms or subdivided, the extra width providing for large centre benches as in the analytical laboratory, or for bulky equipment as in the X-ray section.

Ceilings are generally 10 ft. 9 in. high (basement 8 ft. 9 in.), but in the centrally disposed 8-bay pilot-plant laboratory the first floor has been omitted to give headroom of 22 ft. for tall apparatus such as stills, there being a gallery around three sides at first-floor level, accessible via two iron stairways within the room, with an emergency exit steel door to the first-floor corridor. This double-height room is of fire-resisting construction, isolated from the building by two more steel doors giving access from the ground-floor corridor. There are two more entrances from outside the building directly opposite these isolating doors.

Individual laboratories in the whole block are designed to make changes of function easy to accomplish; specialized layout has therefore given place to flexibility, with the exception of a few special rooms, for example, the X-ray and electron microscopy and the textile sections.

Special attention has been given to stores, all three of which are near the lift, those on the first and second floors having separate lift access gates. Laboratories making greatest demands on the stores are as near as possible to them; offices and other rooms lie farther along the corridors, towards the south end of this building. In general, the ground floor is allotted to the more physical operations; the first, except for the analytical laboratory, is largely administrative; and the second devoted chiefly to chemical work requiring efficient fume disposal above roof-level.

The electrical and mechanical services follow the general flexibility requirement, considerable subdivision with ease of accessibility simplifying maintenance and facilitating modifications with minimum disturbance. Adequate service outlets and floor drain points, either blanked off as future provision or continued to required positions, are provided in nearly every room. Conversion of function, for example, offices into laboratories, is thus straightforward. Some standardization of fittings also has improved adaptability to varying requirements.

In more detail, the distributed services are cold and hot water, medium pressure steam, compressed air, gas, three- and single-phase 400/230-V. A.C. and 210-V. D.C.; low-voltage supplies are provided from any A.C. point by variable transformers and rectifiers, with local batteries where necessary.

Distribution of non-electric services to rooms is via horizontal sub-mains suspended along corridor ceilings on each side, separately controlled branches feeding outwards from the centrally disposed main risers. Branches off the sub-mains enter rooms at high level and are there valved; each room is thus independent of others.

The electrical services are similarly distributed, vertical feeders supplying separate A.C. and D.C. multiple plug-in busbar systems on ground and second floors, and distribution boards elsewhere. By this means, separately fused branch connexions may be made at 2-ft. intervals even with busbars alive without disturbance to more than the single laboratory concerned; leads run in flexible conduit to separate distribution boards in rooms; the whole system is thus extremely adaptable. Each laboratory is fitted with specially designed combination plug and terminal box outlets, the circuits being well subdivided. Additional supplies may be obtained from a fresh tapping of the appropriate busbar system. Lighting points are fed from the same source, but are separately fused. Colour differentiation is employed for all services.

Heating and ventilating of the building are effected by low-pressure steam radiators and the central plenum installation, the latter forcing filtered and tempered air through ducting following the route of the general services. Vitiated air is thus displaced, each room having inlet and exit grilles at high level. The ducts pass centrally along corridors, the whole being enclosed by false ceilings, with removable access panels along the whole length, the voids on each floor communicating with the exit air shaft discharging at roof-level.

A brief summary of the field of chemical and physical research covered by the Chemistry Department was given at the opening ceremony by Dr. T. P. Hughes, the present head of the Department. As a specialist department of the R.A.E., the Chemistry Department must be prepared to offer chemical advice and services to all departments of the Royal Aircraft Establishment and to certain departments of the Ministry of Supply; both these functions have been discharged with some notable successes in the past. Much of the work is necessarily of a short-term and *ad hoc* nature; but roughly speaking about half the effort of the Department is directed along fairly long-term lines and includes a healthy proportion of basic chemical and physical research.

The Chemistry Department is responsible for much of the development and application of non-metallic materials to aircraft, and under Mr. H. W. Hall is a section specializing in the chemistry and physics of such solids as plastics, rubber, wood and adhesives. Recent developments in high-speed flight have emphasized the value of maintaining smooth surfaces on thin highly stressed wings, and it has been considered that reinforced plastic structures might possess many production and operational advantages over the conventional metal wing. To develop this specific application, and also to examine the possibilities of plastic structures for all airframe requirements, a section under Mr. J. E. Gordon is attempting to make a few large-scale structures in reinforced plastics. A related field is that of textiles, where a section under Mr. J. W. W. Dyer is covering certain aspects of the development and performance of textiles and proofed fabrics.

The physics and chemistry of the many special fluids used in civil and military aircraft, such as paints, fuels, hydraulic fluids, lubricating oils and greases, are being studied in a section under Dr. E. W. J. Mardles. Much of the work is concerned at present with the rheological behaviour of these fluids. The assessment and reduction of fire risks in aircraft is the major function of a section directed by Mr. W. G. Glendinning. A section under Dr. J. D. Main-Smith covers miscellaneous chemical problems, chiefly of an inorganic nature. Among many other successes, this group developed the simple chemical carbon monoxide indicator which is widely used for aircraft cabin-contamination tests.

The chemistry of the reactions liberating energy in various forms of aircraft power plant is being investigated in a section under Dr. W. G. Parker. In the same manner as the development of piston engines and their fuels has been materially assisted by the understanding of the combustion process gained by some twenty years of physico-chemical research, it is hoped to obtain some insight into the combustion processes in later power plants, such as gas turbines, ram jets and rockets, for here the greater simplicity of the mechanical design has considerably increased the scope of the chemist.

In his address, Mr. G. R. Strauss emphasized the importance of scientific research in the aircraft field, and declared that the Government would continue to give every support to aeronautical research and development. In the new laboratory he hoped that the chemists and physicists would find congenial working conditions for the important part they have to play in aeronautical research of the future.

GOVERNMENT RESEARCH IN BRITAIN

WHILE the veil of secrecy drawn for the most part over the activities of the Department of Scientific and Industrial Research since the spring of 1939 remains unlifted, and we still await the resumption of publication of the annual reports of the Department and even the appearance of the long-promised review of its war-time activities, pronouncements regarding administrative developments are made in diverse ways and sometimes to strange audiences. The address of the Lord President of the Council to the North Herts Labour Party at Letchworth on January 14, containing the important announcement regarding the development of a scientific centre at the new town of Stevenage, is a recent example. Mr. Morrison prefaced his announcement by stating that the Government is eager to see science supporting enterprise in the national effort for economic recovery and independence. It proposes to bring to public enterprise new ideas and progressive development by making full use of the unrivalled scientific brains of Britain, sweeping away the old isolation of science and the tendency to look at scientific workers as people not needed in industry or only needed in the 'back room', or as long-haired old gentlemen cut off from worldly affairs. The Government is taking steps, he said, to bring science into the forefront of British industry, and does not believe that industry can give the nation what it wants in increasing abundance at decreasing costs unless science becomes more of a partner.

Mr. Morrison referred to the recent increase in the number and the effectiveness of the research associations in industry, and to the way in which the National Coal Board has brought science into the coal-mining industry at the top level and in every area. He looked to the time when every British worker will be conscious that he has a scientific man close at hand to make his work easier and less unpleasant, and to help him to get a better result. Although it would be some time before British industry could be re-equipped, even existing plant could be made much more productive by the assistance of science.

Mr. Morrison emphasized that time would also be required before fundamental research now being carried out could show results in industry; in the meantime, he said, we must rely chiefly on the more effective use of the vast amount of scientific knowledge which already exists, but which has not yet been fully applied in British industry, and on harnessing the social sciences to help managements and workers in their daily problems. Here the Lord President instanced the contribution of housing research under the Department of Scientific and Industrial Research in raising standards of comfort in housing, and to the investigations of the Shirley Institute into the productivity of different cotton mills. The latter investigations had suggested that by bringing the practices of all mills up to those of the best, the output of the present labour force and machinery might be increased by not less than ten, and possibly as much as forty, per cent. Mr. Morrison also referred to the work of the Industrial Health Research Board on lighting and fatigue, and in particular to the value of choosing the right colours for machines and working equipment in reducing fatigue and increasing output.

The organisation of science is also important, and the Lord President, after paying a tribute to the work of the Advisory Council on Scientific Policy, referred to the programme of the recently established Committee on Industrial Productivity and its various panels. If science, however, is to be at the heart of industrial effort in Britain, it is also necessary for the nation to understand, use and continually demand the fruits of science. He said that the new developments mentioned represent a start towards making Britain a truly scientifically minded nation, with all the advantages which flow from that. We must in future be accustomed to setting aside for science larger resources and more man-power if we are to get the maximum results. Much of our scientific research had been carried on under very bad conditions, and the Government is taking steps to improve those conditions as fast as possible. Recently, he said, he had arranged for the largest of our new scientific stations—that for mechanical engineering research—to be located in Scotland. It is important that scientific research and the inspiration it brings should be well distributed over the country, although many of our research establishments must of necessity be in the London region.

The Government has decided, Mr. Morrison said, that the new town at Stevenage should be given preference in considering the sites of new scientific establishments in the London region. A number of research stations would have to move from their present sites, which they have outgrown. He was unable to say what actual research will be located at Stevenage; but the town will become one of the important scientific centres of the future. Letchworth, since its earliest days, has been the home of industries characterized by a progressive attitude to research, and he hopes that those industries would benefit from the new development, and that Letchworth would share the Government's vision of science in the service of the people.

AMERICAN AWARDS TO BRITISH MEN OF SCIENCE

AWARDS have recently been made by the Government of the United States to the following British scientific workers, for their services during the War:

Medal of Freedom with Silver Palm: Sir Henry Dale, president during 1940–45 of the Royal Society and a member of many important Government scientific committees; Sir Jack Drummond, director of research, Boots Pure Drug Co., Ltd., scientific adviser to the British Ministry of Food during 1944–46; Sir Alfred Egerton, professor of chemical technology, Imperial College of Science and Technology, London, for his work as a secretary of the Royal Society and member of the Scientific Advisory Committee to the War Cabinet; Sir Melvill Jones, Francis Mond professor of aeronautical engineering in the University of Cambridge, for scientific research and development, as an outstanding authority on the problems of aerial gunnery; Dr. Alexander King, of the Ministry of Supply from early 1940, and head of the British Commonwealth Scientific Office in Washington from March 1944; Sir Edward Mellanby, secretary of the Medical Research Council, a principal figure in the organisation and conduct of British research in military medicine; Dr. Hugh M. Sinclair, lecturer in biochemistry, University of Oxford, sometime honorary nutritional consultant and co-ordinator of research in the British Zone, Control Commission (British Element); Mr. Cyril G. Trotman, for work as head of the Planning and Reporting Section of the Chemical Defence Experimental Station at Porton, and later as British representative on the international Project Co-ordination Staff in the United States; Dr. Hector F. Willis, of the Admiralty Research Laboratory, Teddington, for scientific research and development in theoretical physics and particularly the transmission of sound.

Medal of Freedom with Bronze Palm: Sir Charles Darwin, director of the National Physical Laboratory, Teddington, and first head of the British Commonwealth Scientific Office in Washington, for service to scientific research and development; Mr. J. N. D. Heenan, for his work in the development of turbo-jet and turbine engines for use in U.S. Army Air Force aircraft; Sir Ian Heilbron, professor of organic chemistry in the Imperial College of Science and Technology, London, for scientific research and development in connexion with chemical warfare munitions; Mr. Charles Lea, who was in charge of the development of incendiaries for the Ministry of Aircraft Production; Mr. Andrew Stratton, of the Royal Aircraft Establishment, South Farnborough, for research work in connexion with proximity fuses; Mr. T. W. J. Taylor, for work in connexion with scientific research and development.

Medal of Freedom: Dr. James Craigie, of the Imperial Cancer Research Fund, associate professor of immunology and bacteriology at the University of Toronto, and member of the Joint United States–Canadian Commission during June 1942–Feb. 1946; Mr. Amherst F. H. Thomson, representative of the Ministry of Supply, and later of the British Admiralty, for work in connexion with the development of proximity fuses.

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, February 9

Royal Society of Arts (at John Adam Street, Adelphi, London, W.C.2), at 4.30 p.m.—Sir Jack Drummond, F.R.S.: "Fats in the Life of the Nation" (Cantor Lecture).

University of London (in the Assembly Hall, Institute of Education, Malet Street, London, W.C.1), at 5.30 p.m.—Prof. J. A. Lauwerys: "International Co-operation in Education".*

Institution of the Rubber Industry, Midland Section (at the James Watt Memorial Institute, Great Charles Street, Birmingham), at 7.15 p.m.—Symposium on "Colour in the Rubber Industry" (Miss M. D. Gauntlett: "Physics and Measurement of Colour"; Mr. J. Haworth: "Technology of Colour"; Mr. T. E. H. Gray: "Use and Abuse of Colour").

Textile Institute, Macclesfield, Leek and District Section (at Nicholson Institute, Leek), at 8 p.m.—Mr. E. B. Higgins: "Plastics, Fabrics and Finishes".

Royal Institute of Chemistry, London and South-Eastern Counties Section (joint meeting with the Alembic Club, in the Physical Chemistry Laboratory, The University, Oxford), at 8.15 p.m.—Dr. F. A. Freeth, F.R.S.: "Relationship between Academic and Industrial Research". (To be repeated on Friday, February 20, at 8.15 p.m., in the University Chemical Laboratory, Pembroke Street, Cambridge.)

Tuesday, February 10

University College London (in the Anatomy Theatre, Gower Street, London, W.C.1), at 1.15 p.m.—Prof. W. H. Pearsall, F.R.S.: "Modern Botany". (Further lecture on February 12.)*

Zoological Society of London (at the Zoological Gardens, Regent's Park, London, N.W.8), at 5 p.m.—Scientific Papers.

Institution of Electrical Engineers, Radio Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Discussion on "The Maintenance of Television Receivers in the Home" (to be opened by Mr. G. H. Watson).

Conway Discussion Circle (at Conway Hall, Red Lion Square, London, W.C.1), at 7 p.m.—Miss Barbara Low: "The Influence on Mind of Unconscious Factors".*

Wednesday, February 11

Physical Society, Colour Group (in the Small Physics Lecture Theatre, Imperial College of Science, Imperial Institute Road, London, S.W.7), at 3.30 p.m.—Dr. D. R. Duncan: "The Classification of Colour-Mixture Phenomena".

Geological Society of London (at Burlington House, Piccadilly, London, W.1), at 5 p.m.—Scientific Papers.

Institute of Petroleum (at Manson House, 26 Portland Place, London, W.1), at 5.30 p.m.—Dr. N. J. M. Taverne: "Aerial Photography and Exploration for Oil".

Institution of Electrical Engineers, Transmission Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. T. W. Ross and Mr. R. M. A. Smith: "Centralized Ripple Control on High-Voltage Networks".

Society of Chemical Industry, Food Group (at the Chemical Society, Burlington House, Piccadilly, London, W.1), at 6.30 p.m.—Dr. A. B. P. Page and Dr. O. F. Lubatti: "Some Effects of Fumigants upon Foods".

Society of Dyers and Colourists, Northern Ireland Section (at the Queen's Hotel, Belfast), at 7.30 p.m.—Dr. P. W. Cunliffe: "Fastness Standards".

Thursday, February 12

Royal Society (at Burlington House, Piccadilly, London, W.1), at 4.30 p.m.—Mr. H. J. Axon and Dr. W. Hume-Rothery, F.R.S.: "Lattice Spacings of Solid Solutions of Different Elements in Aluminium"; Mr. B. Chalmers, Mr. R. King and Mr. R. Shuttleworth: "The Thermal Etching of Silver".

Linnean Society of London (at Burlington House, Piccadilly, London, W.1), at 5 p.m.—Prof. W. V. Mayneord: "Some Applications of Nuclear Physics in Biology and Medicine".

Physical Society, Acoustics Group (in the Lecture Theatre, Science Museum, South Kensington, London, S.W.7), at 5 p.m.—Discussion on "The Borderline of Psychology, Physics and Music" (to be opened by Dr. R. W. Pickford, Prof. van der Pol and Mr. J. Steuart Wilson).

Royal Institution (at 21 Albemarle Street, London, W.1), at 5.15 p.m.—Prof. E. K. Rideal, F.R.S.: "Adsorption and Heterogeneous Catalysis". (Further Lectures on February 19 and 26.)

Chemical Society (joint meeting with the University Chemical Society, in the Chemistry Lecture Theatre, The University, Sheffield), at 5.30 p.m.—Prof. M. G. Evans: "The Factors Influencing Radical Reactions in Solution".

Institution of Electrical Engineers, Installations Section (at Savoy Place, Victoria Embankment, London, W.C.2), at 5.30 p.m.—Mr. C. A. Cameron Brown and Mr. E. W. Golding: "The Application of Electricity to Horticulture".

Royal Aeronautical Society (at the Institution of Civil Engineers, Great George Street, London, S.W.1), at 6 p.m.—Mr. A. R. Howell: "The Aerodynamics of the Gas Turbine".

British Institution of Radio Engineers, North-Western Section (in the Reynolds Hall, College of Technology, Sackville Street, Manchester), at 6.45 p.m.—Mr. J. A. Sargrove: "A New All-Stage Valve".

Royal Photographic Society, Scientific and Technical Group (at 16 Prince's Gate, London, S.W.7), at 7 p.m.—Mr. R. McV. Weston: "The Importance of Illumination in Photomicrography".

Chemical Society, Society of Chemical Industry, and Royal Institute of Chemistry, Edinburgh and East of Scotland Sections (at the North British Station Hotel, Edinburgh), at 7.30 p.m.—Dr. James Stewart: "The Chemistry of Rumination".

Chemical Society (in the Chemical Department, The University, Woodland Road, Bristol).—Prof. H. W. Melville, F.R.S.: "The Formation of Ethylenic Polymers".

Friday, February 13

Physical Society, Low-Temperature Group (joint meeting with the Institution of Chemical Engineers, at the Institution of Civil Engineers, Great George Street, London, S.W.1), at 10 a.m.—Conference on "Developments in the Industrial Production and Use of Gaseous Oxygen".

Textile Institute, Lancashire Section (at 16 St. Mary's Parsonage, Manchester), at 1 p.m.—Mr. J. E. Fielden: "Electronics in the Textile Industry".

Biochemical Society (at Westminster Hospital Medical School, 17 Horseferry Road, London, S.W.1), at 2 p.m.—Scientific Papers and Demonstrations.

Royal Astronomical Society (at Burlington House, Piccadilly, London, W.1), at 4.30 p.m.—Anniversary Meeting, followed by Annual General Meeting.

Institute of Physics, Manchester and District Branch (in the new Physics Theatre, The University, Manchester), at 7 p.m.—Mr. R. J. Bracey: "The Design of Optical Instruments".

Sheffield Metallurgical Association, Methods of Analysis Group (at 198 West Street, Sheffield), at 7 p.m.—Mr. E. J. Vaughan: "The Spekker—What it is and How it Works", Part 2.

Royal Institution (at 21 Albemarle Street, London, W.1), at 9 p.m.—Prof. A. O. Rankine, F.R.S.: "Physical Problems in Oil Production".

Saturday, February 14

British Psychological Society (in the Hastings Hall, Tavistock House, Tavistock Square, London, W.C.1), at 2.30 p.m.—Mr. G. C. Grindley: "The Effect of Knowledge of Results on some Very Simple Skills".
